1	Write	DCR	H'00000021	4	H'000021DE	4	
2	Write	DAR	Address to be erased	4	Address to be erased	4	
3	Write	DCSR	H'04100000	4	H'04200000	4	
4	Write	CWNDR	Any value	4	Any value	4	

(2) OctaRAM Operation Settings

1. Read Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	H'0000C000	4	
2	Write	DAR	H'00040000	4	
3	Write	DCSR	H'04A80502	4	
4	Read	CRR	H'0000xxxx	2	The high-order 16 bits are all set to 0s, and the read data is stored in the low-order 16 bits.

2. Write Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00004000	4	
2	Write	DAR	H'00040000	4	
3	Write	DCSR	H'04A80002	4	
4	Write	CWDR	H'0000xxxx	2	Set all the high-order 16 bits to 0s, and specify the write data in the low-order 16 bits.

22.6 Delaying OM_DQS and Auto-Calibration

22.6.1 Delaying OM_DQS

Depending on the characteristics of the DOPI mode, the controller might not be able to latch data on the rising and falling edges of the OM_DQS clock signal. OM_DQS will then require a delay to allow the latching of data with sufficient margins for the setup and hold times. The DV1DEL[7:0] and DV0DEL[7:0] bits in the memory delay trimming register (MDTR) can be used to specify the amount of delay.
Figure 22.14 shows how a delayed OM_DQS becomes asserted at a good time for latching of the data.

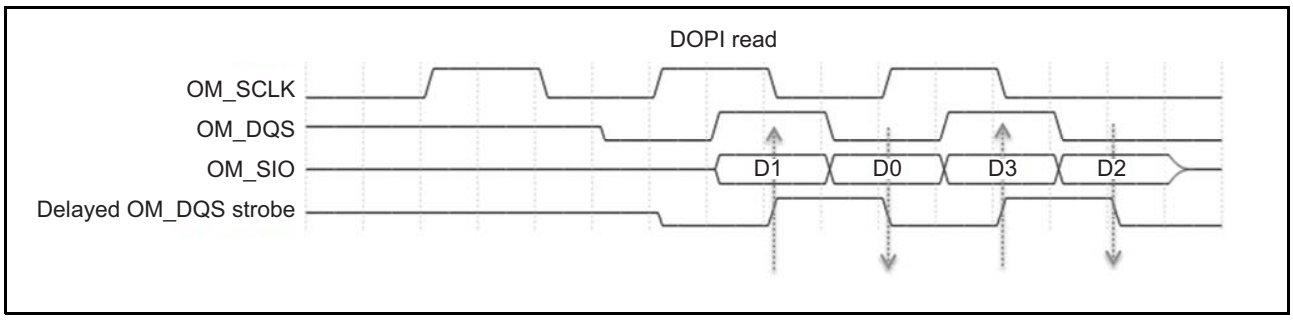

Figure 22.14 Example of Securing the Latching of Data by Delaying OM_DQS

22.6.2 OM_DQS Auto-Calibration

This LSI has an automatic calibration to prevent acquisition of wrong data due to the variation of voltage and temperature. When using the automatic calibration, set the following registers.

- Controller and device setting register (CDSR)
  - Automatic calibration mode ACMODE[1:0] bits setting
- Auto-calibration timer register (ACTR)
  - Automatic calibration cycle time setting
- Auto-calibration address registers 0 and 1 (ACAR0/ACAR1)
  - Preamble pattern store address setting

Automatic calibration requires 16 bytes user area to store the preamble pattern. Store the preamble pattern to the setting address of ACAR0 and ACAR1.

Preamble pattern: H'00F708F7 FF0000F7 0800FF00 FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 0,
H'00F708F7 FF0000F7 0800FF00 FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 1,
H'F700F708 00FFF700 000800FF FFFF0000
store in the flash memory or RAM device.

The operation proceeds as follows when auto-calibration is enabled.
Once the time specified in ACTR has elapsed, the Octa memory controller varies the delay time for OM_DQS and checks whether the preamble pattern can correctly be read from the address specified in ACAR0 or ACAR1.
The preamble pattern is read 48 times per auto-calibration.
The controller seeks the most appropriate timing of latching in this sequence of reading and updates the DV0DEL or DV1DEL bits in MDTR with the result. This re-starts the timer for auto-calibration.
Note that access to the OctaFlash memory or OctaRAM area by the CPU or other bus masters is held pending until reading of the preamble data for auto-calibration is completed.

Figure 22.15 describes the flow of automatic calibration settings for OctaFlash and OctaRAM devices.
Before starting settings, check that the Octa memory controller is selected in the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0).

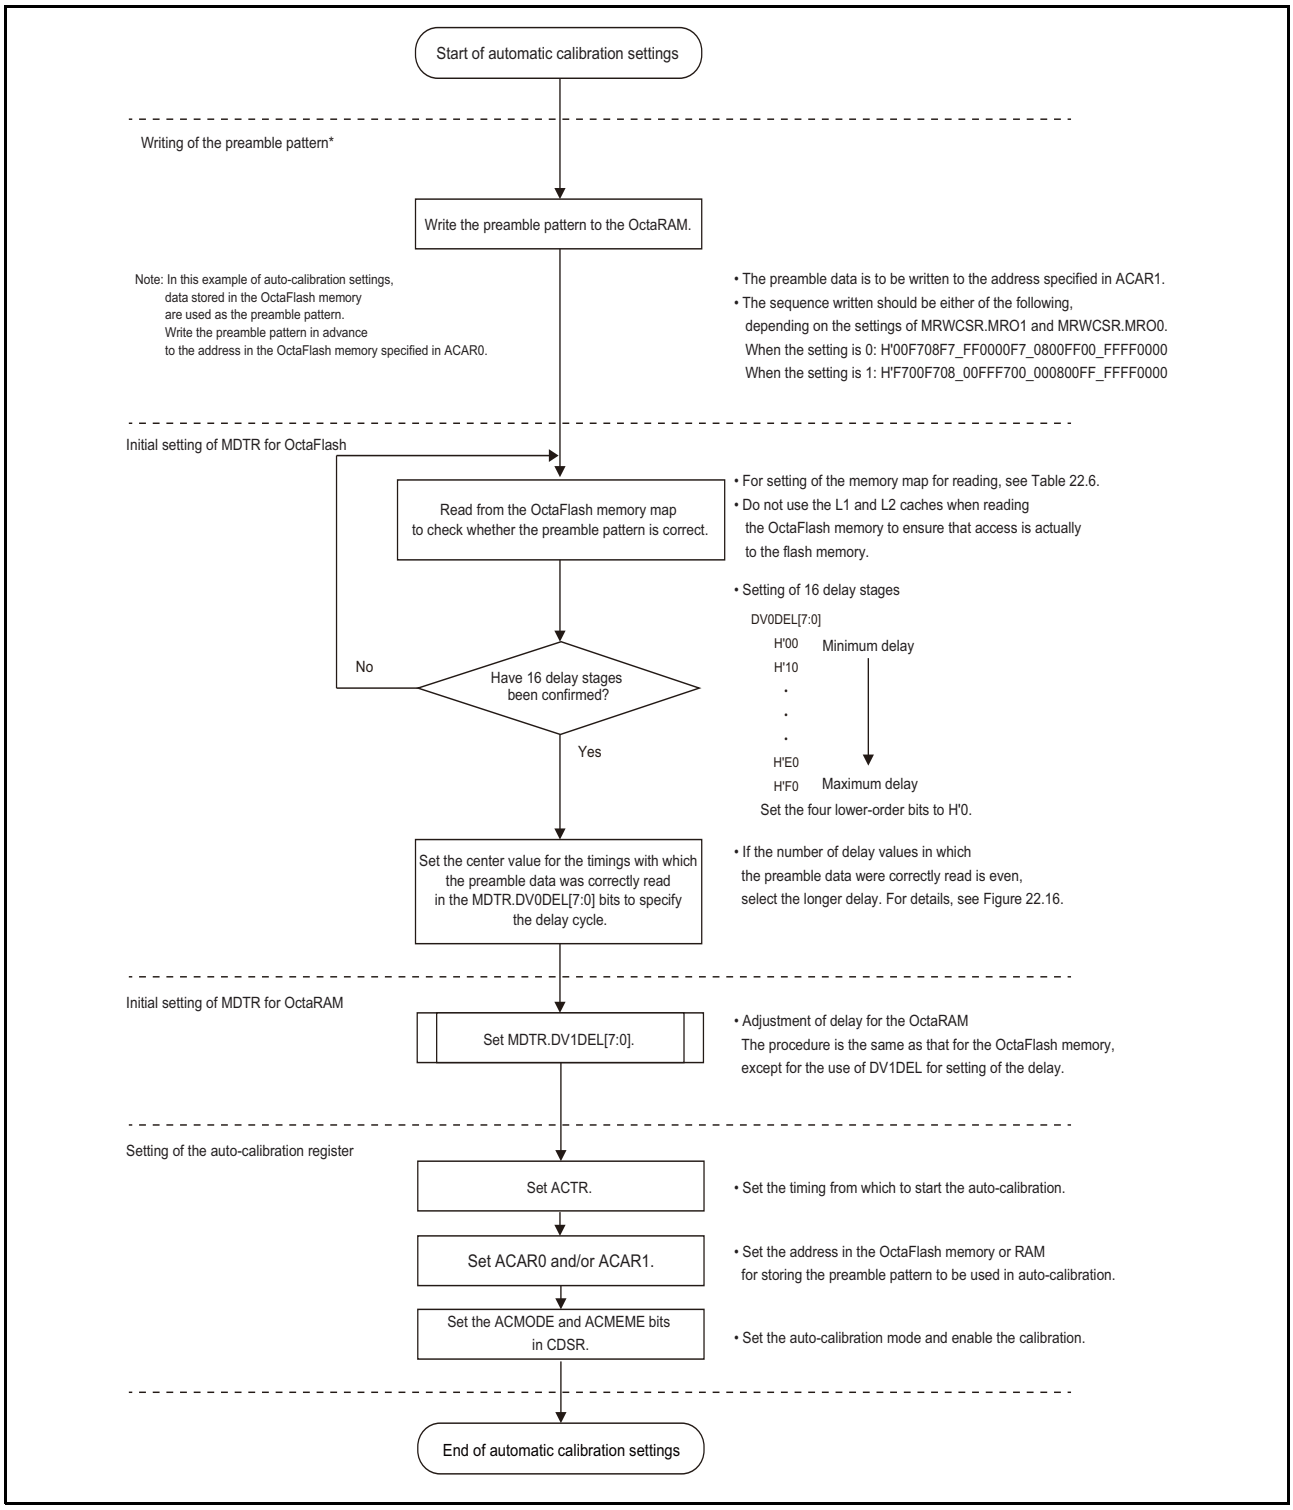

Figure 22.15 Flow of Settings for the Auto-Calibration Mode

Figure 22.16 shows an example of the initial setting of the DV0DEL or DV1DEL Bits in MDTR.

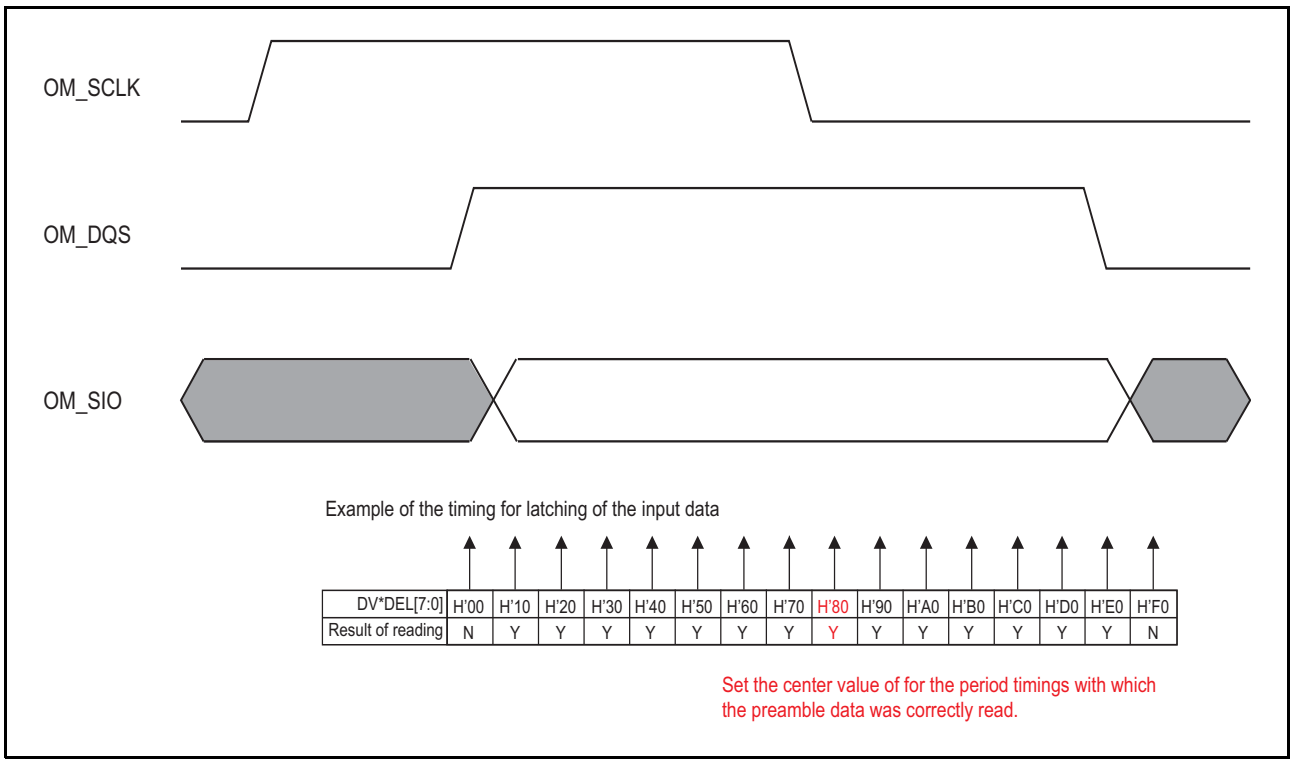

Figure 22.16 Example of the Initial Setting of the DV0DEL or DV1DEL Bits in MDTR

22.7 OM_DQS Enable Counter

During read command operation, the OM_DQS signal is used as the data latch clock by the controller. When the memory device is in the idle state, OM_DQS maintains a high impedance (Hi-Z) state, and asserts low before data is output. This Hi-Z to low transition may latch wrong data by driving the OM_DQS data latch logic of the controller.
Figure 22.15 shows the waveform when OM_DQS maintains a high-impedance (Hi-Z) state and asserts low before data is output.
Avoiding such Hi-Z to low transitions, this controller can bypass wrong data with memory delay trim register (MDTR). (MDTR.DQSEDOPI[3:0] for Flash DOPI mode, MDTR.DQSESOPI[3:0] for Flash SOPI mode, and MDTR.DQSERAM[3:0] for RAM mode)
Each of the bit fields can be set within the range from 0 to 15.

OM_DQS enable counter (MDTR) minimum value ≥ Number of the command cycles + number of the address cycles*1 + number of the stable OM_DQS cycles*2 + number of the OM_DQS delay cycles*3
OM_DQS enable counter (MDTR) maximum value ≤ Number of the command cycles + number of the address cycles*1 + number of the memory dummy cycles (latency) + number of the OM_DQS delay cycles*3 + pre-cycle setting*4

Note 1. Flash SOPI: Number of the command cycles + number of the address cycles = 2 + 4 = 6
Flash DOPI: Number of the command cycles + number of the address cycles = 1 + 2 = 3
RAM DOPI: number of command cycles + number of address cycles = 1 + 2 - 1 = 2 (start dummy (latency) calculation from the second cycle)
Note 2. Number of stable OM_DQS cycles: Maximum value is 2 cycles of OM_SCLK (Reference specification of OctaFlash / OctaRAM)
Note 3. Number of the OM_DQS delay cycles: OM_DQS clock delay due to external causes
When OM_DQS delay ≤ 0.25 OM_SCLK: OM_DQS delay cycles = -1
When 0.25 OM_SCLK < OM_DQS delay ≤ 1.25 OM_SCLK: OM_DQS delay cycles = 0
When 1.25 OM_SCLK < OM_DQS delay ≤ 2.25 OM_SCLK: OM_DQS delay cycles = 1
In the flash SOPI mode, read 0.25 as 0.5, 1.25 as 1.5, and 2.25 as 2.5 in the above expressions.
Note 4. Pre-cycle setting: OM_DQS pre-cycle on/off
OM_DQS pre-cycle off: Pre-cycle setting = 0
OM_DQS pre-cycle on: Pre-cycle setting = -1

Setting example: Flash DOPI mode, dummy cycles (latency) = 4, pre-cycle is off
Minimum value of OM_DQS enable counter (MDTR) ≥ 1 + 2 + 2 + 0 = 5
Maximum value of OM_DQS enable counter (MDTR) ≤ 1 + 2 + 4 + 0 = 7

From the above, setting MDTR .DQSEDOPI[3:0] from 5 to 7 can latch the correct data. If MDTR is too small, wrong data may be latched due to a transition from Hi-Z to Low. If MDTR is too large, no data is latched.

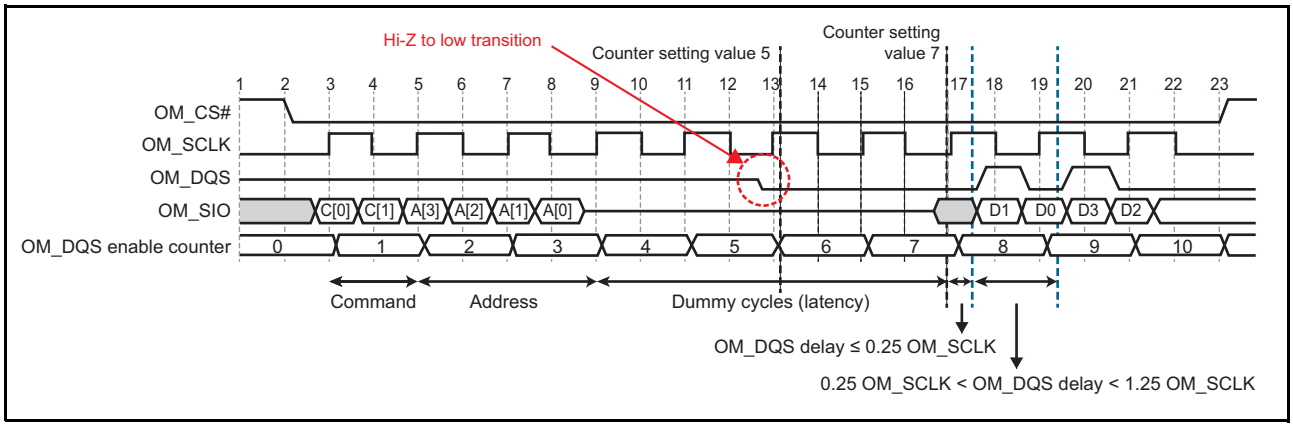

Figure 22.17 Timing of the OM_DQS Enable Counter in DOPI Mode for the Flash Memory with 4 as the Number of Dummy Cycles (Latency), and OM_DQS Pre-Cycle Off

23. I²C Bus Interface

This section gives an overall description of the I²C bus interface (RIIC).
The first section describes the features specific to this LSI, including the number of units and the register base addresses.
The subsequent sections describe the RIIC's functions and registers.

23.1 Features

23.1.1 Channels

This LSI has the following number of channels of the I²C bus interface (RIIC).

Table 23.1 Channels of RIIC

Item	Description
Number of channels	4
Name	RIICn (n = 0 to 3)

Table 23.2 Index

Index	Description
n	Throughout this section, the individual channels of the I²C bus interface are identified by the index "n" (n = 0 to 3); for example, RIICnCR1 for the I²C bus control register 1.

23.1.2 Register Base Addresses

The base address <RIICn_base> of each RIICn is listed in the following table.
All RIICn register addresses are given as values obtained by adding offsets to the register base address <RIICn_base> for each channel.

Table 23.3 Register Base Address

Channel	Base Address Name	Base Address
RIIC0	<RIIC0_base>	$E803\_A000_H$
RIIC1	<RIIC1_base>	$E803\_A400_H$
RIIC2	<RIIC2_base>	$E803\_A800_H$
RIIC3	<RIIC3_base>	$E803\_AC00_H$

23.1.3 External I/O Signals

The following table shows the external I/O signals of the RIIC.

Table 23.4 RIICn Pin Configuration

Channel	Alternative Port Pin Name	Function
RIIC0	RIIC0SCL	RIIC0 serial clock I/O pin
	RIIC0SDA	RIIC0 serial data I/O pin
RIIC1	RIIC1SCL	RIIC1 serial clock I/O pin
	RIIC1SDA	RIIC1 serial data I/O pin
RIIC2	RIIC2SCL	RIIC2 serial clock I/O pin
	RIIC2SDA	RIIC2 serial data I/O pin
RIIC3	RIIC3SCL	RIIC3 serial clock I/O pin
	RIIC3SDA	RIIC3 serial data I/O pin

23.2 Overview

23.2.1 Functional Overview

Communications format

- I²C bus format or SMBus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times for the transfer rate

Transfer rate

Up to 1 Mbps

SCL clock

For master operation, the duty cycle of the SCL clock is selectable in the following range.
0% < Duty cycle < 100%.

Issuing and detecting conditions

- Start, restart, and stop conditions are automatically generated.
- Start conditions (including restart conditions) and stop conditions are detected.

Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses, device ID addresses, and SMBus host addresses are detected.

Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching between the signal on the SDA line and the internal signal for the SDA line.
- Loss of arbitration due to detection of the start condition while the bus is busy is detectable (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching is detectable.
- Loss of arbitration due to non-matching of internal and line levels for data is detectable in slave transmission.

Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

Noise removal

The interface incorporates analog noise filters and digital noise filters for input on the RIICnSCL and RIICnSDA pins, and the width for noise cancellation by the digital noise filters is adjustable by software.

Interrupt sources

- Eight sources:
  - Transmission complete
  - Receive-data-full
  - Transmit-data-empty
  - Detection of a stop condition
  - Detection of a start condition
  - Reception of a NACK
  - Arbitration lost
  - Timeout

Low power consumption function

Module-stop state can be set.

23.2.2 Block Diagram

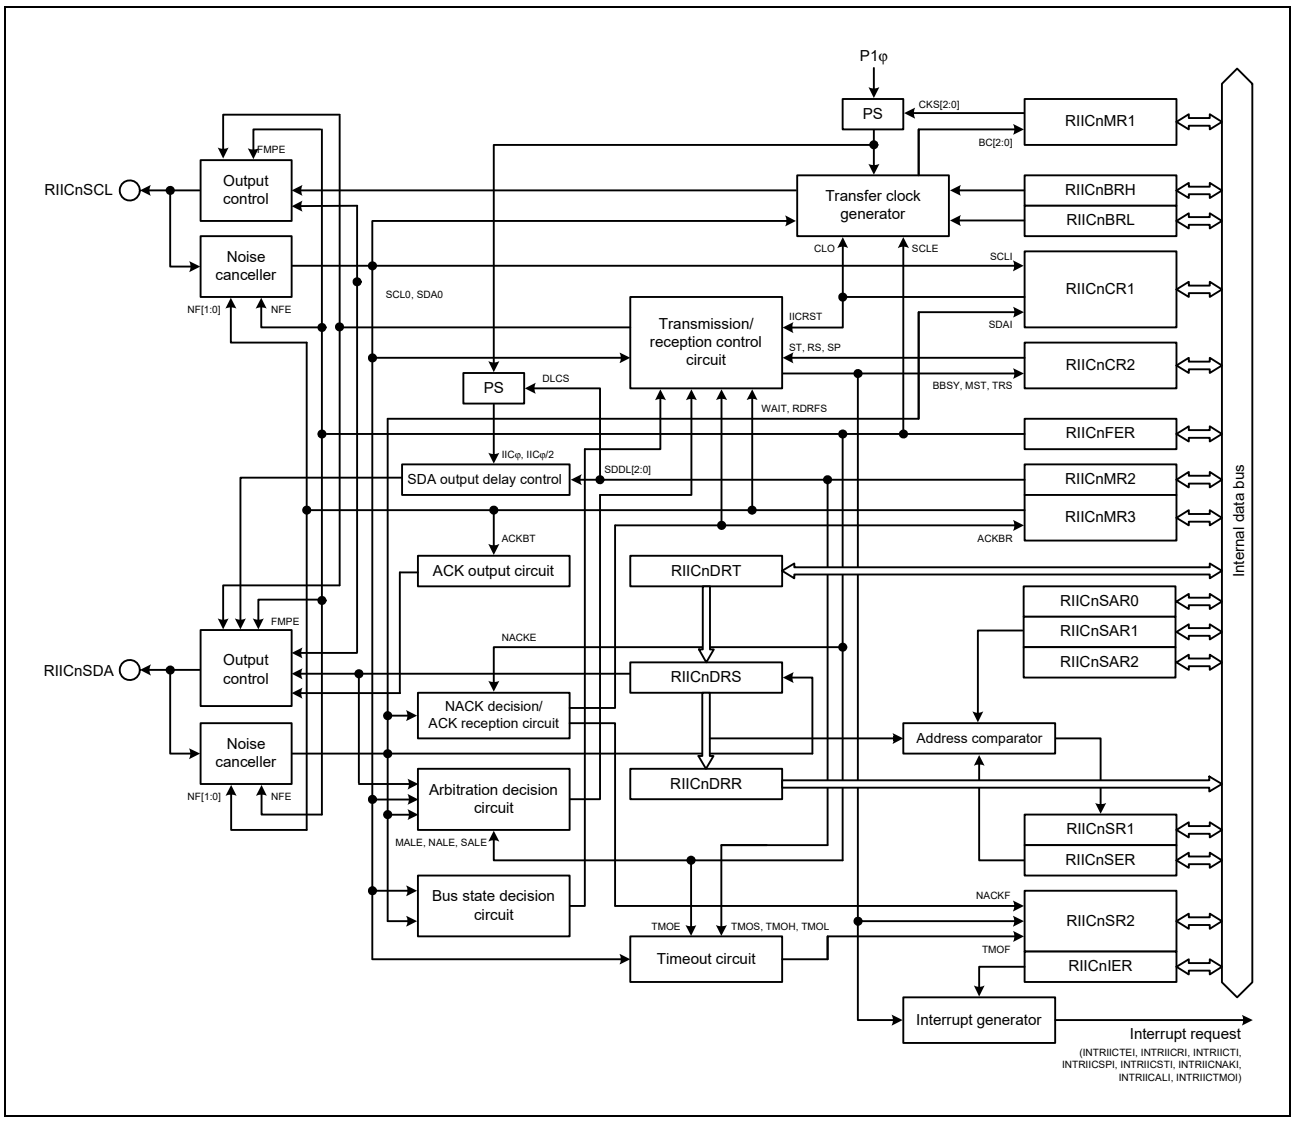

Figure 23.1 Block Diagram of RIIC

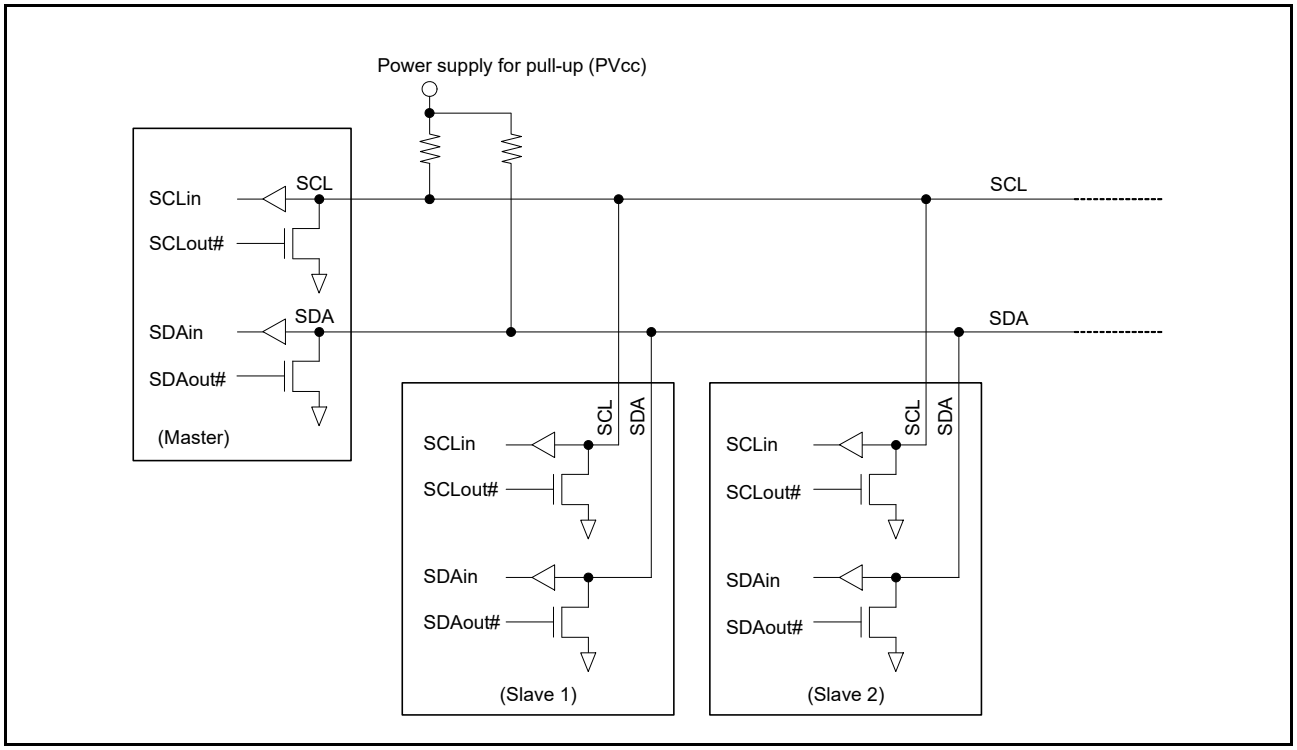

Figure 23.2 Connections to the External Circuit by the I/O Pins (I²C Bus Configuration Example)

RIICnSCL and RIICnSDA are Schmitt input/open-drain output pins for both master and slave operations. Because the output is open drain, an external pull-up resistor is required.

23.3 Registers

Channel	Register Name	Abbreviation	Address	Access Size
RIIC0	I²C bus control register 1	ICCR1	E803 A000h	8, 16, 32
	I²C bus control register 2	ICCR2	E803 A004h	8, 16, 32
	I²C bus mode register 1	ICMR1	E803 A008h	8, 16, 32
	I²C bus mode register 2	ICMR2	E803 A00Ch	8, 16, 32
	I²C bus mode register 3	ICMR3	E803 A010h	8, 16, 32
	I²C bus function enable register	ICFER	E803 A014h	8, 16, 32
	I²C bus status enable register	ICSER	E803 A018h	8, 16, 32
	I²C bus interrupt enable register	ICIER	E803 A01Ch	8, 16, 32
	I²C bus status register 1	ICSR1	E803 A020h	8, 16, 32
	I²C bus status register 2	ICSR2	E803 A024h	8, 16, 32
	I²C slave address register 0	ICSAR0	E803 A028h	8, 16, 32
	I²C slave address register 1	ICSAR1	E803 A02Ch	8, 16, 32
	I²C slave address register 2	ICSAR2	E803 A030h	8, 16, 32
	I²C bus bit rate low-level register	ICBRL	E803 A034h	8, 16, 32
	I²C bus bit rate high-level register	ICBRH	E803 A038h	8, 16, 32
	I²C bus transmit data register	ICDRT	E803 A03Ch	8, 16, 32
	I²C bus receive data register	ICDRR	E803 A040h	8, 16, 32
RIIC1	I²C bus control register 1	ICCR1	E803 A400h	8, 16, 32
	I²C bus control register 2	ICCR2	E803 A404h	8, 16, 32

	I²C bus status enable register	ICSER	E803 A418h	8, 16, 32
	I²C bus interrupt enable register	ICIER	E803 A41Ch	8, 16, 32
	I²C bus status register 1	ICSR1	E803 A420h	8, 16, 32
	I²C bus status register 2	ICSR2	E803 A424h	8, 16, 32
	I²C slave address register 0	ICSAR0	E803 A428h	8, 16, 32
	I²C slave address register 1	ICSAR1	E803 A42Ch	8, 16, 32
	I²C slave address register 2	ICSAR2	E803 A430h	8, 16, 32
	I²C bus bit rate low-level register	ICBRL	E803 A434h	8, 16, 32
	I²C bus bit rate high-level register	ICBRH	E803 A438h	8, 16, 32
	I²C bus transmit data register	ICDRT	E803 A43Ch	8, 16, 32
	I²C bus receive data register	ICDRR	E803 A440h	8, 16, 32
RIIC2	I²C bus control register 1	ICCR1	E803 A800h	8, 16, 32
	I²C bus control register 2	ICCR2	E803 A804h	8, 16, 32
	I²C bus mode register 1	ICMR1	E803 A808h	8, 16, 32
	I²C bus mode register 2	ICMR2	E803 A80Ch	8, 16, 32
	I²C bus mode register 3	ICMR3	E803 A810h	8, 16, 32
	I²C bus function enable register	ICFER	E803 A814h	8, 16, 32
	I²C bus status enable register	ICSER	E803 A818h	8, 16, 32
	I²C bus interrupt enable register	ICIER	E803 A81Ch	8, 16, 32
	I²C bus status register 1	ICSR1	E803 A820h	8, 16, 32
	I²C bus status register 2	ICSR2	E803 A824h	8, 16, 32

Channel	Register Name	Abbreviation	Address	Access Size
RIIC2	I²C slave address register 0	ICSAR0	E803 A828h	8, 16, 32
	I²C slave address register 1	ICSAR1	E803 A82Ch	8, 16, 32
	I²C slave address register 2	ICSAR2	E803 A830h	8, 16, 32
	I²C bus bit rate low-level register	ICBRL	E803 A834h	8, 16, 32
	I²C bus bit rate high-level register	ICBRH	E803 A838h	8, 16, 32
	I²C bus transmit data register	ICDRT	E803 A83Ch	8, 16, 32
	I²C bus receive data register	ICDRR	E803 A840h	8, 16, 32
RIIC3	I²C bus control register 1	ICCR1	E803 AC00h	8, 16, 32
	I²C bus control register 2	ICCR2	E803 AC04h	8, 16, 32
	I²C bus mode register 1	ICMR1	E803 AC08h	8, 16, 32
	I²C bus mode register 2	ICMR2	E803 AC0Ch	8, 16, 32
	I²C bus mode register 3	ICMR3	E803 AC10h	8, 16, 32
	I²C bus function enable register	ICFER	E803 AC14h	8, 16, 32
	I²C bus status enable register	ICSER	E803 AC18h	8, 16, 32
	I²C bus interrupt enable register	ICIER	E803 AC1Ch	8, 16, 32
	I²C bus status register 1	ICSR1	E803 AC20h	8, 16, 32
	I²C bus status register 2	ICSR2	E803 AC24h	8, 16, 32
	I²C slave address register 0	ICSAR0	E803 AC28h	8, 16, 32
	I²C slave address register 1	ICSAR1	E803 AC2Ch	8, 16, 32
	I²C slave address register 2	ICSAR2	E803 AC30h	8, 16, 32
	I²C bus bit rate low-level register	ICBRL	E803 AC34h	8, 16, 32
	I²C bus bit rate high-level register	ICBRH	E803 AC38h	8, 16, 32
	I²C bus transmit data register	ICDRT	E803 AC3Ch	8, 16, 32
	I²C bus receive data register	ICDRR	E803 AC40h	8, 16, 32

23.3.1 RIICnCR1 — I²C Bus Control Register 1

Access: RIICnCR1 is a 32-bit readable/writable register.
RIICnCR1L and RIICnCR1H are 16-bit readable/writable registers.
RIICnCR1LL, RIICnCR1LH, RIICnCR1HL, and RIICnCR1HH are 8-bit readable/writable registers.

Address: RIICnCR1: <RIICn_base> + 0000_H
RIICnCR1L: <RIICn_base> + 0000_H, RIICnCR1H: <RIICn_base> + 0002_H
RIICnCR1LL: <RIICn_base> + 0000_H, RIICnCR1LH: <RIICn_base> + 0001_H, RIICnCR1HL: <RIICn_base> + 0002_H,
RIICnCR1HH: <RIICn_base> + 0003_H

Initial Value: 0000 $001F_H$. This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 23.5 RIICnCR1 register contents (1/2)

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	ICE	I²C Bus Interface Enable 0: Output to the RIICnSCL and RIICnSDA pins is disabled. (Input to the RIICnSCL and RIICnSDA pins is enabled.) 1: Enabled (RIICnSCL and RIICnSDA pins are in the driving state) (An RIIC reset or an internal reset is selected according to the combination of this bit and IICRST bit settings.)
6	IICRST	I²C Bus Interface Internal Reset 0: Clears the RIIC reset or internal reset. 1: Initiates the RIIC reset or internal reset. (Clears the bit counter and the SCL/SDA output latch)
5	CLO	Extra SCL Clock Cycle Output 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle. (The CLO bit is cleared automatically after one clock cycle is output.)
4	SOWP*2	SCLO/SDAO Write Protect 0: Allows the SCLO and SDAO bits to be rewritten. (This bit is read as 1.)
3	SCLO*1,*2	SDA Output Control • Read: 0: RIICnSCL pin output is at a low level. 1: RIICnSCL pin is in a high-impedance state. • Write: 0: Changes the RIICnSCL pin output to a low level. 1: Changes the RIICnSCL pin in a high-impedance state. (High level output is achieved through an external pull-up resistor.)

Table 23.5 RIICnCR1 register contents (2/2)

Bit Position	Bit Name	Function
2	SDAO*1,*2	SDA Output Control • Read: 0: RIICnSDA pin output is at a low level. 1: RIICnSDA pin is in a high-impedance state. • Write: 0: Changes the RIICnSDA pin output to a low level. 1: Changes the RIICnSDA pin in a high-impedance state. (High level output is achieved through an external pull-up resistor.)
1	SCLI	SCL Bus Input Monitor 0: RIICnSCL pin input is at a low level. 1: RIICnSCL pin input is at a high level.
0	SDAI	SDA Bus Input Monitor 0: RIICnSDA pin input is at a low level. 1: RIICnSDA pin input is at a high level.

Note 1. Do not write to these bits during communication. Changing a value during communication may cause a transmission or reception failure or an AL error.
Note 2. To change the SDAO and SCLO bits, set the SOWP bit to 0 at the same timing to set the SDAO and SCLO bits to 0.

CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.
Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.
For details on this function, see section 23.13.2, Extra SCL Clock Cycle Output Function.

IICRST Bit (I²C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC.
Setting this bit to 1 initiates an RIIC reset or internal reset.
Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. Table 23.6 lists the resets of the RIIC.
The RIIC reset resets all registers including the RIICnCR2.BBSY flag (except ICE and IICRST) and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I²C bus shift register (RIICnDRS), and the I²C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see section 23.15, Reset Function of RIIC.
An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error.
If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

Caution: If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 23.6 RIIC Resets

IICRST	ICE	State	Specifications
1	0	RIIC reset	Resets all registers (except ICE and IICRST) and internal states of the RIIC.
	1	Internal reset	Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC.

ICE Bit (I2C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see Table 23.6.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 disables output from the RIICnSCL and RIICnSDA pins.

23.3.2 RIICnCR2 — I²C Bus Control Register 2

Access: RIICnCR2 is a 32-bit readable/writable register.
RIICnCR2L and RIICnCR2H are 16-bit readable/writable registers.
RIICnCR2LL, RIICnCR2LH, RIICnCR2HL, and RIICnCR2HH are 8-bit readable/writable registers.

Address: RIICnCR2: <RIICn_base> + 0004_H
RIICnCR2L: <RIICn_base> + 0004_H, RIICnCR2H: <RIICn_base> + 0006_H
RIICnCR2LL: <RIICn_base> + 0004_H, RIICnCR2LH: <RIICn_base> + 0005_H, RIICnCR2HL: <RIICn_base> + 0006_H,
RIICnCR2HH: <RIICn_base> + 0007_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.7 RIICnCR2 register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	BBSY	Bus Busy Detection Flag 0: The I²C bus is released (bus free state). 1: The I²C bus is occupied (bus busy state or in the bus free state).
6	MST	Master/Slave Mode 0: Slave mode 1: Transmit mode
5	TRS	Transmit/Receive Mode 0: Receive mode 1: Transmit mode
4	—	Reserved These bits are read as 0. The write value should be 0.
3	SP	Stop Condition Issuance Request 0: Does not request to issue a stop condition. 1: Requests to issue a stop condition.
2	RS	Restart Condition Issuance Request 0: Does not request to issue a restart condition. 1: Requests to issue a restart condition.
1	ST	Start Condition Issuance Request 0: Does not request to issue a start condition. 1: Requests to issue a start condition.
0	—	Reserved These bits are read as 0. The write value should be 0.

ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.
When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).
For details on the start condition issuance, see section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function.
[Setting condition]
When 1 is written to the ST bit
[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Caution: Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).
Note that arbitration may be lost if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.
When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).
For details on the restart condition issuance, see section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function.
[Setting condition]
When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1
[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Caution:1. Do not set the RS bit to 1 while issuing a stop condition.
Caution:2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the restart condition issuance request bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.
When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).
For details on the stop condition issuance, see section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function.
[Setting condition]
When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1
[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Caution:1. Wring to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
Caution:2. Do not set the SP bit to 1 while a restart condition is being issued.

TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.
The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.
The value of the TRS bit is automatically changed to the value for transmission mode or reception mode by detection or issuing of a start condition, setting or clearing of the R/W# bit, etc.
[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the R/W# bit added to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave mode, a match between the received address and the address enabled in RIICnSER when the value of the received R/W# bit is 0 (including cases where the received address is the general call address)
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.
The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.
The value of the MST bit is automatically changed to the value for master mode or slave mode by detection or issuing of a start condition, etc.
[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I²C bus is occupied (bus busy) or released (bus free).
This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.
When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.
[Setting condition]

- When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

23.3.3 RIICnMR1 — I²C Bus Mode Register 1

Access: RIICnMR1 is a 32-bit readable/writable register.
RIICnMR1L and RIICnMR1H are 16-bit readable/writable registers.
RIICnMR1LL, RIICnMR1LH, RIICnMR1HL, and RIICnMR1HH are 8-bit readable/writable registers.

Address: RIICnMR1: <RIICn_base> + 0008_H
RIICnMR1L: <RIICn_base> + 0008_H, RIICnMR1H: <RIICn_base> + $000A_H$
RIICnMR1LL: <RIICn_base> + 0008_H, RIICnMR1LH: <RIICn_base> + 0009_H, RIICnMR1HL: <RIICn_base> + $000A_H$,
RIICnMR1HH: <RIICn_base> + $000B_H$

Initial Value: 0000 0008_H This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.8 RIICnMR1 register contents

Bit Position	Bit Name	Function
31 to 7	—	Reserved These bits are read as 0. The write value should be 0.
6 to 4	CKS[2:0]	Internal Reference Clock (IICφ) Selection b6 b4 0 0 0: IICφ = P1φ/1 0 0 1: IICφ = P1φ/2 0 1 0: IICφ = P1φ/4 0 1 1: IICφ = P1φ/8 1 0 0: IICφ = P1φ/16 1 0 1: IICφ = P1φ/32 1 1 0: IICφ = P1φ/64 1 1 1: IICφ = P1φ/128
3	BCWP*1	BC Write Protect 0: Enables a value to be written in the BC[2:0] bits. (This bit is read as 1.)
2 to 0	BC[2:0]	Bit Counter b2 b0 0 0 0: 9 bits 0 0 1: 2 bits 0 1 0: 3 bits 0 1 1: 4 bits 1 0 0: 5 bits 1 0 1: 6 bits 1 1 0: 7 bits 1 1 1: 8 bits

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames when the SCL line is at a low level.

The values of the BC[2:0] bits return to 000_B at the end of a data transfer including the acknowledge bit or when a start condition including a restart condition is detected.

23.3.4 RIICnMR2 — I²C Bus Mode Register 2

Access: RIICnMR2 is a 32-bit readable/writable register.
RIICnMR2L and RIICnMR2H are 16-bit readable/writable registers.
RIICnMR2LL, RIICnMR2LH, RIICnMR2HL, and RIICnMR2HH are 8-bit readable/writable registers.

Address: RIICnMR2: <RIICn_base> + $000C_H$
RIICnMR2L: <RIICn_base> + $000C_H$, RIICnMR2H: <RIICn_base> + $000E_H$
RIICnMR2LL: <RIICn_base> + $000C_H$, RIICnMR2LH: <RIICn_base> + $000D_H$, RIICnMR2HL: <RIICn_base> + $000E_H$,
RIICnMR2HH: <RIICn_base> + $000F_H$

Initial Value: $0000\ 0006_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.9 RIICnMR2 register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	DLCS	SDA Output Delay Clock Source Selection 0: The internal reference clock (IICφ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (IICφ/2) is selected as the clock source of the SDA output delay counter.*1
6 to 4	SDDL[2:0]	SDA Output Delay Counter • When RIICnMR2.DLCS = 0 (IICφ) b6 b4 0 0 0: No output delay 0 0 1: 1 IICφ cycle 0 1 0: 2 IICφ cycles 0 1 1: 3 IICφ cycles 1 0 0: 4 IICφ cycles 1 0 1: 5 IICφ cycles 1 1 0: 6 IICφ cycles 1 1 1: 7 IICφ cycles • When RIICnMR2.DLCS = 1 (IICφ/2) b6 b4 0 0 0: No output delay 0 0 1: 1 or 2 IICφ cycles 0 1 0: 3 or 4 IICφ cycles 0 1 1: 5 or 6 IICφ cycles 1 0 0: 7 or 8 IICφ cycles 1 0 1: 9 or 10 IICφ cycles 1 1 0: 11 or 12 IICφ cycles 1 1 1: 13 or 14 IICφ cycles
3	—	Reserved These bits are read as 0. The write value should be 0.
2	TMOH	Timeout H Count Control 0: Count is disabled while the SCL line is at a high level. 1: Count is enabled while the SCL line is at a high level.

Table 23.9 RIICnMR2 register contents

Bit Position	Bit Name	Function
1	TMOL	Timeout L Count Control 0: Count is disabled while the SCL line is at a low level. 1: Count is enabled while the SCL line is at a low level.
0	TMOS	Timeout Detection Time Selection 0: Long mode is selected. 1: Short mode is selected.

Note 1. The setting DLCS = 1 (IICφ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICφ).

TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICφ) as a count source.
For details on the timeout function, see section 23, Timeout Function.

TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.
For details on this function, see section 23.7, Facility for Delaying SDA Output.

Caution: Set the SDA output delay time to meet the I²C bus standard (within the data enable time/acknowledge enable time*1) or the SMBus standard (within the data hold time: 300 [ns] or more, and SCL-clock low-level period - the data setup time: 250 [ns]). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
3,450 [ns] (0 to 100 [kbps]: standard mode (Sm))
900 [ns] (0 to 400 [kbps]: fast mode (Fm))
450 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

23.3.5 RIICnMR3 — I²C Bus Mode Register 3

Access: RIICnMR3 is a 32-bit readable/writable register.
RIICnMR3L and RIICnMR3H are 16-bit readable/writable registers.
RIICnMR3LL, RIICnMR3LH, RIICnMR3HL, and RIICnMR3HH are 8-bit readable/writable registers.

Address: RIICnMR3: <RIICn_base> + 0010_H
RIICnMR3L: <RIICn_base> + 0010_H, RIICnMR3H: <RIICn_base> + 0012_H
RIICnMR3LL: <RIICn_base> + 0010_H, RIICnMR3LH: <RIICn_base> + 0011_H, RIICnMR3HL: <RIICn_base> + 0012_H,
RIICnMR3HH: <RIICn_base> + 0013_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	SMBE	WAIT	RDRFS	ACKWP	ACKBT	ACKBR	NF[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	W	R/W	R	R/W	R/W

Table 23.10 RIICnMR3 register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	SMBE	SMBus/I²C Bus Selection 0: I²C bus is selected. 1: SMBus is selected.
6	WAIT*2	WAIT 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR.
5	RDRFS*2	RDRF Flag Set Timing Selection 0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle. (The SCL line is not held low at the falling edge of the eighth clock cycle.) 1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle. (The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit.
4	ACKWP*1	ACKBT Write Protect 0: Modification of the ACKBT bit is disabled. 1: Modification of the ACKBT bit is enabled.
3	ACKBT*1	Transmit Acknowledge 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
2	ACKBR	Receive Acknowledge 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).
1, 0	NF[1:0]	Noise Filter Stage Selection b1 b0 0 0: Noise of up to one IICφ cycle is filtered out (single-stage filter). 0 1: Noise of up to two IICφ cycles is filtered out (2-stage filter). 1 0: Noise of up to three IICφ cycles is filtered out (3-stage filter). 1 1: Noise of up to four IICφ cycles is filtered out (4-stage filter).

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.
Note 1. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

NF[1:0] Bits (Noise Filter Stage Selection)

These bits are used to select the width of noise that can be removed from the signals input to RIICnSCL or RIICnSDA pin.

ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.
[Setting condition]
When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.
[Setting condition]
When 1 is written to this bit with the ACKWP bit set to 1
[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition issuance is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

Caution: The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.
When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.
When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.
After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode. When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

Caution: When the value of the WAIT bit is to be read, be sure to read the RIICnDRR beforehand.

SMBE Bit (SMBus Select)

Setting this bit to 1 enables the RIICnSER.HOAE bit.

23.3.6 RIICnFER — I²C Bus Function Enable Register

Access: RIICnFER is a 32-bit readable/writable register.
RIICnFERL and RIICnFERH are 16-bit readable/writable registers.
RIICnFERLL, RIICnFERLH, RIICnFERHL, and RIICnFERHH are 8-bit readable/writable registers.

Address: RIICnFER: <RIICn_base> + 0014_H
RIICnFERL: <RIICn_base> + 0014_H, RIICnFERH: <RIICn_base> + 0016_H
RIICnFERLL: <RIICn_base> + 0014_H, RIICnFERLH: <RIICn_base> + 0015_H, RIICnFERHL: <RIICn_base> + 0016_H,
RIICnFERHH: <RIICn_base> + 0017_H

Initial Value: $0000\ 0072_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.11 RIICnFER register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	FMPE	Fast-mode Plus Enable 0: No fm+ slope control circuit is used for the SCLn pin and SDAn pin 1: An fm+ slope control circuit is used for the SCLn pin and SDAn pin
6	SCLE	SCL Synchronous Circuit Enable 0: No SCL synchronous circuit is used. 1: An SCL synchronous circuit is used.
5	NFE	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
4	NACKE	NACK Reception Transfer Suspension Enable 0: Transfer operation is not suspended during NACK reception (transfer suspension disabled). 1: Transfer operation is suspended during NACK reception (transfer suspension enabled).
3	SALE	Slave Arbitration-Lost Detection Enable 0: Slave arbitration-lost detection is disabled. 1: Slave arbitration-lost detection is enabled.
2	NALE	NACK Transmission Arbitration-Lost Detection Enable 0: NACK transmission arbitration-lost detection is disabled. 1: NACK transmission arbitration-lost detection is enabled.
1	MALE	Master Arbitration-Lost Detection Enable 0: Master arbitration-lost detection is disabled. (Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) 1: Master arbitration-lost detection is enabled. (Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.)
0	TMOE	Timeout Function Enable 0: The timeout function is disabled. 1: The timeout function is enabled.

TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.
For details on the timeout function, see section 23.13.1, Timeout Function.

MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to specify whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode (such as when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with different number of receive bytes).

SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.
When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.
When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1.
When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I^{2}C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.
This bit must not be cleared to 0 except for checking the output of the transfer rate.

FMPE Bit (Fast-mode Plus Enable)

This bit is used to specify whether to use a slope control circuit for Fast-mode Plus [fm+].
When this bit is set to 1, a slope control circuit conforming to the Fast-mode Plus [fm+] slope control standard (tof) of the I^{2}C bus is selected. When this bit is cleared to 0, a slope control circuit conforming to the Standard-mode [Sm] and Fast-mode [fm] slope control standard (tof) of the I^{2}C bus is selected.
Set this bit to 1 when using the transmission rate within a range up to 1 Mbps (Fast-mode Plus[fm+]) of the I^{2}C bus standard. Clear this bit to 0 when using the transmission rate at other rates (up to 100 kbps[Sm], up to 400 kbps[fm]) or for SMBus (10 to 100 kbps).

23.3.7 RIICnSER — I²C Bus Status Enable Register

Access: RIICnSER is a 32-bit readable/writable register.
RIICnSERL and RIICnSERH are 16-bit readable/writable registers.
RIICnSERLL, RIICnSERLH, RRIICnSERHL, and RIICnSERHH are 8-bit readable/writable registers.

Address: RIICnSER: <RIICn_base> + 0018_H
RIICnSERL: <RIICn_base> + 0018_H, RIICnSERH: <RIICn_base> + $001A_H$
RIICnSERLL: <RIICn_base> + 0018_H, RIICnSERLH: <RIICn_base> + 0019_H, RIICnSERHL: <RIICn_base> + $001A_H$,
RIICnSERHH: <RIICn_base> + $001B_H$

Initial Value: $0000\ 0009_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.12 RIICnSER register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	HOAE	Host Address Enable 0: Host address detection is disabled. 1: Host address detection is enabled.
6	—	Reserved This bit is read as 0. The write value should be 0.
5	DIDE	Device-ID Address Detection Enable 0: Device-ID address detection is disabled. 1: Device-ID address detection is enabled.
4	—	Reserved This bit is read as 0. The write value should be 0.
3	GCE	General Call Address Enable 0: General call address detection is disabled. 1: General call address detection is enabled.
2	SAR2	Slave Address Register 2 Enable 0: Slave address in RIICnSAR2 is disabled. 1: Slave address in RIICnSAR2 is enabled.
1	SAR1	Slave Address Register 1 Enable 0: Slave address in RIICnSAR1 is disabled. 1: Slave address in RIICnSAR1 is enabled.
0	SAR0	Slave Address Register 0 Enable 0: Slave address in RIICnSAR0 is disabled. 1: Slave address in RIICnSAR0 is enabled.

SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the received slave address and the slave address set in RIICnSARy.
When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address.
When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

GCE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address ($0000\ 000_B$ + 0 [W]: All 0) when it is received.
When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.
When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID ($1111\ 100_B$) is received in the first frame after a start condition or restart condition is detected.
When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.
When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.
For details on the device-ID address detection, see section 23.9.3, Device-ID Address Detection.

HOAE Bit (Host Address Enable)

This bit is used to specify whether to ignore received host address ($0001\ 000_B$) when the RIICnMR3.SMBS bit is 1.
When this bit is set to 1 while the RIICnMR3.SMBS bit is 1, if the received slave address matches the host address, the RIIC recognizes the received slave address as the host address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs the receive operation.
When the RIICnMR3.SMBS bit or the HOAE bit is cleared to 0, the received slave address is ignored even if it matches the host address.

23.3.8 RIICnIER — I²C Bus Interrupt Enable Register

Access: RIICnIER is a 32-bit readable/writable register.
RIICnIERL and RIICnIERH are 16-bit readable/writable registers.
RIICnIERLL, RIICnIERLH, RIICnIERHL, and RIICnIERHH are 8-bit readable/writable registers.

Address: RIICnIER: <RIICn_base> + $001C_H$
RIICnIERL: <RIICn_base> + $001C_H$, RIICnIERH: <RIICn_base> + $001E_H$
RIICnIERLL: <RIICn_base> + $001C_H$, RIICnIERLH: <RIICn_base> + $001D_H$, RIICnIERHL: <RIICn_base> + $001E_H$,
RIICnIERHH: <RIICn_base> + $001F_H$

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Table 23.13 RIICnIER register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	TIE	Transmit Data Empty Interrupt Enable 0: Transmit data empty interrupt request (INTRIICTI) is disabled. 1: Transmit data empty interrupt request (INTRIICTI) is enabled.
6	TEIE	Transmit End Interrupt Enable 0: Transmit end interrupt request (INTRIICTEI) is disabled. 1: Transmit end interrupt request (INTRIICTEI) is enabled.
5	RIE	Receive Data Full Interrupt Enable 0: Receive data full interrupt request (INTRIICRI) is disabled. 1: Receive data full interrupt request (INTRIICRI) is enabled.
4	NAKIE	NACK Reception Interrupt Enable 0: NACK reception interrupt request (INTRIICNAKI) is disabled. 1: NACK reception interrupt request (INTRIICNAKI) is enabled.
3	SPIE	Stop Condition Detection Interrupt Enable 0: Stop condition detection interrupt request (INTRIICSPI) is disabled. 1: Stop condition detection interrupt request (INTRIICSPI) is enabled.
2	STIE	Start Condition Detection Interrupt Enable 0: Start condition detection interrupt request (INTRIICSTI) is disabled. 1: Start condition detection interrupt request (INTRIICSTI) is enabled.
1	ALIE	Arbitration-Lost Interrupt Enable 0: Arbitration-lost interrupt request (INTRIICALI) is disabled. 1: Arbitration-lost interrupt request (INTRIICALI) is enabled.
0	TMOIE	Timeout Interrupt Enable 0: Timeout interrupt request (INTRIICTMOI) is disabled. 1: Timeout interrupt request (INTRIICTMOI) is enabled.

TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (INTRIICTMOI) when the RIICnSR2.TMOF flag is set to 1. An INTRIICTMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (INTRIICALII) when the RIICnSR2.AL flag is set to 1. An INTRIICALII interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (INTRIICSTI) when the RIICnSR2.START flag is set to 1. An INTRIICSTI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (INTRIICSPI) when the RIICnSR2.STOP flag is set to 1. An INTRIICSPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (INTRIICNAKI) when the RIICnSR2.NACKF flag is set to 1. An INTRIICNAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

RIE Bit (Receive Data Full Interrupt Enable)

This bit is used to enable or disable receive data full interrupt requests (INTRIICRI) when the RIICnSR2.RDRF flag in ICSR2 is set to 1. An INTRIICRI interrupt request is canceled by clearing the RDRF flag or the RIE bit to 0.

TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICTI) when the RIICnSR2.TDRE flag is set to 1.

23.3.9 RIICnSR1 — I²C Bus Status Register 1

Access: RIICnSR1 is a 32-bit readable/writable register.
RIICnSR1L and RIICnSR1H are 16-bit readable/writable registers.
RIICnSR1LL, RIICnSR1LH, RIICnSR1HL, and RIICnSR1HH are 8/1-bit readable/writable registers.

Address: RIICnSR1: <RIICn_base> + 0020_H
RIICnSR1L: <RIICn_base> + 0020_H, RIICnSR1H: <RIICn_base> + 0022_H
RIICnSR1LL: <RIICn_base> + 0020_H, RIICnSR1LH: <RIICn_base> + 0021_H, RIICnSR1HL: <RIICn_base> + 0022_H,
RIICnSR1HH: <RIICn_base> + 0023_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. Only 0 can be written to this bit.

Table 23.14 RIICnSR1 register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	HOA	Host Address Detection Flag 0: Host address is not detected. 1: Host address is detected.
6	—	Reserved This bit is read as 0. The write value should be 0.
5	DID	Device-ID Address Detection Flag 0: Device-ID command is not detected. 1: Device-ID command is detected.
4	—	Reserved This bit is read as 0. The write value should be 0.
3	GCA	General Call Address Detection Flag 0: General call address is not detected. 1: General call address is detected.
2	AAS2	Slave Address 2 Detection Flag 0: Slave address 2 is not detected. 1: Slave address 2 is detected.
1	AAS1	Slave Address 1 Detection Flag 0: Slave address 1 is not detected. 1: Slave address 1 is detected.
0	AAS0	Slave Address 0 Detection Flag 0: Slave address 0 is not detected. 1: Slave address 0 is detected.

AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 0_B + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

GCA Flag (General Call Address Detection)

[Setting condition]

When the received slave address matches the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)

  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100_B) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)

  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address (1111 100_B) + 1 [R] has matched with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID (1111 100_B)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100_B) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

HOA Flag (Host Address Detection)

[Setting condition]

When the received slave address matches the host address (0001 000_B) while the RIICnMR3.SMBE bit and RIICnSER.HOAE bit are set to 1 (host address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA bit after reading HOA = 1
- When a stop condition is detected
- When 0 is written to the RIICnMR3.SMBS bit in ICMR3 or the RIICnSER.HOAE bit
- When the received slave address does not match the host address (0001 000_B) with the RIICnSER.HOAE bit set to 1 (host address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit 1 to apply an RIIC reset or an internal reset

23.3.10 RIICnSR2 — I²C Bus Status Register 2

Access: RIICnSR2 is a 32-bit readable/writable register.
RIICnSR2L and RIICnSR2H are 16-bit readable/writable registers.
RIICnSR2LL, RIICnSR2LH, RIICnSR2HL, and RIICnSR2HH are 8/1-bit readable/writable registers.

Address: RIICnSR2: <RIICn_base> + 0024_H
RIICnSR2L: <RIICn_base> + 0024_H, RIICnSR2H: <RIICn_base> + 0026_H
RIICnSR2LL: <RIICn_base> + 0024_H, RIICnSR2LH: <RIICn_base> + 0025_H, RIICnSR2HL: <RIICn_base> + 0026_H,
RIICnSR2HH: <RIICn_base> + 0027_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.15 RIICnSR2 register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7	TDRE	Transmit Data Empty Flag 0: RIICnDRT contains transmit data. 1: RIICnDRT contains no transmit data.
6	TEND	Transmit End Flag 0: Data is being transmitted. 1: Data has been transmitted.
5	RDRF	Receive Data Full Flag 0: RIICnDRR contains no receive data. 1: RIICnDRR contains receive data.
4	NACKF	NACK Reception Flag 0: NACK is not received. 1: NACK is received.
3	STOP	Stop Condition Detection Flag 0: Stop condition is not detected. 1: Stop condition is detected.
2	START	Start Condition Detection Flag 0: Start condition is not detected. 1: Start condition is detected.
1	AL	Arbitration-Lost Flag 0: Arbitration is not lost. 1: Arbitration is lost.
0	TMOF	Timeout Flag 0: No timeout has occurred. 1: Timeout has occurred.

TMOF Flag (Timeout)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.
[Setting condition]
The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is held low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1).
- The slave address matches that of this module (RIICnSR1 register is not 00_H) and the bus is busy (RIICnCR2.BBSY = 1) in slave mode (RIICnCR2.MST = 0).
- Issuing of a start condition is being requested (RIICnCR2.ST = 1) and the bus is free (RIICnCR2.BBSY = 0).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.
The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.
[Setting conditions]
<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>
When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode
<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>
When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode
[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 23.16 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

RIICnFER			RIICnSR2		
MALE	NALE	SALE	AL	Error	Arbitration-Lost Generation Source
1	x	x	1	Start condition issuance error	When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1
					When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1
			1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
x	1	x	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master receive mode or slave receive mode
x	x	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

x: Don't care

START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

NACKF Flag (NACK Reception)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Caution: When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

RDRF Flag (Receive Data Full)

[Setting conditions]

- Slave receive mode
  - When the received slave address matches and the RIICnCR2.TRS bit is cleared to 0 after a start condition (or a restart condition) is detected
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR
- Master receive mode
  - When the slave address and the data direction are transmitted and the receive mode is entered (the RIICnCR2.TRS bit is set to 1) after a start condition (or a restart condition) is issued
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition (or a restart condition) is detected
  - When the RIIC enters transmit mode from receive mode
- When the received slave address matches while the TRS bit is 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Caution: When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

23.3.11 RIICnSARy — I²C Slave Address Register y (y = 0 to 2)

Access: RIICnSARy is a 32-bit readable/writable register.
RIICnSARyL and RIICnSARyH are 16-bit readable/writable registers.
RIICnSARyLL, RIICnSARyLH, RIICnSARyHL, and RIICnSARyHH are 8-bit readable/writable registers.

Address: RIICnSAR0: <RIICn_base> + 0028_H
RIICnSAR0L: <RIICn_base> + 0028_H, RIICnSAR0H: <RIICn_base> + $002A_H$
RIICnSAR0LL: <RIICn_base> + 0028_H, RIICnSAR0LH: <RIICn_base> + 0029_H, RIICnSAR0HL: <RIICn_base> + $002A_H$,
RIICnSAR0HH: <RIICn_base> + $002B_H$
RIICnSAR1: <RIICn_base> + $002C_H$
RIICnSAR1L: <RIICn_base> + $002C_H$, RIICnSAR1H: <RIICn_base> + $002E_H$
RIICnSAR1LL: <RIICn_base> + $002C_H$, RIICnSAR1LH: <RIICn_base> + $002D_H$, RIICnSAR1HL: <RIICn_base> + $002E_H$,
RIICnSAR1HH: <RIICn_base> + $002F_H$
RIICnSAR2: <RIICn_base> + 0030_H
RIICnSAR2L: <RIICn_base> + 0030_H, RIICnSAR2H: <RIICn_base> + 0032_H
RIICnSAR2LL: <RIICn_base> + 0030_H, RIICnSAR2LH: <RIICn_base> + 0031_H, RIICnSAR2HL: <RIICn_base> + 0032_H,
RIICnSAR2HH: <RIICn_base> + 0033_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.17 RIICnSARy register contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are read as 0. The write value should be 0.
15	FSy	7-Bit/10-Bit Address Format Selection 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.
14 to 10	—	Reserved These bits are read as 0. The write value should be 0.
9 to 1	SVA[9:1]	7-Bit Address/10-Bit Address Upper Bits A slave address is set. • When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are Valid and form a 7-bit slave address. • When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit).
0	SVA0	10-Bit Address LSB The least significant bit (LSB) of a 10-bit slave address is set. • When the FSy bit is 0 (7-bit address format), this bit is invalid. • When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits).

SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.
When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.
While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).
When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.
When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.
While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

23.3.12 RIICnBRL — I²C Bus Bit Rate Low-Level Register

Access: RIICnBRL is a 32-bit readable/writable register.
RIICnBRLL and RIICnBRLH are 16-bit readable/writable registers.
RIICnBRLLL, RIICnBRLLH, RIICnBRLHL, and RIICnBRLHH are 8-bit readable/writable registers.

Address: RIICnBRL: <RIICn_base> + 0034_H
RIICnBRLL: <RIICn_base> + 0034_H, RIICnBRLH: <RIICn_base> + 0036_H
RIICnBRLLL: <RIICn_base> + 0034_H, RIICnBRLLH: <RIICn_base> + 0035_H, RIICnBRLHL: <RIICn_base> + 0036_H,
RIICnBRLHH: <RIICn_base> + 0037_H

Initial Value: 0000 $00FF_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.18 RIICnBRL register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7 to 5	—	Reserved These bits are read as 1. The write value should be 1.
4 to 0	BRL[4:0]	Bit Rate Low-Level Period Low-level period of SCL clock

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.
It also works to generate the data setup time for automatic SCL low-hold operation (see section 23.10, Automatically Low-Hold Function for SCL); when the RIIC is used only in slave mode, this register needs to be set to a value at least the same as the data setup time*1.
RIICnBRL counts the low-level period with the internal reference clock source (IICφ) specified by the RIICnMR1.CKS[2:0] bits.

Note 1. Data setup time ($t_{SU: DAT}$)
250 [ns] (0 to 100 [kbps]: standard mode (Sm))
100 [ns] (0 to 400 [kbps]: fast mode (Fm))
50 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

23.3.13 RIICnBRH — I²C Bus Bit Rate High-Level Register

Access: RIICnBRH is a 32-bit readable/writable register.
RIICnBRHL and RIICnBRHH are 16-bit readable/writable registers.
RIICnBRHLL, RIICnBRHLH, RIICnBRHHL, and RIICnBRHHH are 8-bit readable/writable registers.

Address: RIICnBRH: <RIICn_base> + 0038_H
RIICnBRHL: <RIICn_base> + 0038_H, RIICnBRHH: <RIICn_base> + $003A_H$
RIICnBRHLL: <RIICn_base> + 0038_H, RIICnBRHLH: <RIICn_base> + 0039_H, RIICnBRHHL: <RIICn_base> + $003A_H$, RIICnBRHHH:<RIICn_base> + $003B_H$

Initial Value: 0000 $00FF_H$ This register is initialized by any reset.

Table 23.19 RIICnBRH register contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are read as 0. The write value should be 0.
7 to 5	—	Reserved These bits are read as 1. The write value should be 1.
4 to 0	BRH[4:0]	Bit Rate High-Level Period High-level period of SCL clock

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.
RIICnBRH counts the high-level period with the internal reference clock source (IICφ) specified by the RIICnMR1.CKS[2:0] bits in ICMR1.
The frequency and duty cycle are calculated using one of the following expressions (1) to (5) according to the register settings.

Caution: The minimum value that can be specified in RIICnBRL and RIICnBRH is determined according to the values of the SCLE and NFE bits in RIICnFER and the NF bit in RIICnMR3. For details of the minimum specifiable value, see Table 23.20.

(1) When SCLE = 0
Frequency = 1 / {[(BRH + 1) + (BRL + 1)] / IICφ + tr + tf}
Duty cycle = {tr + (BRH + 1) / IICφ} / {tr + tf + [(BRH + 1) + (BRL + 1)] / IICφ}

(2) When SCLE = 1, NFE = 0, CKS = 000 (IICφ = P1φ)
Frequency = 1 / {[(BRH + 3) + (BRL + 3)] / IICφ + tr + tf}
Duty cycle = {tr + (BRH + 3) / IICφ} / {tr + tf + [(BRH + 3) + (BRL + 3)] / IICφ}

(3) When SCLE = 1, NFE = 1, CKS = 000 (IICφ = P1φ)
Frequency = 1 / {[(BRH + 3 + nf) + (BRL + 3 + nf)] / IICφ + tr + tf}
Duty cycle = {tr + (BRH + 3 + nf) / IICφ} / {tr + tf + [(BRH + 3 + nf) + (BRL + 3 + nf)] / IICφ}

(4) When SCLE = 1, NFE = 0, CKS ¹ 000 (IICφ< P1φ)
Frequency = 1 / {[(BRH + 2) + (BRL + 2)] / IICφ + tr + tf}
Duty cycle = {tr + (BRH + 2) / IICφ} / {tr + tf + [(BRH + 2) + (BRL + 2)] / IICφ}

(5) When SCLE = 1, NFE = 1, CKS ¹ 000 (IICφ < P1φ)
Frequency = 1 / {[(BRH + 2 + nf) + (BRL + 2 + nf)] / IICφ + tr + tf}
Duty cycle = {tr + (BRH + 2 + nf) / IICφ} / {tr + tf + [(BRH + 2 + nf) + (BRL + 2 + nf)] / IICφ}

Symbols in the expressions
SCLE: RIICnFER.SCLE bit
BRH: RIICnBRH.BRH[4:0] bits
BRL: RIICnBRL.BRL[4:0] bits
CKS: RIICnMR1.CKS bits
NFE: RIICnFER.NFE bit
IICφ: Internal reference clock selected by the CKS bits
tf: SCL signal falling time [s]*1
tr: SCL signal rising time [s]*1
nf: Number of digital noise filter stages specified in the RIICnMR3.NF[1:0] bits

Note 1. The rising time (tr) and falling time (tf) of the SCL signal depend on the total capacitance of the bus line (Cb) and pull-up resistor (Rp). For details, see I²C Bus Standard from NXP Semiconductors.

Table 23.20 Minimum Specifiable Value for RIICnBRL and RIICnBRH

SCLE	NFE	nf	Minimum Pulse Width that Passes through Digital Filter	Minimum Specifiable Value for BRH and BRL	Pulse Width when Minimum Value is Specified
0	0	—	1 × IICφ	1	2 × IICφ
0	1	1	2 × IICφ	2	3 × IICφ
0	1	2	3 × IICφ	3	4 × IICφ
0	1	3	4 × IICφ	4	5 × IICφ

23.3.14 RIICnDRT — I²C Bus Transmit Data Register

Access: RIICnDRT is a 32-bit readable/writable register.
RIICnDRTL and RIICnDRTH are 16-bit readable/writable registers.
RIICnDRTLL, RIICnDRTLH, RIICnDRTHL, and RIICnDRTHH are 8-bit readable/writable registers.

Address: RIICnDRT: <RIICn_base> + $003C_H$
RIICnDRTL: <RIICn_base> + $003C_H$, RIICnDRTH: <RIICn_base> + $003E_H$
RIICnDRTLL: <RIICn_base> + $003C_H$, RIICnDRTLH: <RIICn_base> + $003D_H$, RIICnDRTHL: <RIICn_base> + $003E_H$,
RIICnDRTHH: <RIICn_base> + $003F_H$

Initial Value: 0000 $00FF_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

When RIICnDRT detects a space in the I²C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.
The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.
RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICTI) request is generated. When writing to bits 8 to 15, be sure to write 0 to these bits.

23.3.15 RIICnDRR — I²C Bus Receive Data Register

Access: RIICnDRR is a 32-bit readable/writable register.
RIICnDRRL and RIICnDRRH are 16-bit readable/writable registers.
RIICnDRRLL, RIICnDRRLH, RIICnDRRHL, and RIICnDRRHH are 8-bit readable/writable registers.

Address: RIICnDRR: <RIICn_base> + 0040_H
RIICnDRRL: <RIICn_base> + 0040_H, RIICnDRRH: <RIICn_base> + 0042_H
RIICnDRRLL: <RIICn_base> + 0040_H, RIICnDRRLH: <RIICn_base> + 0041_H, RIICnDRRHL: <RIICn_base> + 0042_H,
RIICnDRRHH: <RIICn_base> + 0043_H

Initial Value: $0000\ 0000_H$ This register is initialized by any reset.

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

When 1 byte of data has been received, the received data is transferred from the I²C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.
The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.
RIICnDRR cannot be written. Read data from RIICnDRR once when a receive data full interrupt (INTRIICRI) request is generated.
If DRR receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

23.3.16 RIICnDRS — I²C Bus Shift Register

Access: This register is not accessible.
Address: —
Initial Value: 0000 00FF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

RIICnDRS is an 8-bit shift register to transmit and receive data.
During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.
RIICnDRS cannot be accessed directly.

23.4 Interrupt Sources

The RIIC issues eight types of interrupt request: transmit end, receive data full, transmit data empty, stop condition detection, start condition detection, NACK reception, arbitration-lost, and timeout.

Table 23.23 lists details of the several interrupt requests. The receive data full and transmit data empty sources are both capable of launching data transfer by the DMAC.

Table 23.23 Interrupt Sources

Symbol	Interrupt Source	Interrupt Flag	DMAC Launching	Priority*1	Interrupt Condition
INTRIICTEI	Transmission complete	TEND	Not possible	High	TEND = 1 • TEIE = 1
INTRIICRI	Receive-data-full	RDRF	Possible	↑	RDRF = 1 • RIE = 1
INTRIICTI	Transmit-data-empty	TDRE	Possible		TDRE = 1 • TIE = 1
INTRIICSPI	Detection of a stop condition	STOP	Not possible		STOP = 1 • SPIE = 1
INTRIICSTI	Detection of a start condition	START	Not possible		START = 1 • STIE = 1
INTRIICNAKI	Reception of a NACK	NACKF	Not possible		NACKF = 1 • NAKIE = 1
INTRIICALI	Arbitration lost	AL	Not possible		AL = 1 • ALIE = 1
INTRIICTMOI	Timeout	TMOF	Not possible	Low	TMOF = 1 • TMOIE = 1

Note 1. When the interrupt priority register (ICDIPRn) setting is the same

Clear or mask the each flag during interrupt handling.

Caution:1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
Caution:2. Since INTRIICRI and INTRIICTI are edge-detected interrupts, they do not require clearing.
Caution:3. When using the INTRIICTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICTEI interrupt processing.
Caution:4. When using the INTRIICSPI interrupt, clear the RIICnSR2.STOP flag in the INTRIICSPI interrupt processing.
Caution:5. When using the INTRIICSTI interrupt, clear the RIICnSR2.START flag in the INTRIICSTI interrupt processing.
Caution:6. When using the INTRIICNAKI interrupt, clear the RIICnSR2.NACKF flag in the INTRIICNAKI interrupt processing.
Caution:7. When using the INTRIICALI interrupt, clear the RIICnSR2.AL flag in the INTRIICALI interrupt processing.
Caution:8. When using the INTRIICTMOI interrupt, clear the RIICnSR2.TMOF flag in the INTRIICTMOI interrupt processing.

23.5 Operation

23.5.1 Communication Data Format

The I²C bus format consists of 8-bit data and 1-bit acknowledge (one frame). After a start condition or restart condition is issued, the master device sends the slave address and data direction in the first frame. The specified slave is valid until a stop condition is issued or a new slave is specified by a restart condition.
Figure 23.3 shows the I²C bus format, and Figure 23.4 shows the I²C bus timing.

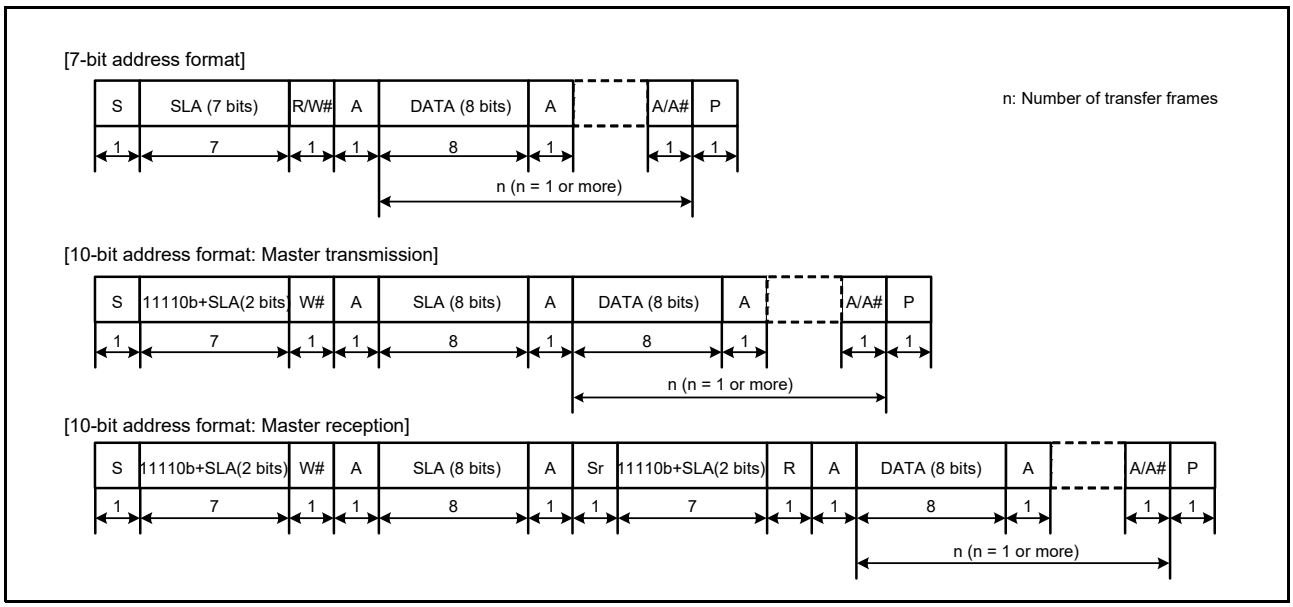

Figure 23.3 I²C Bus Format

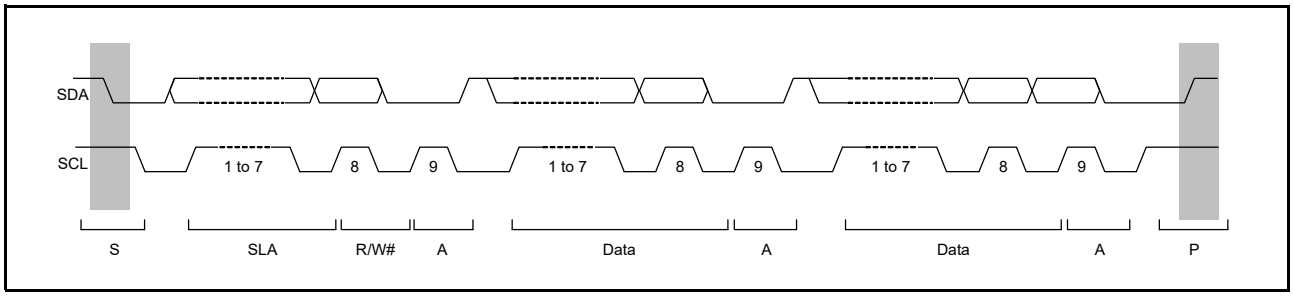

Figure 23.4 I²C Bus Timing (SLA = 7 Bits)

S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

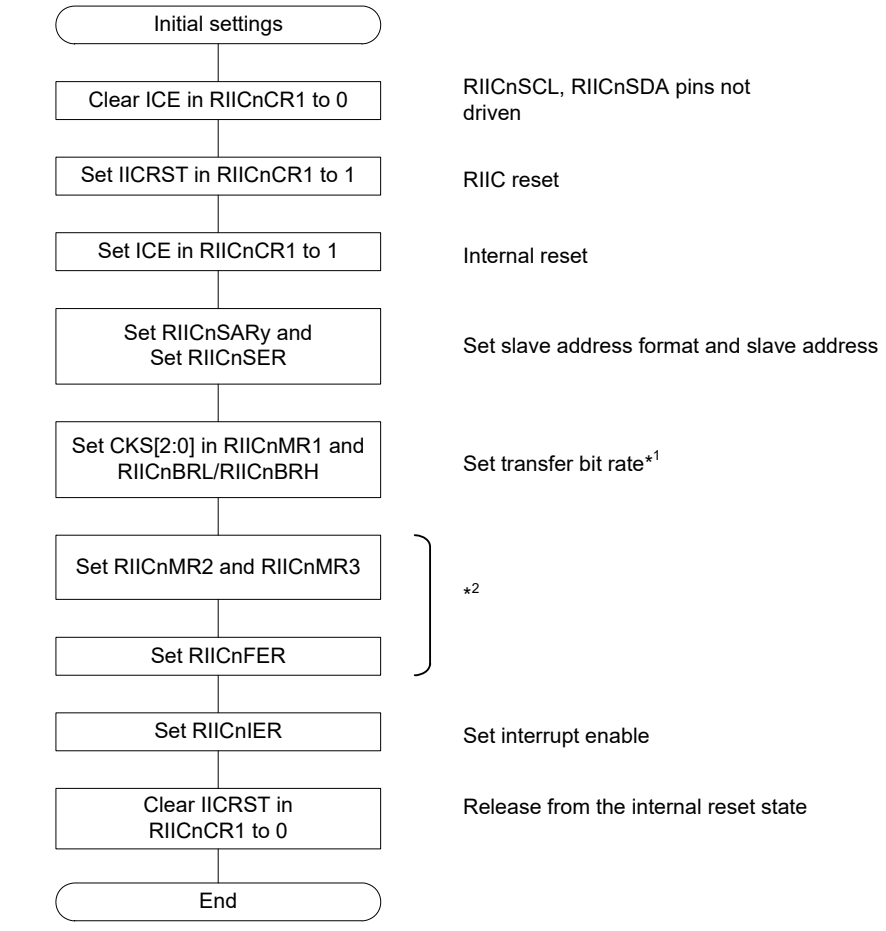
Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

23.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in Figure 23.5.



Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value at least the same as the data setup time.
Note 2. Set these registers as necessary.

Figure 23.5 Example of RIIC Initialization Flowchart

23.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. Figure 23.6 shows an example of usage of master transmission and Figure 23.7 to Figure 23.9 show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see Figure 23.5). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For data transmission with an address in the 10-bit format, start by writing 1111 0_B, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After the last byte of the data to be transmitted is written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00_B and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

Caution: Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

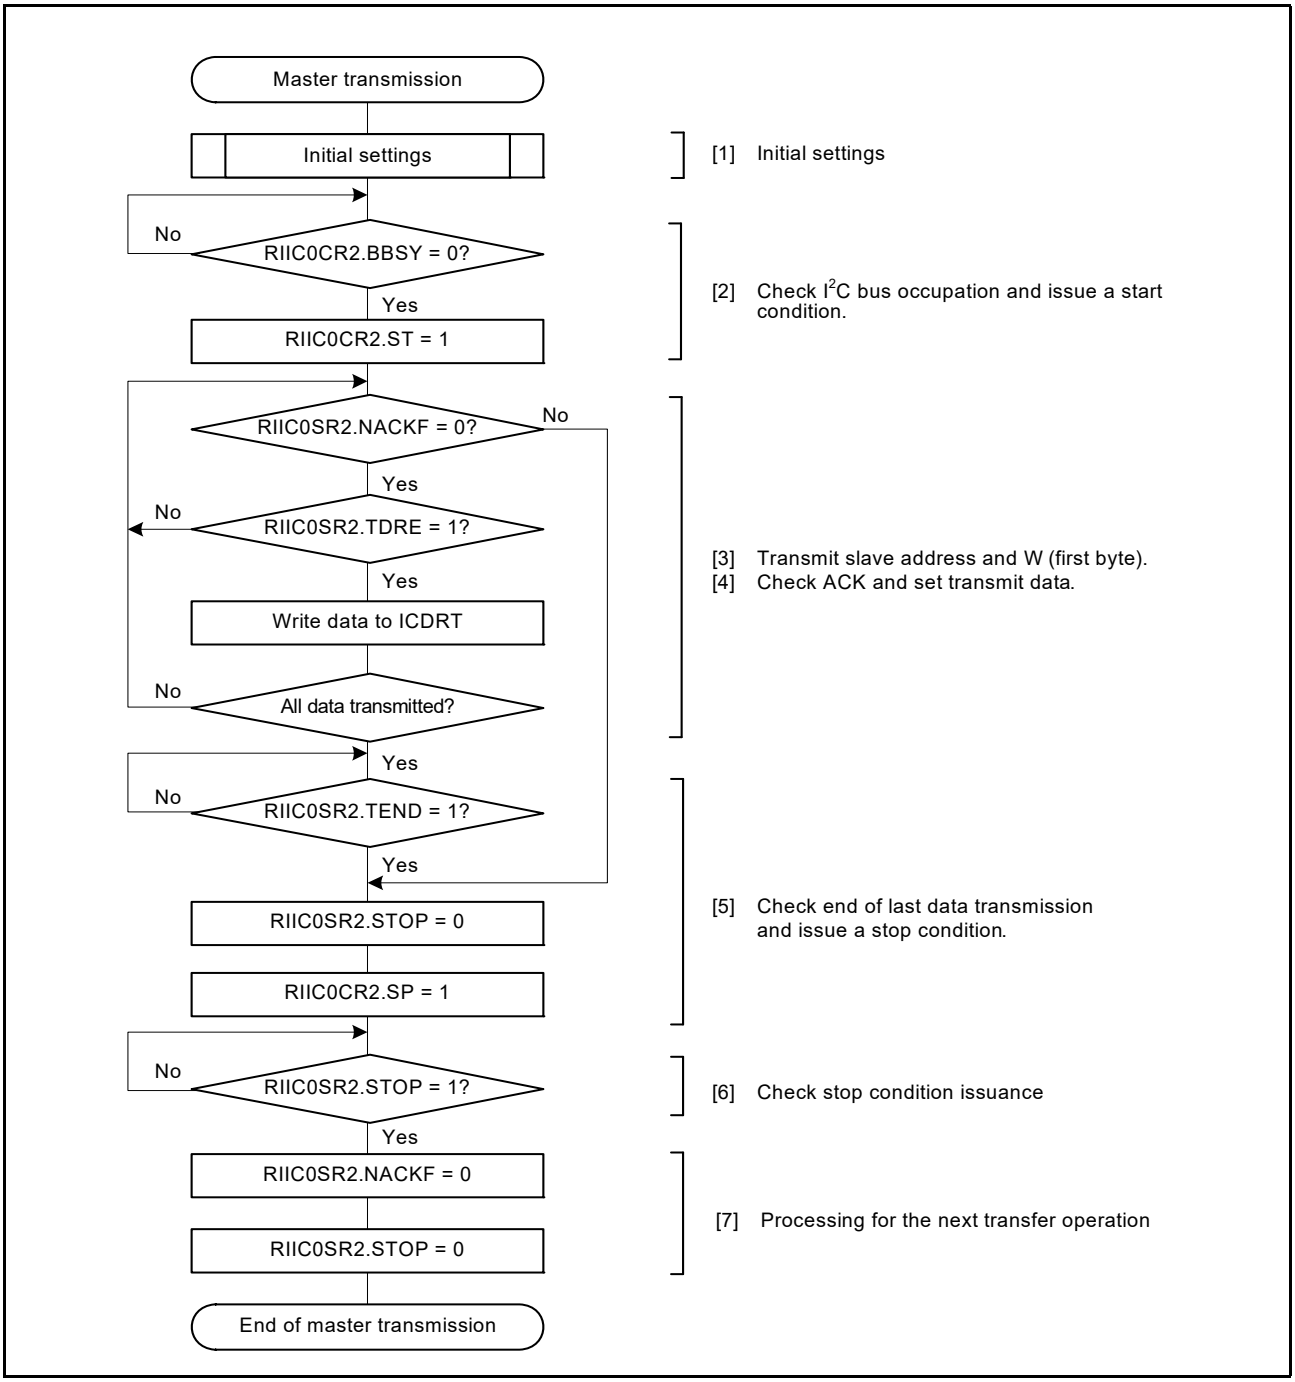


Figure 23.6 Example of Master Transmission Flowchart

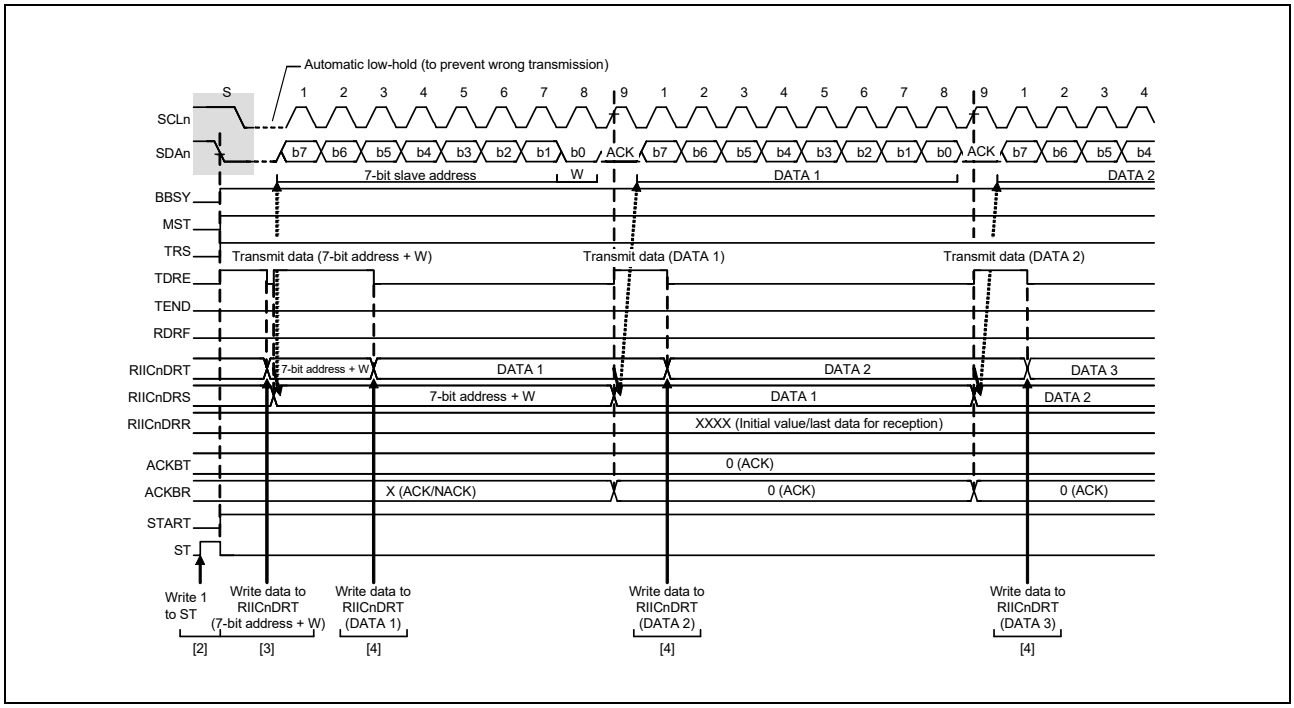

Figure 23.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

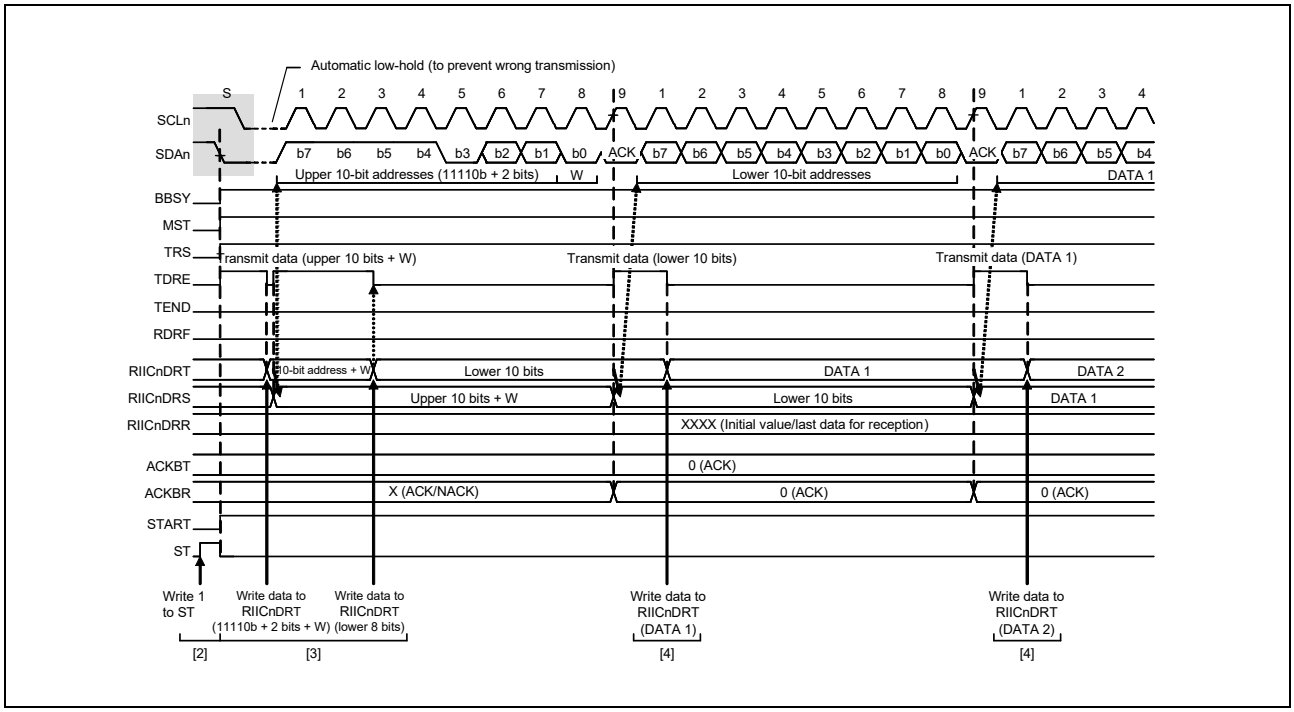

Figure 23.8 Master Transmit Operation Timing (2) (10-Bit Address Format)

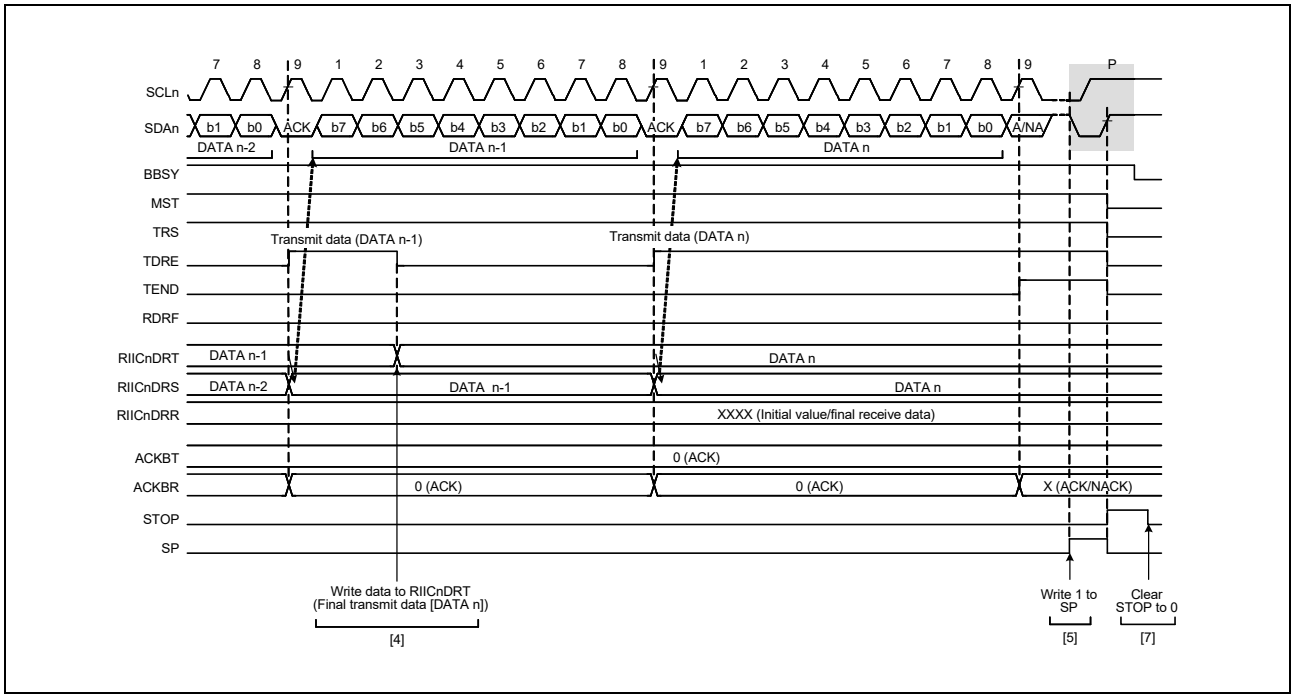

Figure 23.9 Master Transmit Operation Timing (3)

23.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 23.10 shows an example of usage for the master reception of 3 or more bytes (7-bit address format), Figure 23.14 shows an example of usage for the master reception of 1 or 2 bytes (7-bit address format), and Figure 23.11 to Figure 23.13 show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see Figure 23.5). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. Once the byte containing the slave address and R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 1111 0B, the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00B and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

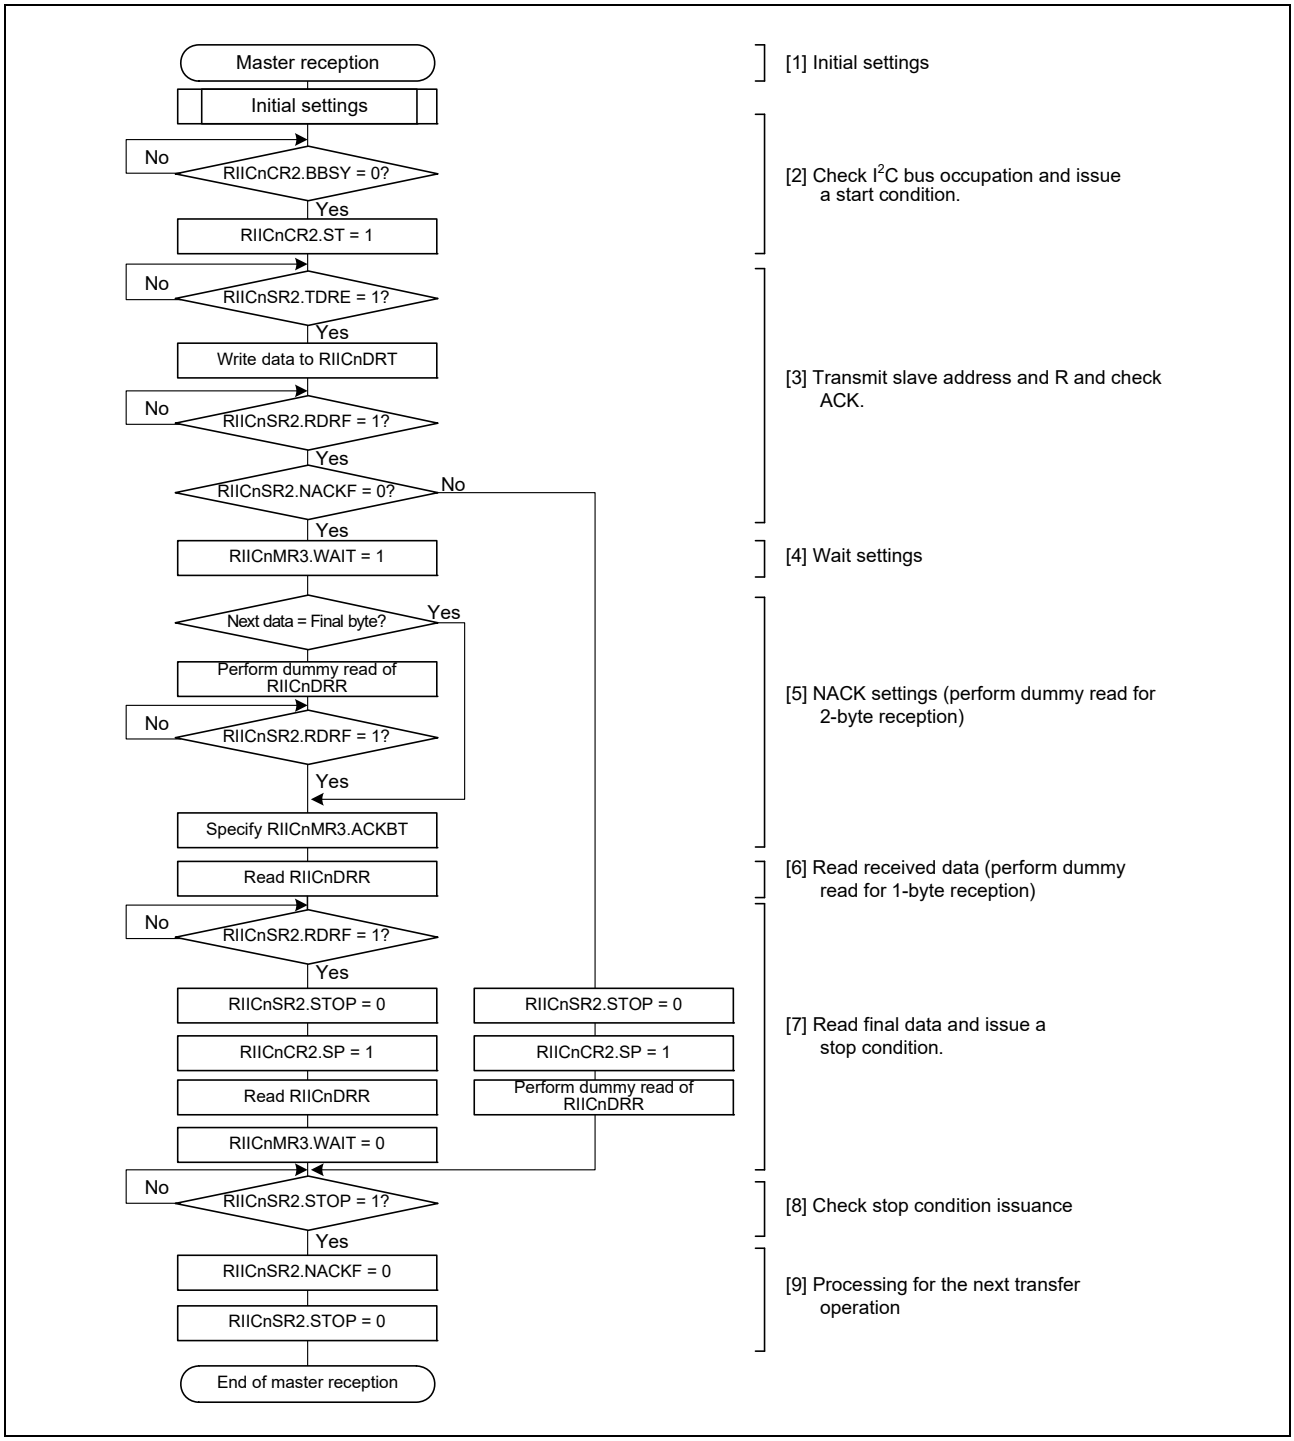

Figure 23.14 Example Flowchart for the Master Reception of 1 or 2 Bytes (7-Bit Address Format)

23.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

Figure 23.15 shows an example of usage of slave transmission and Figure 23.16 and Figure 23.17 show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in Figure 23.5 to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TEND flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait unit the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

Caution: Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

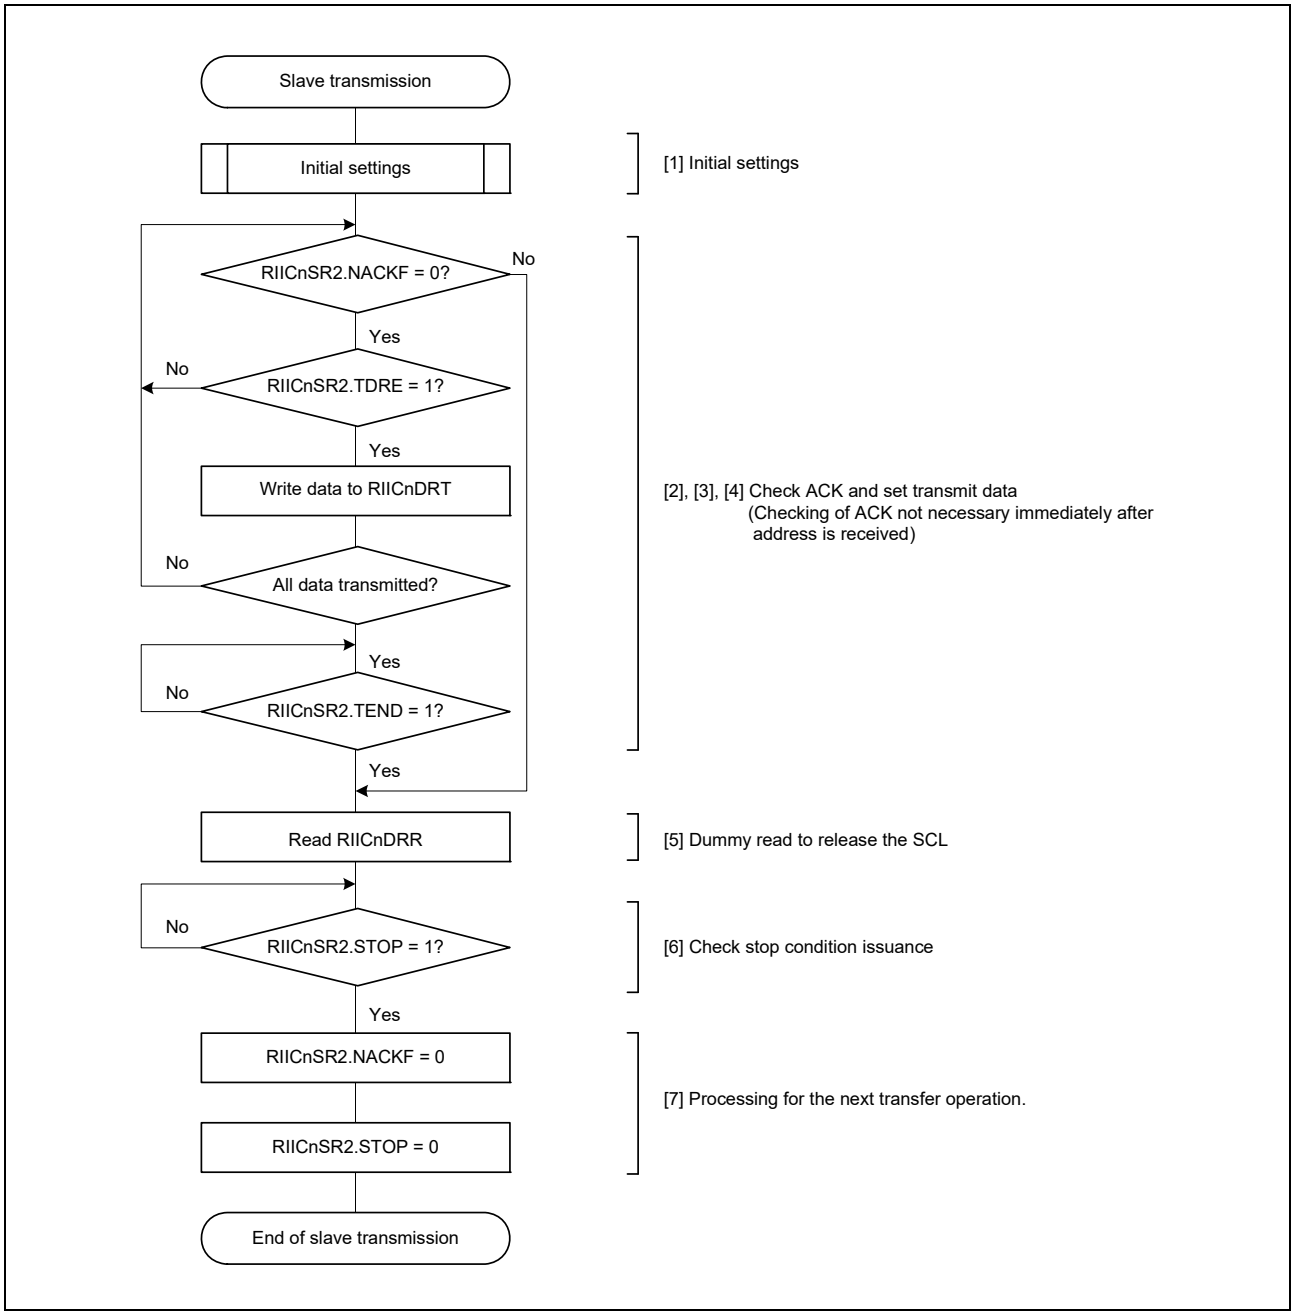

Figure 23.15 Example of Slave Transmission Flowchart

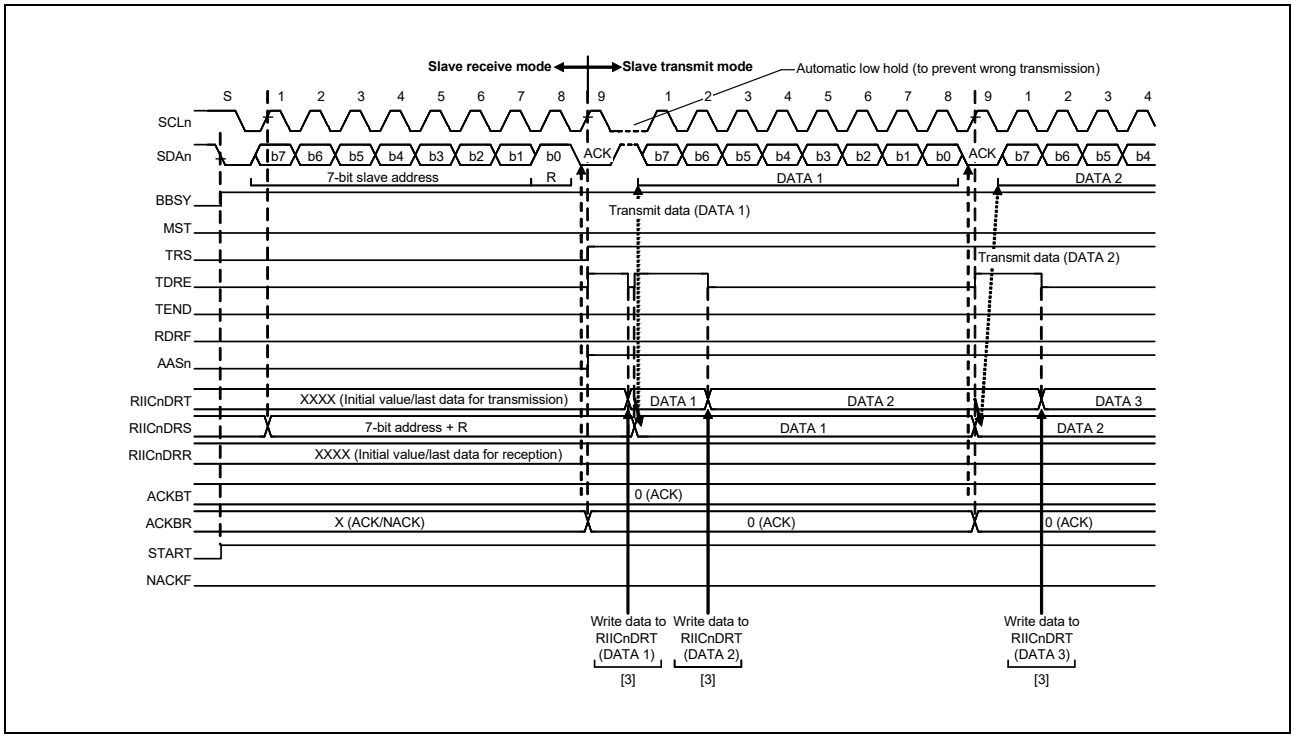

Figure 23.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

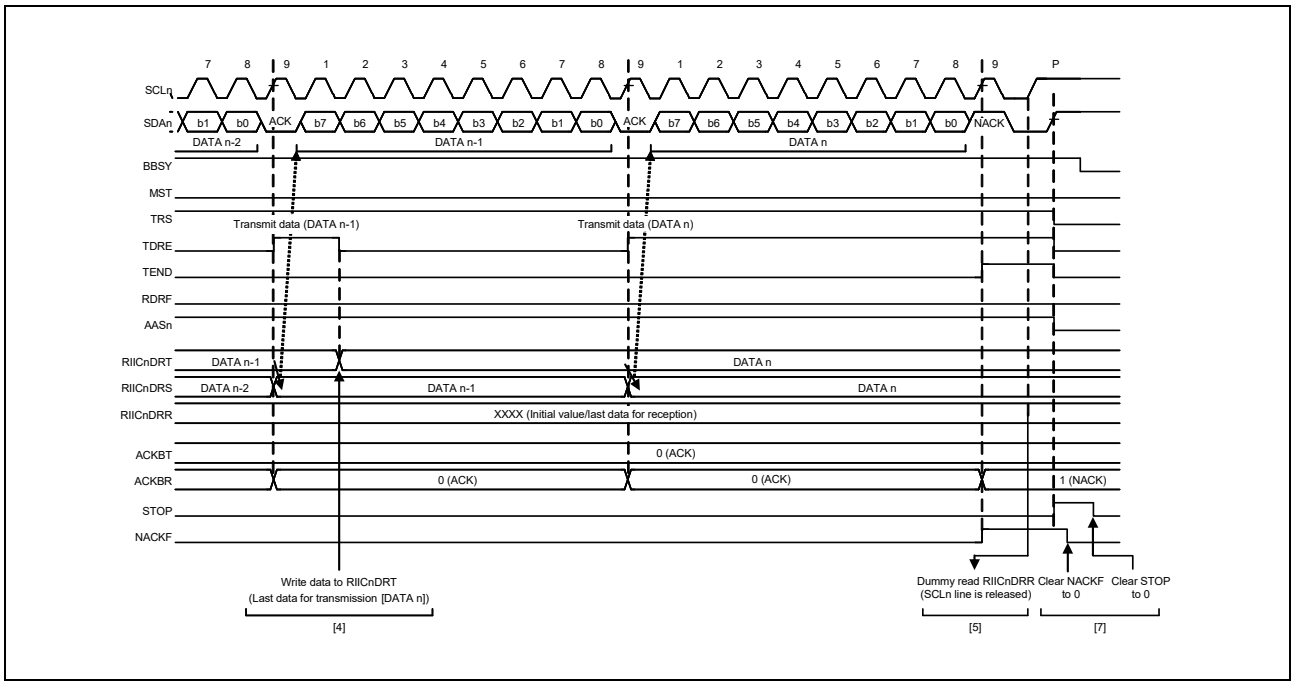

Figure 23.17 Slave Transmit Operation Timing (2)

23.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.
Figure 23.18 shows an example of usage of slave reception and Figure 23.19 and Figure 23.20 show the timing of operations in slave reception.
The following describes the procedure and operations for slave reception.

(1) Follow the procedure in Figure 23.5 to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.
(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.
(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).
(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.
(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 0.
(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

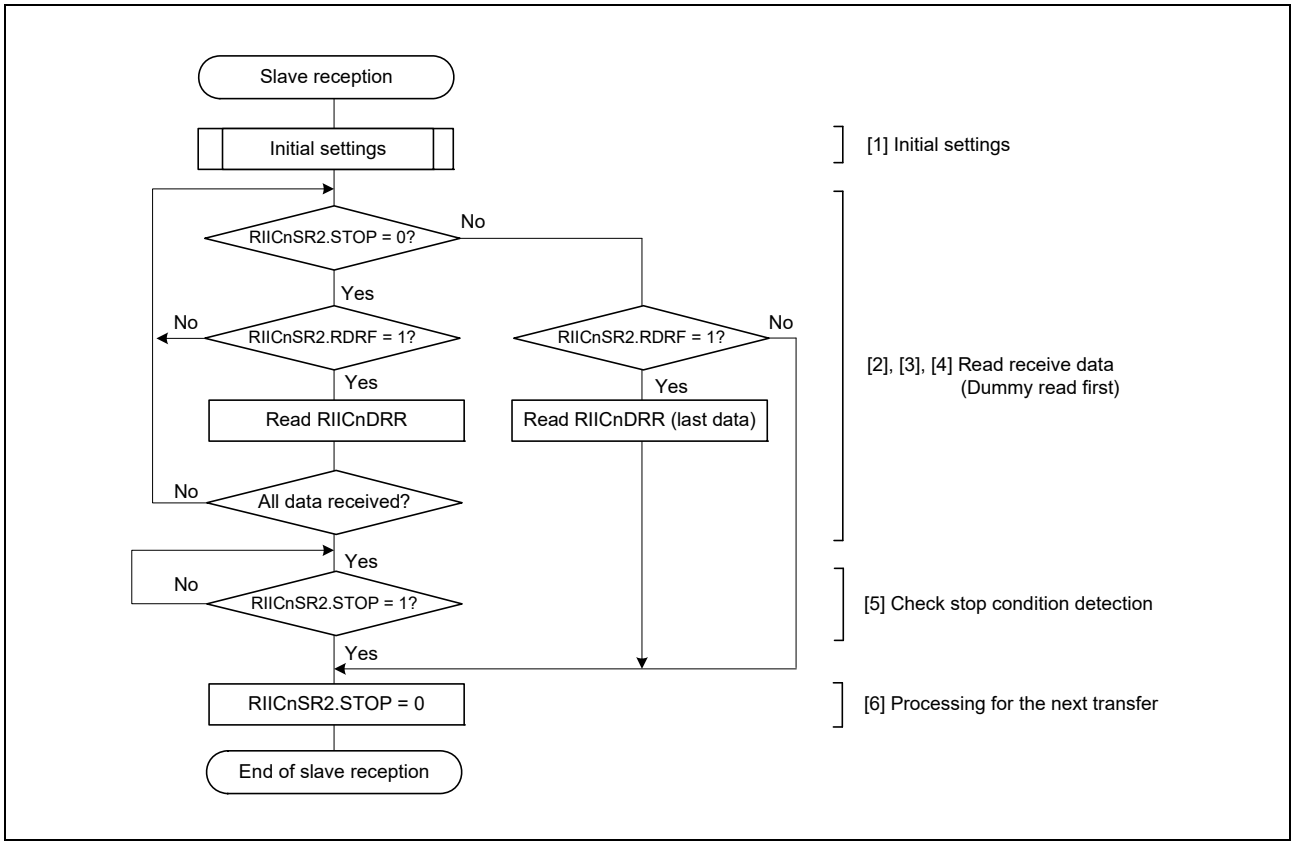

Figure 23.18 Example of Slave Reception Flowchart

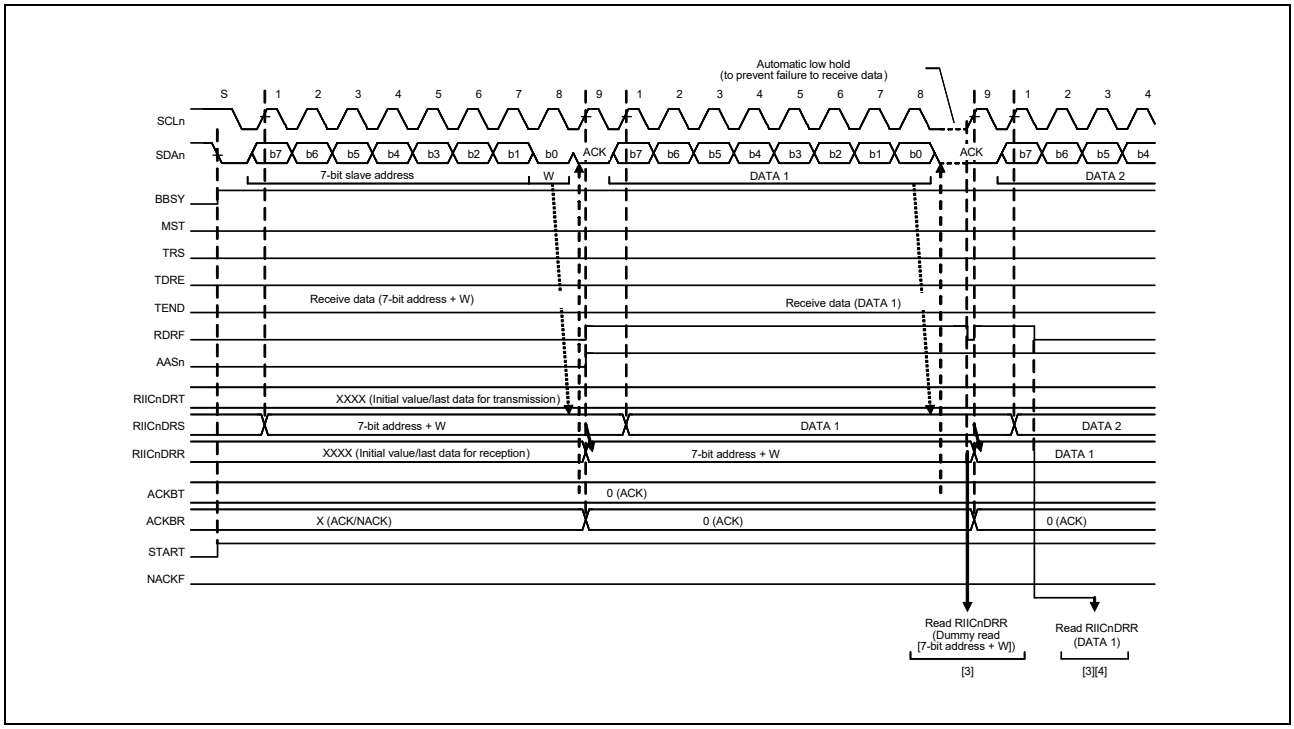

Figure 23.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)

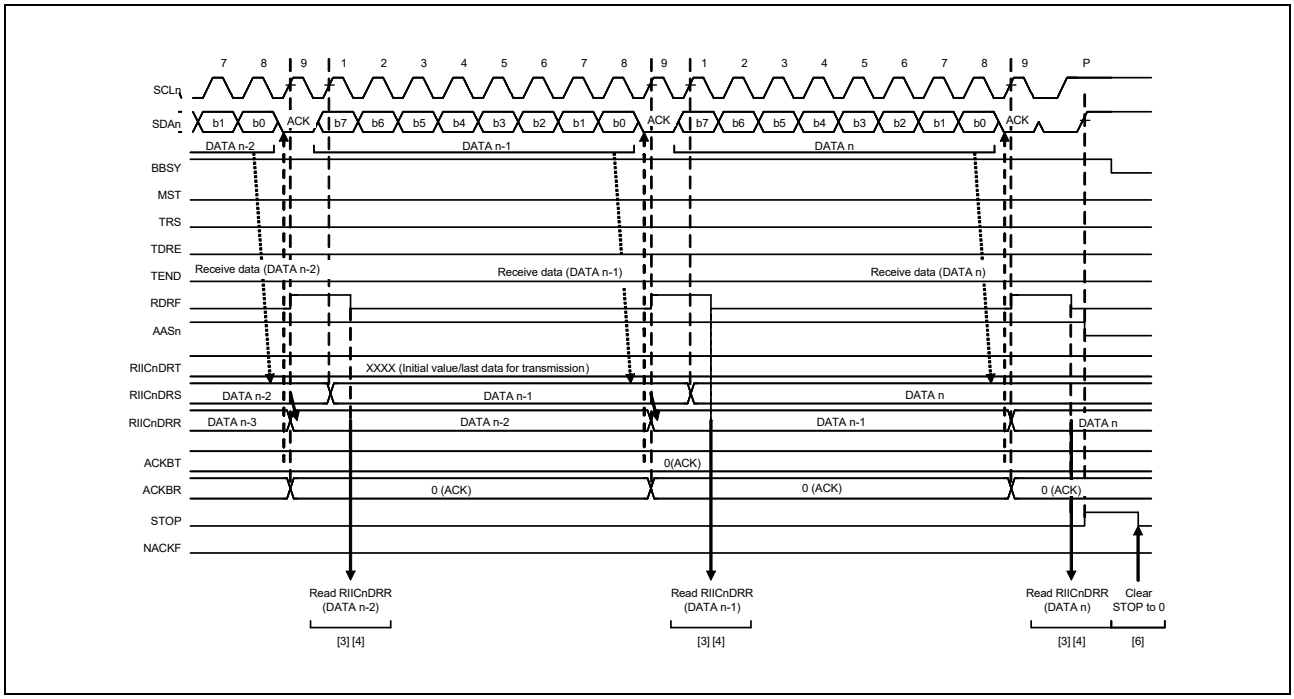

Figure 23.20 Slave Receive Operation Timing (2) (when RDRFS = 0)

23.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I²C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. When the RIIC finishes outputting the low-level period of the SCL clock, the SCL line is released and the SCL clock rises. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.

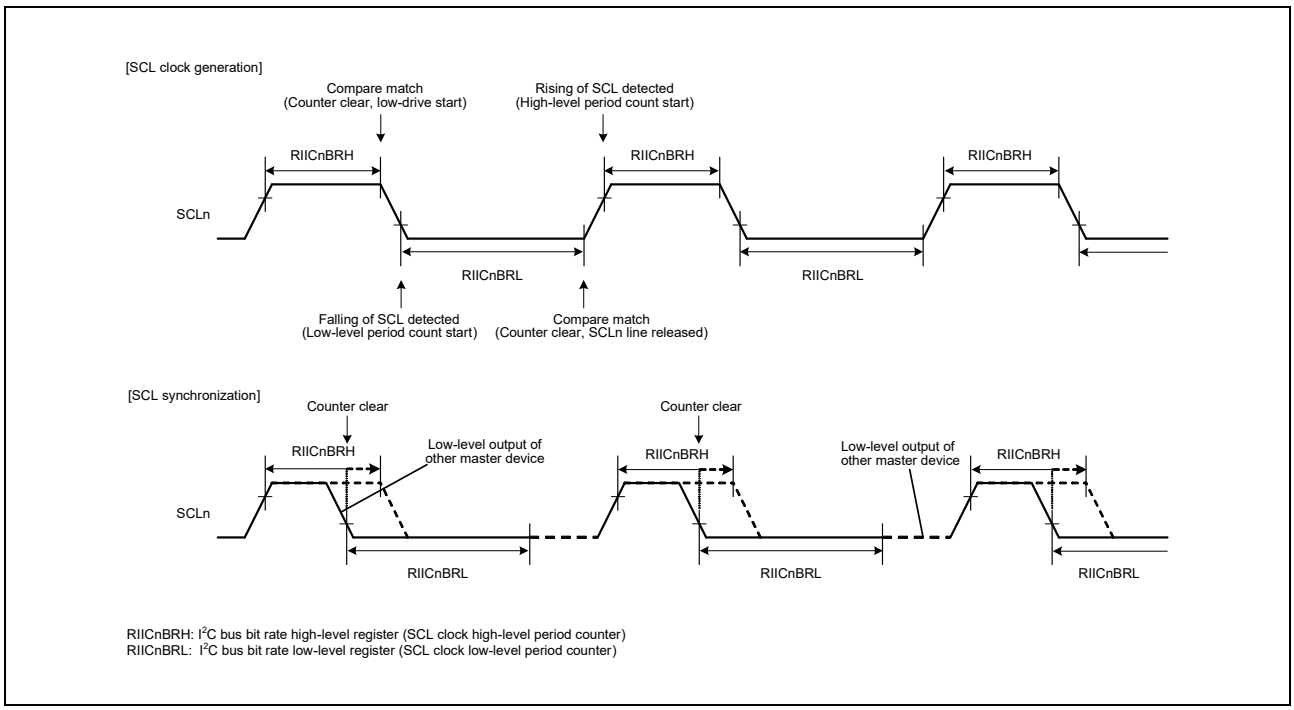

Figure 23.21 Generation and Synchronization of the SCL Signal from the RIIC

23.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices, with the aim of satisfying the 300-ns (min.) data-hold time requirement of the SMBus specification.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000_B, and disabled by setting the same bits to 000_B.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits in IMCR2 are set to any value other than 000_B), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICφ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICφ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in IMCR2. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.

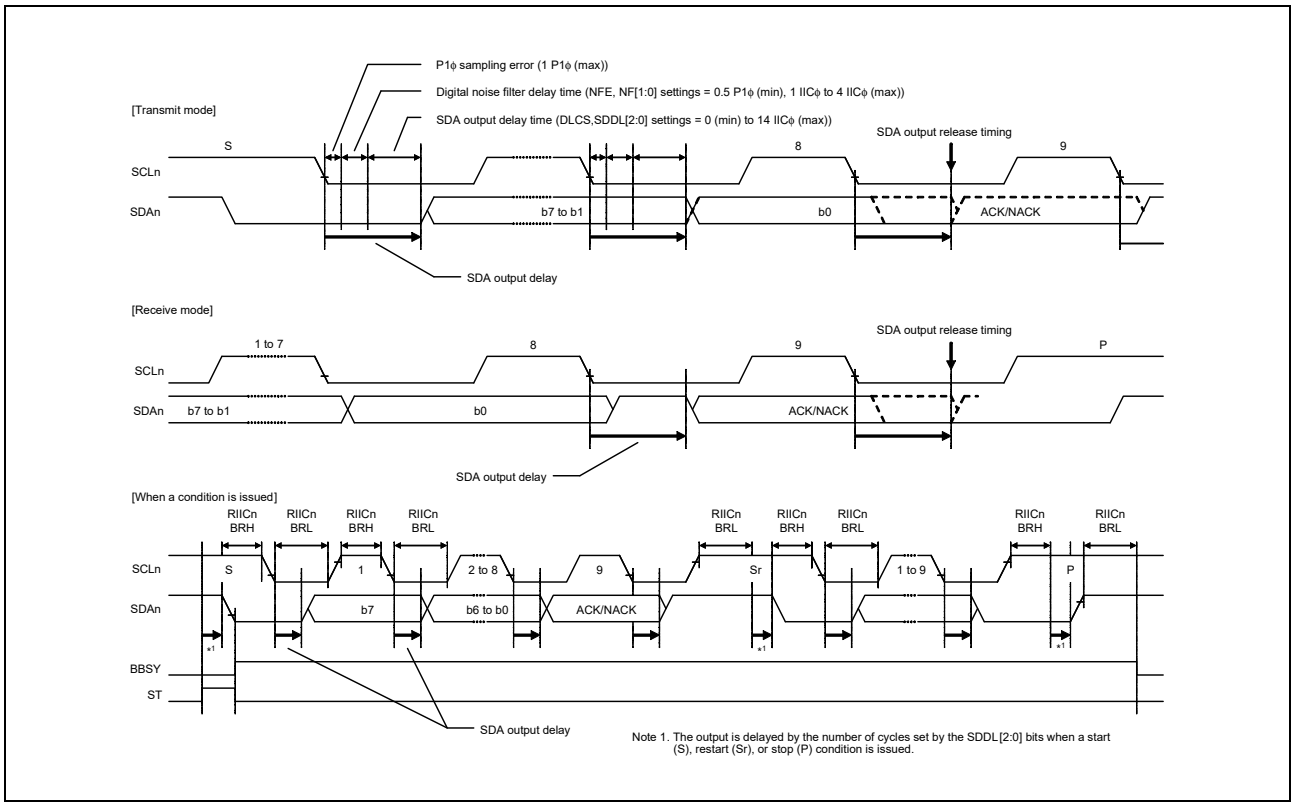

Figure 23.22 SDA Output Delay Facility

23.8 Digital Noise-Filter Circuits

Figure 23.23 is a block diagram of the digital noise-filter circuit. When the NFE bit in the RIICnFER register is set to 1, input to the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through digital noise-filter circuits.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICφ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICφ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed to the subsequent stage. If the signal levels do not match, the previous value is retained.

If the ratio between P1φ and IICφ is small when the RIICnMR1.CKS[2:0] bits are set to 000_B, note that the characteristics of the digital noise filter may lead to the elimination of needed signals as noise.

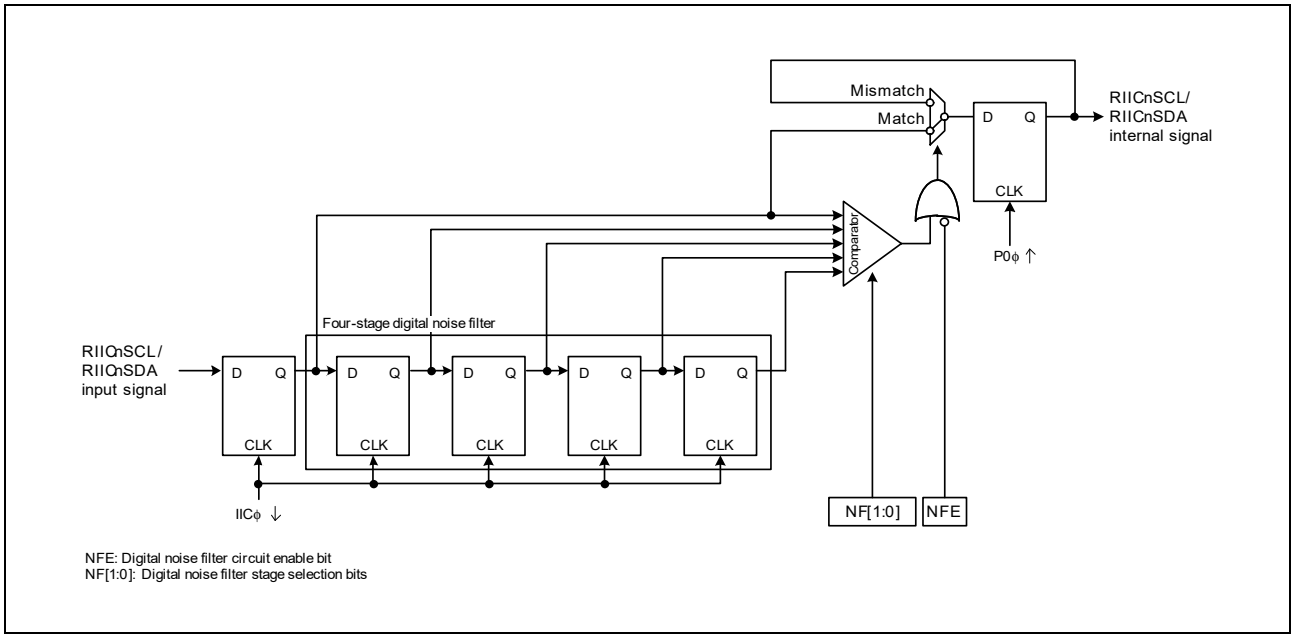

Figure 23.23 Block Diagram of Digital Noise Filter Circuit

23.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and host address, and also can set 7-bit or 10-bit slave addresses.

23.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected. When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (INTRIICRI) or transmit data empty interrupt (INTRIICTI) to be generated. The AASy flag is used to identify which slave address has been specified.
Figure 23.24 to Figure 23.26 show the AASy flag set timing in three cases.

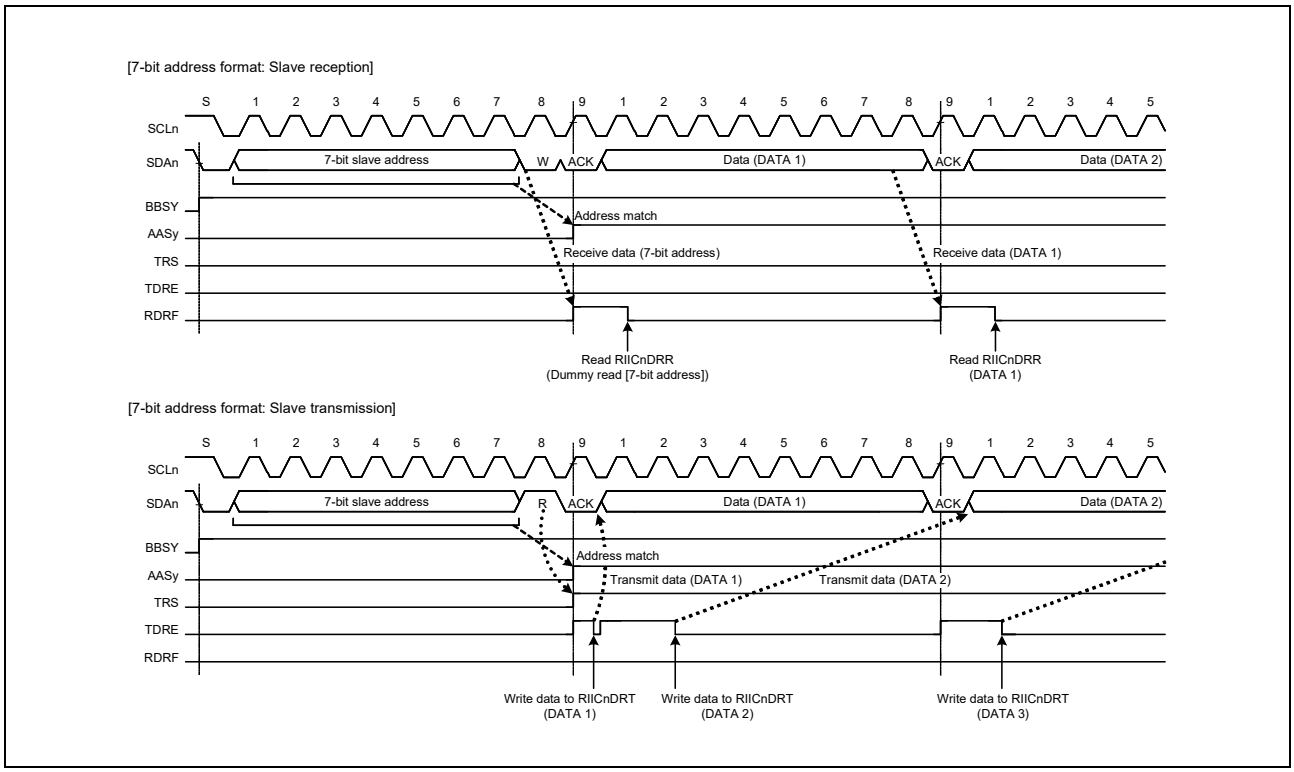

Figure 23.24 AASy Flag Set Timing with 7-Bit Address Format Selected

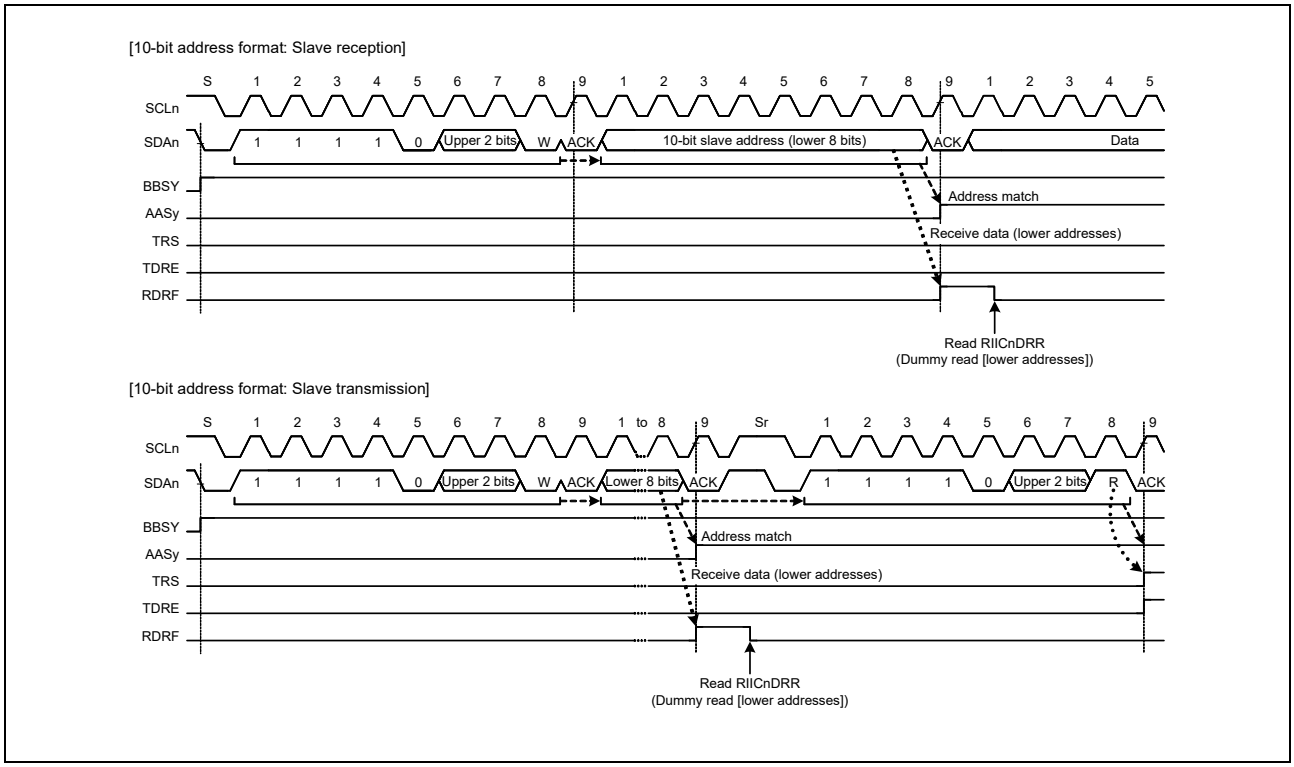

Figure 23.25 AASy Flag Set Timing with 10-Bit Address Format Selected

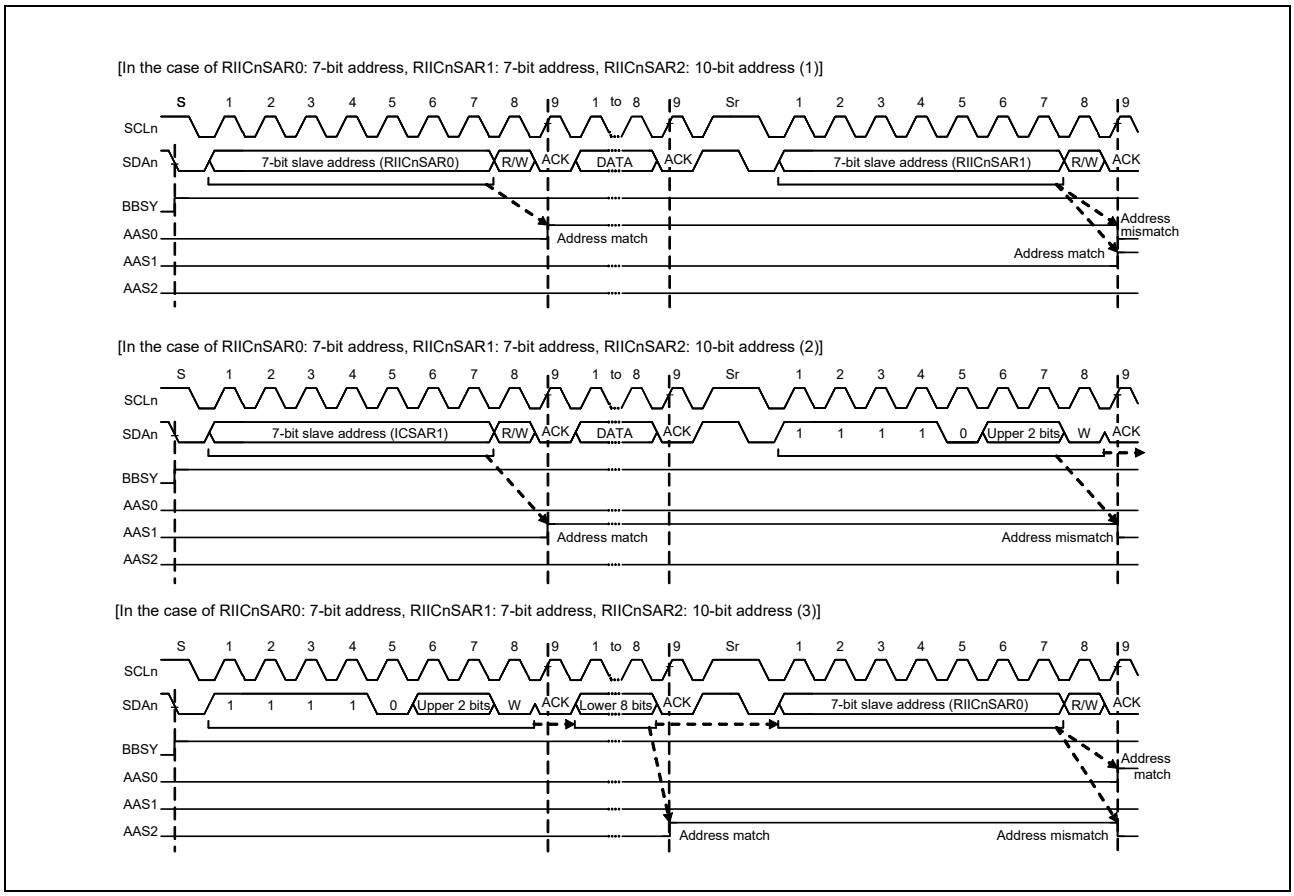

Figure 23.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

23.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000 000_B + 0 [W]). This is enabled by setting the RIICnSER.GCE bit to 1.

If the address received after a start or restart condition is issued is 0000 000_B + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive data full interrupt (INTRIICRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

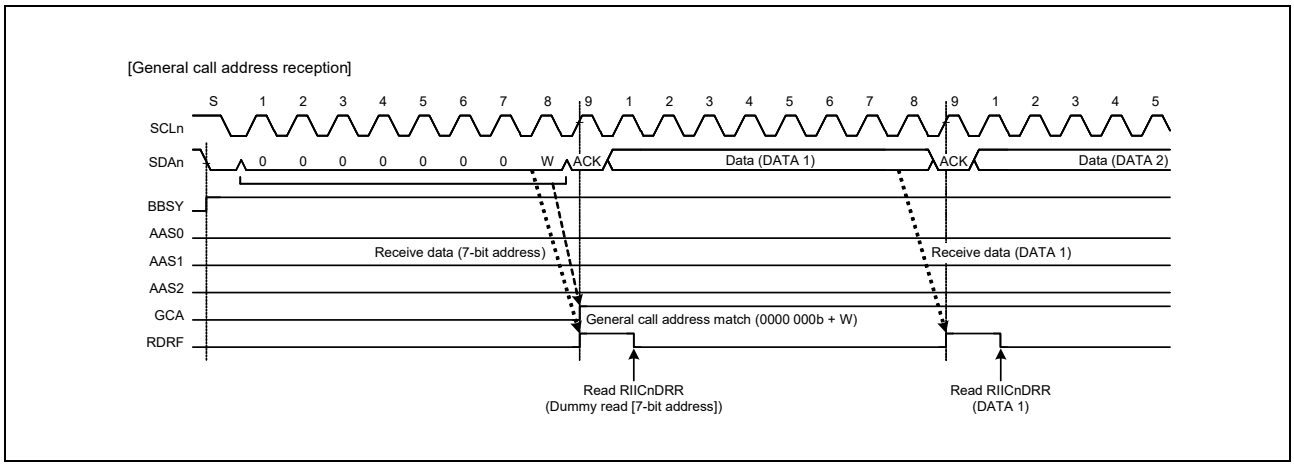

Figure 23.27 Timing of GCA Flag Setting during Reception of General Call Address

23.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conformant with the I²C bus specification (Rev. 03). When the RIIC receives 1111 100_B as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 100_B) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 100_B) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I²C Bus Standard from NXP Semiconductors.

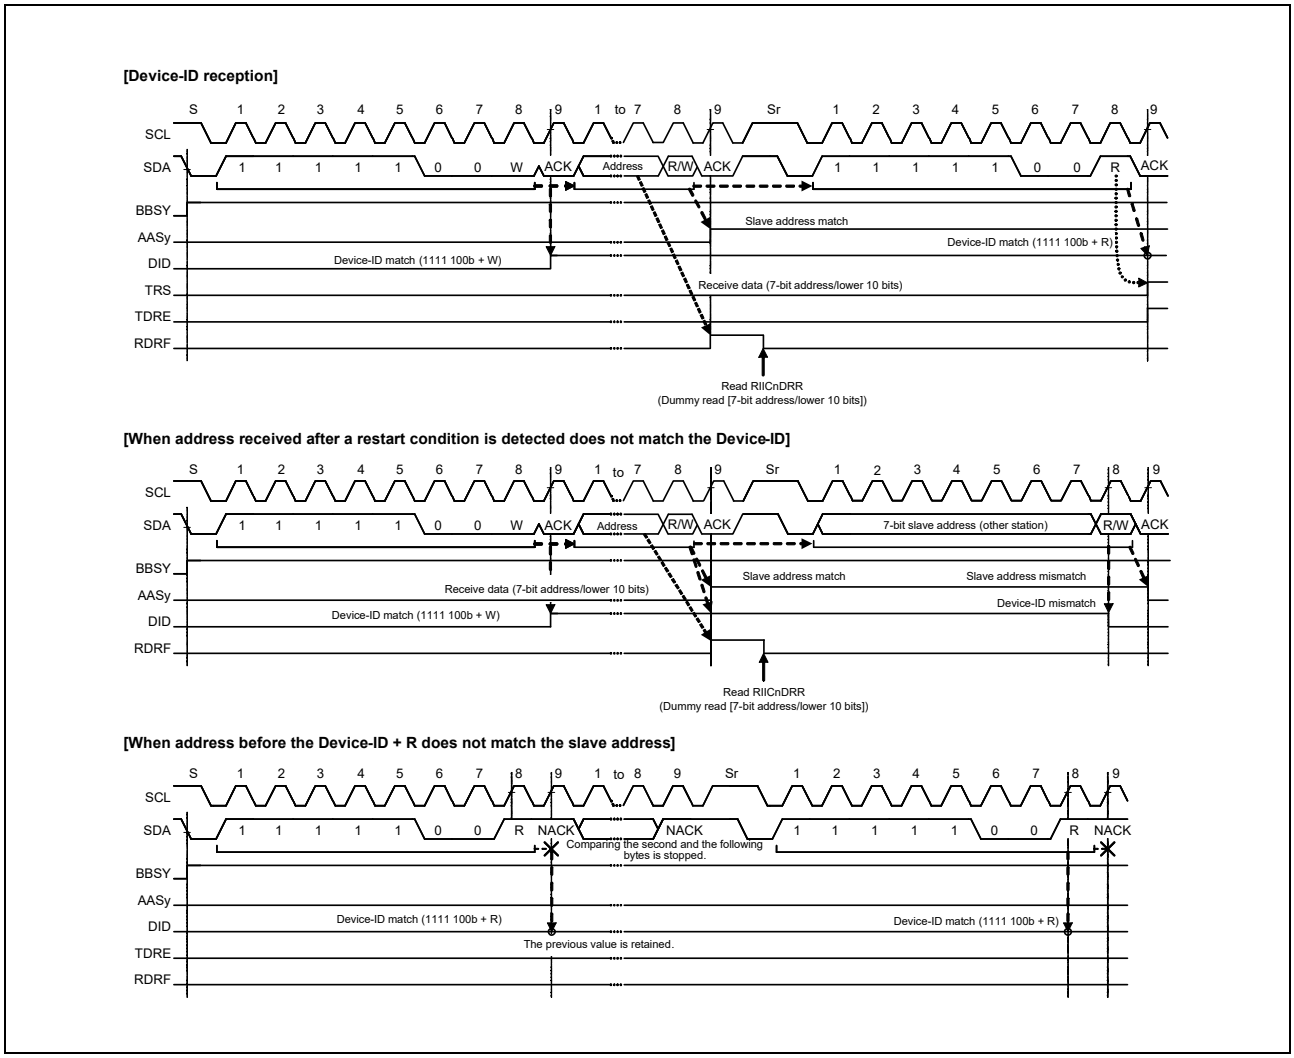

Figure 23.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

23.9.4 Host Address Detection

The RIIC has a function to detect the host address while the SMBus is operating. When the RIICnSER.HOAE bit is set to 1 while the RIICnMR3.SMBS bit is 1, the RIIC can detect the host address ($0001\ 000_B$) in slave receive mode (RIICnCR2.MST and TRS bits = 00_B).

When the RIIC detects the host address, the RIICnSR1.HOA flag is set to 1 at the rising edge of the ninth SCL clock cycle, and at the same time, the RIICnSR2.RDRF flag is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (INTRIICRI) to be generated. The HOA flag is used to recognize that the host address was sent from the smart battery or other devices.

If the bit following the host address ($0001\ 000_B$) is an Rd bit (R/W# bit = 1), the RIIC can also detect the host address. After the host address is detected, the RIIC operates in the same manner as normal slave operation.

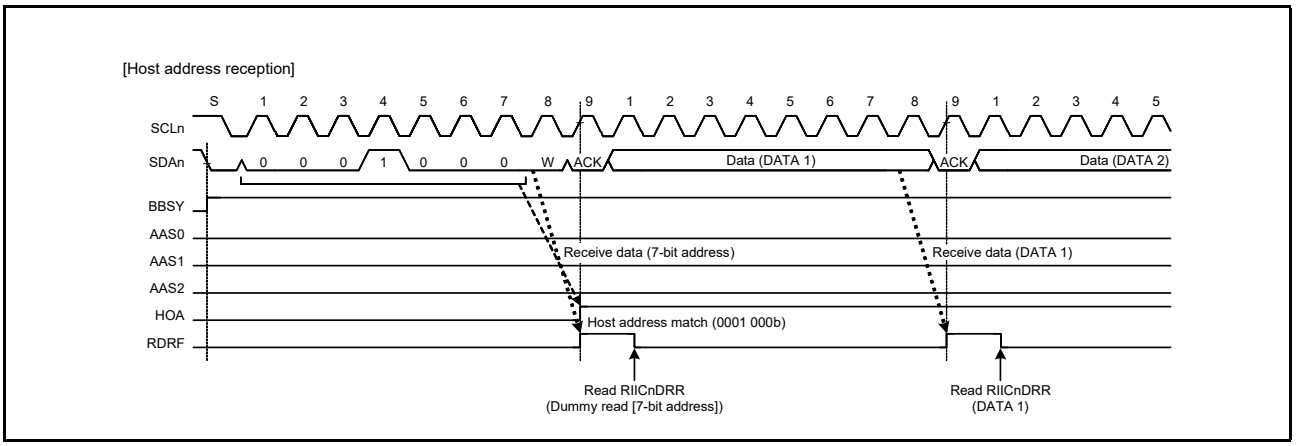

Figure 23.29 HOA Flag Set Timing during Reception of Host Address

23.10 Automatically Low-Hold Function for SCL

23.10.1 Function to Prevent Wrong Transmission of Transmit Data

If the shift register (RIICnDRS) is empty when data have not been written to the transmit data register (RIICnDRT) with the RIIC in transmission mode (RIICnCR2.TRS bit = 1), the SCL signal is automatically held at the low level over the intervals shown below. This low-hold period is extended until data for transmission have been written, which prevents the unintended transmission of erroneous data.

<Master transmit mode>

- Low-level interval after a start condition or restart condition is issued
- Low-level interval of one clock cycle between the ninth clock cycle of one transfer and the first clock cycle of the next

<Slave transmit mode>

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

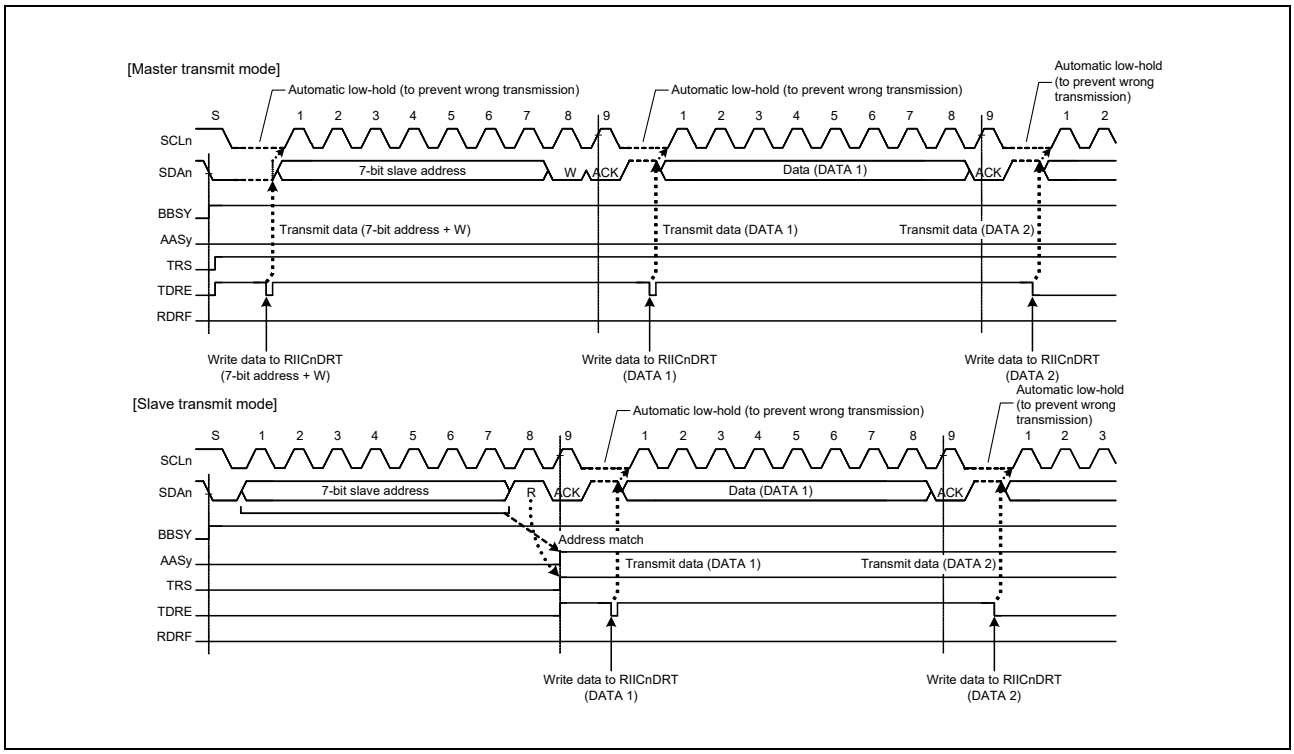

Figure 23.30 Automatic Low-Hold Operation in Transmit Mode

23.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0 after issuing a restart condition or clear the NACKF and STOP flags to 0 after confirming that a stop condition has been issued, and then issue a start condition.

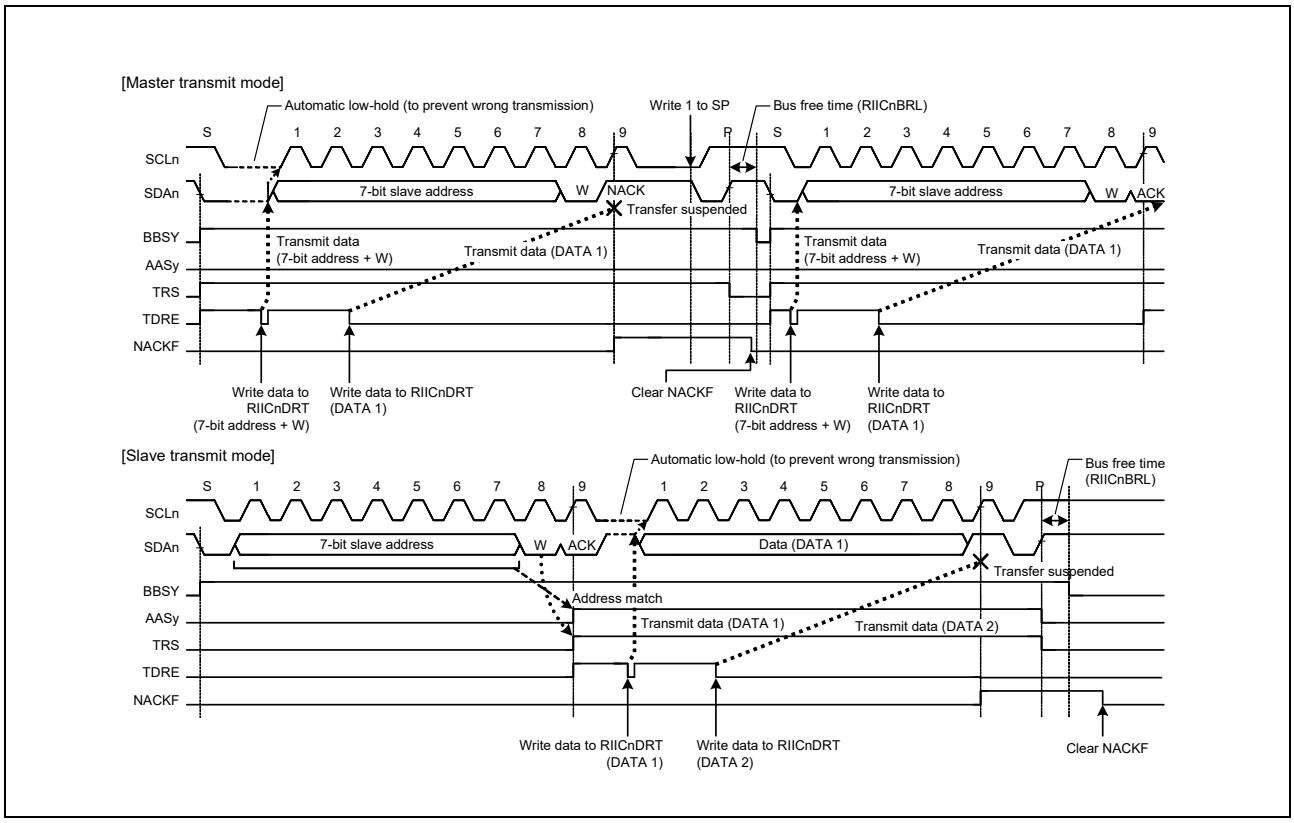

Figure 23.31 Suspension of Data Transfer when NACK is Received (NACKE = 1)

23.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive data full (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.
This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.
Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

(1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function. Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.
The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

(2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function. When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive data full) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.
The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

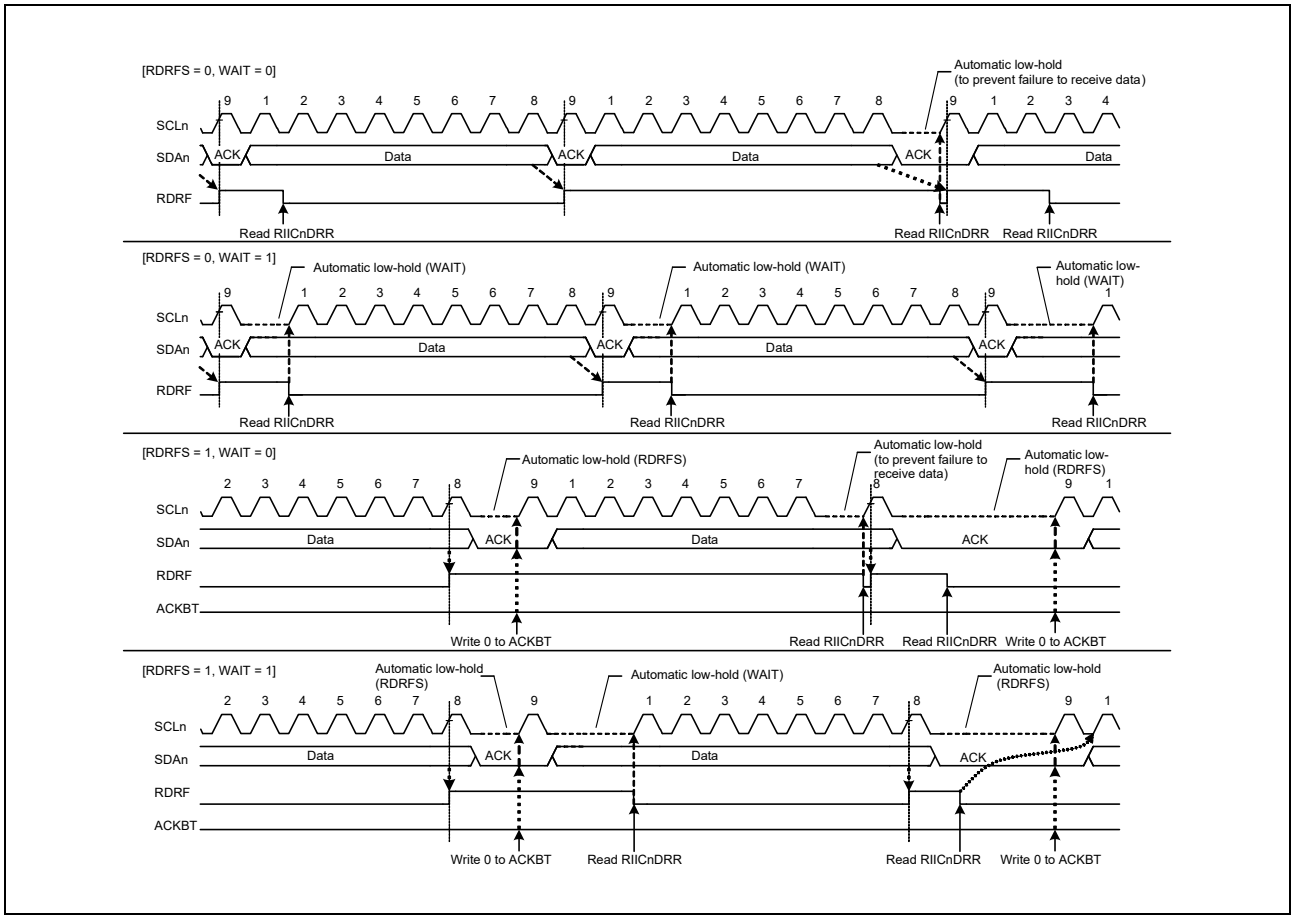

Figure 23.32 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

23.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I²C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

23.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC regards its own issuing of a start condition as an error and considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the RIICnCR2.ST bit to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration, thus preventing a failure of transfer due to issuing of a start condition while transfer is in progress.
When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line, the RIIC loses in arbitration.
After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.
A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).
[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11_B)

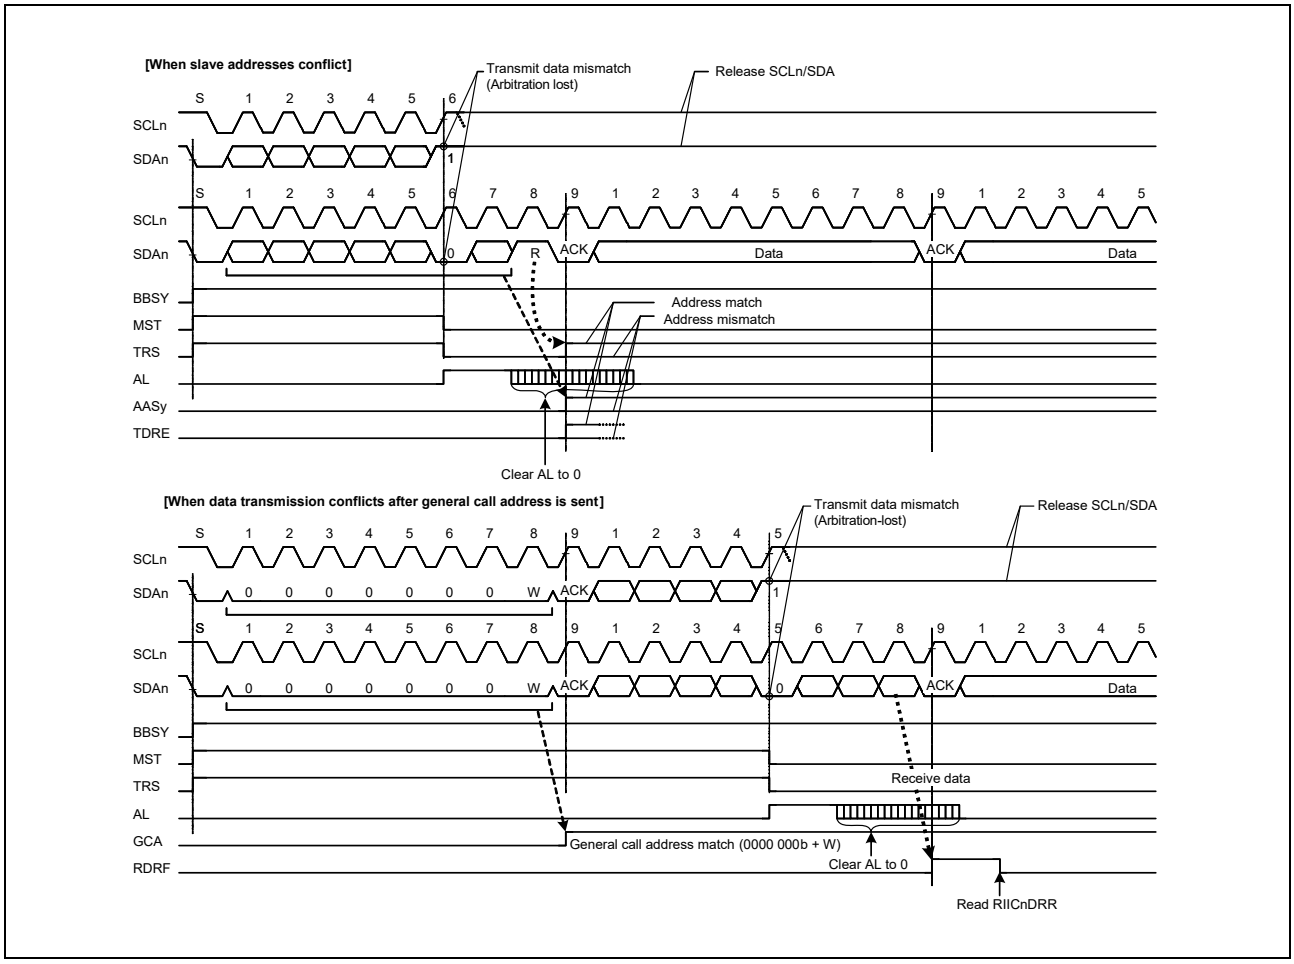

Figure 23.33 Examples of Master Arbitration-Lost Detection (MALE = 1)

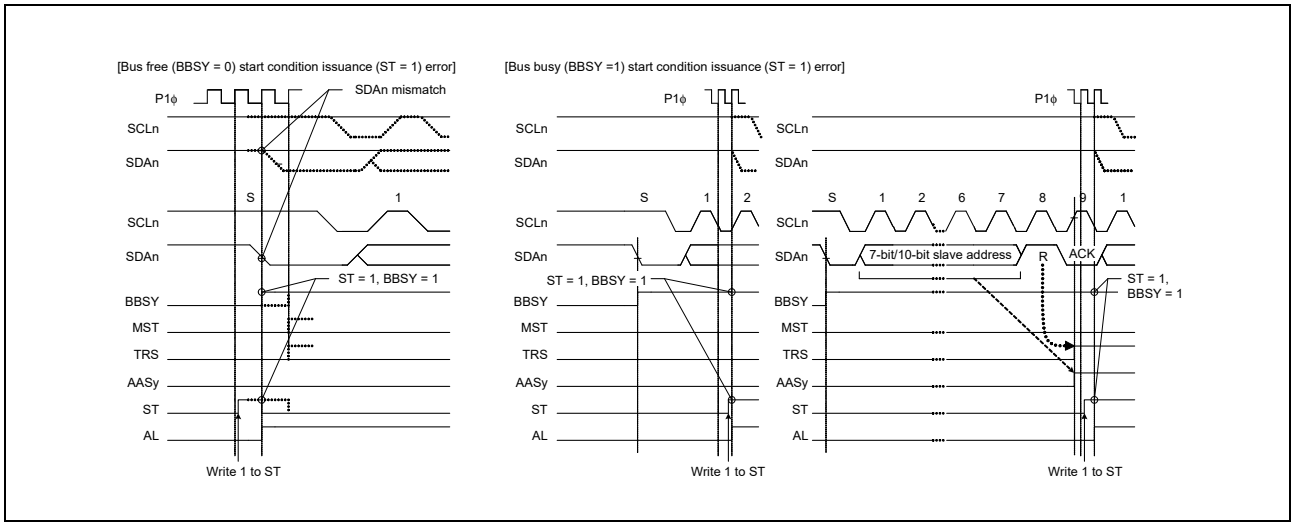

Figure 23.34 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

23.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. Figure 23.35 shows an example of arbitration-lost detection during transmission of NACK.

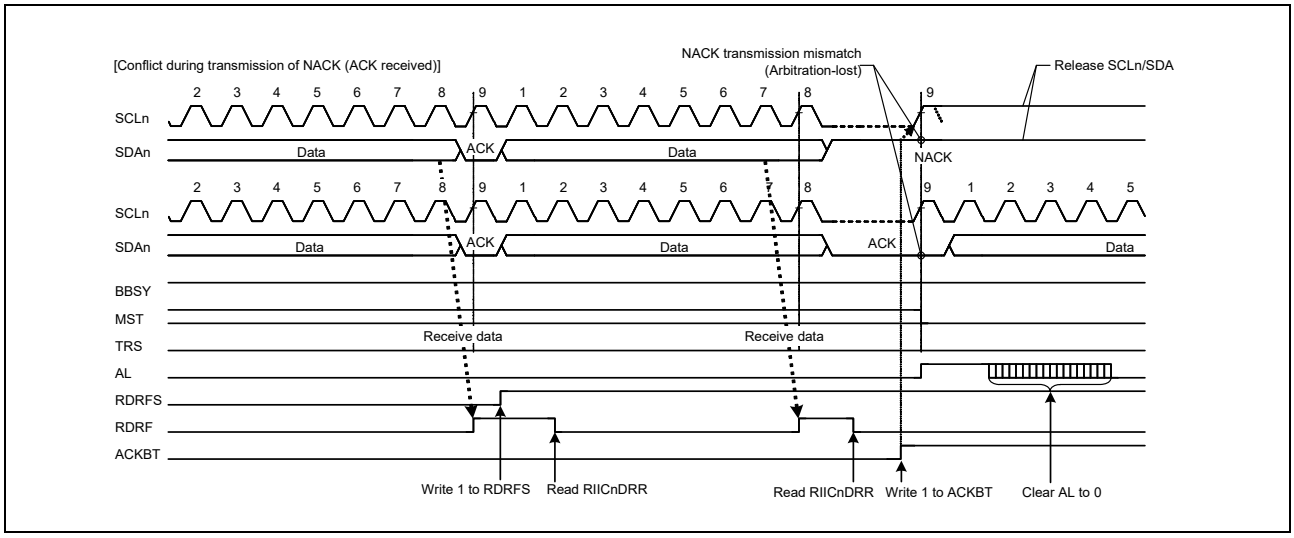

Figure 23.35 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition. Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing (such as FF_H transmission processing) necessary if the UDID (Unique Device Identifier) of assign address does not match in the Get UDID (general) processing after the Assign address command.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1).

23.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state) and the low level is detected on the SDA line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When it loses slave arbitration, the RIIC enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing (processing for the transmission of FF_H).

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01_B)

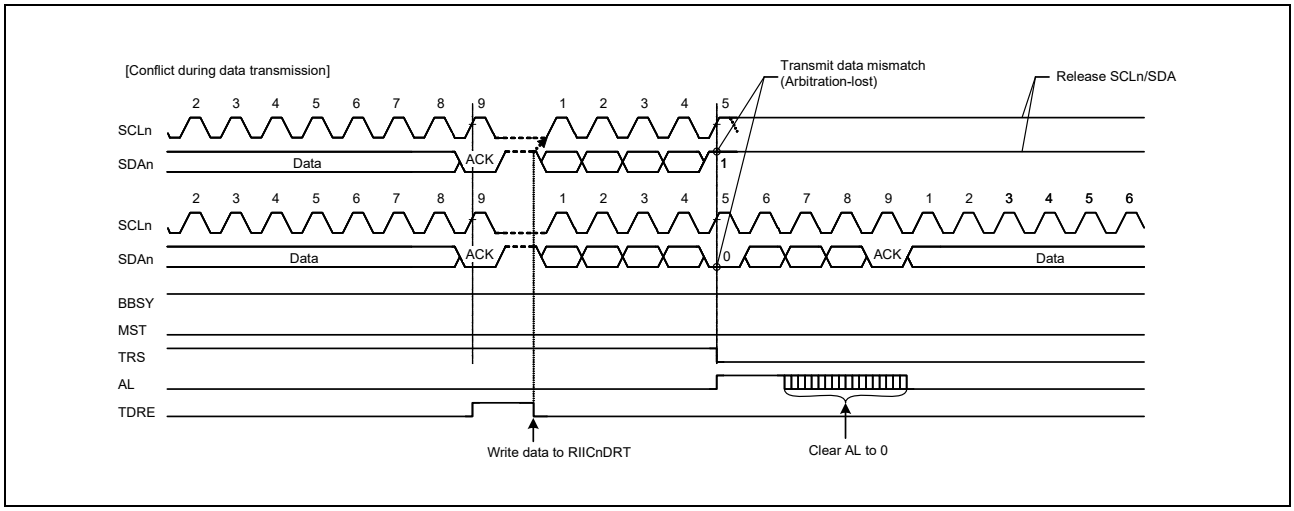

Figure 23.36 Example of Slave Arbitration-Lost Detection (SALE = 1)

23.12 Start Condition/Restart Condition/Stop Condition Issuing Function

23.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.
When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.
A start condition is issued in the following sequence.
[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

23.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.
When the RS bit is set to 1, a restart condition issuance request is made and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).
A restart condition is issued in the following sequence.
[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

Caution: To issue a restart condition request, set RIICnSR2.RS to 1 after setting RIICnSR2.START to 0. After checking that RIICnSR2.START is 1, set RIICnSR2.START to 0, and then write the slave address to RIICnDRT.

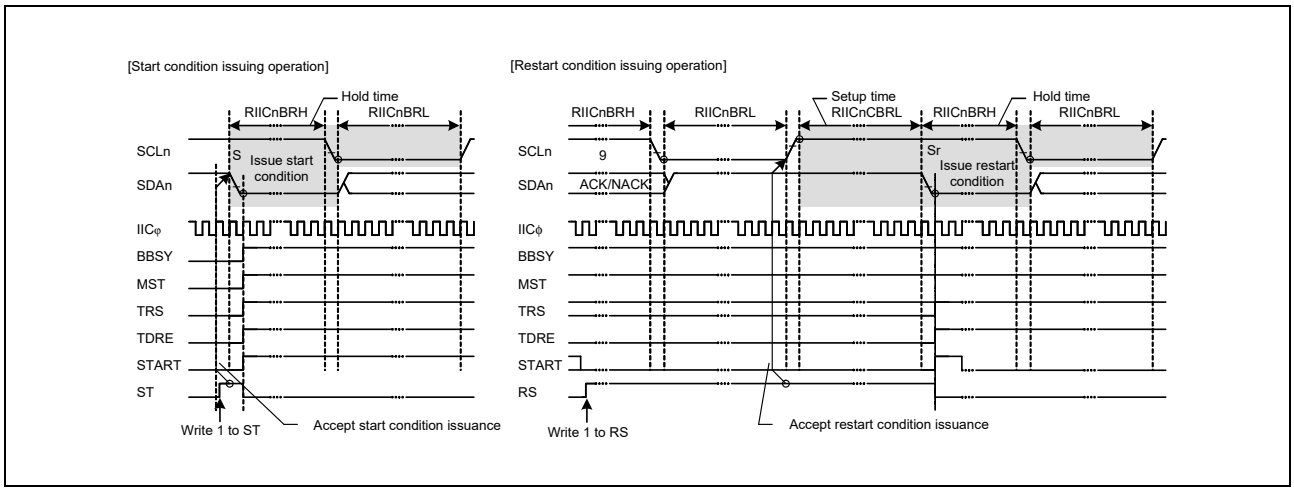

Figure 23.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

23.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.
When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).
A stop condition is issued in the following sequence.
[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

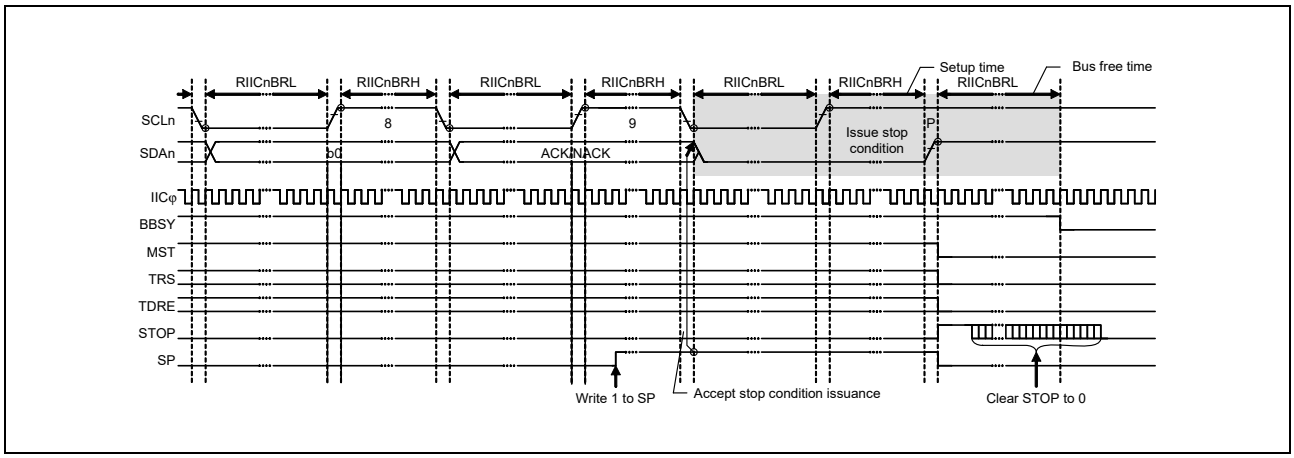

Figure 23.38 Stop Condition Issue Timing (SP Bit)

23.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I^2C bus might hang with a fixed level on the SCL line and/or SDA line.
As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.
By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

23.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.
The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.
This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state in which the SCL line is held low or high in the following cases.

1. When the bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1)
2. When the bus is busy (RIICnCR2.BBSY = 1) and the RIIC's own slave address matches (RIICnSR1 is not 00_H) in slave mode (RIICnCR2.MST = 0)
3. While the bus is free (RIICnCR2.BBSY = 0) and issuing of a start condition is being requested (RIICnCR2.ST = 1).

The internal counter of the timeout function works using the internal reference clock (IICφ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).
The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

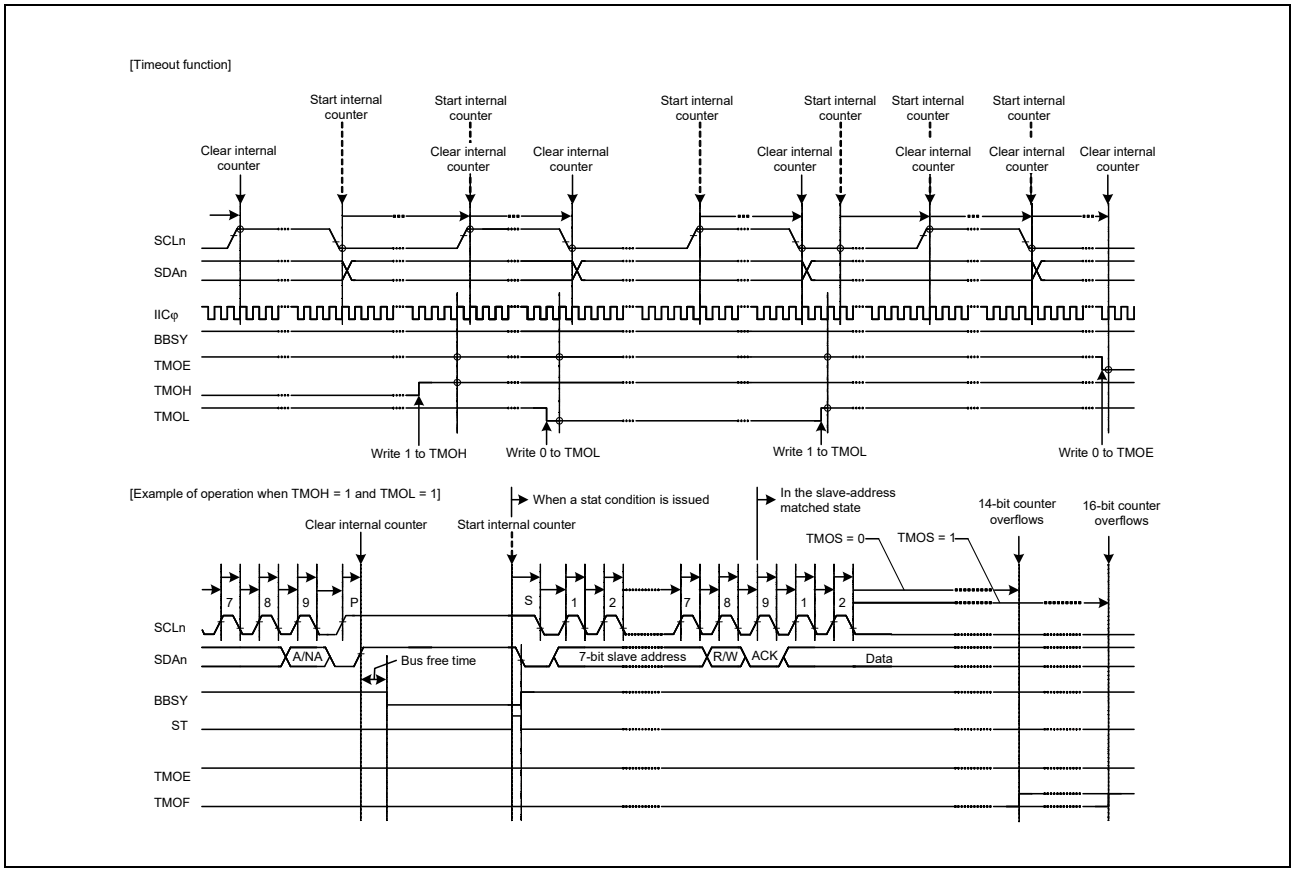

Figure 23.39 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

23.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.
This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.
When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. At this point, the SCL pin output is held at a low level if the BBSY flag is 1, or the SCL pin outputs at high level if the BBSY flag is 0. Further clock cycles can consecutively be output by writing 1 to the CLO bit after having read CLO is 0 by software.
When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.
[Output conditions for using the RIICnCR1.CLO bit]

- When the bus is free (RIICnCR2.BBSY flag = 0) or in master mode (RIICnCR2.MST bit = 1 and BBSY flag = 1)
- When the communication device does not hold the SCL line low

Figure 23.40 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

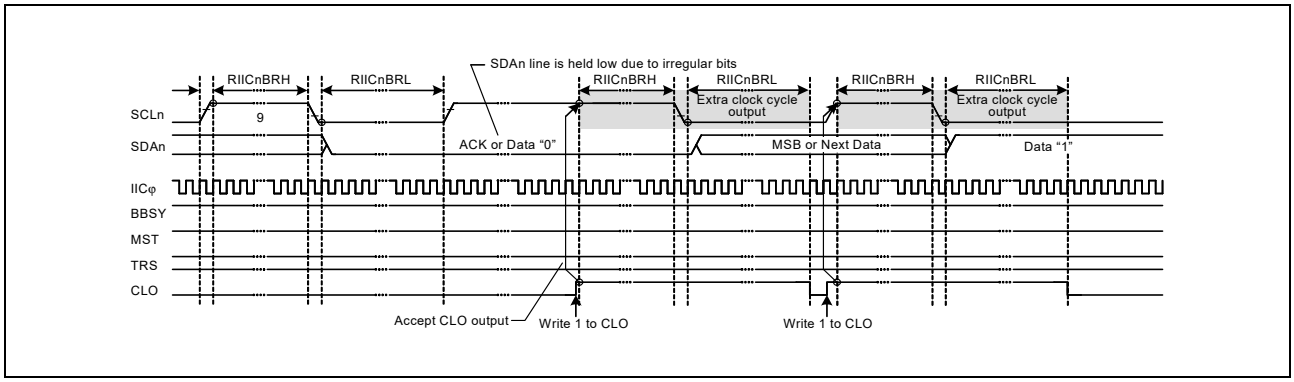

Figure 23.40 Extra SCL Clock Cycle Output Function (CLO Bit)

23.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings. After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoided this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = 01_B).

For a detailed description of the RIIC and internal resets, see section 23.15, Reset Function of RIIC.

23.14 SMBus Operation

The RIIC is available for data communication conforming to the SMBus (Version 2.0). To perform SMBus communication, set the RIICnMR3.SMBS bit to 1. To use the transfer rate within a range of 10 kbps to 100 kbps of the SMBus standard, set the RIICnMR1.CKS[2:0] bits, RIICnCBRH, and RIICnBRL. In addition, determine the values of the RIICnMR2.DLCS bit and the RIICnMR2.SDDL[2:0] bits to meet the data hold time specification of 300 ns or more. If the RIIC is used only as a slave device, the transfer rate setting is not necessary. When the RIIC is used only as a slave device, the transfer rate setting is not necessary, whereas the RIICnBRL needs to be set to a value at least the same as the data setup time (250 ns).
For the SMBus device default address ($1100\ 001_B$), use one of the slave address registers L0 to L2 (RIICnSAR0, RIICnSAR1, and RIICnSAR2), and set the corresponding RIICnSARy.FSy bit (7-bit/10-bit address format select) (y = 0 to 2) to 0 (7-bit address format).
When transmitting the UDID (Unique Device Identifier), set the RIICnFER.SALE bit to 1 to enable the slave arbitration lost detection function.

23.14.1 SMBus Timeout Measurement

(1) Measuring timeout of slave device

The following period (timeout interval: $T_{LOW:\ SEXT}$) must be measured for slave devices in SMBus communication.

- From start condition to stop condition
  To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the internal timer using a start condition detection interrupt (INTRIICSTI) and stop condition detection interrupt (INTRIICSPI) of the RIIC. The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW:\ SEXT}$: 25 ms (max.) of the SMBus standard.
  If the time measured with the internal timer exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (min.) of the SMBus standard, the slave device must release the bus by writing 1 to the RIICnCR1.IICRST bit to issue an internal reset of the RIIC. When an internal reset is issued, the RIIC stops driving the bus for the SCL pin and SDA pin and make the SCL/SDA pin outputs high impedance, which releases the bus.

(2) Measuring timeout of master device

The following periods (timeout interval: $T_{LOW:\ MEXT}$) must be measured for master devices in SMBus communication.

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition

To measure timeout for master devices, measure these periods with the internal timer using a start condition detection interrupt (INTRIICSTI), stop condition detection interrupt (INTRIICSPI), and transmit end interrupt (INTRIICTEI) or receive data full interrupt (INTRIICRI) of the RIIC. The measured timeout period must be within the total clock low-level extended period [master device] $T_{LOW:\ MEXT}$: 10 ms (max.) of the SMBus standard, and the total of all $T_{LOW:MEXT}$ from start condition to stop condition must be within $T_{LOW:\ SEXT}$: 25 ms (max.).
For the ACK receive timing (rising edge of the ninth SMBCLK clock cycle), monitor the RIICnSR2.TEND flag in master transmit mode (master transmitter) and the RIICnSR2.RDRF flag in master receive mode (master receiver). For this reason, perform bytewise transmit operation in master transmit mode, and hold the RIICnMR3.RDRFS bit 0 until the byte just before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 at the rising edge of the ninth SMBCLK clock cycle.
If the period measured with the internal timer exceeds the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (min.) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (writing data to RIICnDRT).

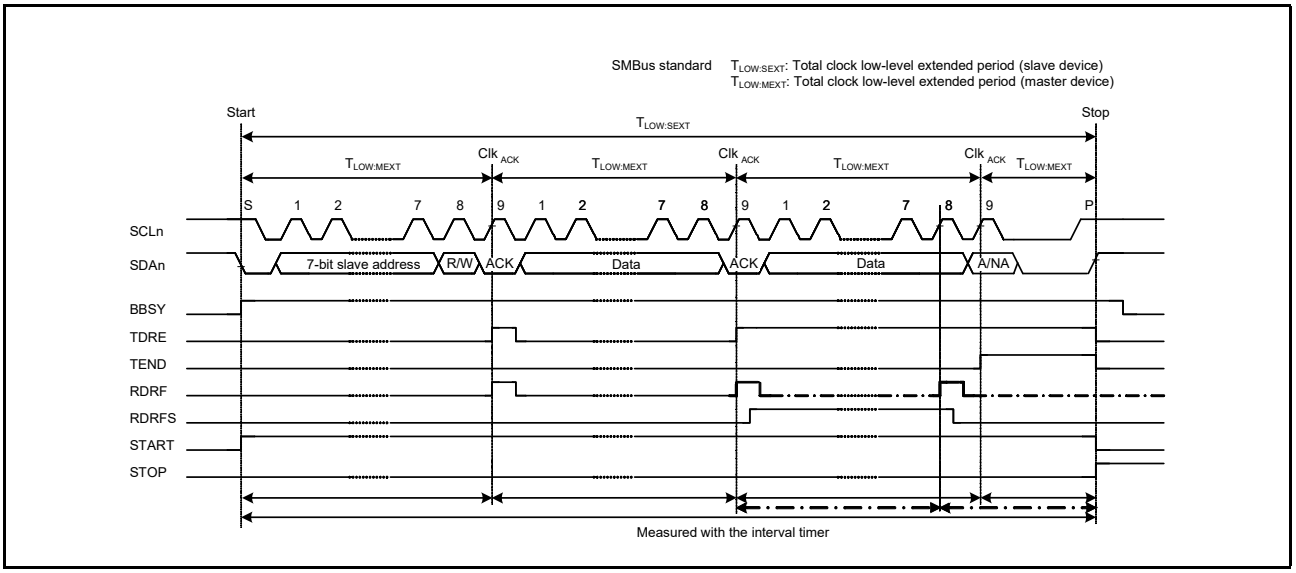

Figure 23.41 SMBus Timeout Measurement

23.14.2 SMBus Host Notification Protocol/Notify ARP Master

In communications over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of (or request the SMBus host for) its own slave address or to request its own slave address from the SMBus host.

For this LSI to operate as an SMBus host (or ARP master), the host address ($0001\ 000_B$) sent from the slave device must be detected as a slave address, so the RIIC has a function for detecting the host address. To detect the host address as a slave address, set the RIICnMR3.SMBS bit and the RIICnSER.HOAE bit to 1. Operation after the host address has been detected is the same as normal slave operation.

23.15 Reset Function of RIIC

The RIIC has chip reset, RIIC reset, and internal reset functions. Table 23.24 lists the scope of each reset and reset conditions.

Table 23.24 RIIC Reset Functions

Register		RIIC Reset (ICE = 0, IICRST = 1)	Internal Reset (ICE = 1, IICRST = 1)	Start Condition/Restart Condition Detection	Stop Condition Detection

Table 23.24 RIIC Reset Functions

Register	RIIC Reset (ICE = 0, IICRST = 1)	Internal Reset (ICE = 1, IICRST = 1)	Start Condition/Restart Condition Detection	Stop Condition Detection
RIICnSAR0, RIICnSAR1, RIICnSAR2	Initialized	Retained	Retained	Retained
RIICnBRH, RIICnBRL	Initialized	Retained	Retained	Retained
RIICnDRT	Initialized	Retained	Retained	Retained
RIICnDRR	Initialized	Retained	Retained	Retained
RIICnDRS	Initialized	Initialized	Retained	Retained

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

24. Serial Sound Interface (SSIF-2)

24.1 Overview

The serial sound interface (SSIF-2) transmits and receives audio data to and from various devices that are compatible with I²S format, monaural format and TDM format.

24.1.1 Features

Table 24.1 Features of SSIF-2

Item		Description
Number of interfaces		• 4
Communication mode		• Master/slave • Full-duplex communication is available in interfaces 0, 1, and 3. Half-duplex communication is only available in interface 2.
Communication format		• I²S format • Monaural format • TDM format
Serial data		• MSB first • Data can be left-justified or right-justified. • Data delay (one clock cycle) or no delay selectable for the period from SSILRCK/SSIFS to SSITxD/SSIRxD • System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits • Data word length: 8, 16, 18, 20, 22, 24, or 32 bits • Padding polarity: Low or high
Bit clock (SSIBCK)	In master mode	• Two clock sources available (AUDIO_CLK/AUDIO_X) • Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128. • Supply/stop of SSIBCK is selectable while communication is halted.
	In slave mode	• SSIBCK input method: Direct input or via the noise canceller
	In master/slave mode	• Polarity: Rising/falling edge canceler
Left and right clock/frame synchronization (SSILRCK/SSIFS)	In master mode	• Polarity: Low/high level selectable • Supply/stop of LRCK is selectable while communication is halted.
	In slave mode	• Two input methods: Direct input or via the noise canceller
Transmit data (SSITxD) and receive data (SSIRxD)	Transmission	• Mute: Transmission of transmit FIFO data or fixed value 0 selectable
	Reception (in slave mode)	• Two input methods: Direct input or via the noise canceller
FIFO	Capacity	• Transmit FIFO/receive FIFO: 4 bytes × 32 stages, • Receive FIFO: 4 bytes × 32 stages
	Data alignment	• Method of data transfer between FIFO and shift register (Left-justification and right-justification) selectable.
Interrupt	Interrupt output	• Communication error/idle mode error (level) • Receive data full interrupt (edge) • Transmit data empty interrupt (edge) • Receive data full/transmit data empty interrupt (edge)
	Interrupt capture spilling solution function	• Edge Interrupt supports inhibition function of capture spilling.
Low power consumption function		• Supply/stop of audio clock is selectable in master-mode communication.

The definition of words and phrases used by the format of the communication of SSIF-2 is as follows.

Table 24.2 Word Definition List

Word	Definition
Start trigger	The first edge that reaches value that set to LRCKP in SSILRCK/ SSIFS pin after SSIF-2 permit communication.
Frame boundary	When SSIF-2 begins to transmit the first data of one frame. When SSIF-2 forwarding ends final data of one frame.
Frame word number	Sound channel number in one frame
System word length	Bit length in one frame.
Data word length	Effective bit length in one frame.
Control bit of communication format	• SSICR register: FRM,DWL,SWL,LRCKP,SPDP,SDTA,PDTA,DEL • SSIFCR register: BSW • SSIOFR register: OMOD • SSISCR register: TDES, RDFS

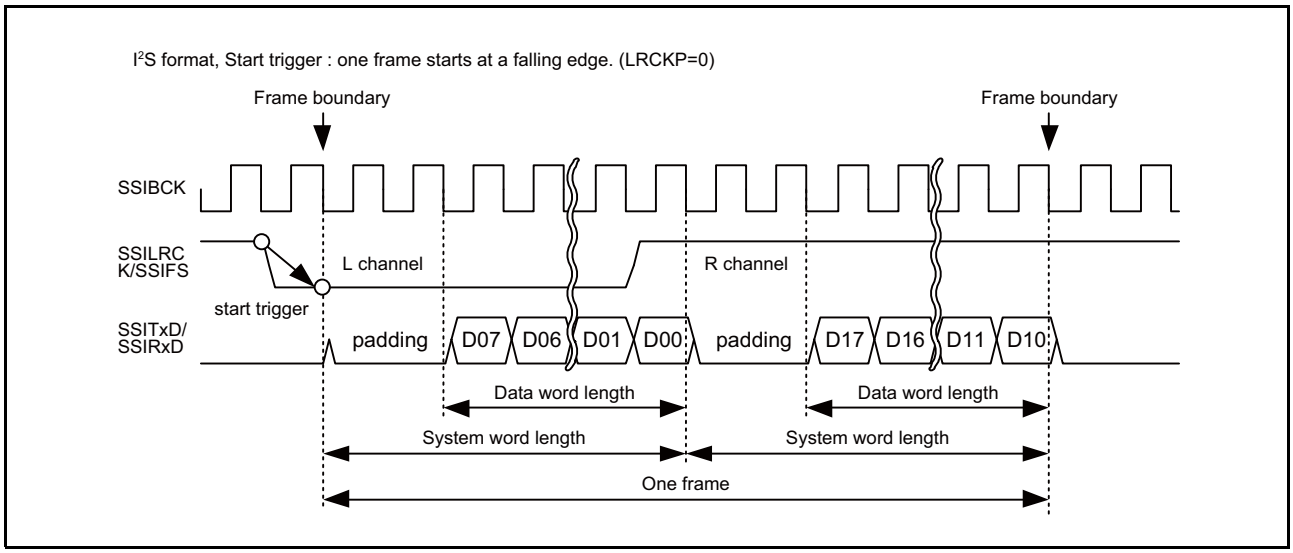

Figure 24.1 Communication Format Definition

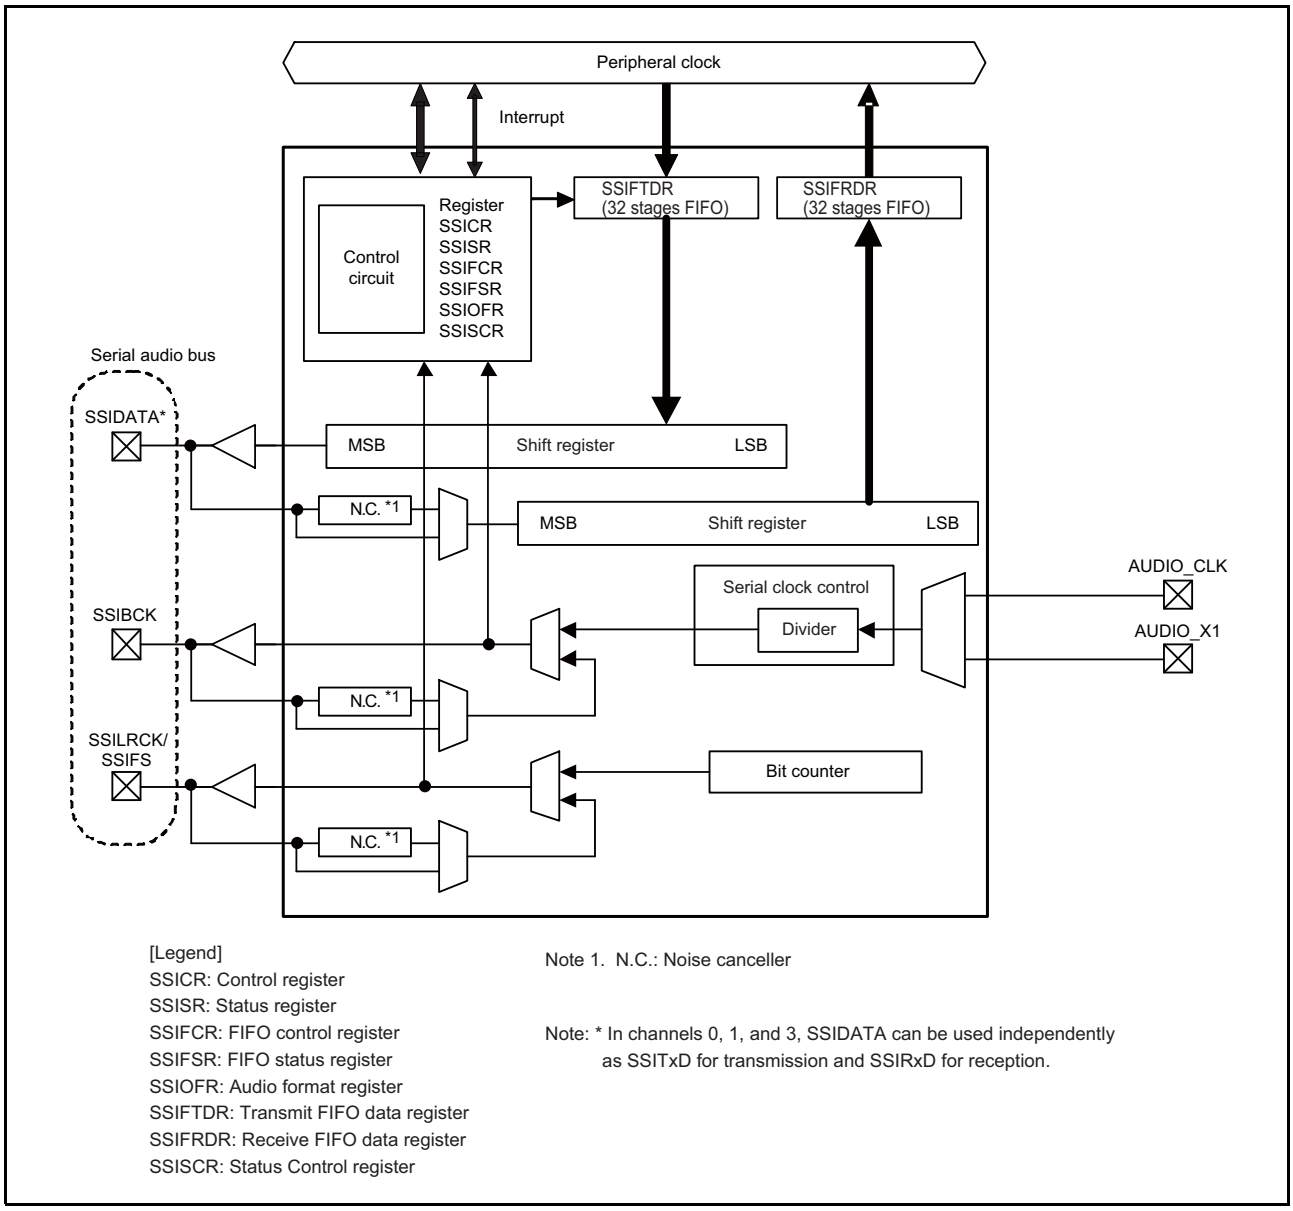
24.1.2 Block Diagram

Figure 24.2 shows the block diagram of SSIF-2.



[Legend]
SSICR: Control register
SSISR: Status register
SSIFCR: FIFO control register
SSIFSR: FIFO status register
SSIOFR: Audio format register
SSIFTDR: Transmit FIFO data register
SSIFRDR: Receive FIFO data register
SSISCR: Status Control register

Note 1. N.C.: Noise canceller

Note: * In channels 0, 1, and 3, SSIDATA can be used independently as SSITxD for transmission and SSIRxD for reception.

Figure 24.2 SSIF-2 Block Diagram

Figure 24.3 shows the clock configuration of SSIF-2.

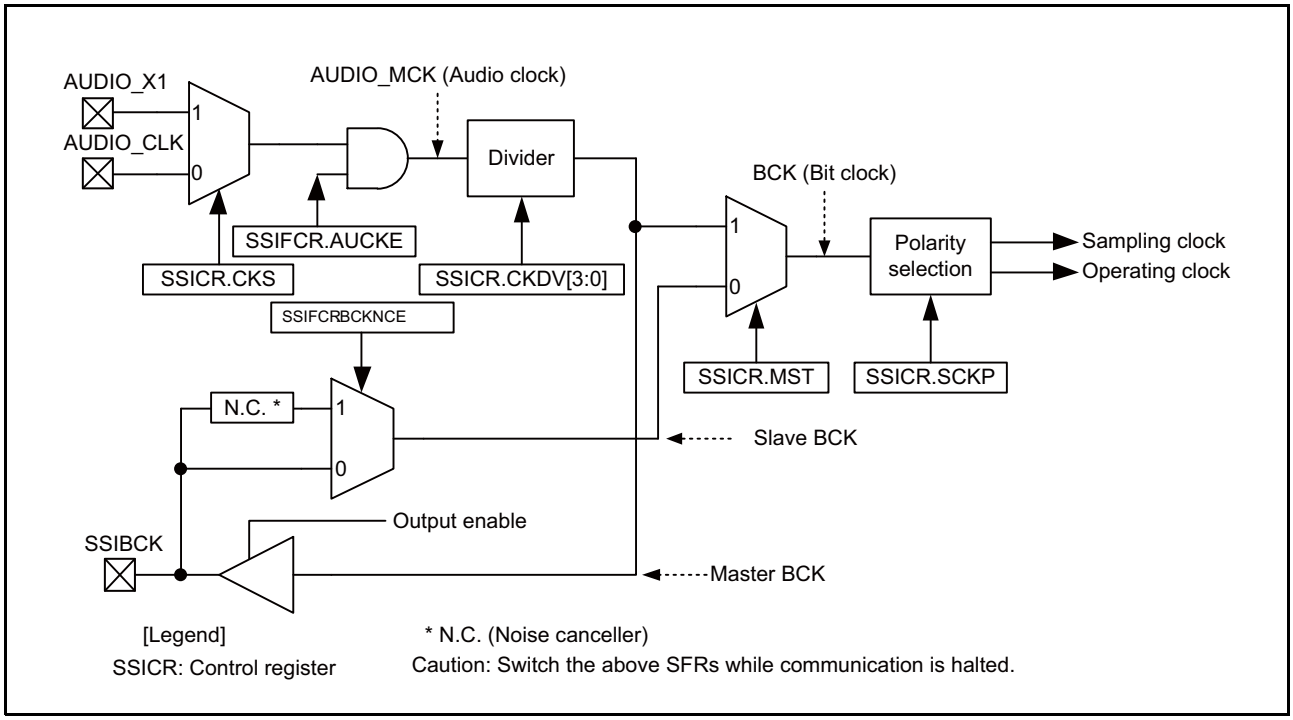


Figure 24.3 SSIF-2 Clock Configuration

24.2 Input/Output Pins

Table 24.3 shows the pin configuration

Table 24.3 Pin Configuration

Interface	name	I/O	Function
0, 1, 3	SSIBCK0, SSIBCK1, SSIBCK3	I/O	Bit clock
	SSILRCK0, SSILRCK1, SSILRCK3	I/O	LR clock/frame synchronization
	SSITxD0, SSITxD1, SSITxD3	Output	Serial data output
	SSIRxD0, SSIRxD1, SSIRxD3	Input	Serial data input
2	SSIBCK2	I/O	Bit clock
	SSILRCK2	I/O	LR clock/frame synchronization
	SSIDATA2	I/O	Serial data I/O
Common	AUDIO_CLK	Input	External clock for audio (The oversampling clock signal is input.)
	AUDIO_X1	Input	Audio clock (crystal oscillator or externally input clock) (The oversampling clock signal is input.)
	AUDIO_X2	Output	

24.3 List of Registers

Table 24.4 List of Control Registers

Channel	Register Name	Symbol	R/W	Initial Value	Address	Access Size
0	Control register	SSICR	RW	0000_0000H	E804_8000H	32 bits
	Status register Note: Bits 31, 30, and 25 to 0 are read only.	SSISR	RW	0200_0000H	E804_8004H	32 bits

	FIFO status register Note: Bits 31 to 17 and 15 to 1 are read only.	SSIFSR	RW	0001_0000H	E804_9014H	32 bits
	Transmit FIFO data register	SSIFTDR	W	0000_0000H	E804_9018H	32 bits, 16 bits, 8 bits
	Receive FIFO data register	SSIFRDR	R	0000_0000H	E804_901CH	32 bits, 16 bits, 8 bits
	Audio format register	SSIOFR	RW	0000_0000H	E804_9020H	32 bits
	Status control register	SSISCR	RW	0000_0000H	E804_9024H	32 bits

Table 24.4 List of Control Registers

Channel	Register Name	Symbol	R/W	Initial Value	Address	Access Size
3	Control register	SSICR	RW	0000_0000H	E804_9800H	32 bits
	Status register Note: Bits 31, 30, and 25 to 0 are read only.	SSISR	RW	0200_0000H	E804_9804H	32 bits
	FIFO control register	SSIFCR	RW	0000_0000H	E804_9810H	32 bits
	FIFO status register Note: Bits 31 to 17 and 15 to 1 are read only.	SSIFSR	RW	0001_0000H	E804_9814H	32 bits
	Transmit FIFO data register	SSIFTDR	W	0000_0000H	E804_9818H	32 bits, 16 bits, 8 bits
	Receive FIFO data register	SSIFRDR	R	0000_0000H	E804_981CH	32 bits, 16 bits, 8 bits
	Audio format register	SSIOFR	RW	0000_0000H	E804_9820H	32 bits
	Status control register	SSISCR	RW	0000_0000H	E804_9824H	32 bits

Note: Access to the addresses other than those listed above is prohibited.

24.4 Function Details

24.4.1 Register Descriptions

24.4.1.1 Control Register (SSICR)

This is a 32-bit readable/writable register. With this register, select an audio clock, control IRQ, select data formats, and set an operation mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	—	R	0	Reserved. Write 0. The read value is 0.
14	MST	RW	0	Master enable*1 0: Slave-mode communication 1: Master-mode communication
13	BCKP	RW	0	Selects bit clock polarity*1 0: SSILRCK/SSIFS and SSIFTxD/SSIFRxD change at a falling edge (sampling SSILRCK/SSIFS and SSIFRxD at a rising edge of SSIBCK). 1: SSILRCK/SSIFS and SSIFTxD/SSIFRxD change at a rising edge (sampling SSILRCK/SSIFS and SSIFRxD at a falling edge of SSIBCK).
12	LRCKP	RW	0	Selects the initial value and polarity of LRCK/FS*1 0: The initial value is at a high level For SSILRCK/SSIFS, one frame start trigger is falling edge of SSILRCK/SSIFS. 1: The initial value is at a low level For SSILRCK/SSIFS, one frame start trigger is rising edge of SSILRCK/SSIFS.
11	SPDP	RW	0	Selects serial padding polarity*1 0: Padding data is at a low level 1: Padding data is at a high level
10	SDTA	RW	0	Selects serial data alignment*1 0: Transmits and receives serial data first and then padding bits. 1: Transmit and receives padding bits first and then serial data.
9	PDTA	RW	0	Selects placement data alignment*1 0: Left-justifies placement data (SSIFTDR, SSIFRDR) 1: Right-justifies placement data (SSIFTDR, SSIFRDR)
8	DEL	RW	0	Selects serial data delay*1 0: Delay of one cycle of SSIBCK between SSILRCK/SSIFS and SSIFTxD/SSIFRxD. 1: No delay between SSILRCK/SSIFS and SSIFTxD/SSIFRxD. This bit control SSILRCK/SSIFS in monaural format (Refer to section 24.4.2.2, Monaural Format for details).

Bits	Bit Name	R/W	Initial Value	Description
7 to 4	CKDV[3:0]	RW	0H	Selects bit clock division ratio*1 CKDV[3:0] 0000: AUDIO_MCK 0001: AUDIO_MCK/2 0010: AUDIO_MCK/4 0011: AUDIO_MCK/8 0100: AUDIO_MCK/16 0101: AUDIO_MCK/32 0110: AUDIO_MCK/64 0111: AUDIO_MCK/128 1000: AUDIO_MCK/6 1001: AUDIO_MCK/12 1010: AUDIO_MCK/24 1011: AUDIO_MCK/48 1100: AUDIO_MCK/96 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited
3	MUEN	RW	0	Mute (silent) enable 0: Disables muting on the next frame boundary. 1: Enables muting on the next frame boundary.
2	—	R	0	Reserved. Write 0. The read value is 0.
1	TEN	RW	0	Transmission and reception enable*2 (TEN, REN): Operating 00: Disables transmission and reception 01: Enables reception (starts reception) 10: Enables transmission (starts transmission) 11: Enables transmission and reception (starts transmission and reception)
0	REN	RW	0	

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

- CKS Bit

This bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in section 24.4.1.3, FIFO Control Register (SSIFCR) for detailed timing.

- TUIEN Bit

This bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

- TOIEN Bit

This bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

- RUIEN Bit

This bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

- ROIEN Bit

This bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

- IIEN Bit

This bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

- FRM[1:0] Bits

These bits set system word number in one frame of the communication formats.
Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in section 24.4.1.7, Audio Format Register (SSIOFR) for the output operation of the LR clock.

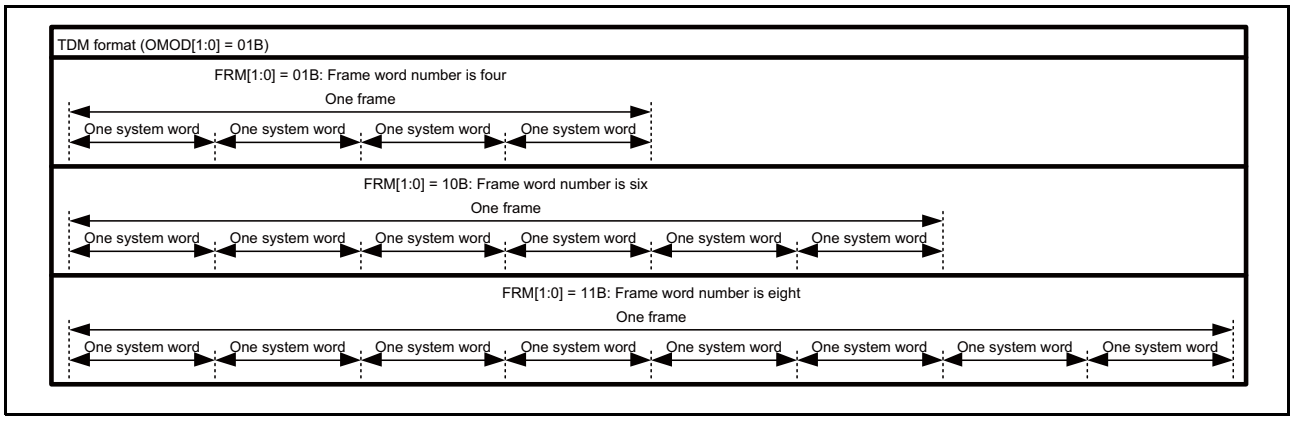

Figure 24.4 Frame word number

- DWL[2:0] Bits

These bits set the number of bits in one data word. The setting whose number of data of system word lengths is shorter than that of the data word length is a prohibition. Refer to Figure 24.13 in section 24.4.2, Communication Formats for details.

- SWL[2:0] Bits

These bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See Table 24.13 in section 24.4.2, Communication Formats for details.
Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in section 24.4.1.7, Audio Format Register (SSIOFR) for the output operation of the LR clock.

- MST Bit

This bit sets master-/slave-mode communication.
To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in section 24.4.1.3, FIFO Control Register (SSIFCR) for detailed timing.

- BCKP Bit

This bit sets the bit clock polarity (Table 24.5).
To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in section 24.4.1.3, FIFO Control Register (SSIFCR) for detailed timing.

Table 24.5 Bit Clock Polarity

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	At SSILRCK/SSIFS sampling	SSIBCK rising edge	SSIBCK falling edge
	Master/slave	At SSIFRxD sampling	SSIBCK rising edge	SSIBCK falling edge
Transmission	Master	At change of SSILRCK/SSIFS output	SSIBCK falling edge	SSIBCK rising edge
	Master/slave	At change of SSIFTxD output	SSIBCK falling edge	SSIBCK rising edge

- LRCKP Bit

This bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIF-2 (Table 24.6). Only the start trigger is used at slave communication (MST=0).
Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in section 24.4.1.7, Audio Format Register (SSIOFR) for the output operation of the LR clock.

Table 24.6 Initial Output Value and Polarity of SSILRCK/SSIFS Pin

Communication Format	Expected Initial State	Setting Value of LRCKP
I²S	H	0
Monaural	L	1
TDM	L	1

Note: Do the setting that can be communicated respectively to I²S, monaural, and TDM at the compatible format.

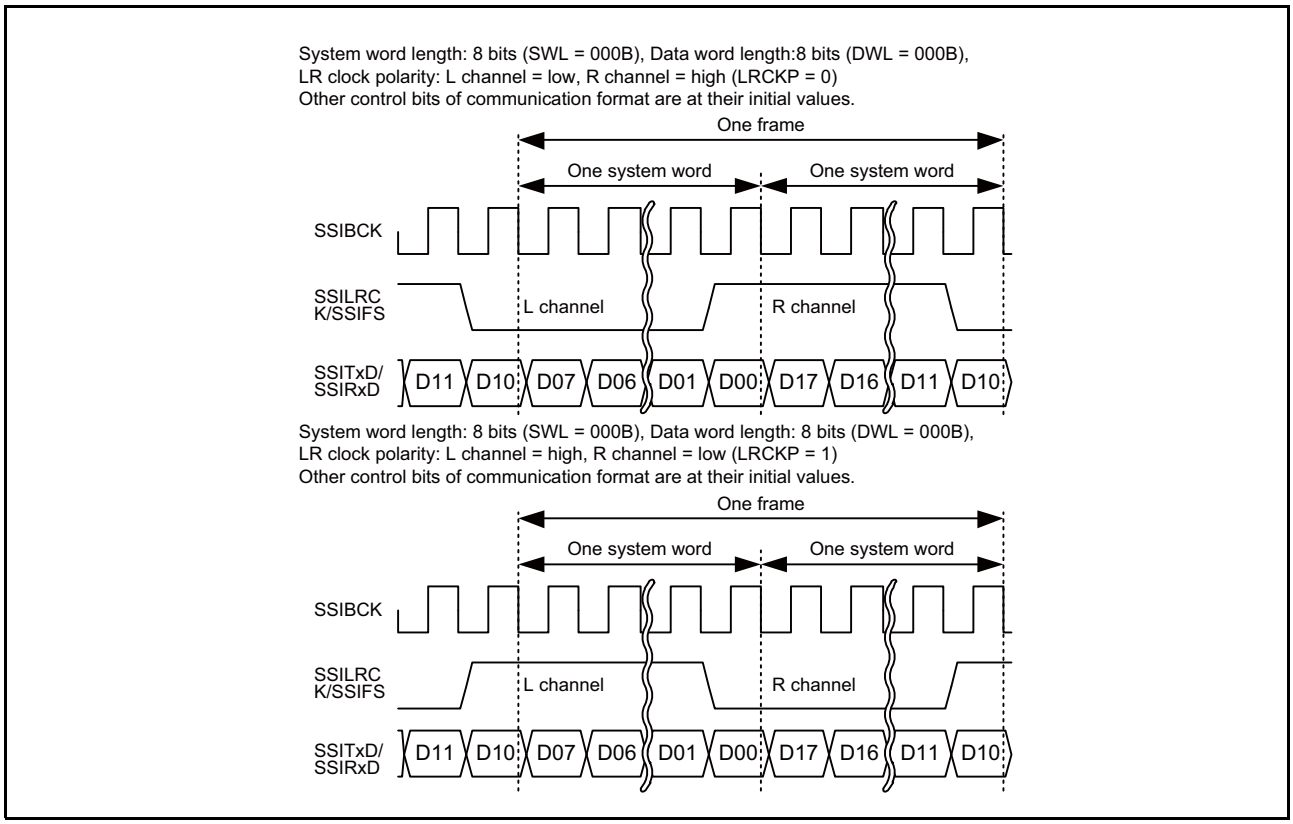

Figure 24.5 LRCK/FS Polarity Setting

- SPDP Bit

This bit sets polarity of padding bits.

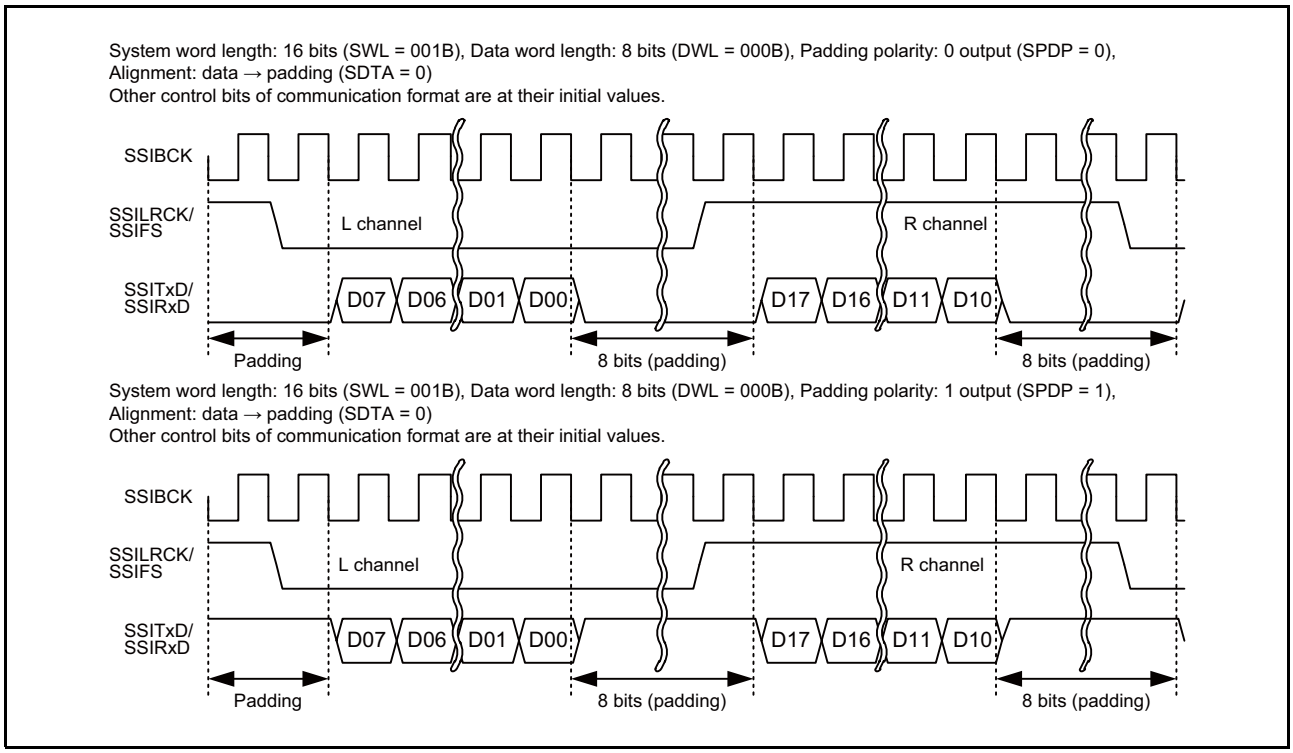

Figure 24.6 Padding Bit Polarity

- SDTA Bit

This bit sets alignment of serial data (data bits and padding bits). For communication without padding bits, this bit is invalid.

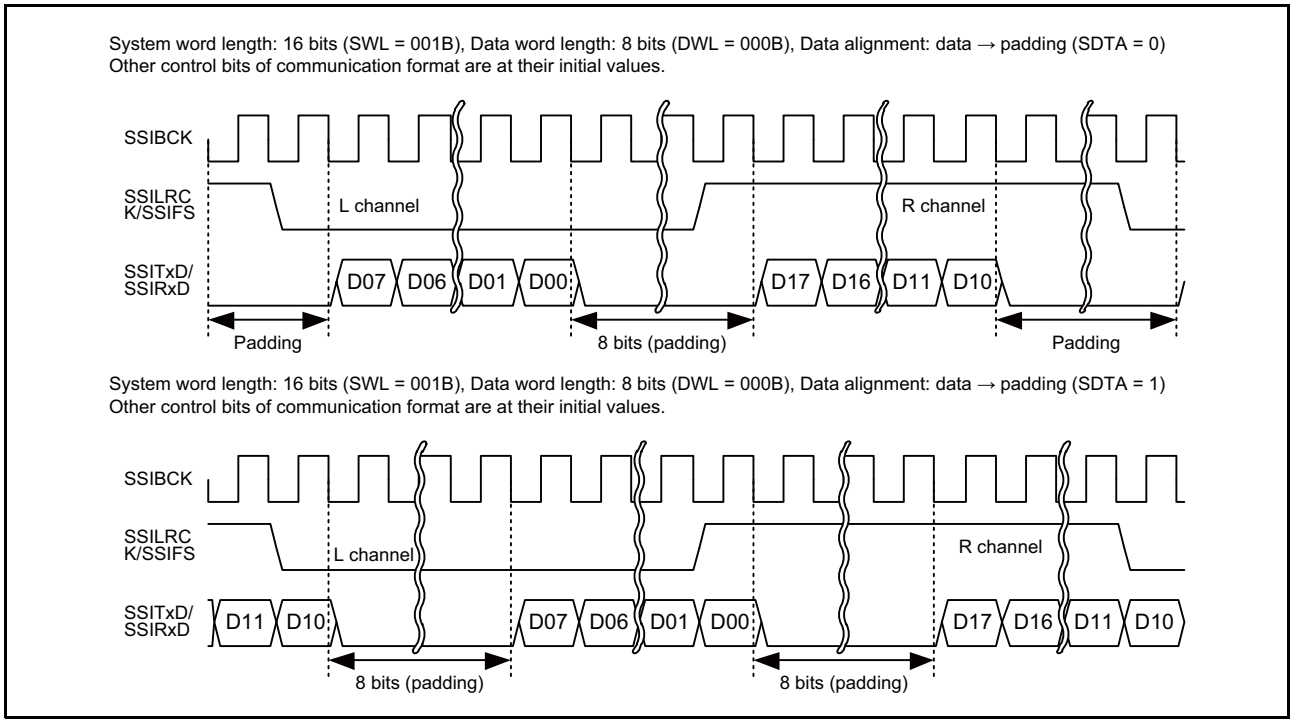

Figure 24.7 Alignment Setting of Serial Data with Padding Bits

- PDTA Bit

This bit sets alignment of placement data. With the setting of data word length as 32 bits (DWL[2:0] = 110B), this bit is invalid.

At transmission:

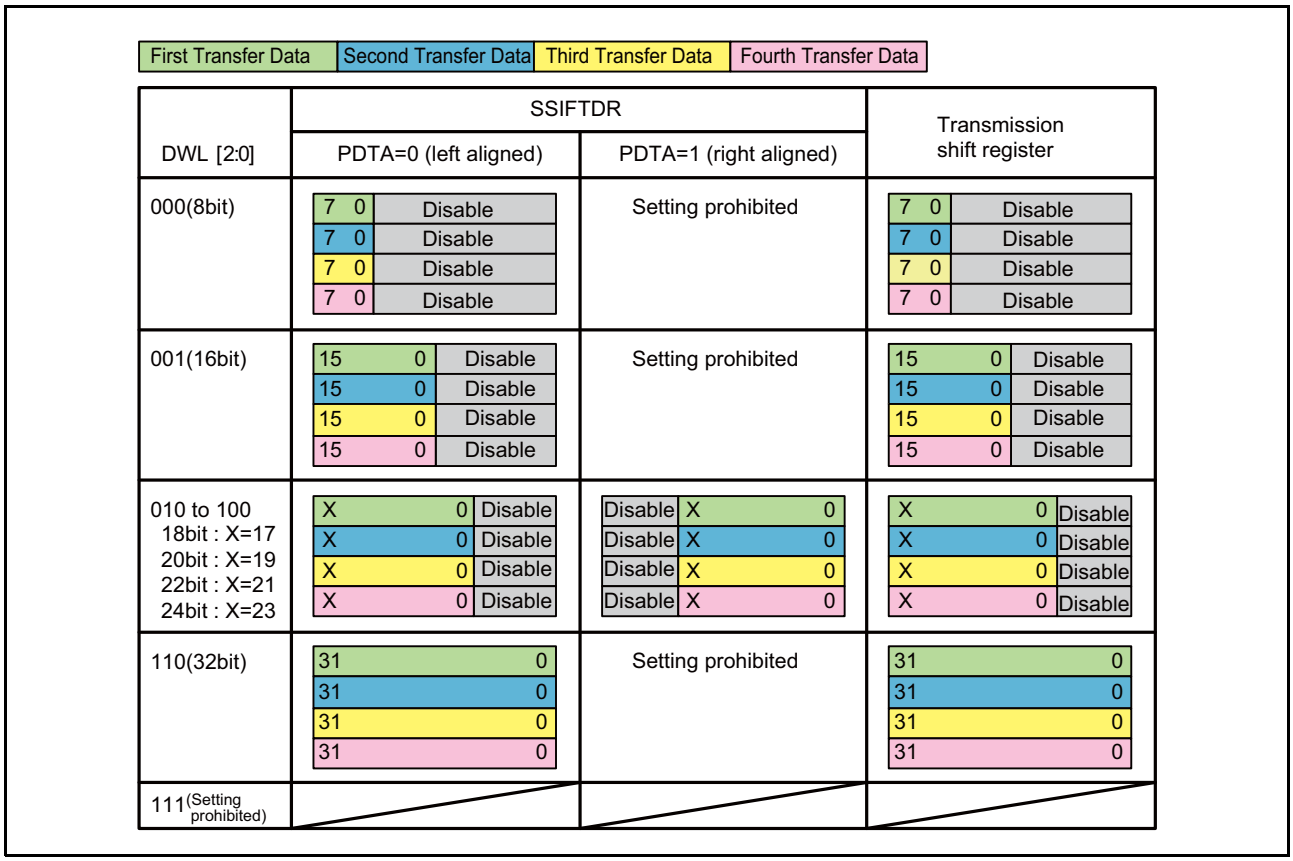

Figure 24.8 Alignment Setting of Placement Data in Transmission

At reception:

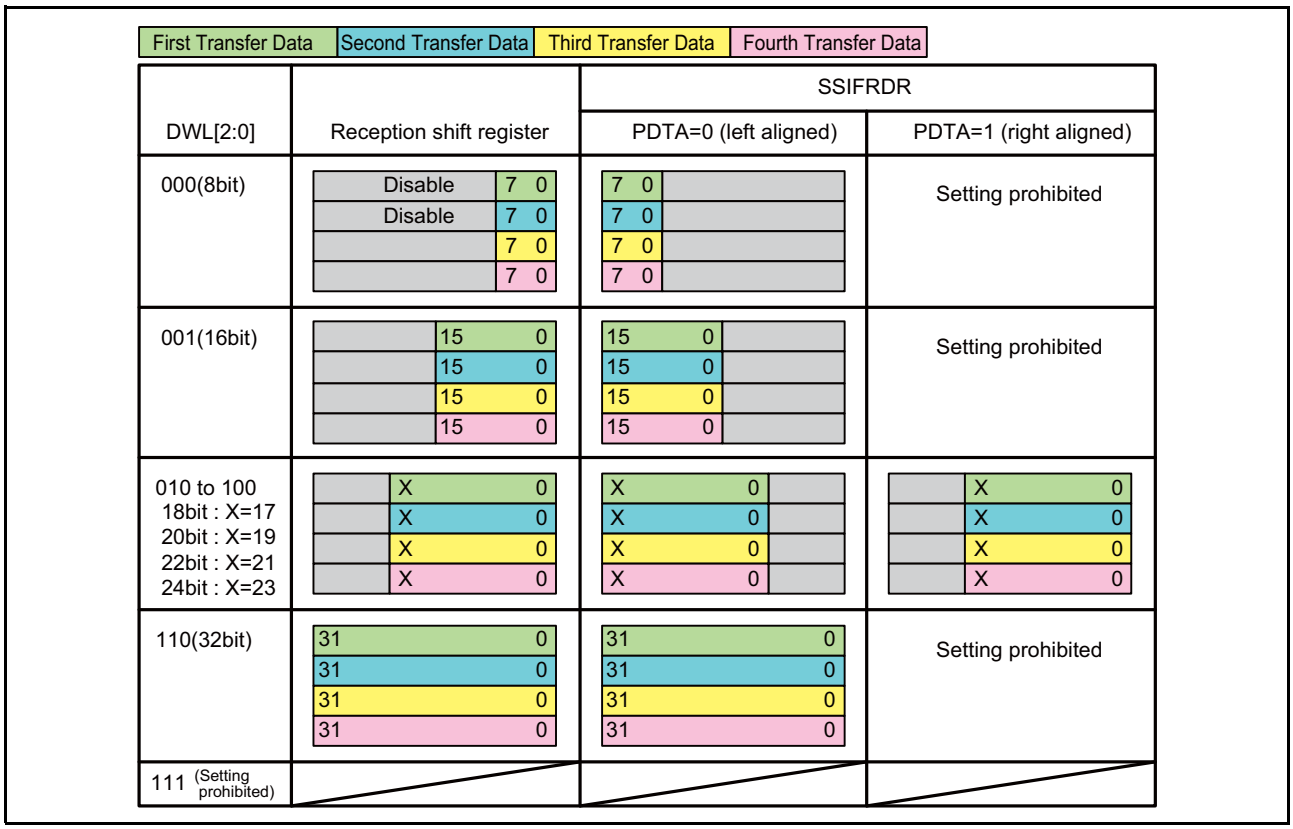

Figure 24.9 Alignment Setting of Placement Data in Reception

- DEL Bit

This bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITxD/SSIRxD.

With the I²S format and TDM format, set 0 to DEL (Figure 24.10). With the monaural format, this bit changes the high period width. Refer to section 24.4.2.2, Monaural Format for details. Do the setting that can be communicated at the compatible communication format.

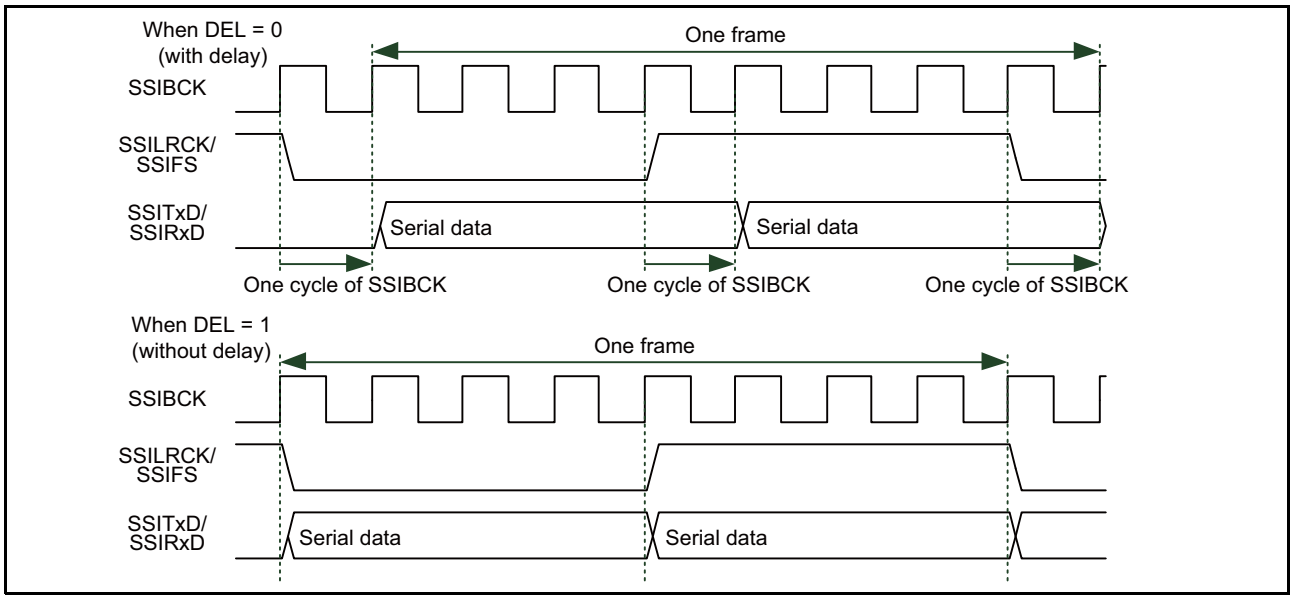

Figure 24.10 Setting of Delay in Serial Data

- CKDV[3:0] Bits

These bits set the division ratio of the bit clock based on AUDIO_MCK in master-mode communication (MST = 1) (Figure 24.11). In slave-mode communication (MST = 0), setting of these bits are invalid.
To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in section 24.4.1.3, FIFO Control Register (SSIFCR) for detailed timing.

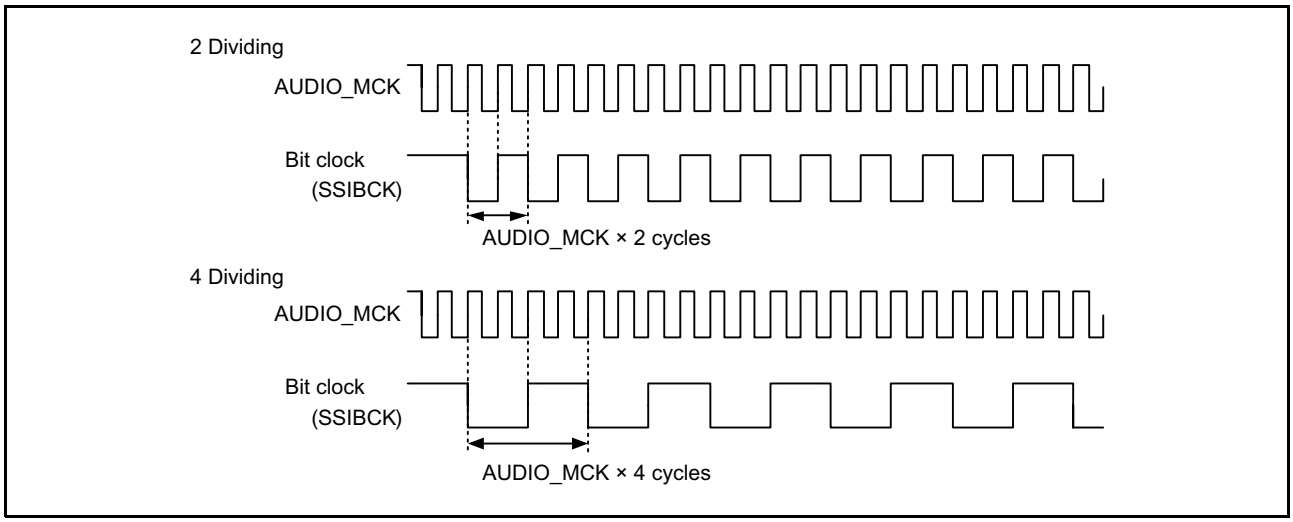

Figure 24.11 Sampling Frequencies in Master-mode Communication

- MUEN Bit

This bit sets/clears the mute function for the data output from the terminal SSITxD. When you set this bit to 1, the output value of SSITxD becomes 0 from the next frame boundary. When you set this bit to 0, the output value of SSITxD can be made the data of the FIFO transmission data register from the following frame boundary.
Note that this bit controls data only. Status flags and interrupt signals are normally generated.
Set this bit after setting completing the communication format.

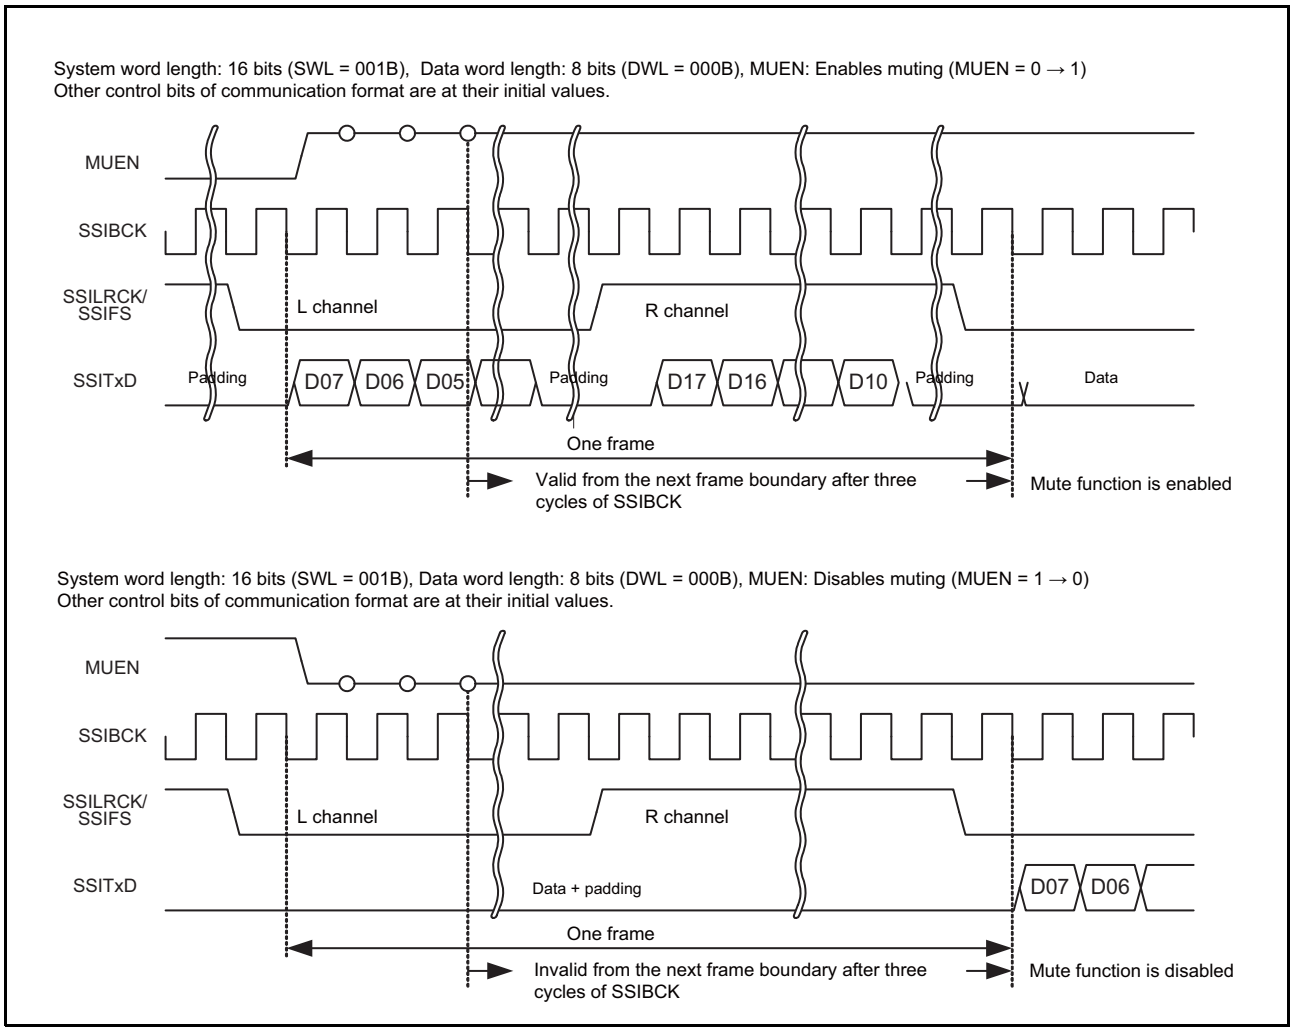

Figure 24.12 Transmit Data with the Mute Function Set

- TEN and REN Bits

These bits enable/disable transmission and reception. Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to section 24.5.2.2, Transmission, section 24.5.2.3, Reception, and section 24.5.2.4, Transmission and Reception for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).
To stop communication without waiting for the frame boundary, follow the software reset procedure.

24.4.1.2 Status Register (SSISR)

This is a readable/writable 32-bit register. It is configured with status flags that indicate SSIF-2 operational state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	TUIRQ	TOIRQ	RUIRQ	ROIRQ	IIRQ	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W0	R/W0	R/W0	R/W0	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	R/W	Initial Value	Description
31, 30	—	R	00B	Reserved. Write 0. The read value is 0.
29	TUIRQ	RW0	0	Transmit underflow error status flag 0: No transmit underflow error is generated. 1: A transmit underflow error is generated.
28	TOIRQ	RW0	0	Transmit overflow error status flag 0: No transmit overflow error is generated. 1: A transmit overflow error is generated.
27	RUIRQ	RW0	0	Receive underflow error status flag 0: No receive underflow error is generated. 1: A receive underflow error is generated.
26	ROIRQ	RW0	0	Receive overflow error status flag 0: No receive overflow error is generated. 1: A receive overflow error is generated.
25	IIRQ	R	1	Idle mode status flag 0: In the communication state 1: In the idle state
24 to 0	—	R	0000000H	Reserved. Write 0. The read value is 0.

- TUIRQ Bit

This is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing serial data necessary for one frame to SSIFTDR was slower than one frame of the transmission operation. Even if this flag is cleared after this flag becomes '1', the output value of SSIFTxD is 0. Follow the communication stop procedure (Figure 24.55) and the error procedure (Figure 24.56) to output the data written in transmission FIFO data register (SSIFTDR) to the terminal SSIFTxD. See section 24.5.2.6, Error Handling for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]
Setting is prioritized.*1

[Clearing condition]
When either the following is approved.
(1) Writing 0 to this flag after reading this flag as 1.*2
(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]
Timing according to the above-mentioned clear condition.
(1) At completion of writing 0 to this flag after reading this flag as 1 (Figure 24.13).
(2) Write 1 in SSICR.TEN, complete, and after one cycle of P1φ (Figure 24.13).

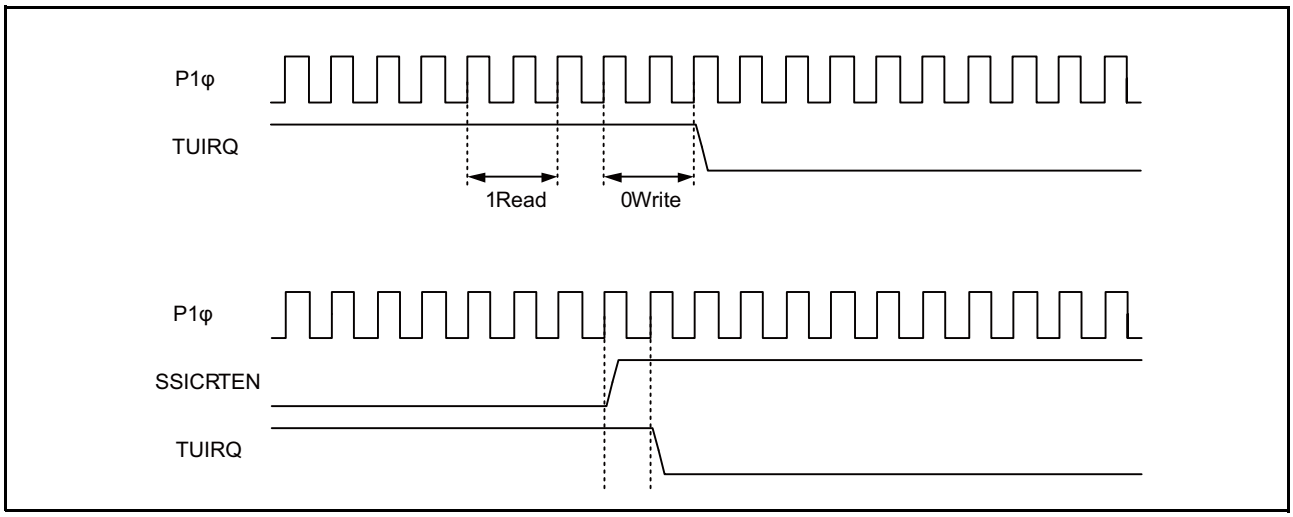

Figure 24.13 TUIRQ Clearing Timing

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.
Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
• Software reset (SSIFCR.SSIRST=1).
• Completion of writing 0 to this flag after having read it as 1.
• One cycle of P1φ elapsing after the completion of writing 1 to SSICR.TEN.
Note 3. After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]
When data to be transmitted in the next frame is not fully written to SSIFTDR at the frame boundary of continuance communication.

[Setting timing]
After three cycles of P1φ from frame boundary (Figure 24.14).

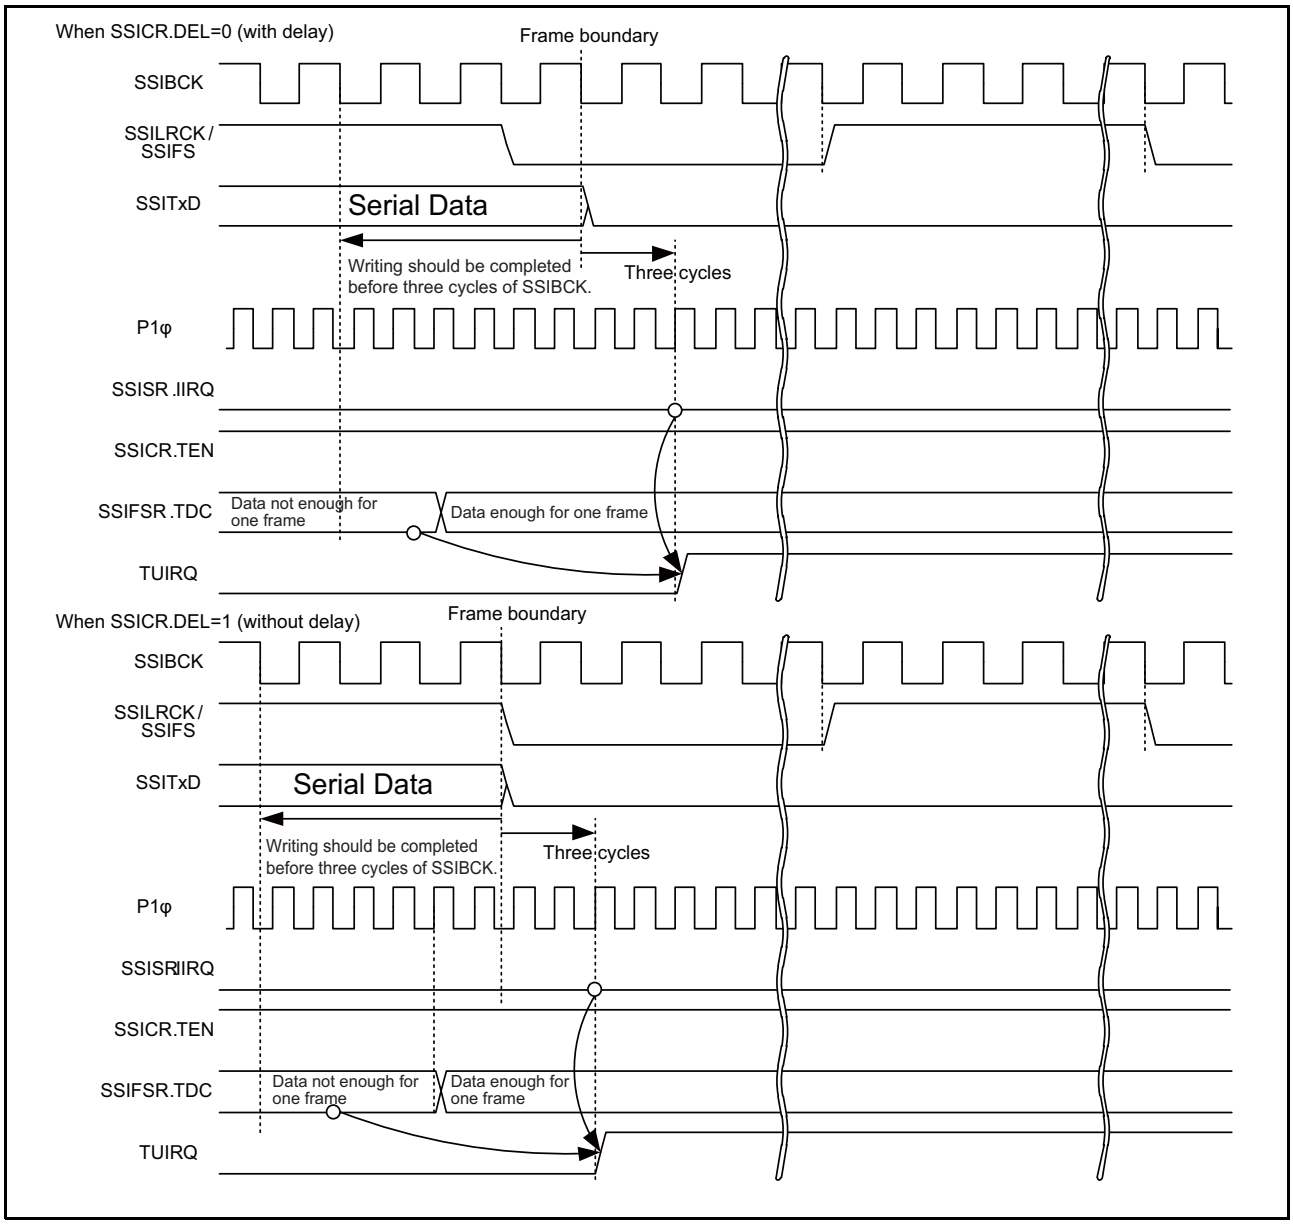

Figure 24.14 TUIRQ Setting Timing (When you continue communicating)

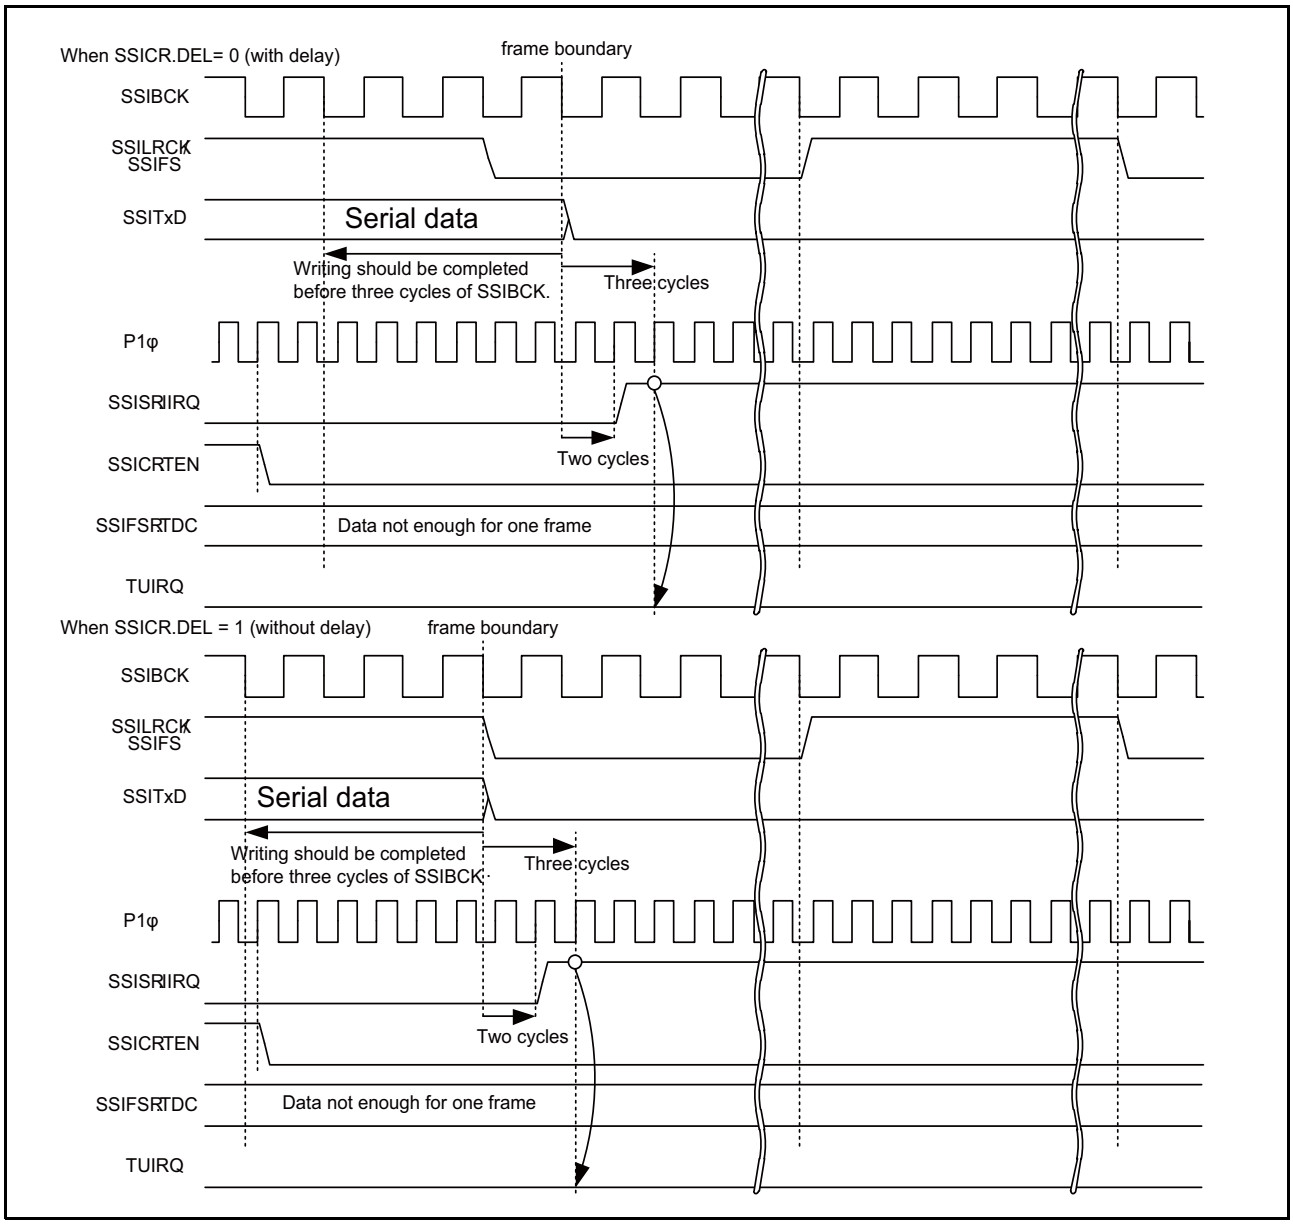

Figure 24.15 TUIRQ Setting Timing (When you stop communicating)

- TOIRQ Bit

This is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that serial data is written to SSIFTDR when it is full during transmission (SSICR.TEN=1). Data is not written to SSIFTDR where a transmit overflow error is generated. See section 24.5.2.6, Error Handling for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as Figure 24.13).

(2) Write 1 in SSICR.TEN, complete, and after one cycle of P1φ (same as Figure 24.13).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P1φ elapsing after the completion of writing 1 to SSICR.TEN.

Note 3. After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]

During transmission operation (SSICR.TEN = 1), data is written to SSIFTDR while it is full.

[Setting timing]

At completion of writing to SSIFTDR (Figure 24.16)

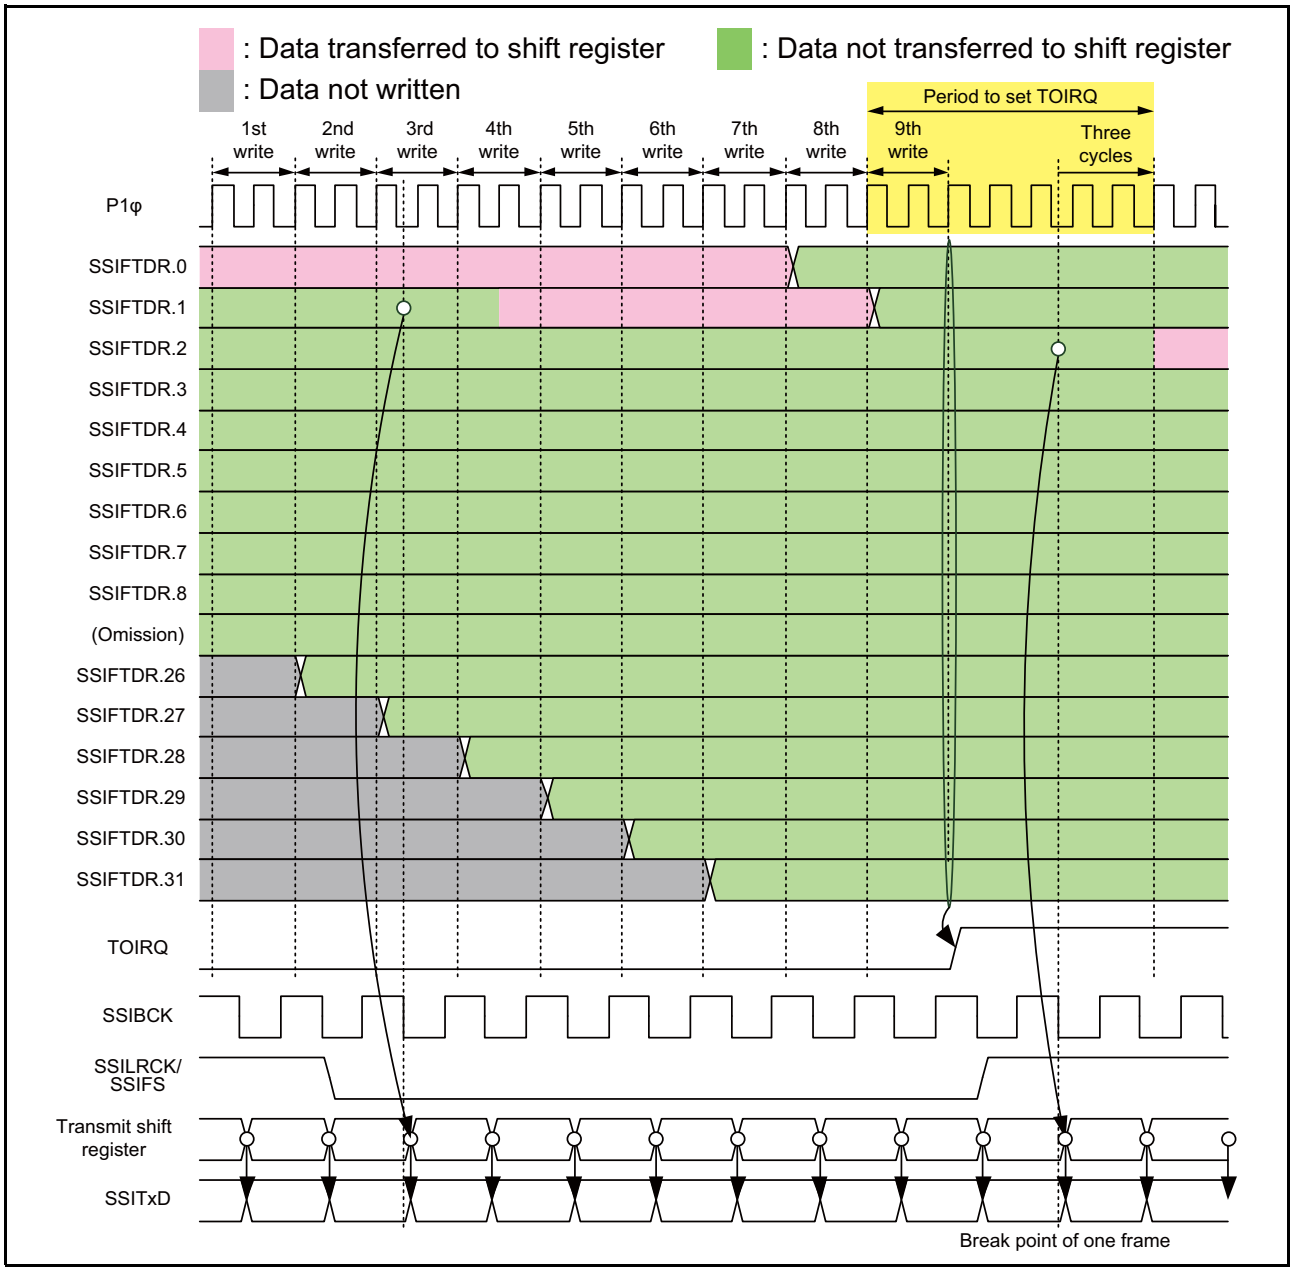

Figure 24.16 TOIRQ Setting Timing

- RUIRQ Bit

This is a status flag that indicates a receive underflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See section 24.5.2.6, Error Handling for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST). Even if SSIFRDR is read to (SSIFCR.RFRST=1) while resetting reception FIFO data register, it doesn't set 1.

[Priority order for setting and clearing]
Setting is prioritized.*1
[Clearing condition]
When either the following is approved.
(1) Writing 0 to this flag after reading this flag as 1.*2
(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as Figure 24.13).

(2) Write 1 in SSICR.REN, complete, and after one cycle of P1φ (same as Figure 24.13).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P1φ elapsing after the completion of writing 1 to SSICR.TEN.

Note 3. After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR (Figure 24.17).

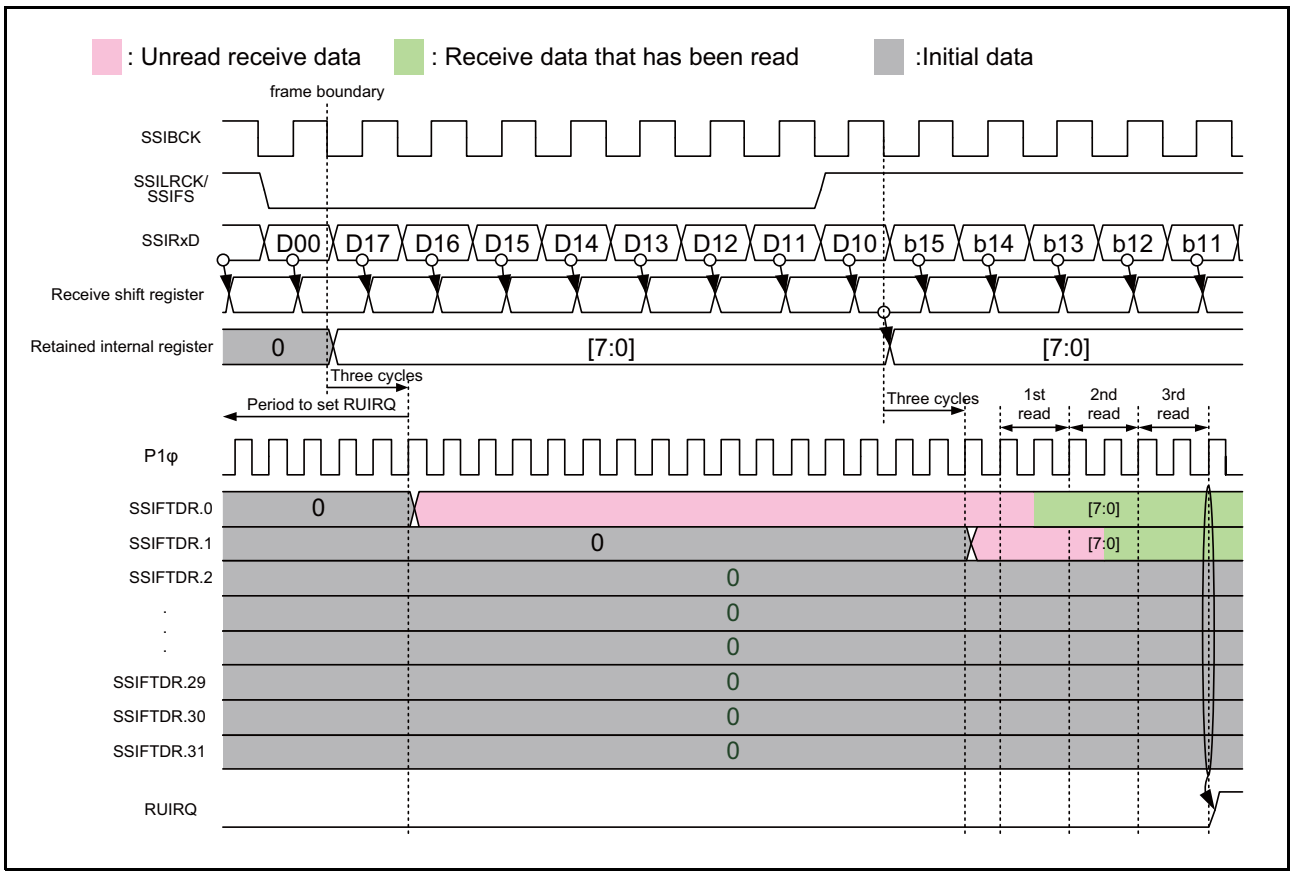

Figure 24.17 RUIRQ Setting Timing

- ROIRQ Bit

This is a status flag that indicates a receive overflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. See section 24.5.2.6, Error Handling for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]
Setting is prioritized.
[Clearing condition]
Writing 0 to this flag after reading this flag as 1.

[Clearing timing]
At completion of writing 0 after reading 1 from an SFR (same as Figure 24.13).
[Priority order for setting and clearing]
Setting is prioritized.*1
[Clearing condition]
When either the following is approved.
(1) Writing 0 to this flag after reading this flag as 1.*2
(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]
Timing according to the above-mentioned clear condition.
(1) At completion of writing 0 to this flag after reading this flag as 1 (same as Figure 24.13).
(2) Write 1 in SSICR.REN, complete, and after one cycle of P1φ (same as Figure 24.13).

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P1φ elapsing after the completion of writing 1 to SSICR.TEN.

Note 3. After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]
At completion of receiving new data while SSIFRDR is full.
[Setting timing]
Three cycles of P1φ after reception is completed (Figure 24.18).

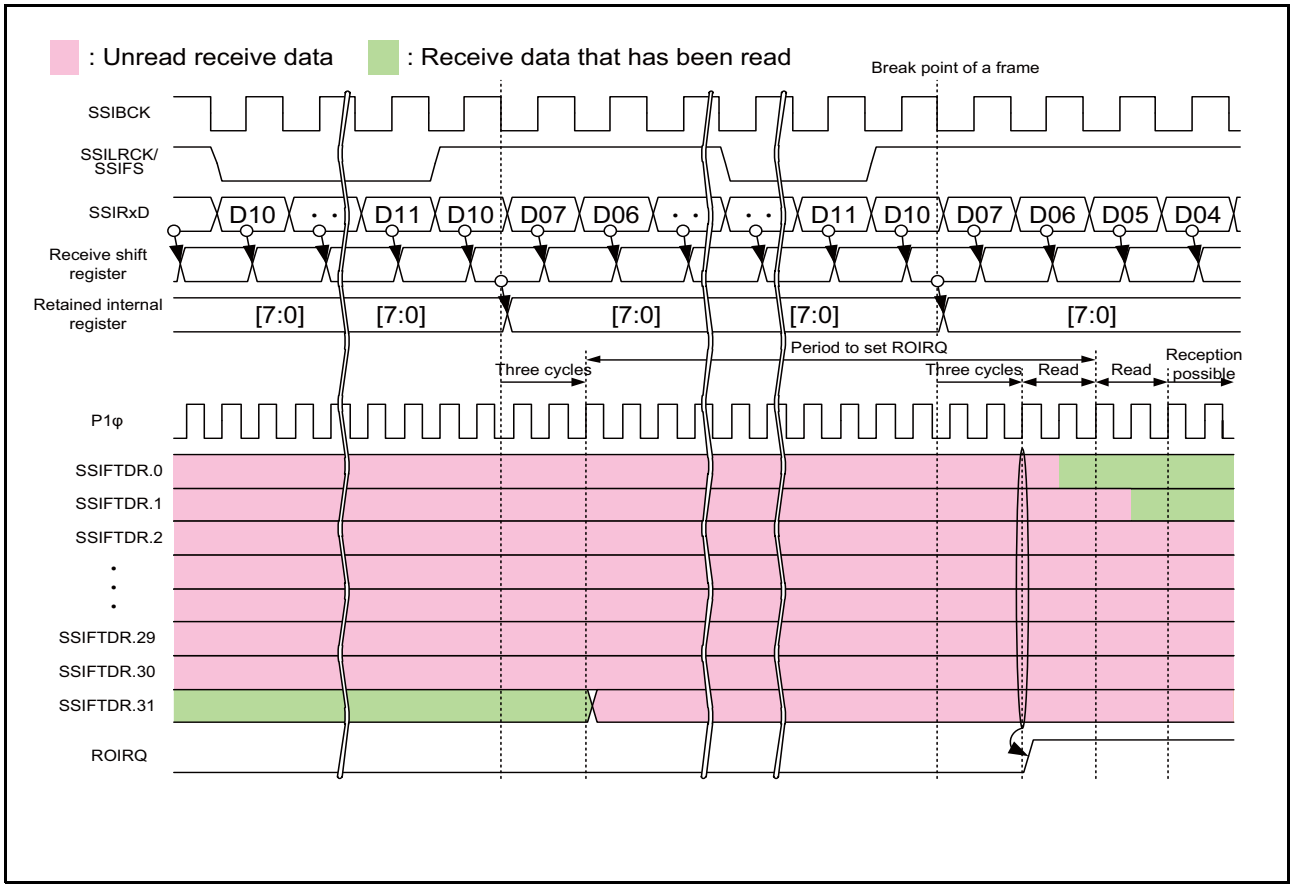

Figure 24.18 ROIRQ Setting Timing

- IIRQ Bit

This is a status flag that indicates the idle state. It indicates whether SSIF-2 is in the idle state or communication state (Figure 24.19 and Figure 24.20).

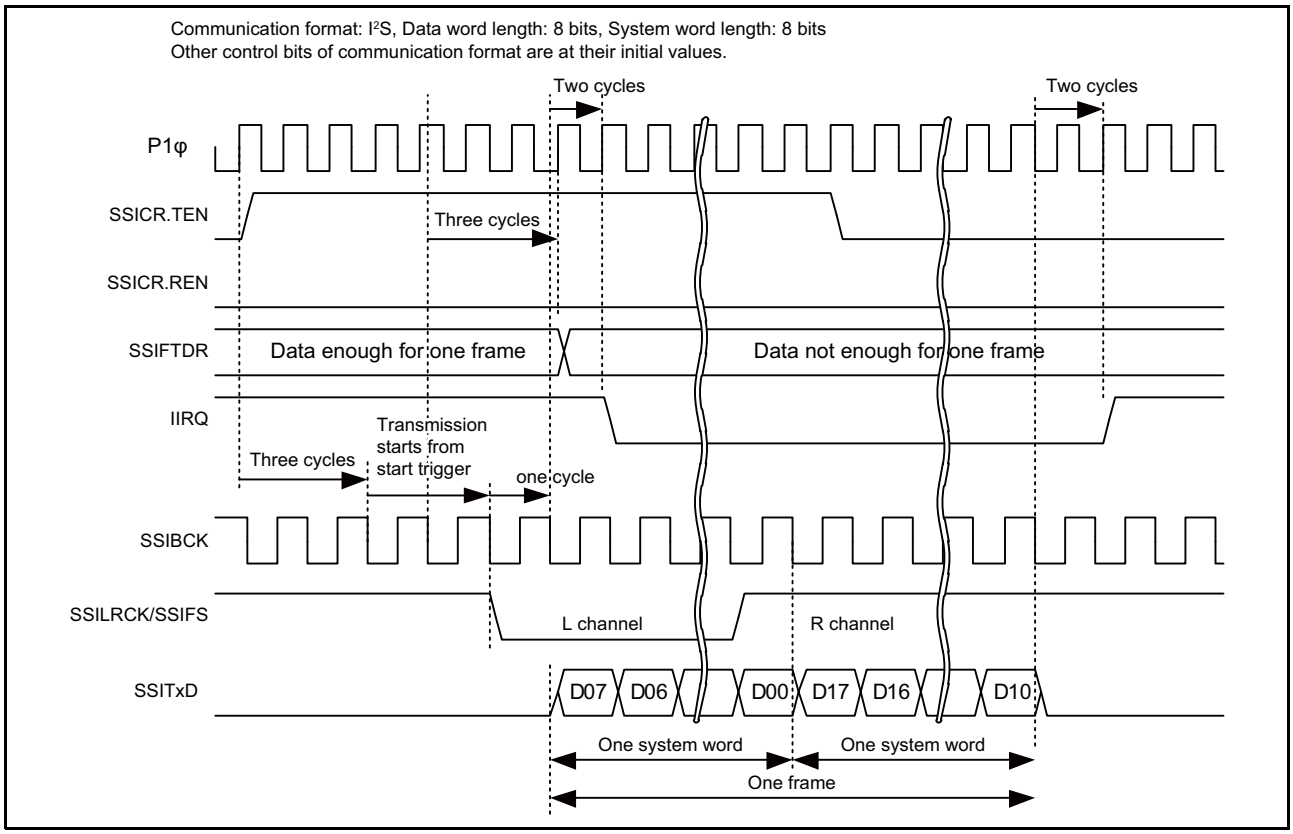

Figure 24.19 IIRQ Setting Timing (Transmission)

- Transmitter (dedicated to transmission)

[Clearing condition]

While transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P1φ after one cycle of SSIBCK where a start trigger is generated.

[Setting condition]

One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P1φ after transmission is complete according to the setting condition (frame boundary).

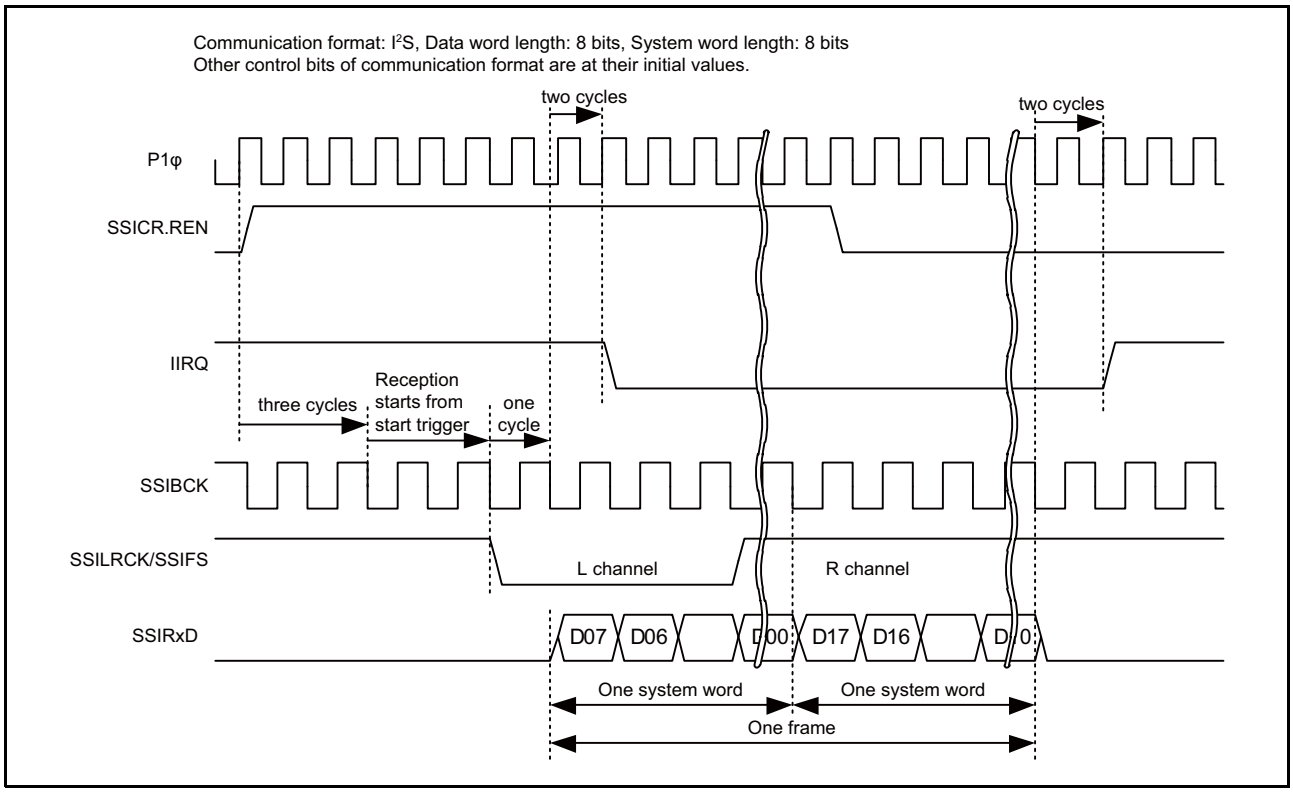

Figure 24.20 IIRQ Setting Timing (Reception)

- Receiver (dedicated to reception)

[Clearing condition]
While reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), and a start trigger is generated in SSILRCK/SSIFS.
[Clearing timing]
Two cycles of P1φ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.
[Setting condition]
One frame of data has been received while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).
[Setting timing]
Two cycles of P1φ after reception of the setting condition is completed (frame boundary).

- Transceiver (transmission and reception)

[Clearing condition]
While transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.
[Clearing timing]
Two cycles of P1φ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.
[Setting condition]
One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).
[Setting timing]
Two cycles of P1φ after transmission is completed according to the setting condition (frame boundary).

24.4.1.3 FIFO Control Register (SSIFCR)

This is a readable/writable 32-bit register. It sets a software reset, byte swap, noise canceller, and enable/disable of interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AUCKE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSIRST
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	BSW	BCK NCE	LRCK NCE	RXD NCE	—	—	—	—	TIE	RIE	TFRST	RFRST
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	R/W	Initial Value	Description
31	AUCKE	RW	0	AUDIO_MCK Enable in Master-mode Communication*1 0: Disables supply of AUDIO_MCK 1: Enables supply of AUDIO_MCK
30 to 17	—	R	0000H	Reserved. Write 0. The read value is 0.
16	SSIRST	RW	0	Software Reset 0: Clears a software reset condition 1: Sets a software reset condition
15 to 12	—	R	00H	Reserved. Write 0. The read value is 0.
11	BSW	RW	0	Byte Swap Enable*1 0: Disables byte swap 1: Enables byte swap
10	BCKNCE	RW	0	Noise Canceller Enable in Slave-mode Communication (SSIBCK)*1*2 0: Disables (bypasses) the noise canceller 1: Enables the noise canceller
9	LRCKNCE	RW	0	Noise Canceller Enable in Slave-mode Communication (SSILRCK/SSIFS)*1*2 0: Disables (bypasses) the noise canceller 1: Enables the noise canceller
8	RXDNCE	RW	0	Received Data Input Noise Canceller Enable in Slave-mode Communication (SSIRxD)*1*2 0: Disables (bypasses) the noise canceller 1: Enables the noise canceller
7 to 4	—	R	00H	Reserved. Write 0. The read value is 0.
3	TIE	RW	0	Transmit Data Empty Interrupt Output Enable 0: Disables transmit data empty interrupts 1: Enables transmit data empty interrupts
2	RIE	RW	0	Receive Data Full Interrupt Output Enable 0: Disables receive data full interrupts 1: Enables receive data full interrupts
1	TFRST	RW	0	Transmit FIFO data register reset*1 0: Clears a transmit data FIFO reset condition 1: Sets a transmit data FIFO reset condition
0	RFRST	RW	0	Receive FIFO data register reset*1 0: Clears a receive data FIFO reset condition 1: Sets a receive data FIFO reset condition

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. This bit can only be set to 1 in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1'. Be sure to clear this bit to 0 in master-mode communication (SSICR.MST = '1') or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

- AUCKE Bit

This bit enables/disables supply to AUDIO_MCK while in master-mode communication (MST = 1). Select AUDIO_MCK (SSICR.CKS bit) before writing 1 to this bit.
Rewrite this bit after completing the setting (CKS, MST, BCKP, and CKDV of the SSICR register) that relates to AUDIO_MCK.

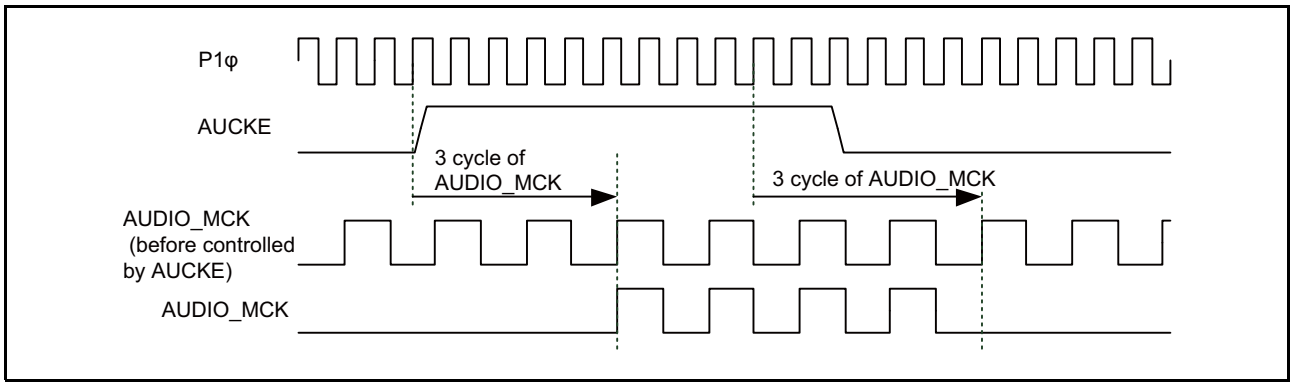

Figure 24.21 Stop/Resume of AUDIO_MCK

Caution: In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (Figure 24.52) or wait for an idle state by taking the procedure to resume communication (Figure 24.57).

Caution: In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF-2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (Figure 24.52) or wait for the idle state by taking the procedure to resume communication (Figure 24.57).

Figure 24.22 and Figure 24.23 show timing until outputting it to the terminal SSIBCK after this bit is set to '1'.

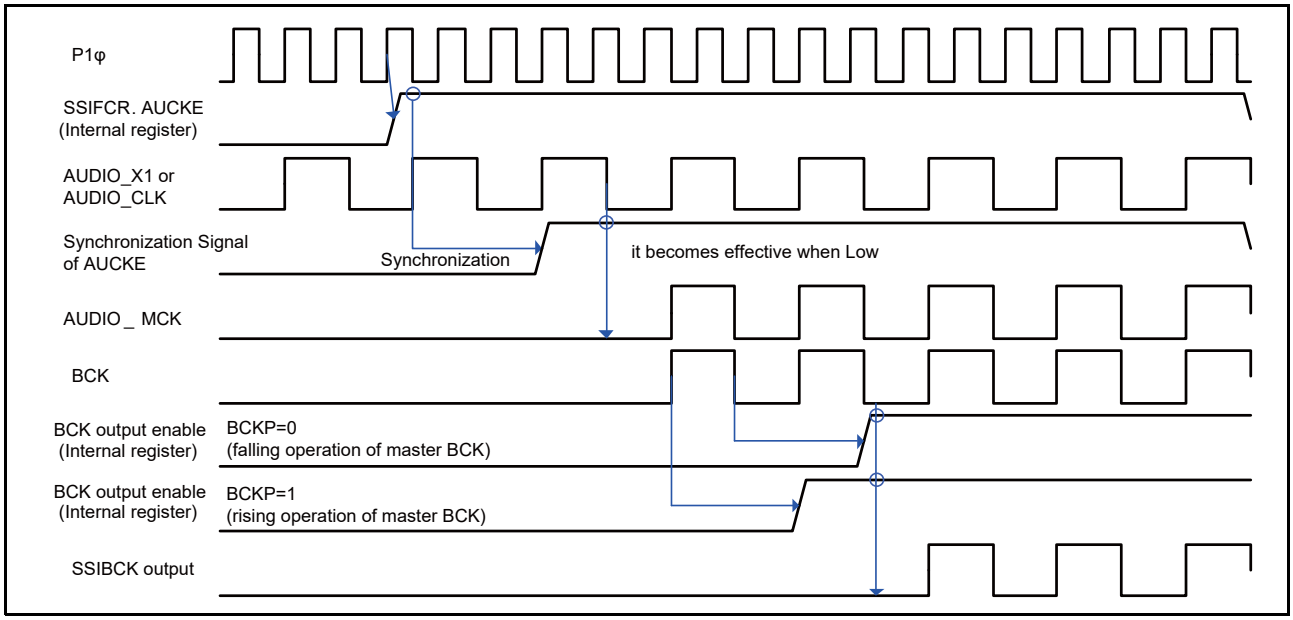

Figure 24.22 Timing chart when it begins to communicate master from system reset

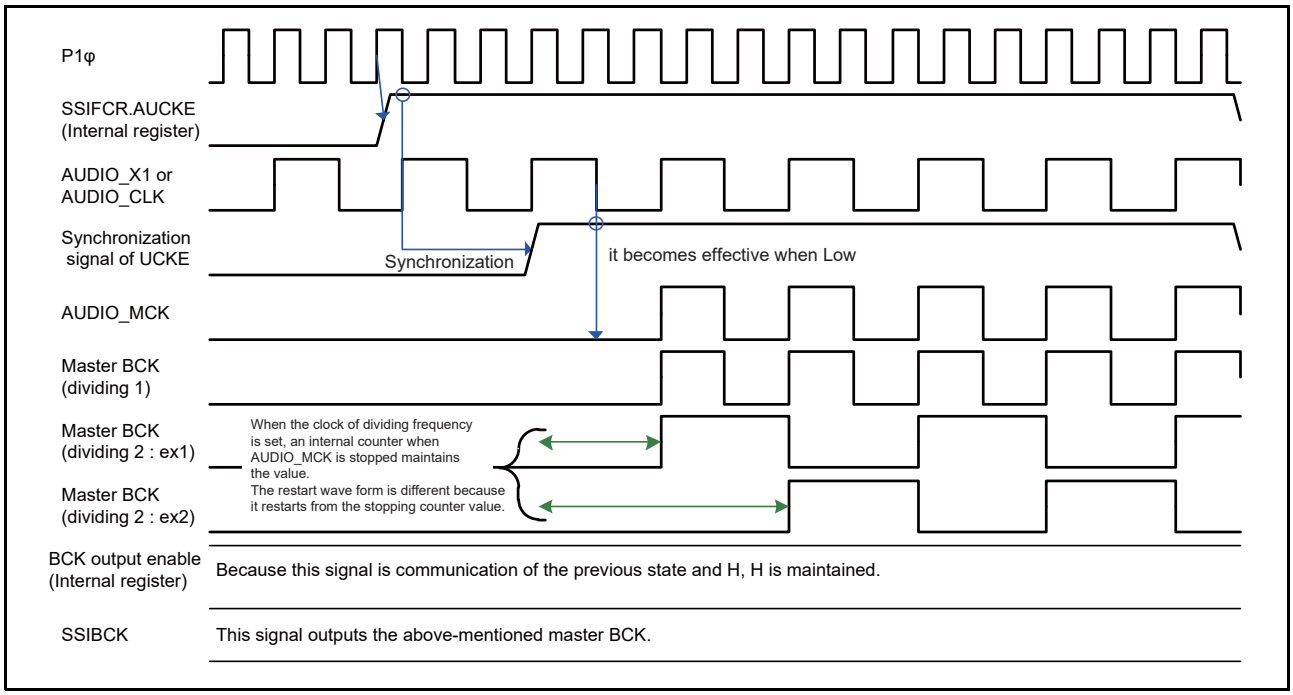

Figure 24.23 Timing chart when it begins to communicate master from communication stop

Note: When the supply of AUDIO_MCK is stopped, the terminal SSIBCK maintains the value. The terminal SSIBCK might stop in the state of "H".

- SSIRST Bit

This bit sets a software reset of SSIF-2. Writing 1 to this bit initializes the internal state of SSIF-2. After a reset by writing 1, write 0 to release the reset because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.
To stop communication of SSIF-2 immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

Table 24.7 Bits Initialized by Software Reset of the SSIFCR.SSIRST Bit

Symbol	Address (Base+)		+0								+1							
			31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

- BSW Bit

This bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR (Figure 24.24).

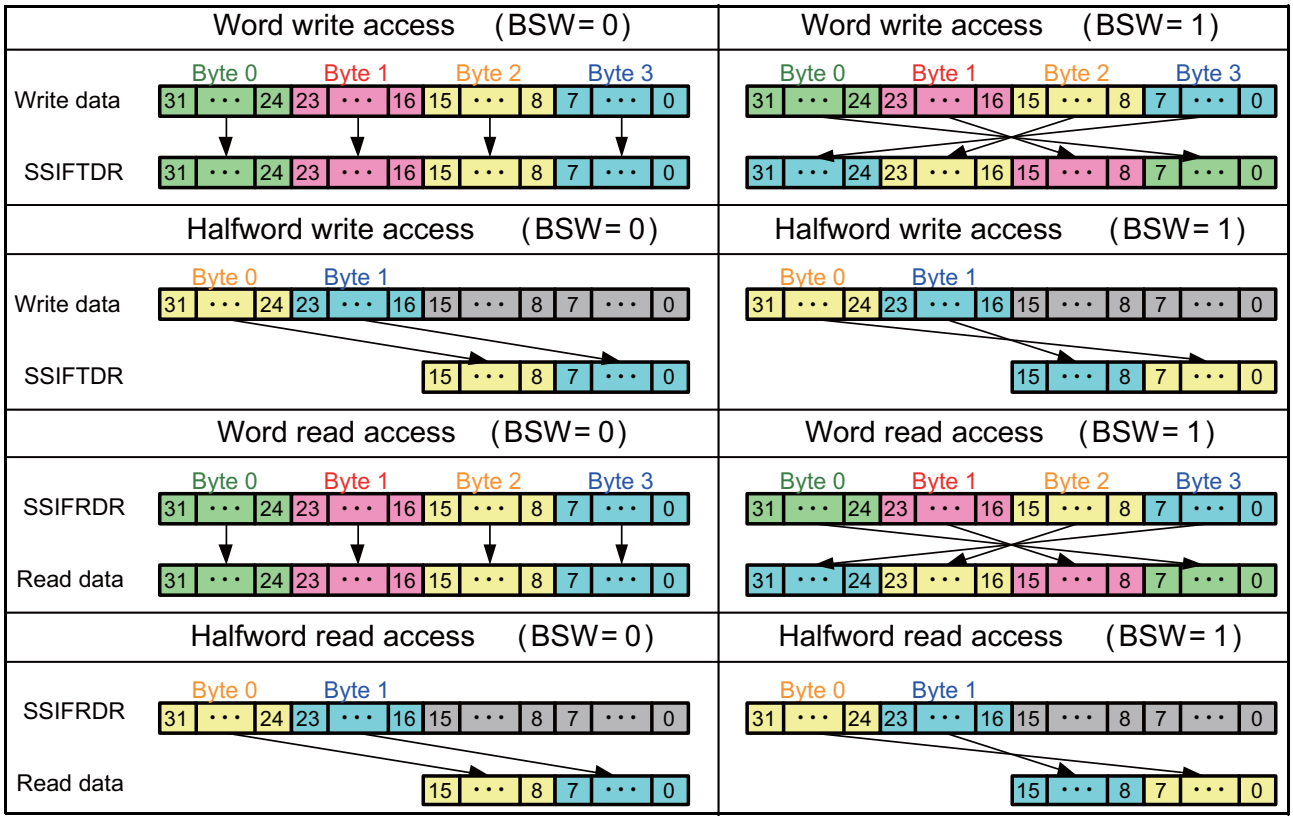

Figure 24.24 Operation Example of Byte Swap

- BCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIBCK pin in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1'. The setting of this bit in master-mode communication (SSICR.MST = '1') is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

- LRCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSILRCK and SSIFS pins in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1'. The setting of this bit in master-mode communication (SSICR.MST = '1') is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

- RXDNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIRxD pin in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1' and while reception is enabled (SSICR.REN = '1').

The setting of this bit in master-mode communication (SSICR.MST = '1') or while reception is disabled (SSICR.REN = '0') is disabled.
Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

- TIE Bit

This bit enables/disables output of transmit data empty interrupts. Transmission data empty interrupt is used as an interrupt factor written in the FIFO transmission data register. Set this bit to 1 after setting set condition (SSISCR.TDES) of transmission data empty interrupt. See Figure 24.25 for the generation timing of a transmit data empty interrupt.

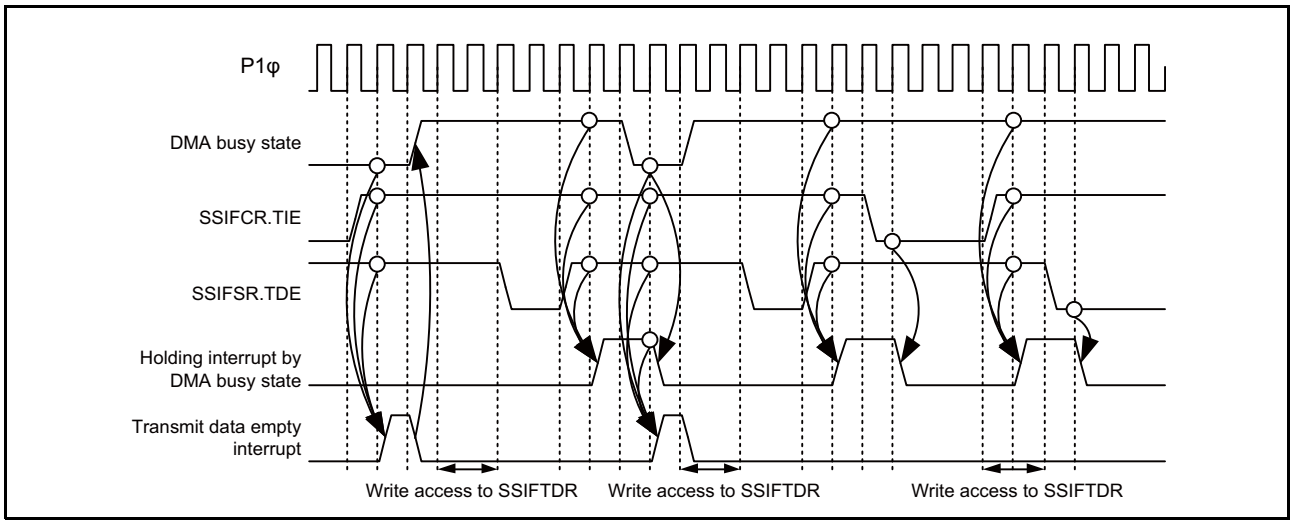

Figure 24.25 Generation timing of transmit data empty interrupt

- RIE Bit

This bit enables/disables output of receive data full interrupts. Receive data empty interrupt is used as an interrupt factor to read the FIFO receive data register. Set this bit to 1 after setting set condition (SSISCR.RDFS) of Receive data empty interrupt. See Figure 24.26 for the generation timing of a receive data full interrupt.

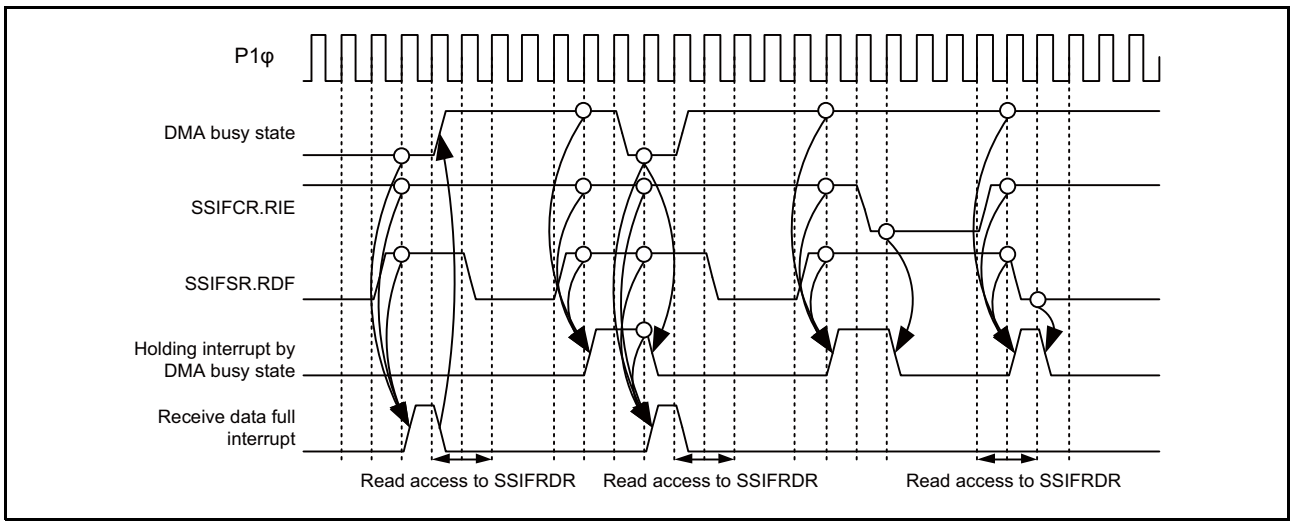

Figure 24.26 Generation timing of receive data empty interrupt

- TFRST Bit

This bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. See Table 24.8 for the registers to which this software reset is applied. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.
This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

Table 24.8 Bits Initialized by Software Reset of the SSIFCR.TFRST Bit

- RFRST Bit

This bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.
This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

24.4.1.4 FIFO Status Register (SSIFSR)

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	TDC[5:0]						—	—	—	—	—	—	—	TDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RDC[5:0]						—	—	—	—	—	—	—	RDF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W0

Bit	Bit Name	R/W	Initial Value	Description
31, 30	—	R	0H	Reserved. Write 0. The read value is 0.
29 to 24	TDC[5:0]	R	00H	Number of Transmit FIFO Data Indication Flag
23 to 17	—	R	00H	Reserved. Write 0. The read value is 0.
16	TDE	RW0	1	Transmit Data Empty Flag 0: The free space of SSIFTDR is not more than the value of SSISCR.TDES 1: The free space of SSIFTDR is not less than the value of SSISCR.TDES plus one.
15, 14	—	R	0H	Reserved. Write 0. The read value is 0.
13 to 8	RDC[4:0]	R	00H	Number of Receive FIFO Data Indication Flag
7 to 1	—	R	00H	Reserved. Write 0. The read value is 0.
0	RDF	RW0	0	Receive Data Full Flag 0: The size of received data in SSIFRDR is not more than the value of SSISCR.RDFS 1: The size of received data in SSIFRDR is not less than the value of SSISCR.RDFS plus one.

- TDC[5:0] Bits

These bits indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as 0H, there is no data to be transmitted. With 10H, there is no space to write data.

- TDE Bit

This bit indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set by automatic determination but it must be cleared by register access.
[Priority order for setting and clearing]
Clearing is prioritized.*1
[Clearing condition]
Either of the following two:
(1) Writing 0 to this bit after reading this bit as 1. (CPU operation)*2
(2) Last access when SSIFTDR is written by using DMA in one interrupt routine (DMA operation).

[Clearing timing]
Timing according to the above-mentioned clear condition.
(1) At completion of writing 0 to this bit after reading this bit as 1 (Figure 24.13).
(2) At completion of last access when SSIFTDR is written by using DMA in one interrupt routine.

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Resetting of the transmit FIFO data register (SSIFCR.TFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- Last access is performed to write data to SSIFTDR by an interrupt routine using DMA.

[Setting condition]
SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.
[Setting timing]
While operating on P1φ, SSIFTDR is found to have free space not less than "size set in the SSISCR.TDES bits + 1."

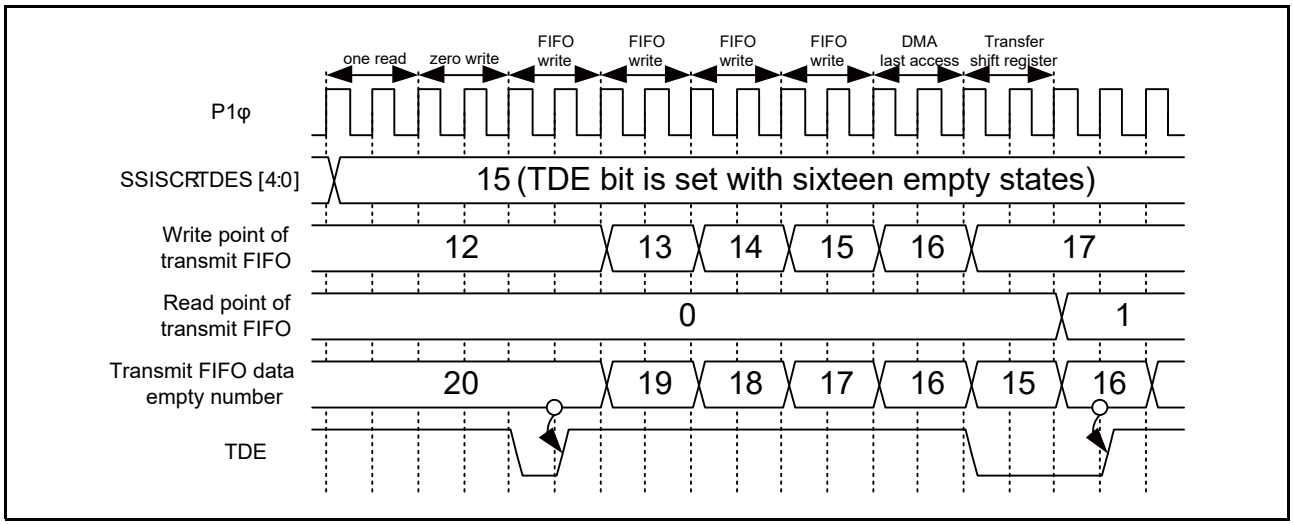

Figure 24.27 Set timing and clear timing of TDE

- RDC[5:0] Bits

These bits indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as 0H, there is no received data. With 20H, the register is filled with received data and there is no free space.

- RDF Bit

This bit indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.
[Priority order for setting and clearing]
Clearing is prioritized.*1
[Clearing condition]
Either of the following two:
(1) Writing 0 to this bit after reading this bit as 1. (CPU operation)*2
(2) Last access when SSIFRDR is read by using DMA in one interrupt routine (DMA operation).

[Clearing timing]
Timing according to the above-mentioned clear condition.
(1) At completion of writing 0 to this bit after reading this bit as 1 (Figure 24.13).
(2) One cycle of P1φ after the last read access to SSIFRDR by using DMA in one interrupt routine.

Note 1. This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Clearing conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

Note 2. The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Receive FIFO data register reset (SSIFCR.RFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- Last access is performed to read data from SSIFRDR by an interrupt routine using DMA.

[Setting condition]

SSIFRDR has data not less than the amount set with the SSISCR.RDFS bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

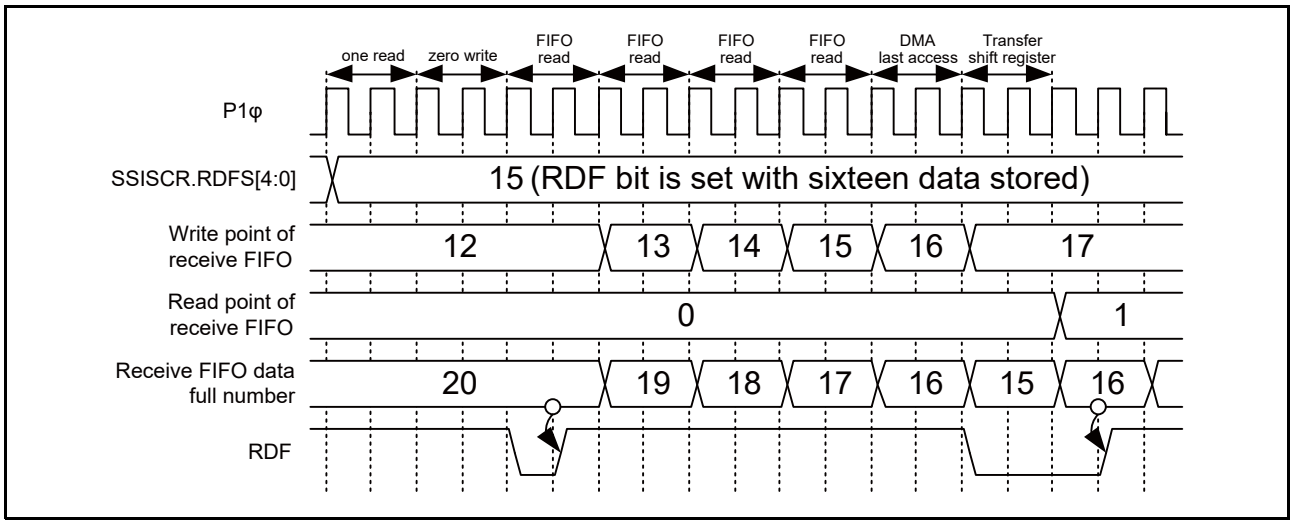

Figure 24.28 Set timing and clear timing of RDF

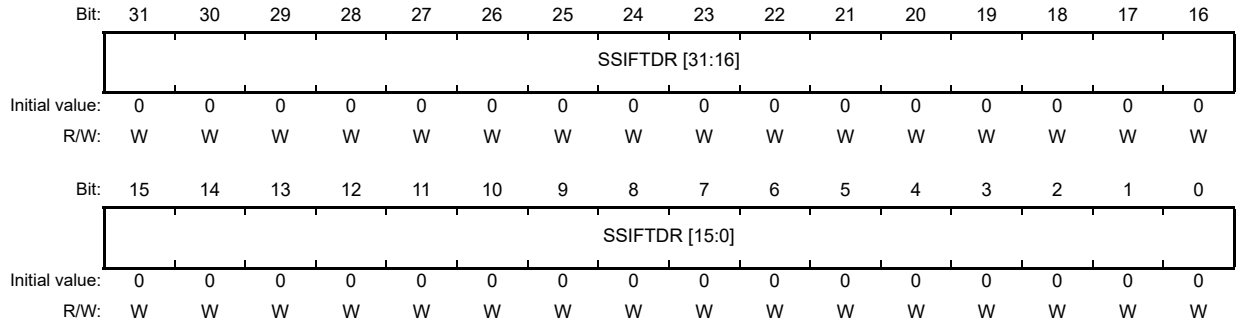
24.4.1.5 Transmit FIFO Data Register (SSIFTDR)

This is a 32-bit writable register. 0 is returned when this register is read. This register stores data to be serially transmitted.



Bit	Bit Name	R/W	Initial Value	Description
31 to 0	SSIFTDR[31:0]	W	00000000H	Transmit FIFO data

To use this register for transmission, set DMA operation handling of a transmit data empty interrupt as writing to this register. Determine the access size to this register according to the data word length to be communicated (Table 24.10).

Table 24.10 Register Access Restriction to FIFOs

		Access Size		
SSICR.DWL[2:0]	Data Word Length	Byte	Halfword	Word
000B	8	√	—	—
001B	16	—	√	—
010B	18	—	—	√
011B	20	—	—	√
100B	22	—	—	√
101B	24	—	—	√
110B	32	—	—	√
111B	Setting prohibited	—	—	—

Figure 24.29 shows register access to the transmit FIFO data register.

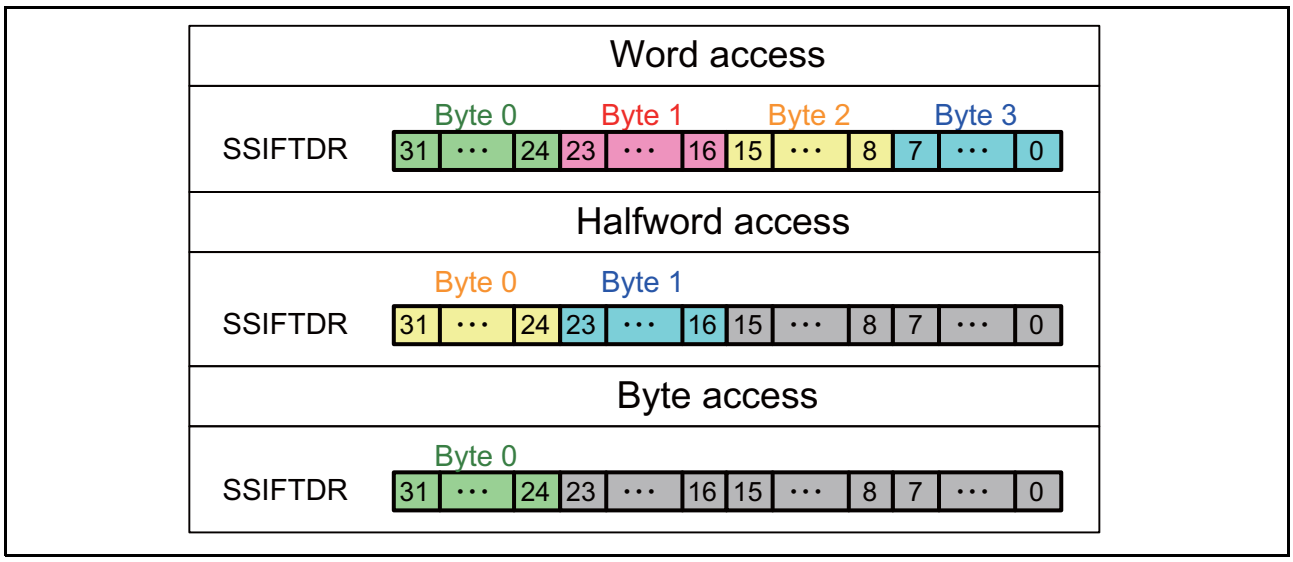


Figure 24.29 Example of Register Access to the Transmit FIFO Data Register

Figure 24.30 shows the configurations and operation examples of the transmit FIFO data register and transmit shift register. The configurations are for storing data to FIFO and not related with communication.

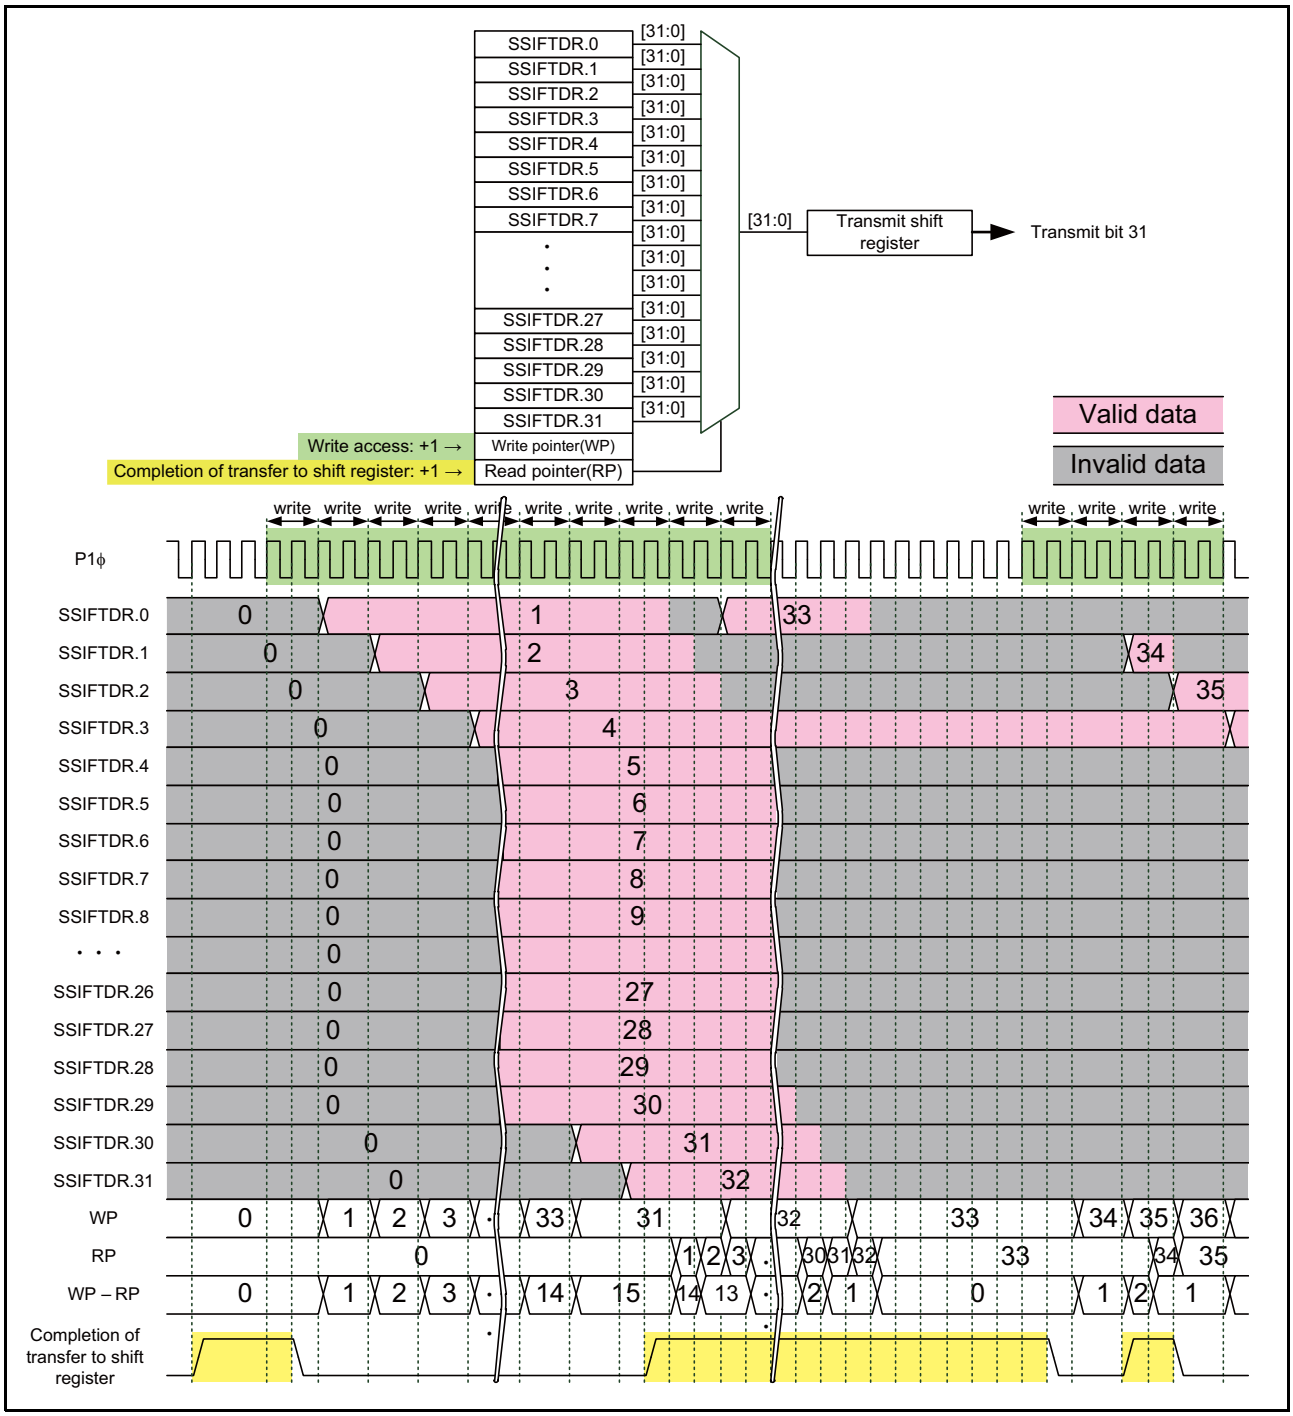

Figure 24.30 Configuration of the Transmit FIFO Data Register and Transmit Shift Register, and FIFO Operation Example

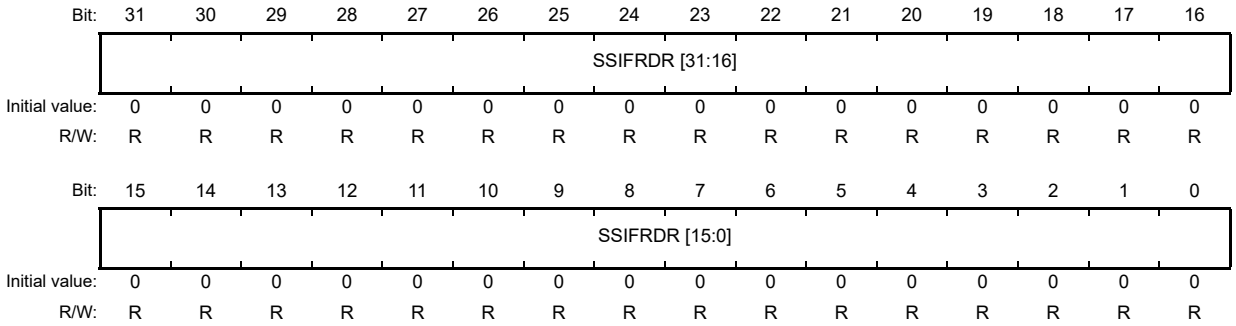
24.4.1.6 Receive FIFO Data Register (SSIFRDR)

This is a readable 32-bit register. This register stores received serial data.



Bit	Bit Name	R/W	Initial Value	Description
31 to 0	SSIFRDR[31:0]	R	00000000H	Receive FIFO data

To use this register for reception, set DMA operation handling of a receive data full interrupt as reading from this register. Determine the access size to this register according to the data word length to be communicated (Table 24.10). Register access to the receive FIFO data register is same as for the transmit FIFO data register (Figure 24.29). Figure 24.31 shows the configurations and operation examples of the receive FIFO data register and receive shift register.

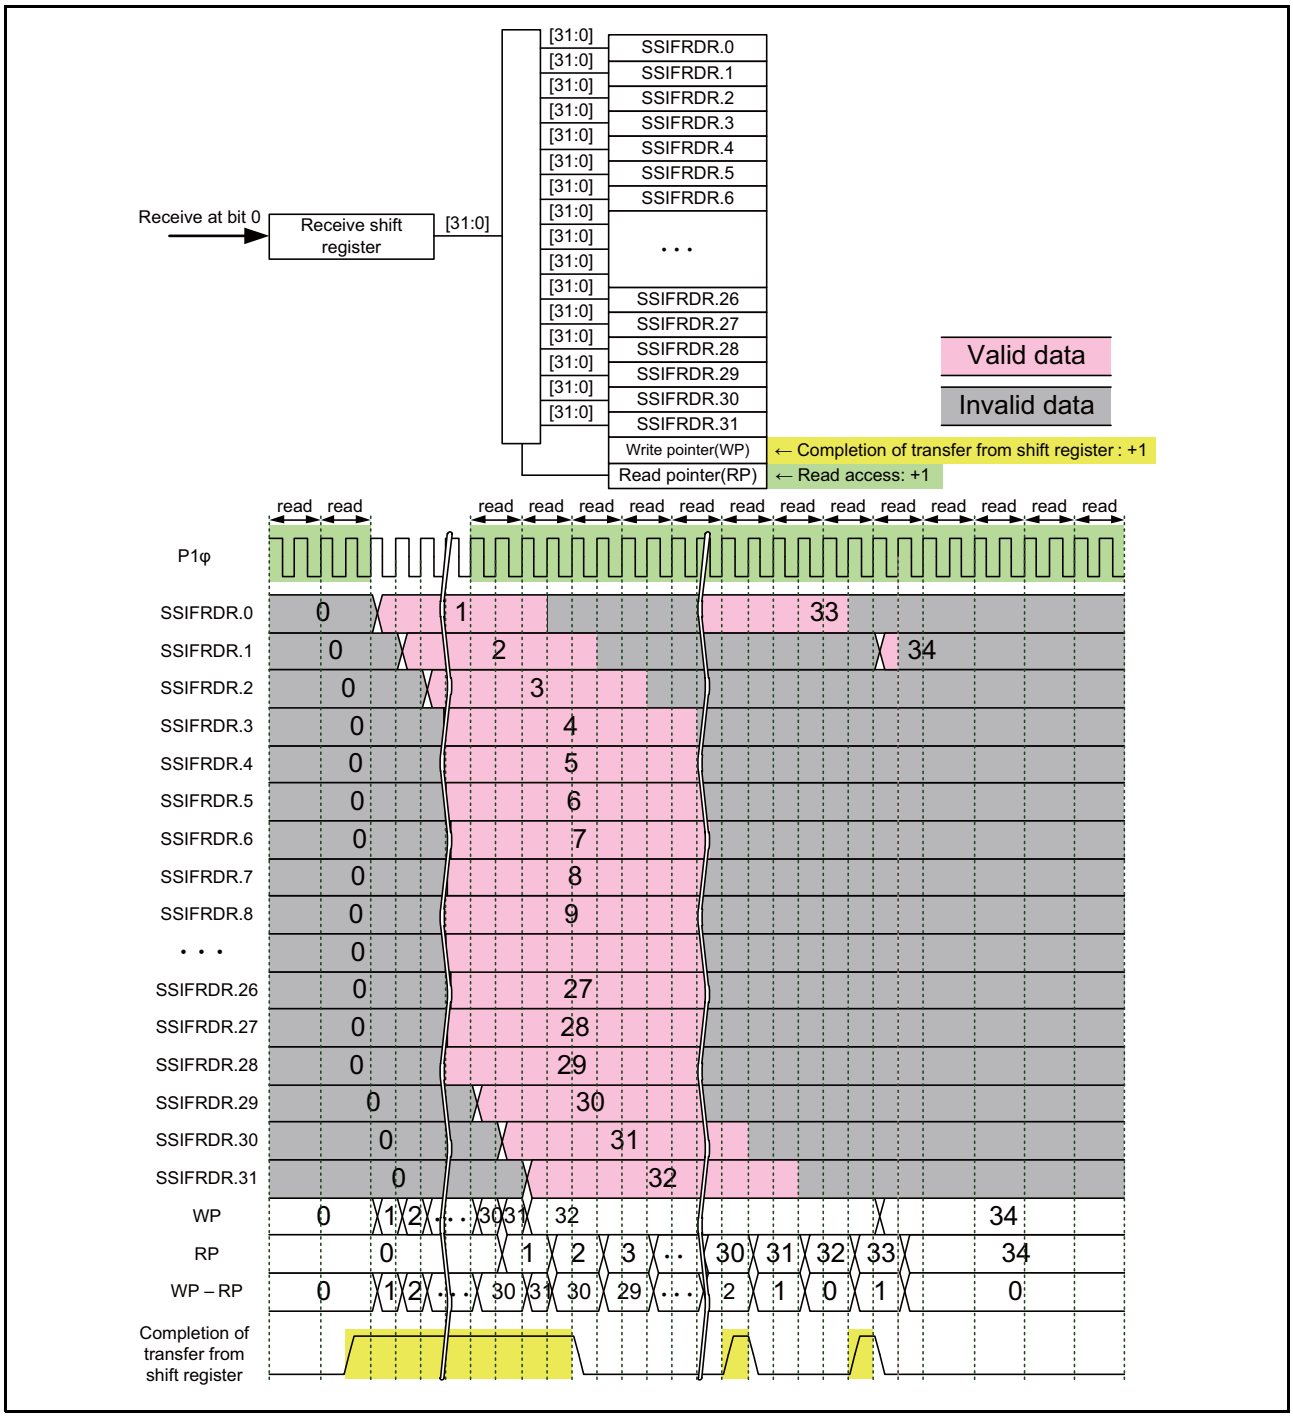


Figure 24.31 Configuration of the Receive FIFO Data Register and Receive Shift Register, and FIFO Operation Example

24.4.1.7 Audio Format Register (SSIOFR)

This is a readable/writable 32-bit register. It sets an audio format including the communication format, LRCK/FS continuation mode, and BCK output stop.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	BCK STP	LR CONT	—	—	—	—	—	—	OMOD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	R/W	Initial Value	Description
31 to 10	—	R	000000H	Reserved. Write 0. The read value is 0.
9	BCKASTP	RW	0	BCK Output Stop Enable*1*2 0: Enables output of BCK 1: Disables output of BCK
8	LRCONT	RW	0	LRCK/FS Continuation Enable*1*2 0: Disables LRCK continuation 1: Enables LRCK continuation
7 to 2	—	R	00H	Reserved. Write 0. The read value is 0.
1,0	OMOD[1:0]	RW	0	Audio Format Select*3*4 OMOD[1:0]: Format 00: I²S format 01: TDM format 10: Monaural format 11: Setting prohibited

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).
Note 2. BCKASTP=1 and LRCONT=1 is prohibitions.
Note 3. Writing in this bit is a prohibition when SSIF-2 is communication state (SSISR.IIRQ=0). Operation is not guaranteed when rewriting it.
Note 4. Use the communication format setting that can be communicated when the format of the communication of the opposing device is compatible format of SSIF-2.

- BCKASTP Bit

This bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in Figure 24.32 and Figure 24.33 in master-mode communication (SSICR.MST = 1).
Set this bit after setting completing the communication format.
This bit must defend the following usage. Start communication with BCKASTP = 0, and set 1 to BCKASTP while communicating. As a result, the bit clock output to the terminal SSIBCK stops by the automatic operation when the communication stop is done. When you will restart the communication, set 0 to BCKASTP with idle state (SSICR.IIRQ=1) and the AUDIO_MCK supply state (SSIFCR.AUCKE = 1)

When master communication (SSICR.MST=1) and idle state (SSICR.IIRQ=1).

Table 24.11 BCKASTP state, and Output state of SSIBCK pin.

BCKASTP bit	output state of SSIBCK pin
0	Enable
1	Disable

Note: When the opposing device who is the slave needs the clock of the terminal SSIBCK before the communication operates, it is not possible to use it. Use it to stop clocking after the communication ends (Figure 24.33). Refer to Figure 24.32 for timing that the function becomes effective.

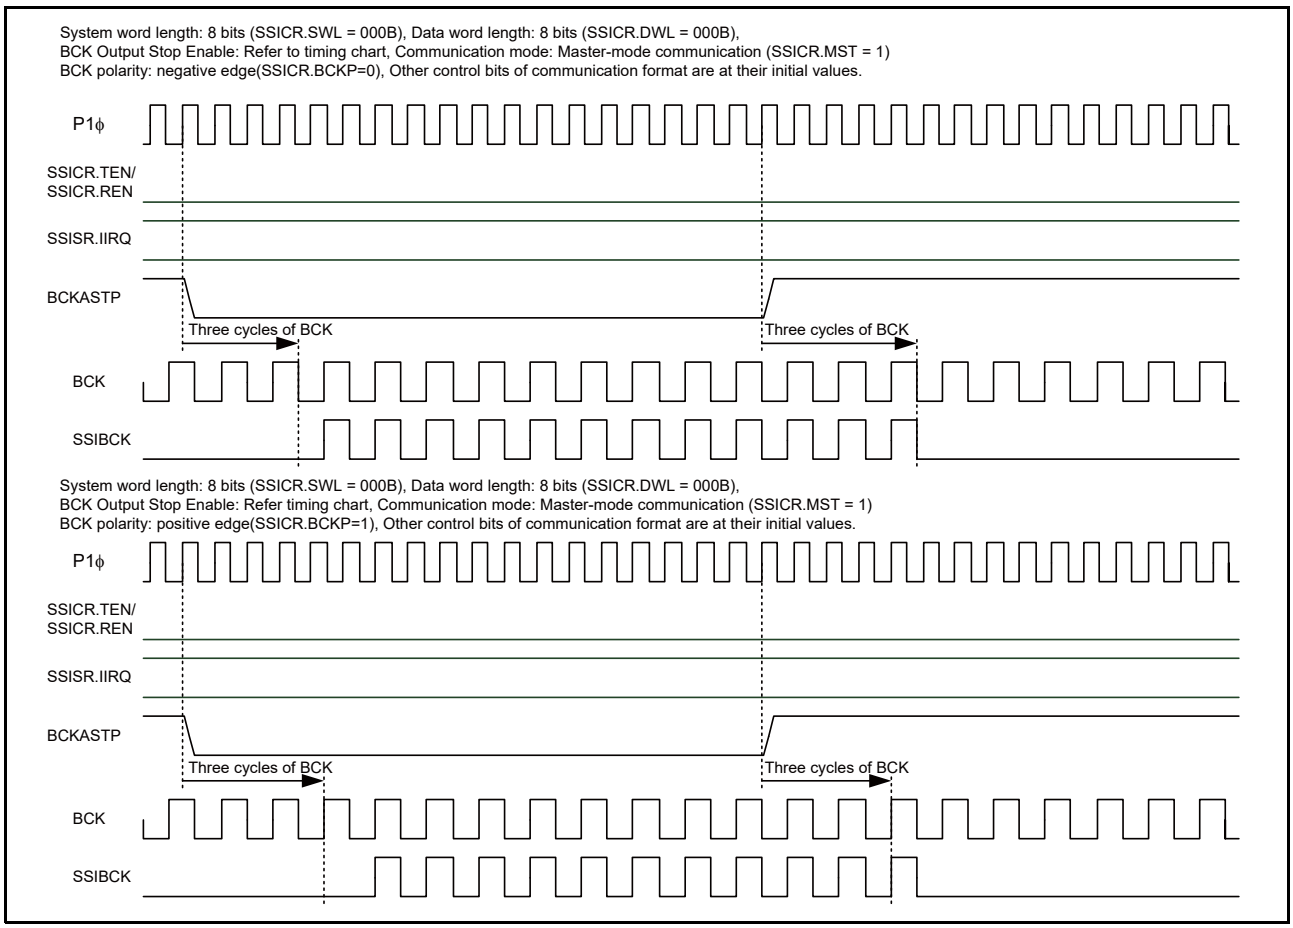

Figure 24.32 Example Operation of the BCKASTP Bit (in idle state)

When master communication (SSICR.MST=1) and the BCK output automatic operation stop function (BCKASTP = 1) (Figure 24.33).

Details of the BCK output to SSIBCK pin are as follows.

- Output start timing: To generate an effective edge in timing that LRCK/FS is changed into the valid value, BCK is output.
- Output stop timing: Frame boundary from 1 to 1.5 clock

Refer to the timing chart of Figure 24.33 for detailed timing.

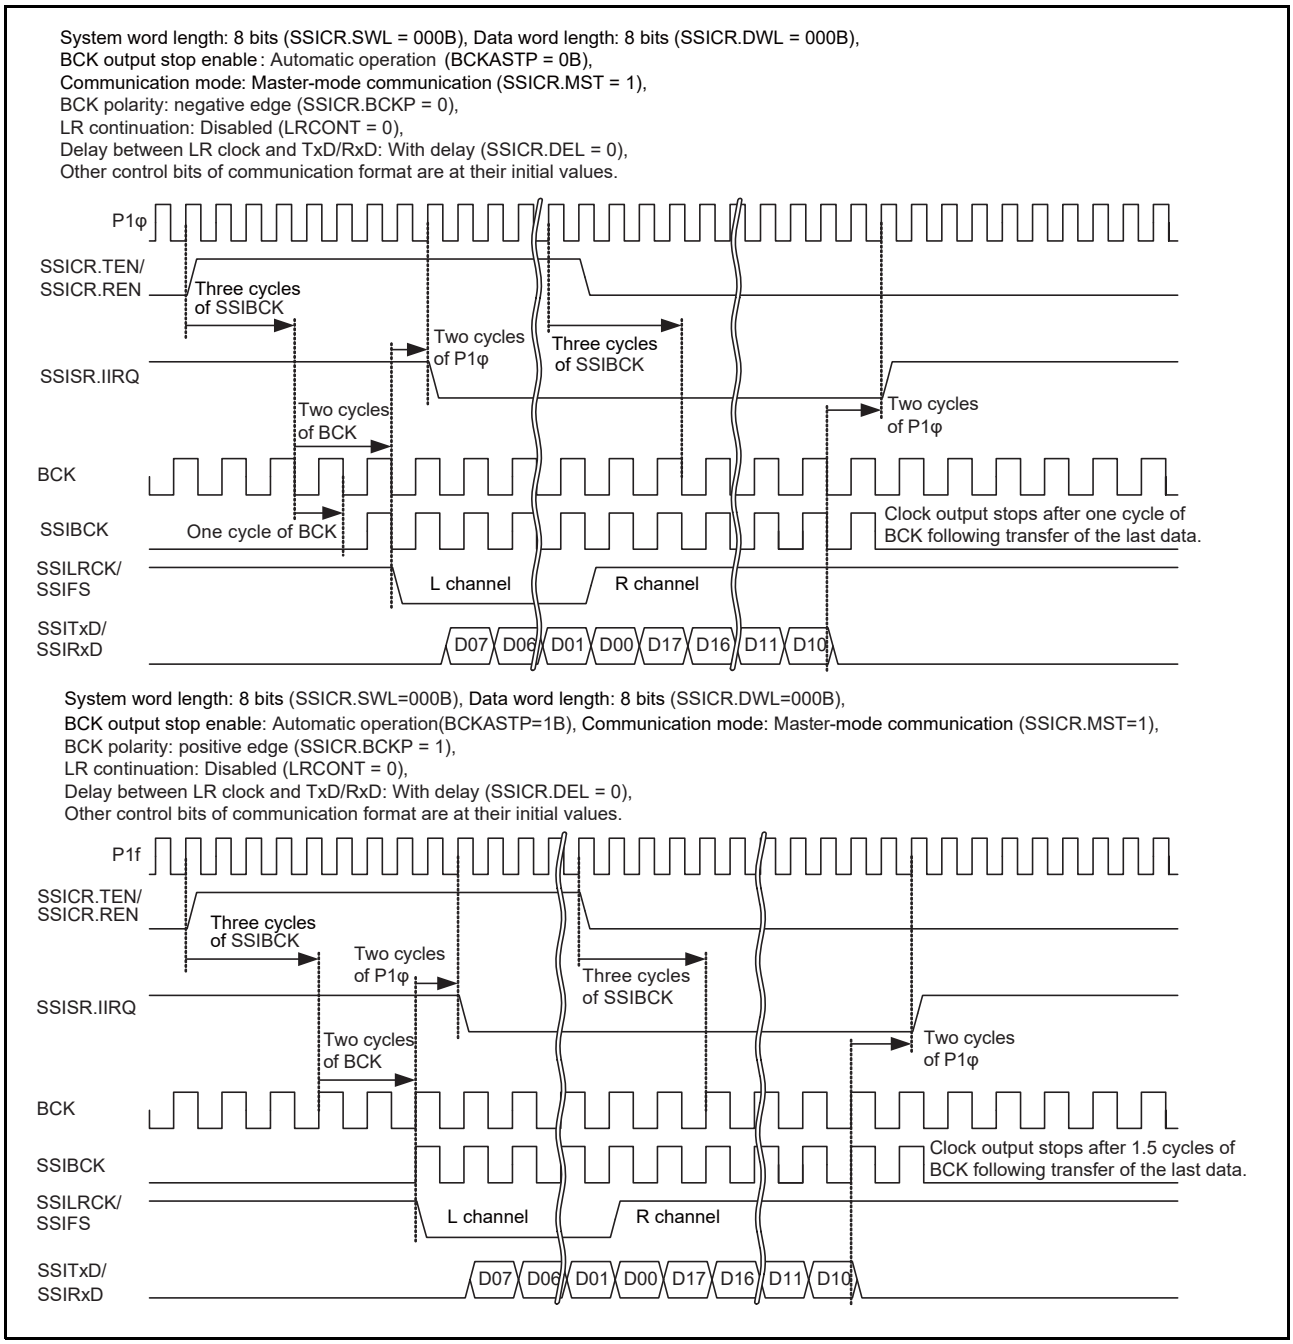

Figure 24.33 Example Operation of the BCKASTP Bit (Communication behavior in BCKASTP=1)

- LRCONT Bit

This bit enables/disables the output from the SSILRCK/SSIFS pin when SSIF-2 is master communication (SSICR.MST=1) and idle state (SSISR.IIRQ=1). Writing 1 to this bit (enables LRCK/FS continuation) in master mode (SSICR.MST = 1) enables continuation of the output from the SSILRCK/SSIFS pins even when idle state.

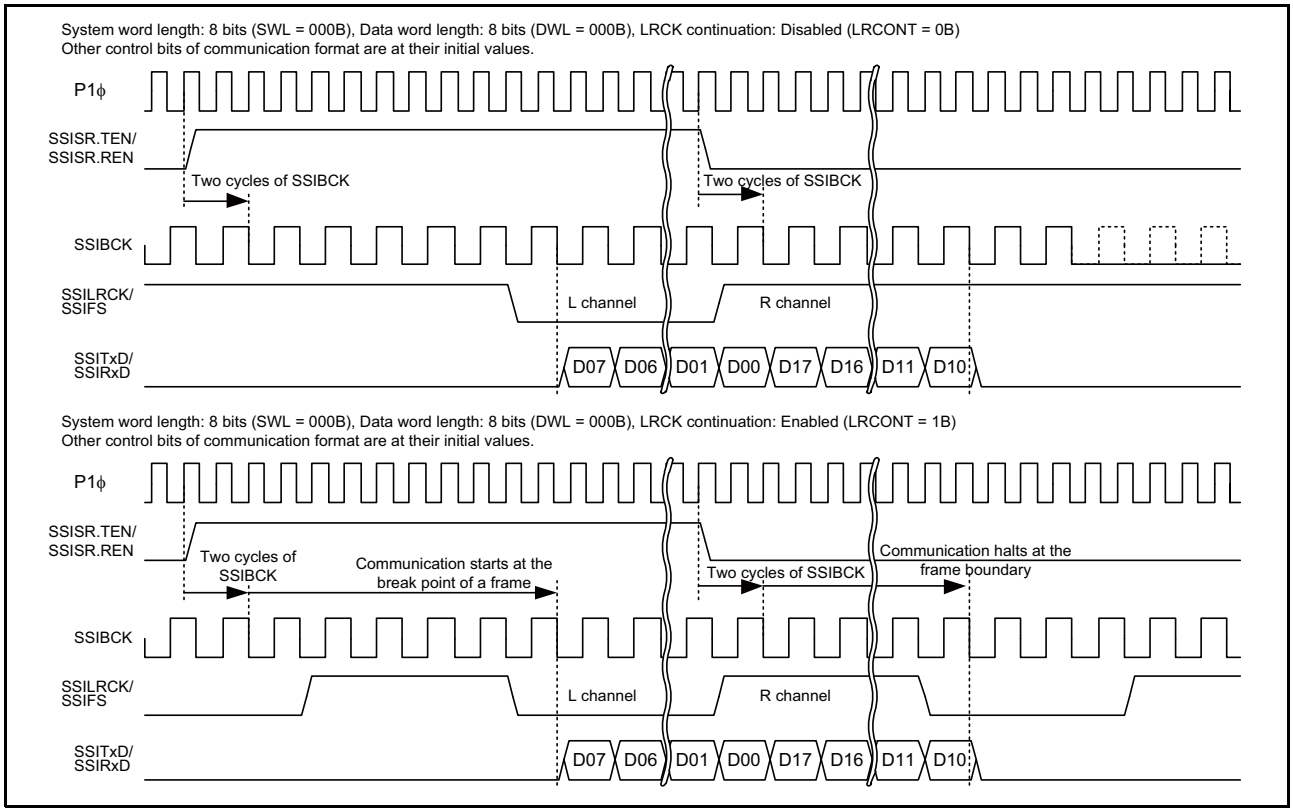

Figure 24.34 Operation Example of LRCK/FS Continuation (in idle state)

- OMOD[1:0] Bits

These bits set an audio format.

Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in section 24.4.1.7, Audio Format Register (SSIOFR) for the output operation of the LR clock.

24.4.1.8 Status Control Register (SSISCR)

This is a readable/writable 32-bit register. It sets the operation of the TDE and RDF flags.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	R/W	Initial Value	Description
31 to 13	—	R	00000H	Reserved. Write 0. The read value is 0.
12 to 8	TDES[4:0]	RW	0H	TDE Setting Condition Select*1 TDES[4:0]: Operation 00000B: SSIFTDR has one stage or more free space 00001B: SSIFTDR has two stages or more free space (snip) 11110B: SSIFTDR has thirty-one stages or more free space 11111B: SSIFTDR has thirty-two stages or more free space
7 to 5	—	R	0H	Reserved. Write 0. The read value is 0.
4 to 0	RDFS[4:0]	RW	0H	RDF Setting Condition Select*1 RDFS[4:0]: Operation 00000B: SSIFRDR has one stage or more data size 00001B: SSIFRDR has two stages or more data size (snip) 01110B: SSIFRDR has thirty-one or more data size 01111B: SSIFRDR has thirty-two stages or more data size

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

- TDES[4:0] Bits

These bits set the setting condition of the transmit data empty flag (TDE). Set these bits in byte units.

- RDFS[4:0] Bits

These bits set the setting condition of the receive data full flag (RDF). Set these bits in byte units.

24.4.2 Communication Formats

SSIF-2 supports three communication formats (Table 24.12).

Table 24.12 Supported Communication Formats

Communication Format	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

The following figure shows the serial data configuration common to communication formats. Serial data is determined according to the system word length (SSICR.SWL[2:0]) and the data word length (SSICR.DWL[2:0]). When the system word length is longer than the data word length, padding bits are transferred (Figure 24.35).

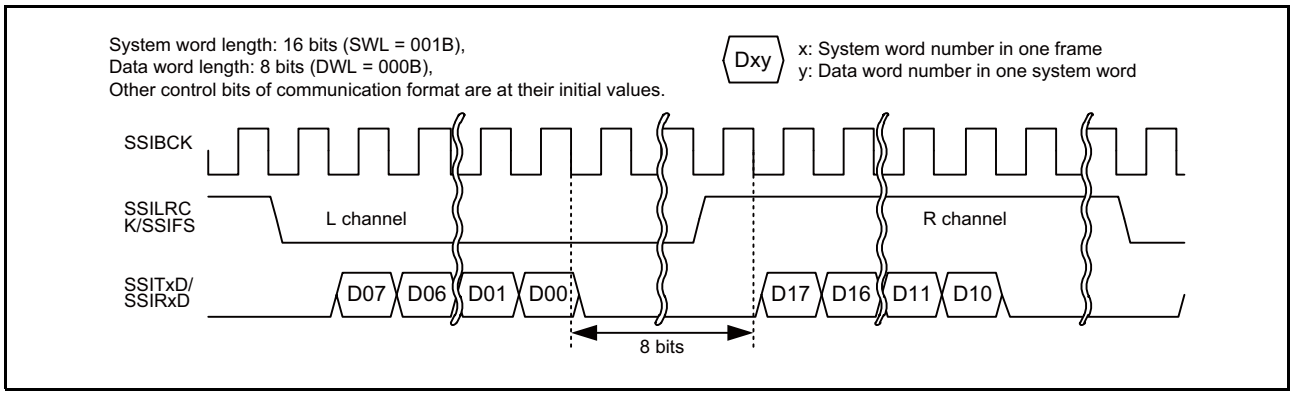

Figure 24.35 Example of Padding Bit Transfer (I²S Format: System Word Length > Data Word Length)

Table 24.13 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). "-" indicates that the setting is prohibited.

Table 24.13 Number of Padding Bits

	SSICR.DWL[2:0]	000B	001B	010B	011B	100B	101B	110B	111B
SSICR.SWL[2:0]	System Word Length	8	16	18	20	22	24	32	Set prohibition
000B	8	0	—	—	—	—	—	—	—
001B	16	8	0	—	—	—	—	—	—
010B	24	16	8	6	4	2	0	—	—
011B	32	24	16	14	12	10	8	0	—
100B	48	40	32	30	28	26	24	16	—
101B	64	56	48	46	44	42	40	32	—
110B	128	120	112	110	108	106	104	96	—
111B	256	248	240	238	236	234	232	224	—

24.4.2.1 I²S Format

The I²S format is a communication format used for connection with I²S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00B), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. Figure 24.36 shows the I²S format without padding. See Figure 24.35 for the format with padding.

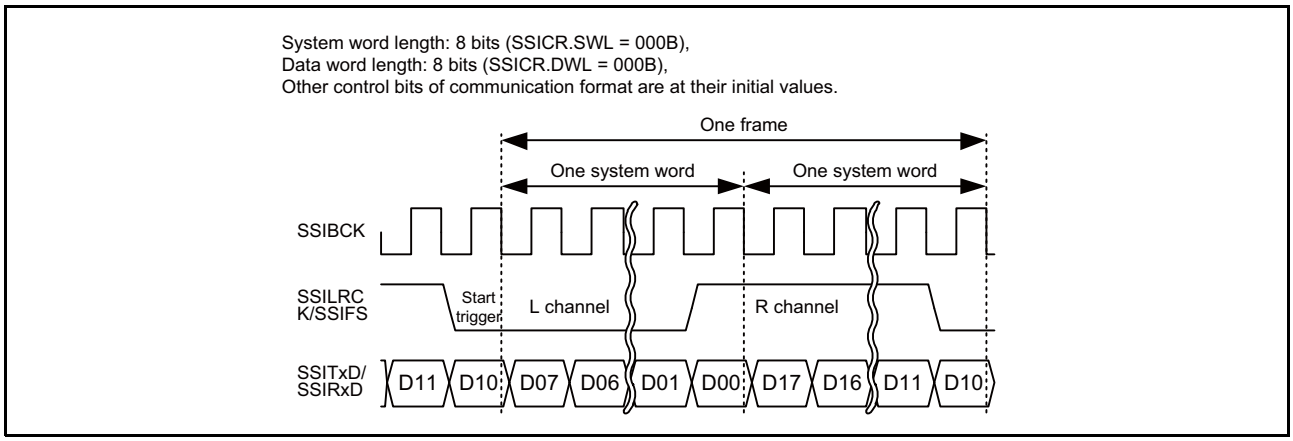

Figure 24.36 I²S Format (Without Padding: System Word Length = Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see section 24.5.1.1, Idle State.

Note: SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

24.4.2.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 10B), one frame is configured with the number of system words set with the SSICR.FLM[1:0] bits (Figure 24.37). A rising of the SSILRCK/SSIFS signal means a start trigger. Figure 24.37 and Figure 24.38 respectively show the monaural formats without and with padding.

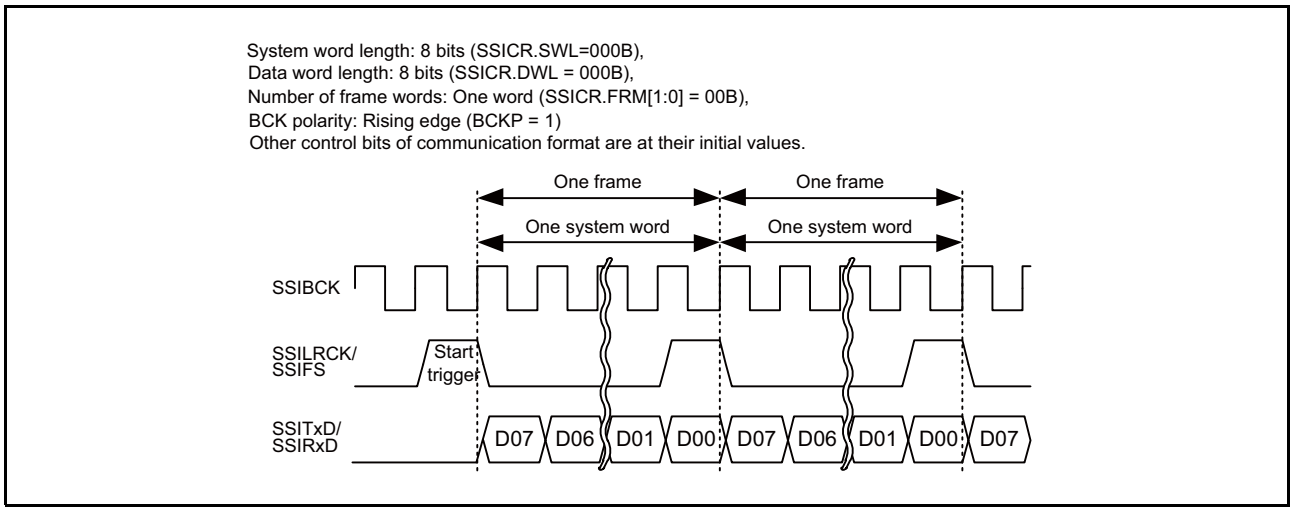

Figure 24.37 Short Frame in Monaural Format (Without Padding: System Word Length = Data Word Length)

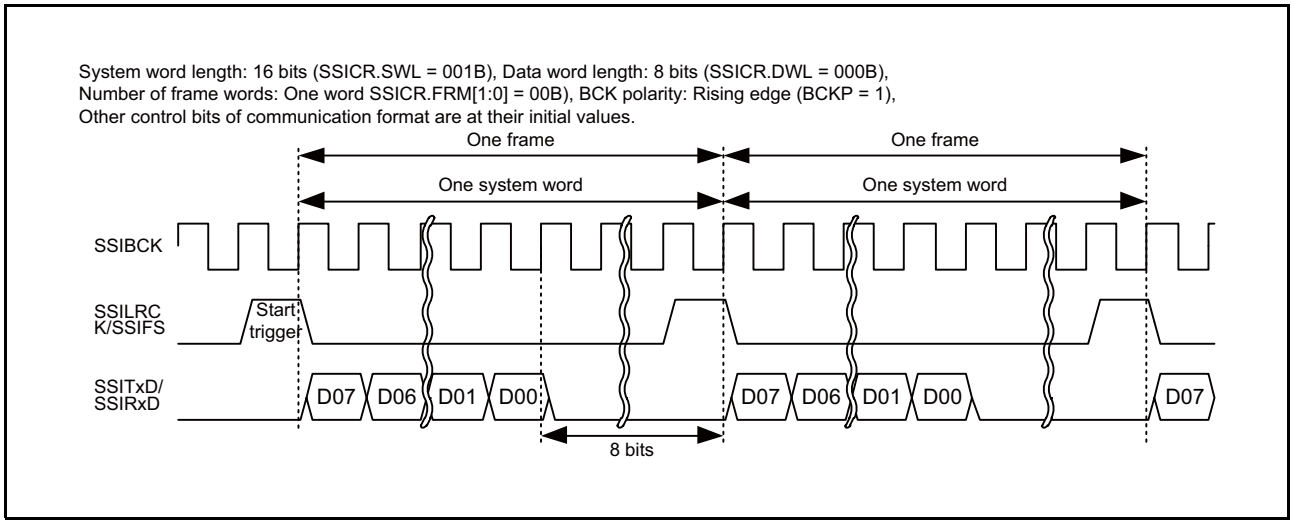

Figure 24.38 Short Frame in Monaural Format (With Padding: System Word Length > Data Word Length)

The monaural formats supported by SSIF-2 consist of short frames and long frames. See section 24.4.2.2, (1), Short Frame and (2), Long Frame for the difference between these two frames.
For the state of external pins state when SSIF-2 is in the idle state, see section 24.5.1.1, Idle State.

Note: SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

(1) Short Frame

With the short frame (SSICR.DEL = 0), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for one cycle of SSIBCK. Data transfer starts at the falling edge of the signal (Figure 24.37 and Figure 24.38).

(2) Long Frame

With the long frame (SSICR.DEL = 1), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for two cycles of SSIBCK. Data transfer starts at the rising edge of the signal (Figure 24.39).

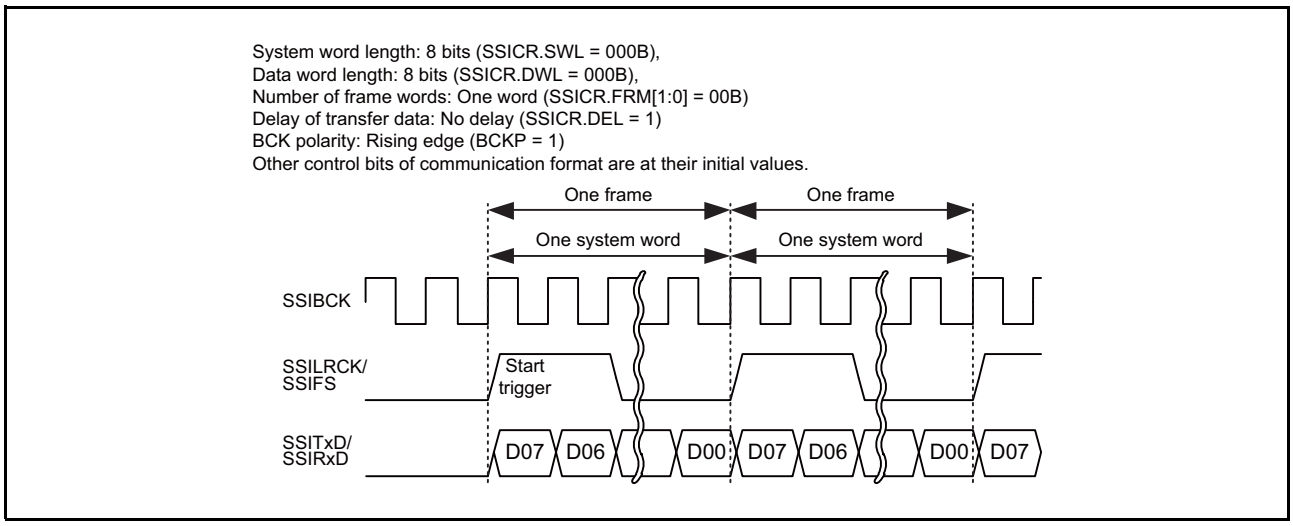

Figure 24.39 Long Frame in Monaural Format (Without Padding)

24.4.2.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01B), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. Figure 24.40 and Figure 24.41 respectively show the TDM formats with and without padding.

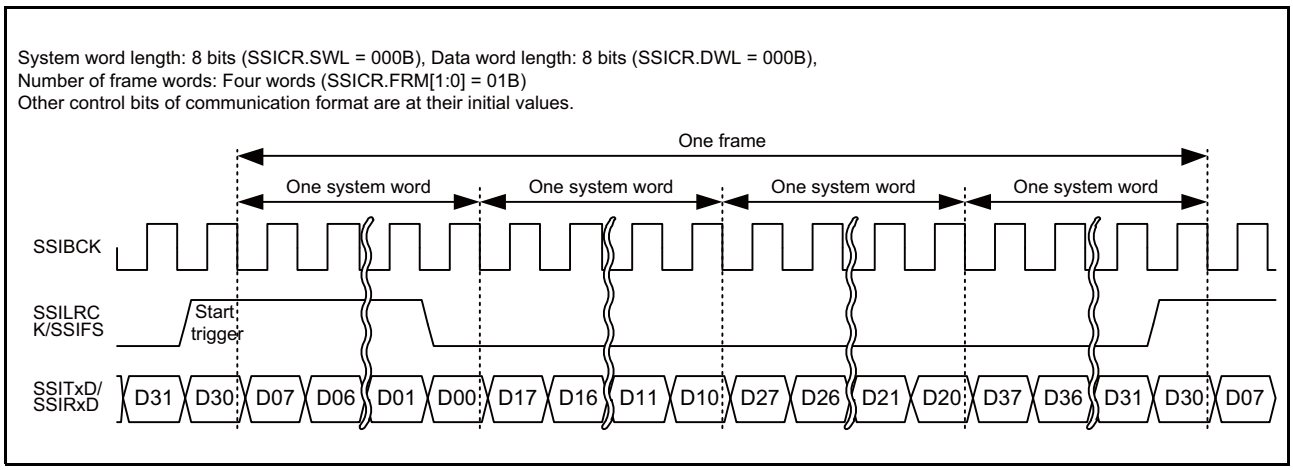

Figure 24.40 TDM Format (Without Padding: System Word Length = Data Word Length)

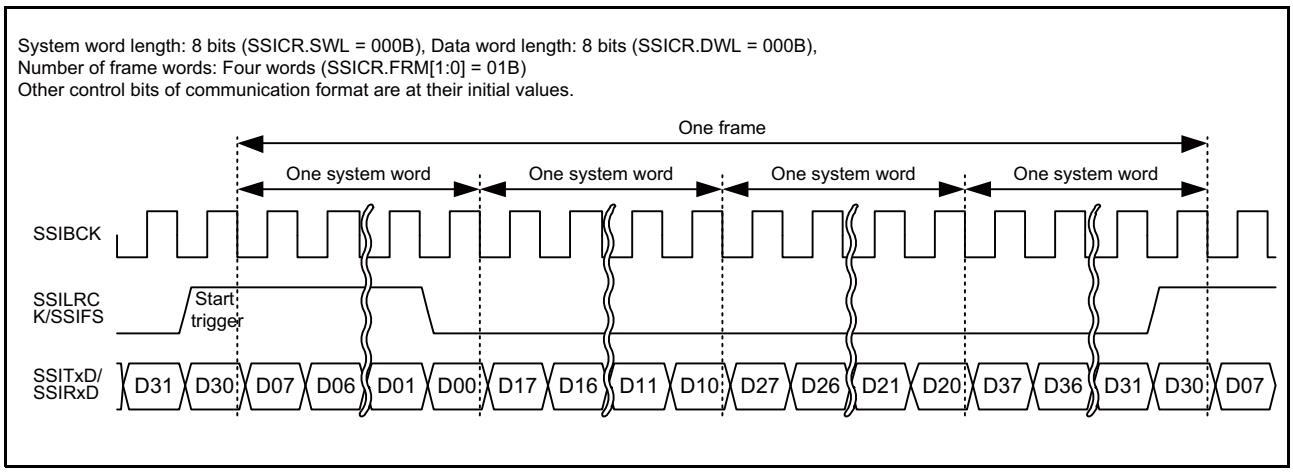

Figure 24.41 TDM Format (With Padding: System Word Length > Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see section 24.5.1.1, Idle State.

Note: SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

24.4.3 Communication Modes

SSIF-2 supports the following communication modes. Table 24.15 lists the control bits that are not available with each communication mode. See section 24.4.3.1 to section 24.4.3.5 for details of these communication modes.

Table 24.14 Communication Modes

Communication Mode	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
Slave-mode transmission and reception	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
Master-mode transmission and reception	1	1	1

Table 24.15 Control Bits that Cannot be Used in Each Communication Mode

Communication / Mode Control Bit	Slave-mode Reception	Slave-mode Transmission	Slave-mode Transmission and Reception	Master-mode Reception	Master-mode Transmission	Master-mode Transmission and Reception
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available

SSISCR.RDFS	Available	Invalid	Available	Available	Invalid	Available

Note 1. Disabled when SSICR.DEL = '1'
Note 2. Disabled during transmission (SSICR.TEN = '1') when SSICR.DEL = '1'

24.4.3.1 Slave-mode Communication

SSIF-2 operates in slave mode with SSICR.MST = 0. Supply the SSIBCK signal and the SSILRCK/SSIFS signal used for the serial data communication from external devices. If these signals do not match the communication format set for SSIF-2, operation is not guaranteed.

24.4.3.2 Master-mode Communication

SSIF-2 operates in master mode with SSICR.MST = 1. The SSIBCK signal and SSILRCK/SSIFS signal used for the serial data communication are internally generated from the audio clock. These signals use the format according to the setting of SSIF-2. If the communication format of another device working as the slave device does not match the communication format set for SSIF-2, operation is not guaranteed.

24.4.3.3 Transmission

SSIF-2 transmits serial data to opposing device when SSICR.TEN = 1 and SSICR.REN = 0. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

24.4.3.4 Reception

SSIF-2 receives serial data from opposing device when SSICR.TEN = 0 and SSICR.REN = 1. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

24.4.3.5 Transmission and Reception

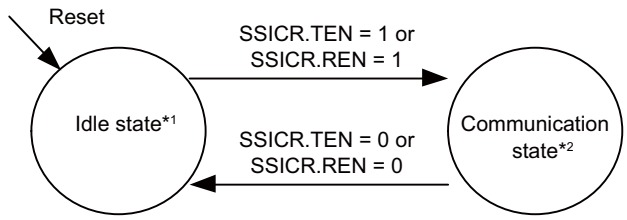
SSIF-2 transmits and receives serial data to and from opposing device when SSICR.TEN = 1, SSICR.REN = 1. If the communication format of opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

24.5 Operation

24.5.1 Operational State

SSIF-2 has the following two main operation states (Figure 24.42).

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0)



Notes: 1. See section 24.5.1.1 for details of the idle state.
2. See section 24.5.1.2 for details of the communicationstate.

Figure 24.42 SSIF-2 State Transition

24.5.1.1 Idle State

In this state, communication of SSIF-2 is halted. However, when SSICR.MST = 1, output of BCK and LRCK/FS to external pins is enabled depending on the settings in the SSIOFR.BCKASTP bit and the SSIOFR.LRCONT bit (Table 24.16). This function is common to all formats.

Table 24.16 Output from External Pins in the Idle State

			Output from Pins		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITxD
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop
1	1	1	Stop	Supply	Stop

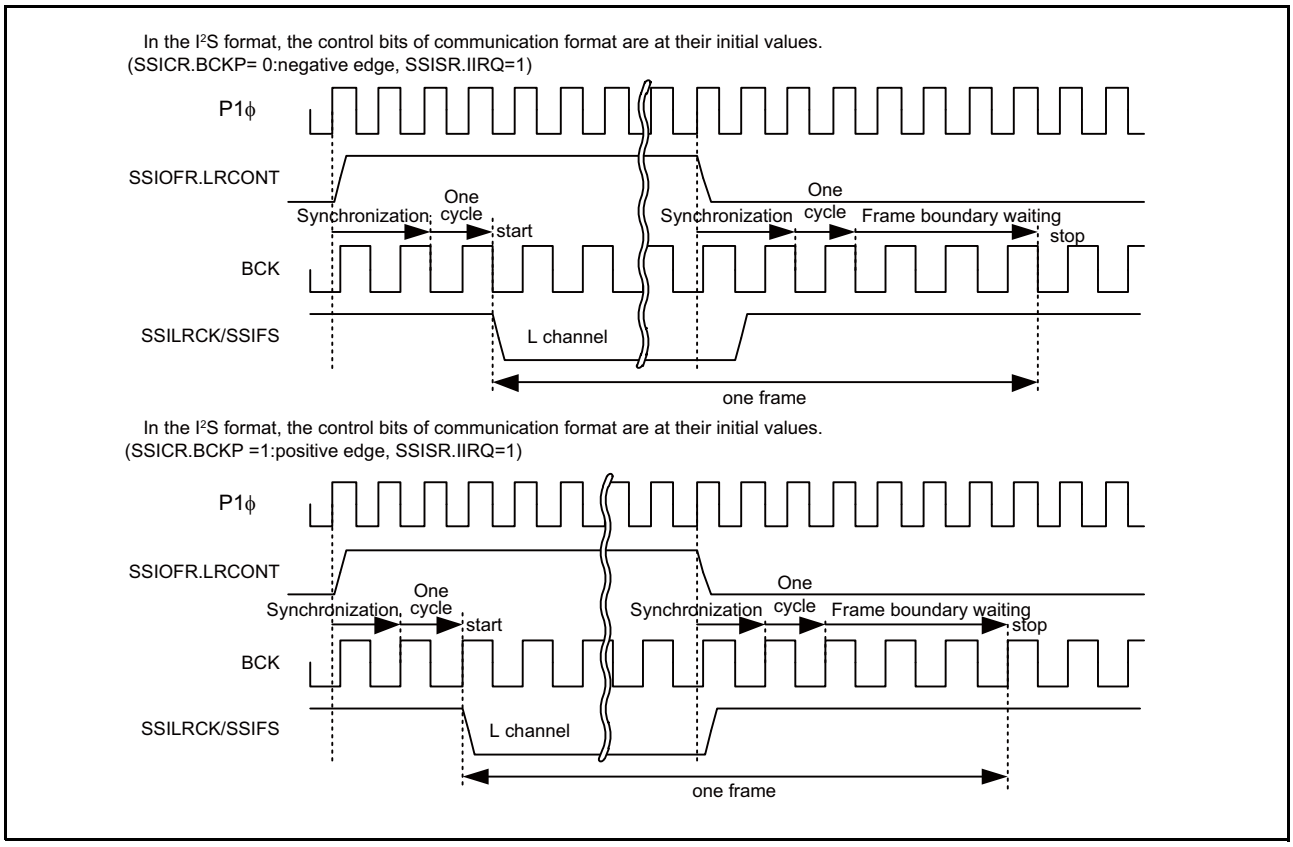


Figure 24.43 Example of LRCK/FS Continuation Release with SSIOFR.LRCONT

Note: To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (Figure 24.43). Make sure that the remote device is not affected.

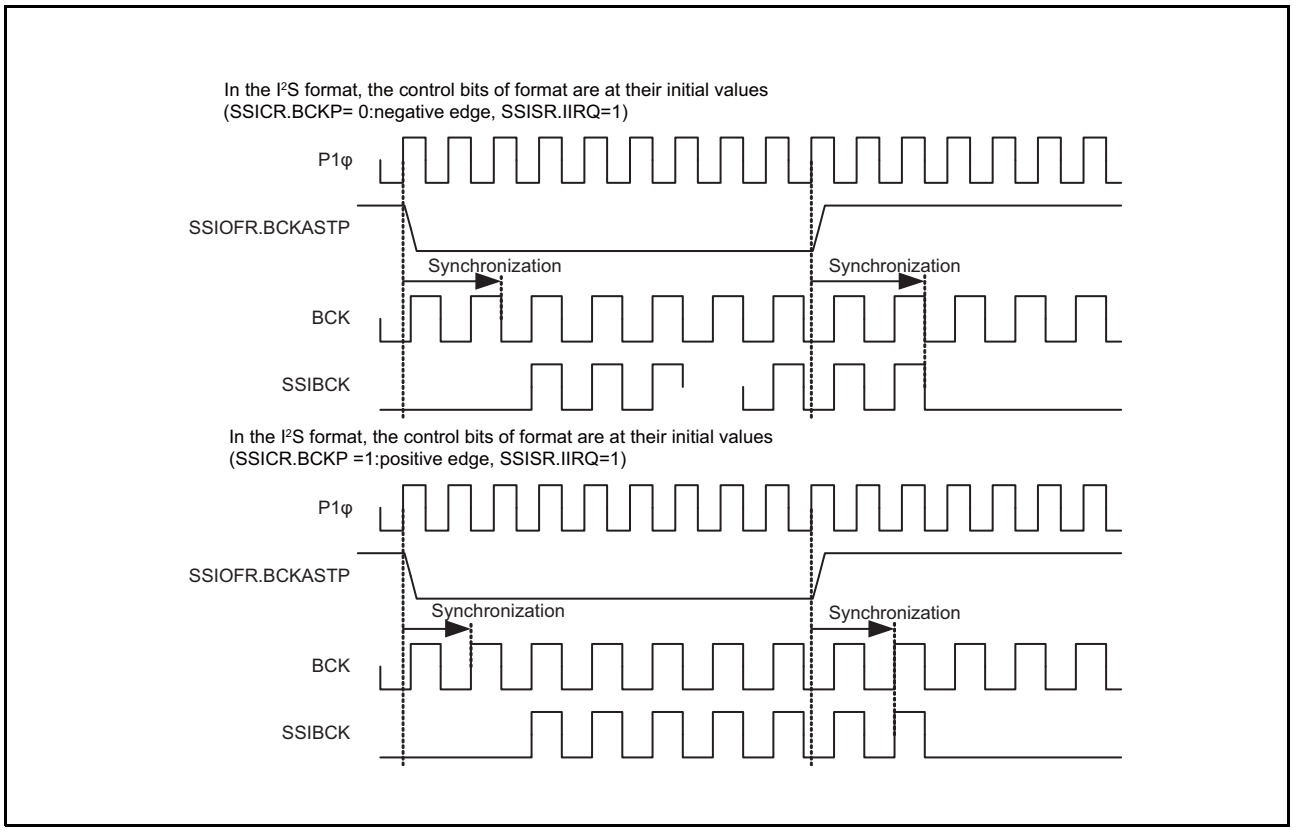

Figure 24.44 Example of Stopping SSIBCK with SSIOFR.BCKASTP

Note: To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (Figure 24.44). So, make sure that the remote device is not affected.

24.5.1.2 Communication States

In this state, SSIF-2 is during communication.Figure 24.45 shows transitions of communication states and Table 24.17 lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

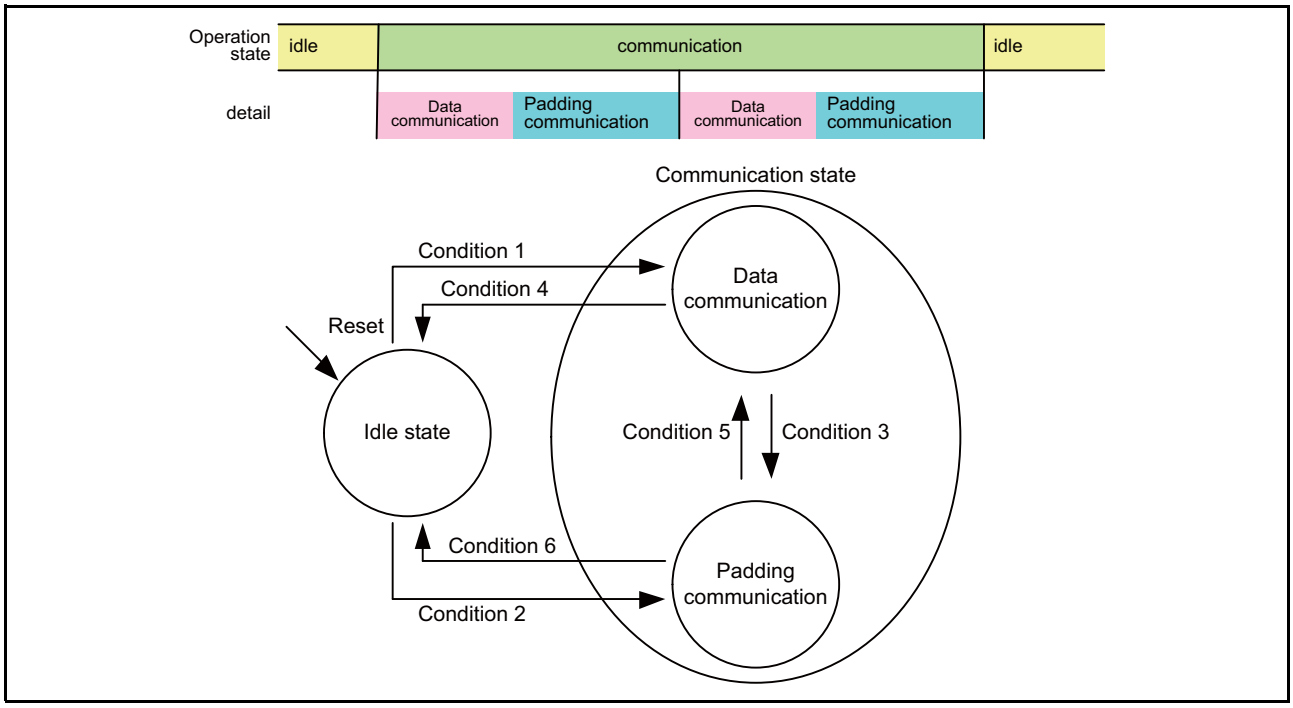

Figure 24.45 Communication State Transition

Table 24.17 Condition for Communication State Transition

Condition No.	Condition for Transition
1	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits.
2	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits.
3	The following all of three conditions are satisfied: • SSICR.TEN = 1 or SSICR.REN = 1 • In the setting without padding bits • Transfer data words of the last data bit is completed.
4	The following all of two conditions are satisfied: • SSICR.SDTA = 1 or without padding bits • Transfer data words of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0
5	Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1
6	The following all of two conditions are satisfied: • SSICR.SDTA = 0 and with padding bits • Transfer of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0.

See Table 24.13 for the setting with/without padding bits.

(1) Data Communication State

In this state, SSIF-2 is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

- State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIF-2 is during data communication for all the time (Figure 24.46). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0), SSIF-2 transits to the idle state (Figure 24.47).

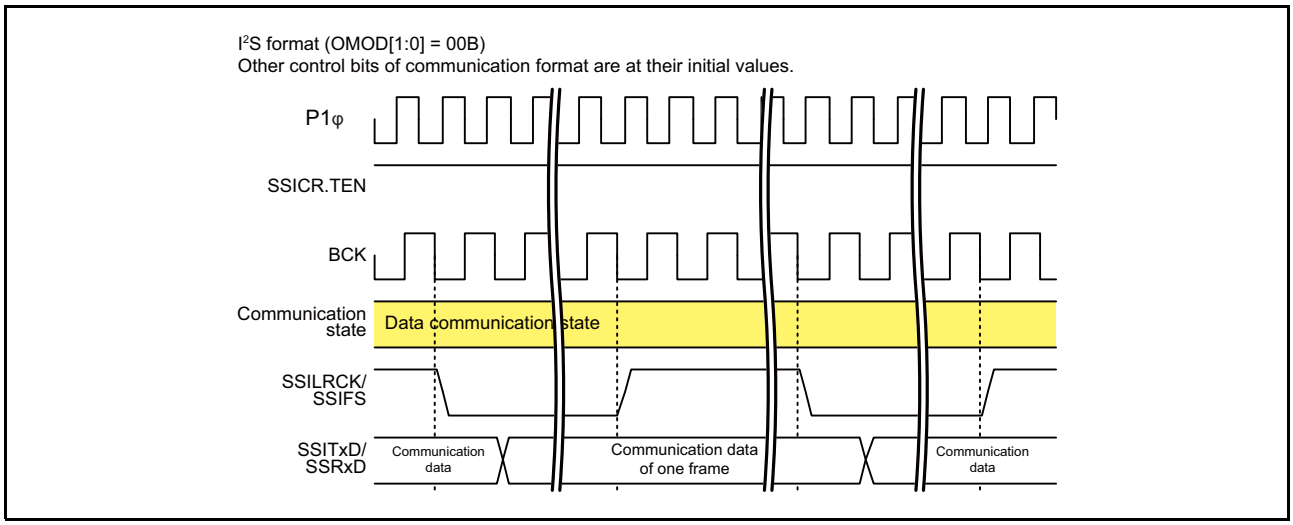

Figure 24.46 Continuation of the Data Communication State

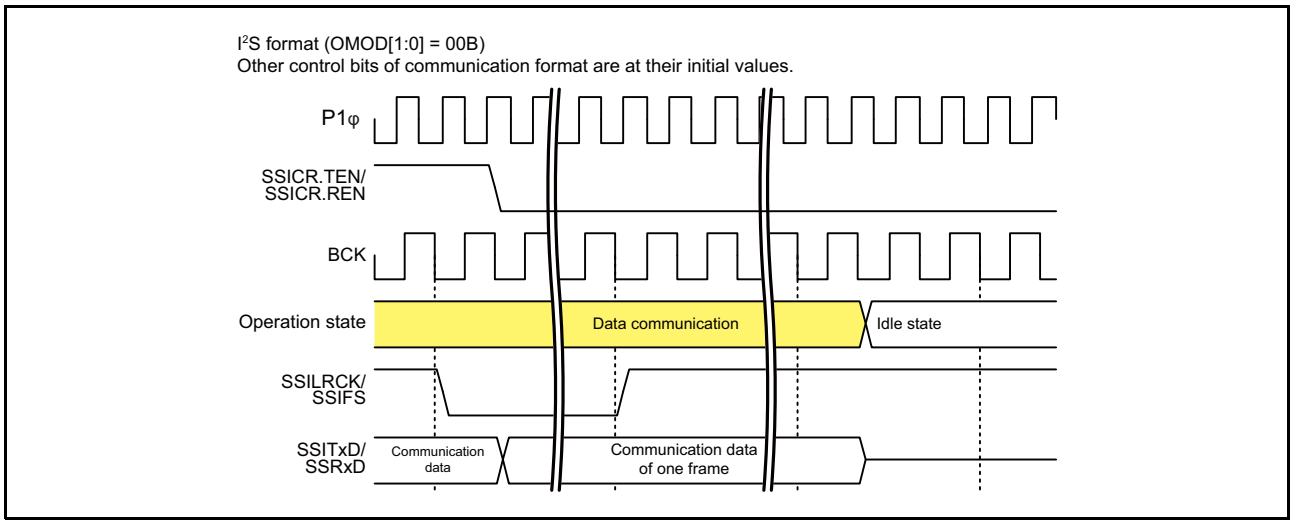

Figure 24.47 Halt from the Data Communication State (without Padding Bits)

- State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last bit of a data word, SSIF-2 transits to the padding communication state from data communication state (Figure 24.48). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 1, SSIF-2 transits to the idle state from data communication state when the communication stop is done. (Figure 24.50).

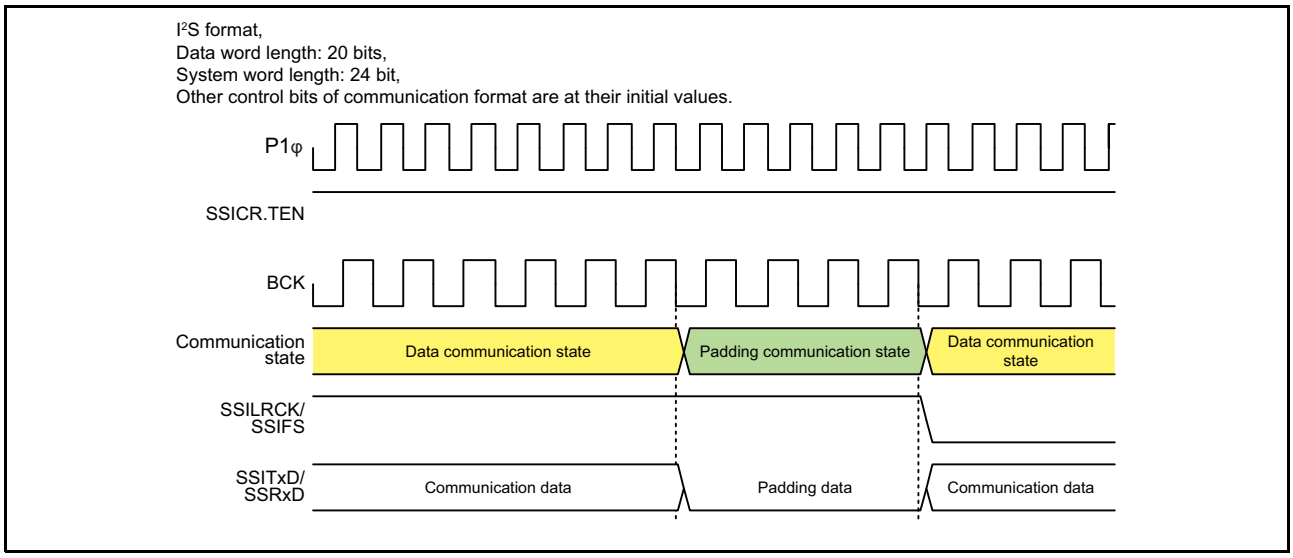

Figure 24.48 Transition from Data Communication to Padding Communication

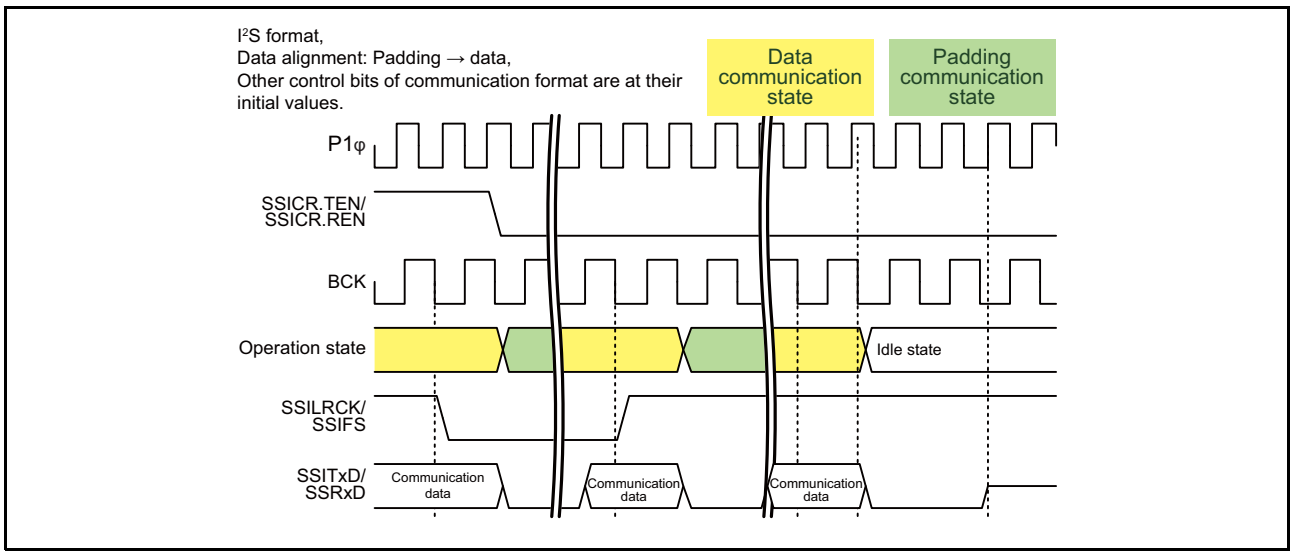

Figure 24.49 Halt from Data Communication (with Padding Bits)

(2) Padding Communication State

In this state, SSIF-2 is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

- State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last padding bit, SSIF-2 transits to data communication state (Figure 24.48). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 0, SSIF-2 transits to the idle state from padding communication when the communication stop is done. (Figure 24.50).

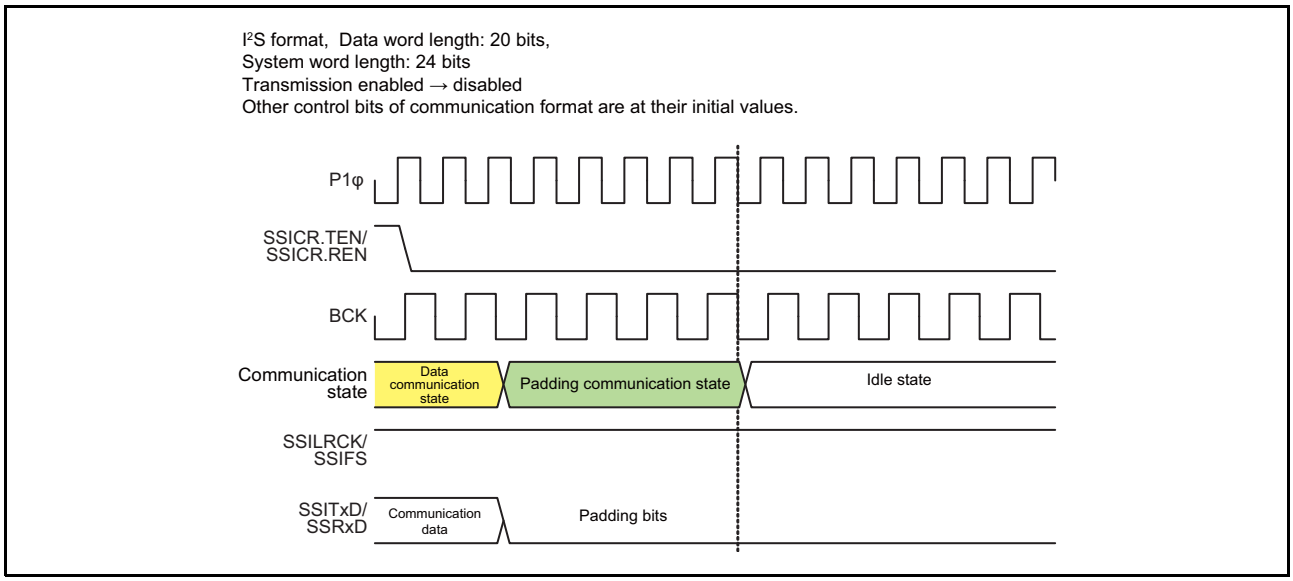

Figure 24.50 Halt from the Padding Communication State

24.5.2 Communication Operation

Figure 24.51 shows the communication flow of SSIF-2.

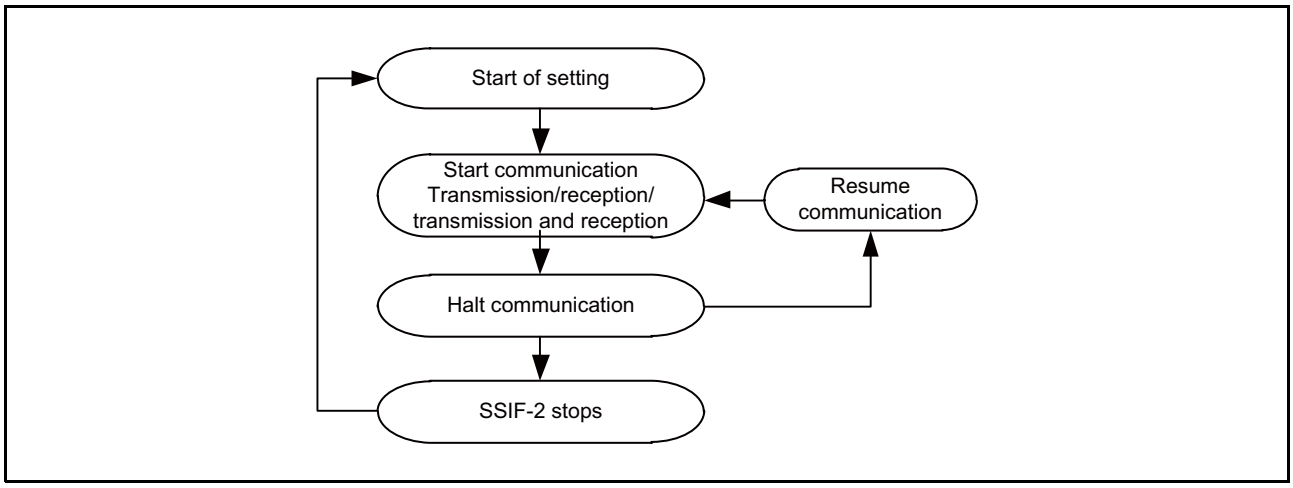

Figure 24.51 SSIF-2 Communication Operation

The procedure of each operation is described in section 24.5.2.1, Start Communication to section 24.5.2.7, Resume Communication.

24.5.2.1 Start Communication

This section describes how to start communication of SSIF-2. Figure 24.52 shows the procedure to start communication. Be sure to follow the procedure. See section 24.5.2.2 for transmission operation and section 24.5.2.3 for reception operation.

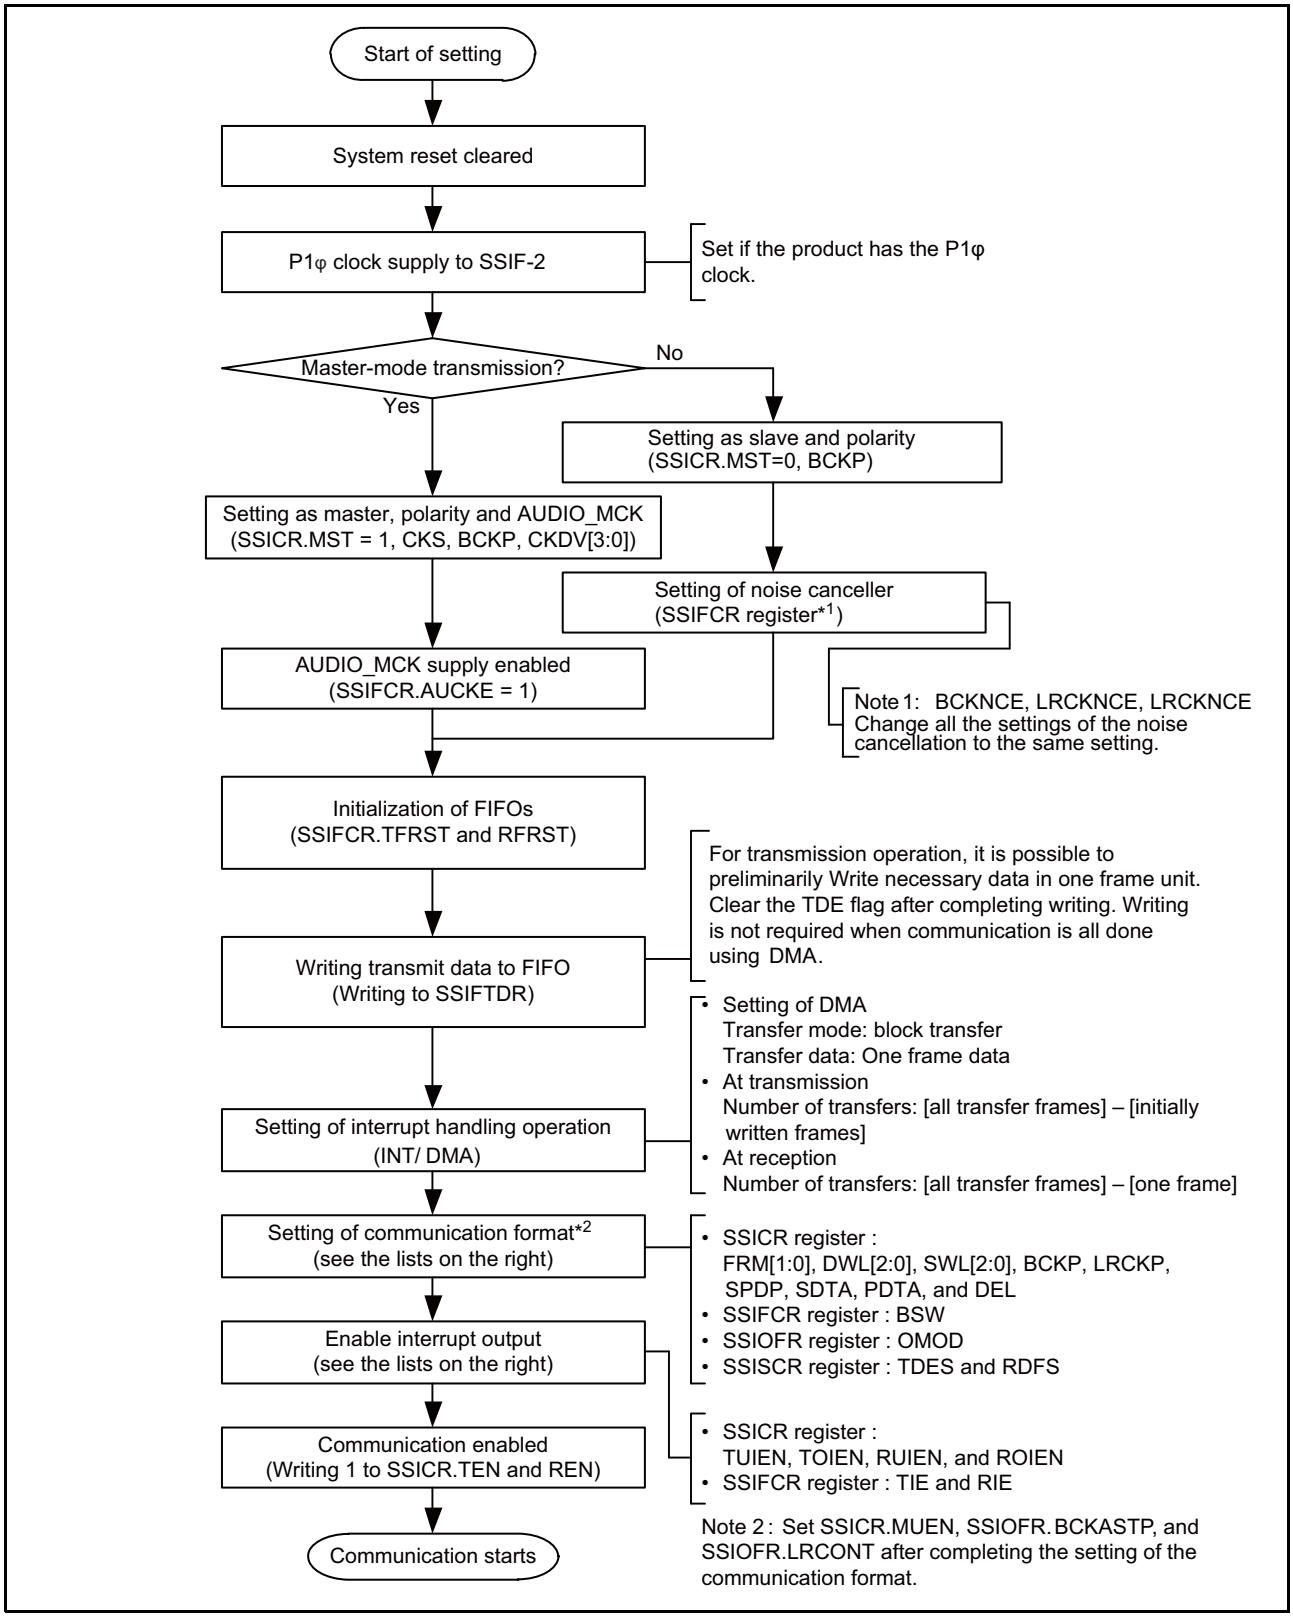

Figure 24.52 Procedure to Start Communication (CPU Procedure)

For SSIF-2 communication, continuous communication is possible with DMA interrupt handling. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.

24.5.2.2 Transmission

Follow the transmission operation procedure (Figure 24.53) while the transmission is operating.
Transmission starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0) and while there is one or more frame of serial data in the transmit FIFO data register (SSIFTDR).
SSIF-2 outputs a transmit data empty interrupt to DMA according to the setting condition of TDE (SSISCR.TDES) and transmit data empty interrupt (SSIFCR.TIE) being enabled.
This interrupt requests writing to the transmit FIFO data register (SSIFTDR). By writing to SSIFTDR at each generation of an interrupt, serial data transmission is realized.
In the procedure to start communication, set DMA handling for transmit data empty interrupts as writing to the transmit FIFO data register (SSIFTDR). As a result, SSIF-2 is able not to mediate CPU and to transmit continuous data. When it becomes empty capacity of transmission FIFO data register set with SSISCR.TDES, transmission data empty interrupt is generated. Set the writing number of times according to empty capacity of transmission FIFO data register that transmission data empty interrupt shows. In a case of an error, stop receive procedure (section 24.5.2.5) and then take the error procedure (section 24.5.2.6).

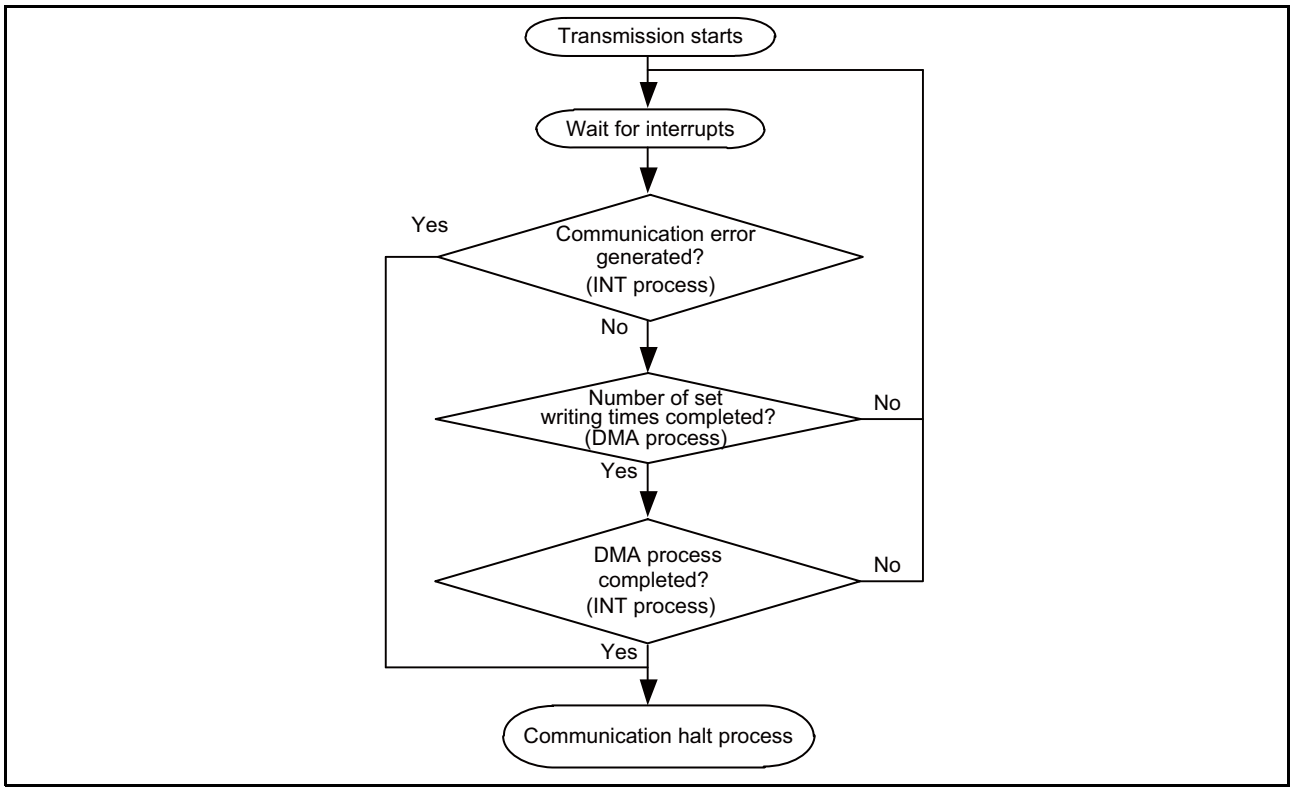

Figure 24.53 Transmission Procedure

Note: The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. Clear the transmission data that corresponds to empty capacity and clear the SSIFSR.TDE flag to SSIFTDR after writing. Transmission operation consecutive by the repeated thing is possible. SSIFSR.TDE is not cleared when not clearing.

24.5.2.3 Reception

Follow the reception operation procedure (Figure 24.54) while the reception is operating.
Reception starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1). SSIF-2 outputs a receive data full interrupt to DMA according to the setting of RDF (SSISCR.RDFS) and receive data empty interrupt (SSIFCR.RIE) being enabled. This interrupt requests reading from the receive FIFO data register (SSIFRDR). By reading from SSIFRDR at each generation of an interrupt, serial data reception is realized.
In the procedure to start communication, set DMA handling for receive data full interrupts as reading from receive FIFO data register (DDIFRDR). As a result, SSIF-2 is able not to mediate CPU and to receive continuous data. If the data capacity of reception FIFO data register set with SSISCR.RDFS is stored, receive data full interrupt is generated. Set the writing number of times according to the data capacity of reception FIFO data register that receive data full interrupt shows.
In the case of an error, stop the receive operation (section 24.5.2.6) and then take the error procedure (section 24.5.2.6).

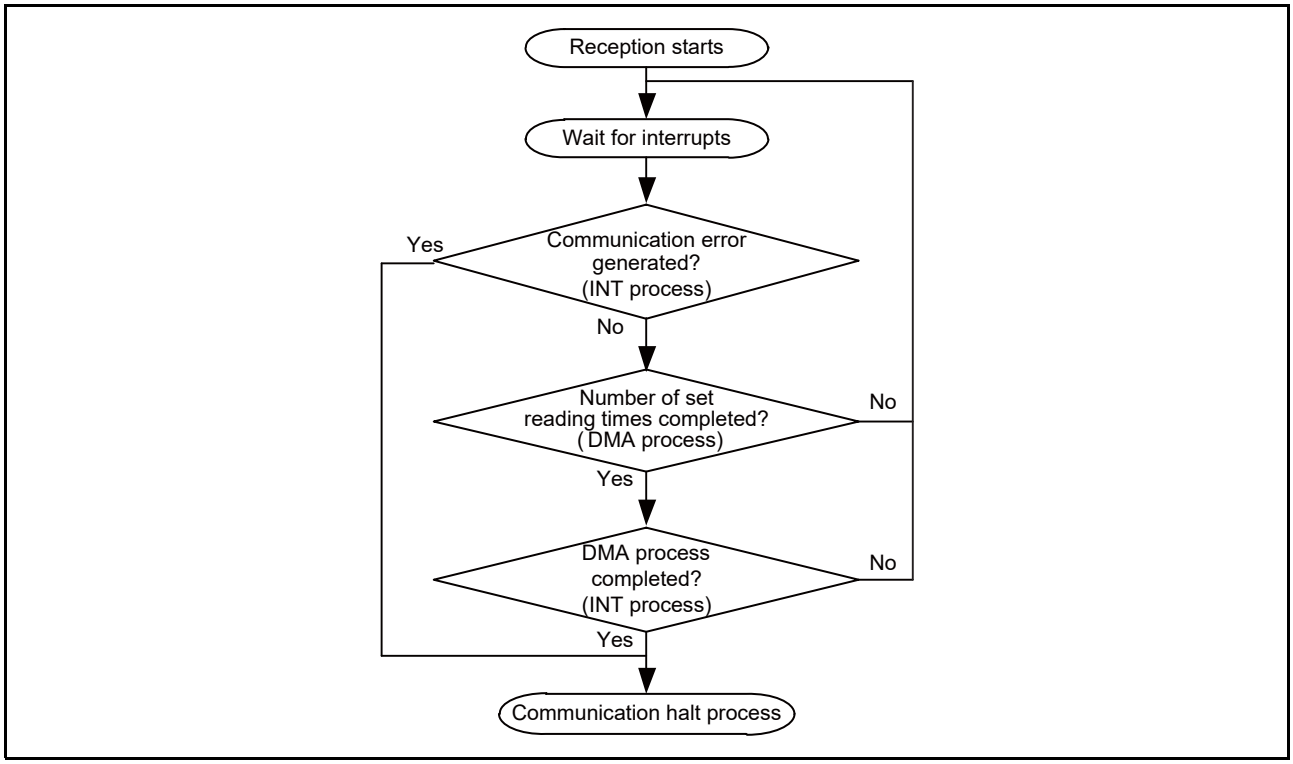

Figure 24.54 Reception Procedure

Note: The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. Clear data that does the reception completion and clear the SSIFSR.RDF flag from SSIFRDR after reading. Reception operation consecutive by the repeated thing is possible. SSIFSR.RDF is not cleared when not clearing.

24.5.2.4 Transmission and Reception

Transmission and reception starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1) and while there is one or more frames of serial data in the transmit FIFO data register (SSIFTDR). The transmission and reception operation of SSIF-2 can be transmitted and received continuously by each doing the procedure for showing in the transmission operation (section 24.5.2.2) and the reception operation (section 24.5.2.3). As transmission and reception are independent in SSIF-2, see sections of transmission and reception respectively. See section 24.5.2.5, Halt Communication to halt communication.

24.5.2.5 Halt Communication

This section describes how to halt communication of SSIF-2. Figure 24.55 shows the procedure to halt communication. Be sure to follow the procedure.

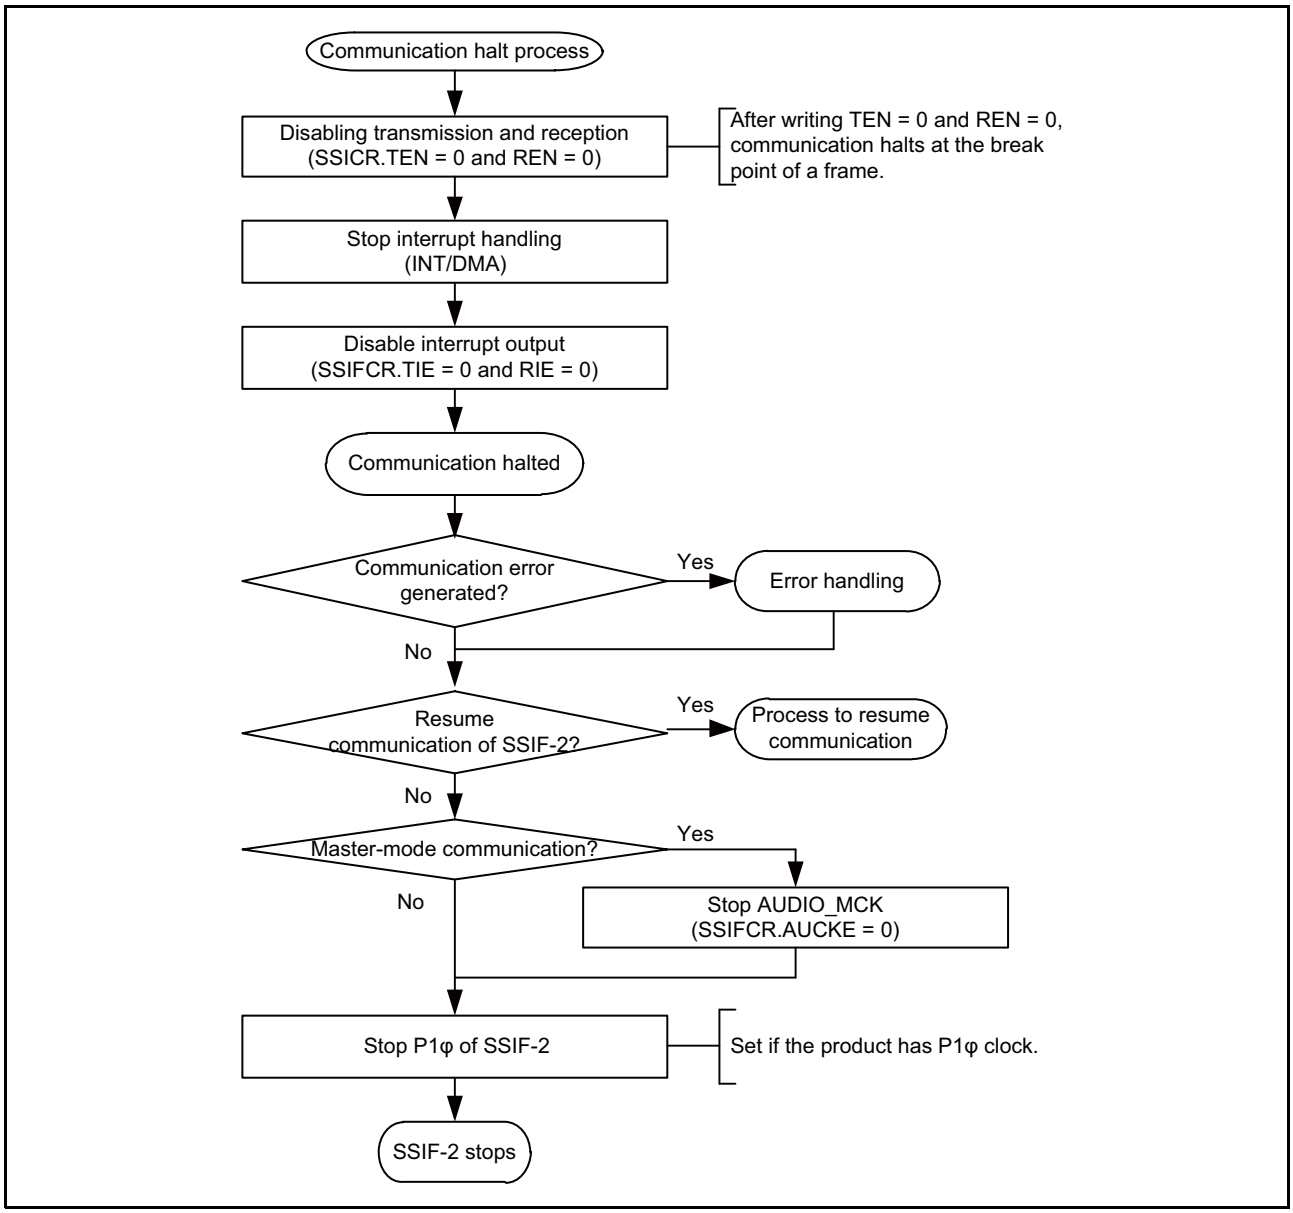

Figure 24.55 Procedure to Halt Communication (CPU Procedure)

To halt the communication of SSIF-2, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1

To resume communication of SSIF-2 in the previous setting, see section 24.5.2.7, Resume Communication.

Note: When communication of SSIF-2 is halted according to the procedure to halt communication in Figure 24.55, resume communication according to the procedure to start communication in Figure 24.52.

24.5.2.6 Error Handling

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (Figure 24.56) according to the procedure to halt communication (Figure 24.55).

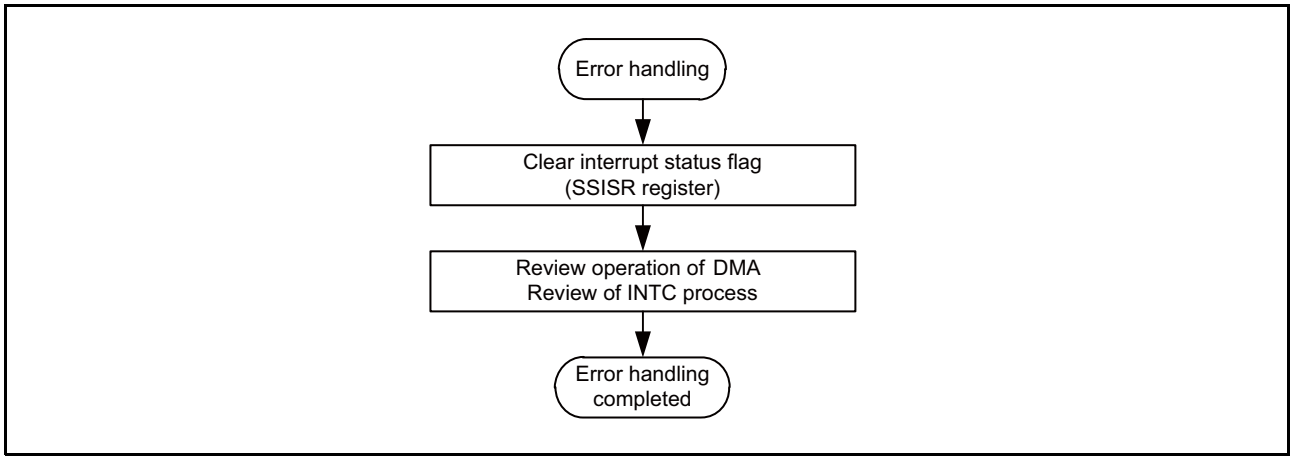

Figure 24.56 Error Handling Procedure

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See descriptions of flags in section 24.4.1.2, Status Register (SSISR) for the setting conditions of error flags.

(1) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

(2) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56). When communication is resumed, consider the lost serial data.

(3) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception

of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(4) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error handling procedure (Figure 24.56).

24.5.2.7 Resume Communication

To resume communication of SSIF-2, follow the procedure shown in Figure 24.57. After communication is halted, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (Figure 24.52). For communication after resume, see section 24.5.2.2 and section 24.5.2.3.

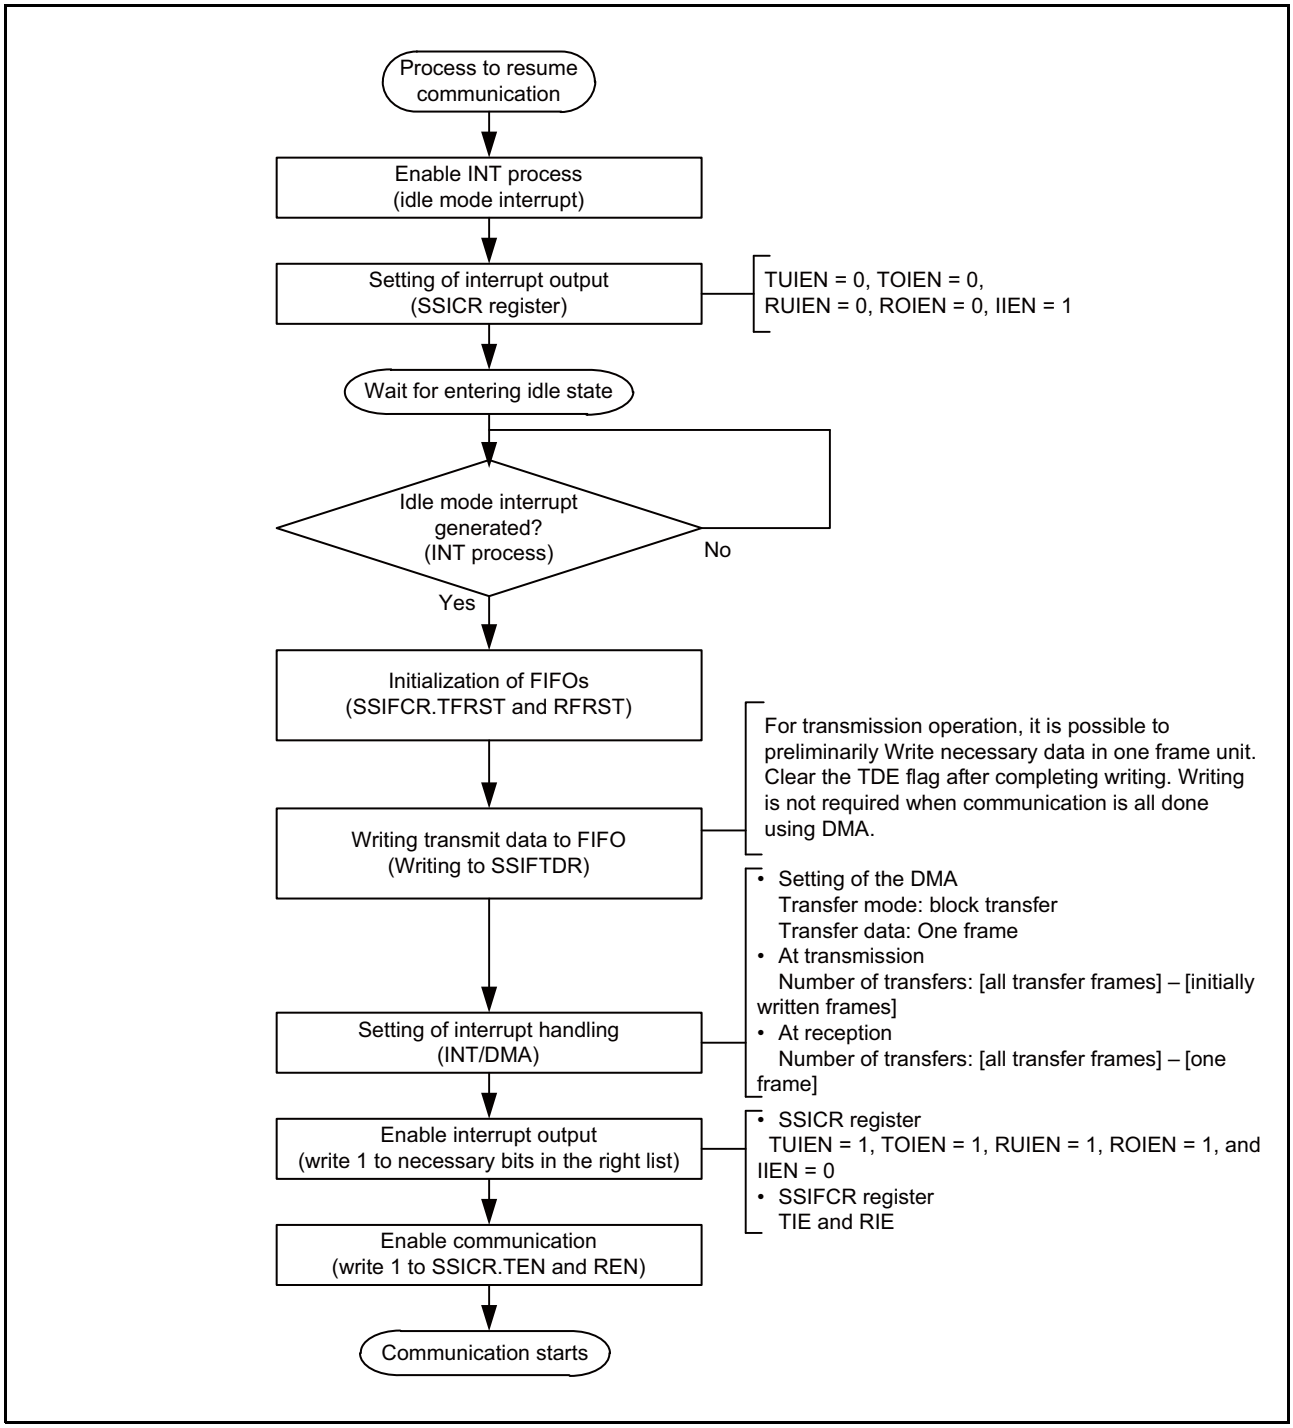

Figure 24.57 Procedure to Resume Communication (CPU Procedure)

24.5.3 Interrupt Sources

Table 24.18 lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

Table 24.18 Interrupt Sources

Interrupt Source	Interrupt	Interrupt Flag	Interrupt Sense	DMA Activation
INT_ssif_int_req	Transmit underflow interrupt/ Transmit overflow interrupt/ Receive underflow interrupt/ Receive overflow interrupt/ Idle mode interrupt	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Level	Not available
INT_ssif_dma_tx	Transmit data empty interrupt	SSIFSR.TDE	Edge	Available
INT_ssif_dma_rx	Receive data full interrupt	SSIFSR.RDF	Edge	Available
INT_ssif_dma_rt	Receive data full interrupt/ Transmit data empty interrupt	SSIFSR.TDE/SSIFSR.RDF	Edge	Available

24.5.3.1 INT_ssif_int_req Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIF-2. This interrupt moves from the flag and the output enable permission that five factors have respectively (Figure 24.58). To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

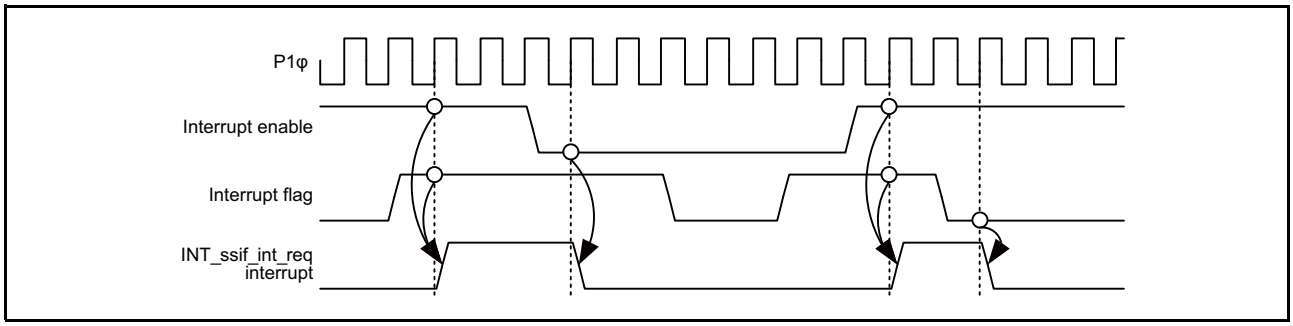

Figure 24.58 Timing Chart of the Common Interrupt Source, INT_ssif_int_req

(1) Transmit underflow interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(2) Transmit overflow interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TOIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(3) Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. RUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(4) Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. ROIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(5) Idle mode interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. When the thing that the communication has stopped completely is confirmed, this interrupt is used. Figure 24.57).

24.5.3.2 INT_ssif_dma_tx Interrupt [full-duplex communication]

As the transmit data empty interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.TDE and SSIFCR.TIE becomes 1.
  SSIF-2 operation: SSIFSR.TDE becomes 1 from 0 while SSIFCR.TIE = 1
  CPU operation: SSIFCR.TIE is changed to 1 from 0 while SSIFSR.TDE = 1

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (Figure 24.59).

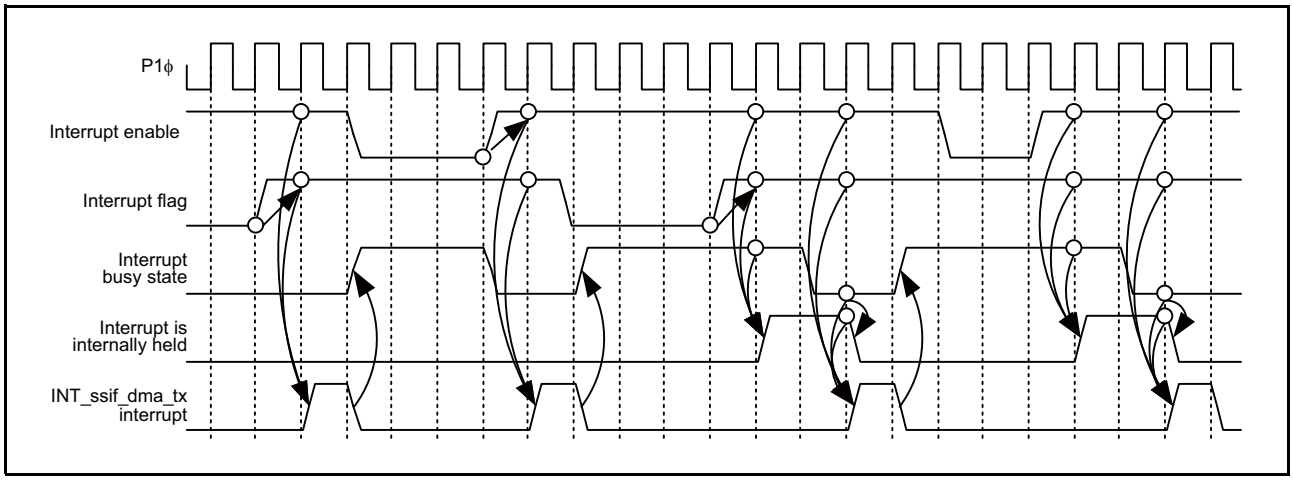

Figure 24.59 INT_ssif_dma_tx Interrupt Timing Chart

24.5.3.3 INT_ssif_dma_rx Interrupt [full-duplex communication]

As the receive data full interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.RDF and SSIFCR.RIE becomes 1.
  SSIF-2 operation: SSIFSR.RDF becomes 1 from 0 while SSIFCR.RIE = 1.
  CPU operation: SSIFCR.RIE is changed to 1 from 0 while SSIFSR.RDF = 1.

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable. It operates in the same way as in Figure 24.59.

24.5.3.4 INT_ssif_dma_rt Interrupt [half-duplex communication]

This interrupt is output by two sources, transmit data empty interrupt and receive data full interrupt. When this interrupt is generated, read the interrupt flag and specify the interrupt source.
An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (Figure 24.59).

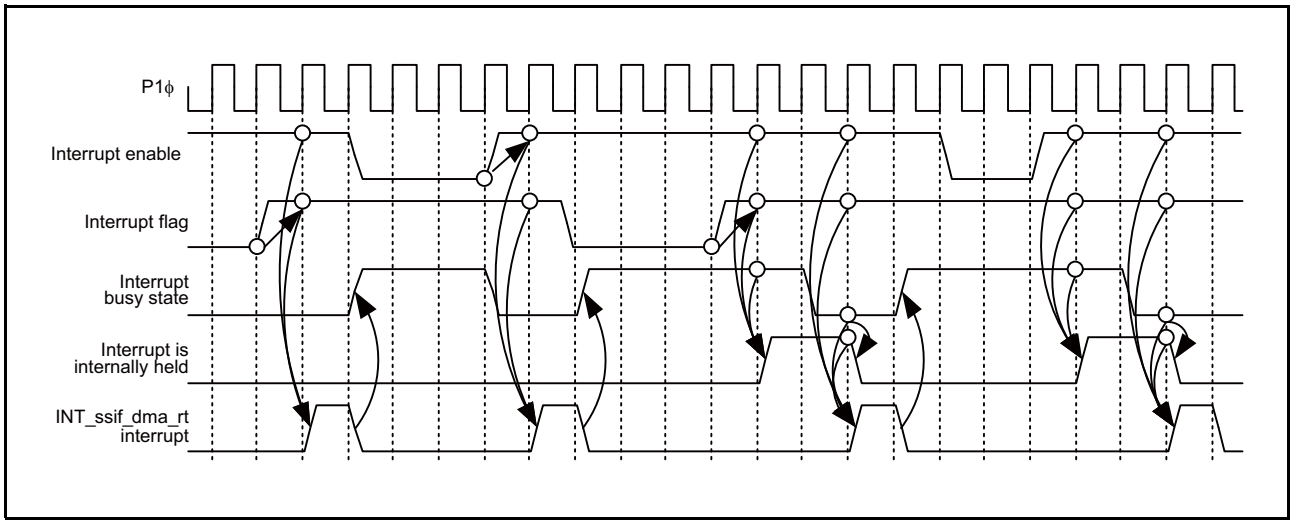

Figure 24.60 INT_ssif_dma_tx Interrupt Timing Chart

24.5.4 Software Resets

SSIF-2 has three software reset bits to reset its states.

- SSIF-2 software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSICR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST)

It explains the procedure of three software reset.

24.5.4.1 Software Reset Procedure

(1) SSIF-2 Software Reset

For the SSIF-2 software reset bit (SSIFCR.SSIRST), follow the procedure shown in Figure 24.61. After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (Figure 24.52). See section 24.5.2.2, Transmission and section 24.5.2.3, Reception respectively for transmission and reception after communication is resumed.

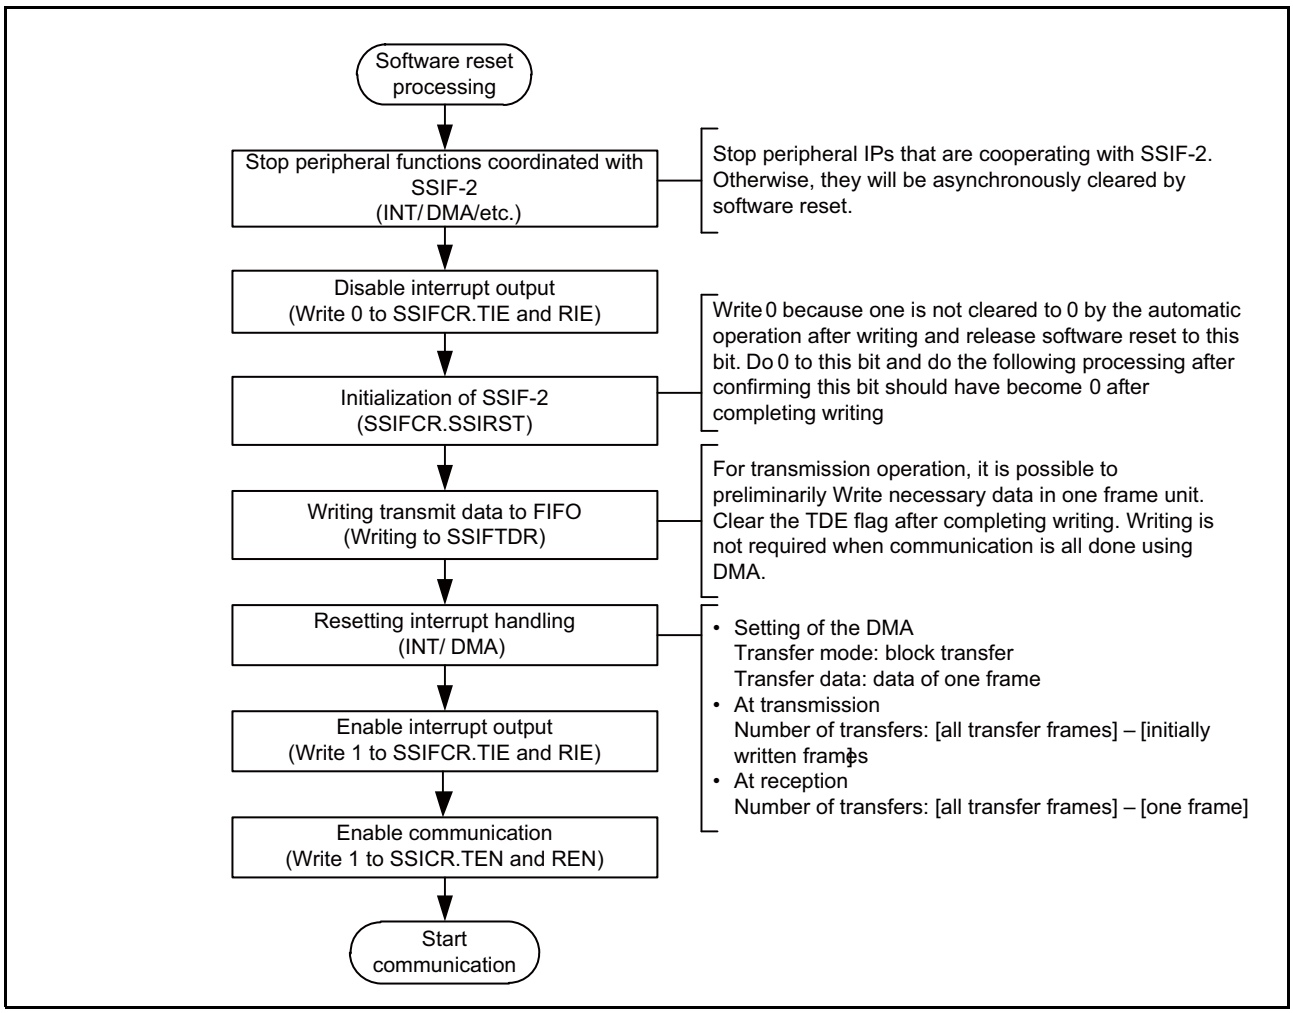

Figure 24.61 Software Reset Procedure (CPU Procedure)

(2) Transmit FIFO Data Register Reset

To initiate a transmit FIFO data register reset, follow the procedure to start communication (Figure 24.52) and resume communication (Figure 24.57).

(3) Receive FIFO Data Register Reset

To initiate a receive FIFO data register reset, follow the procedure to start communication (Figure 24.52) and resume communication (Figure 24.57).

24.6 Notes

24.6.1 Notes

24.6.1.1 Attention by communication using DMA

SSIF-2 assumes the DMA access as follows.

Table 24.19 Interrupt to expect DMA access

Communication operation	Interrupt	DMA access	LSI specification	Remarks
Transmission	INT_ssif_dma_tx	Write to SSIFTDR	Full duplex transmission	
	INT_ssif_dma_rt		Half duplex transmission	
Reception	INT_ssif_dma_rx	Read SSIFRDR	Full duplex transmission	
	INT_ssif_dma_rt		Half duplex transmission	
Transmission and Reception	INT_ssif_dma_tx	Write to SSIFTDR	Full duplex transmission	
	INT_ssif_dma_rx	Read SSIFRDR	Half duplex transmission	

Defend the following when communicating without using DMA.

- Clear SSIFSR.TDE when you access finality when it is writing in SSIFTDR with CPU. There is a possibility that the transmission overflow not intended occurs when not clearing.
- Clear SSIFSR.RDE when you access finality when you read SSIFRDR with CPU. There is a possibility that the reception overflow not intended occurs when not clearing.

24.6.1.2 Notes for Slave-mode Communication

(1) ADCKE Control

In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (Figure 24.52) or wait for an idle state by taking the procedure to resume communication (Figure 24.57).

(2) SSILRCK/SSIFS

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

24.6.1.3 Notes for Master-mode Communication

(1) ADCKE Control

In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF-2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (Figure 24.52).

(2) LRCONT Control

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (Figure 24.43). Make sure that the remote device is not affected.

(3) BCKASTP Control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (Figure 24.44). So, make sure that the remote device is not affected.
Note: When the opposing device who is the slave needs the clock of the terminal SSIBCK before the communication operates, it is not possible to use it.

24.6.1.4 Notes for Communication Flow

(1) When an Error Interrupt is Generated

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (Figure 24.56) according to the procedure to halt communication (Figure 24.55).

(a) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

(b) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56). When communication is resumed, consider the lost serial data.

(c) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception

of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error procedure (Figure 24.56).

(d) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (Figure 24.55) and then take the error handling procedure (Figure 24.56).

(2) Transmit Data Empty Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. Clear the transmission data that corresponds to empty capacity and clear the SSIFSR.TDE flag to SSIFTDR after writing. Transmission operation consecutive by the repeated thing is possible. SSIFSR.TDE is not cleared when not clearing.

(3) Receive Data Full Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. Clear data that does the reception completion and clear the SSIFSR.RDF flag from SSIFRDR after reading. Reception operation consecutive by the repeated thing is possible. SSIFSR.RDF is not cleared when not clearing.

(4) Switching Transfer Modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

(5) Resume Communication after Halting SSIF-2

When communication of SSIF-2 is halted according to the procedure to halt communication in Figure 24.55, resume communication according to the procedure to resume communication in Figure 24.52.

24.6.1.5 Write Access Restriction

(1) SSICR Register

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

(a) TEN Bit and REN Bit

Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to section 24.5.2.2, Transmission, section 24.5.2.3, Reception, and section 24.5.2.4, Transmission and Reception for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).

(2) SSICR Register

(a) Clear operation of TUIRQ and TOIRQ

After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

(b) Clear operation of RUIRQ and ROIRQ

After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

(3) Communication State

Writing to the bits with shaded area in Table 24.20 is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Table 24.20 Bits Protected from Writing during Communication

25. CANFD Interface (RS-CANFD)

This section contains a generic description of the CANFD interface (RS-CANFD).
The first part of this section describes all this LSI specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

25.1 Features of RS-CANFD

25.1.1 Number of Units and Channels

This product has the following number of RS-CANFD units.

Table 25.1 Number of Units

RS-CANFD	
Number of Units	1
Name	RSCFD0

This product has the CANFD interface channel listed below.

Table 25.2 Unit Configurations and Channels

RS-CANFD	
Number of Channels	2
Name	CAN0, CAN1

The RS-CANFD has two interface modes (classical CAN mode and CANFD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 25.3 Index

Index	Meaning
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit.
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0, 1); for example, RSCFDn(CFD)CmSTS is the channel m status register.
j	The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to 5); for example, RSCFDn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d” (classical CAN mode: d = 0, 1, CANFD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k.
q	The individual receive buffers are generically indicated by the index “q” (q = 0 to 31); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p” (p = 0 to 31); for example, RSCFDn(CFD)TMCp is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0, 1, CANFD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q.
r	The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the letter “y” (y = 0); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for the RS-CANFDs that has 2 channels (m = 0, 1). When referring to information with indexes, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

25.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.
RSCFDn register addresses are given as offsets from the base addresses in general.

Table 25.4 Register Base Address

Base Address Name	Base Address
<RSCFD0_base>	E802 0000

25.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 25.5 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
RSCFDn	clk_xincan	CAN_CLK
	clkc	P1φ/2
	pclk	P1φ

The operating frequency of the RSCFDn depends on the transfer rate and the number of channels in use. Table 25.6 shows the range of the frequency.

Table 25.6 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI

Condition			Range of Operating Frequency		
Mode	Transfer Rate	No. of Channels in Use	pclk	clk_xincan*1	clkc*1,*2
CANFD	4.125 Mbps	2ch	pclk ≥ 64 MHz	32 MHz ≤ clk_xincan ≤ pclk/2	32 MHz ≤ clkc ≤ pclk/2
		1ch			
	2 Mbps	2ch	pclk ≥ 32 MHz	16 MHz ≤ clk_xincan ≤ pclk/2	16 MHz ≤ clkc ≤ pclk/2
		1ch			
CAN/CANFD	1 Mbps	2ch	pclk ≥ 30.6 MHz	8 MHz ≤ clk_xincan ≤ pclk/2	8 MHz ≤ clkc ≤ pclk/2
		1ch	pclk ≥ 27.5 MHz		
	500 kbps	2ch	pclk ≥ 27.5 MHz	4 MHz ≤ clk_xincan ≤ pclk/2	4 MHz ≤ clkc ≤ pclk/2
		1ch			
	125 kbps	2ch	pclk ≥ 27.5 MHz	1 MHz ≤ clk_xincan ≤ pclk/2	1 MHz ≤ clkc ≤ pclk/2
		1ch			

Note 1. Setting the DCS bit in the RSCFDn(CFD)GCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2.
Note 2. When pclk< 25 MHz, select clk_xincan.

25.1.4 Interrupt Request

RSCFDn interrupt requests are listed in the following table.

Table 25.7 Interrupt Requests

Unit Interrupt Signal		Outline
INTRCANGERR		CAN global error interrupt
INTRCANGRECC		CAN receive FIFO interrupt
CAN0	INTRCAN0ERR	CAN0 error interrupt
	INTRCAN0REC	CAN0 transmit/receive FIFO receive completion interrupt
	INTRCAN0TRX	CAN0 transmit interrupt
CAN1	INTRCAN1ERR	CAN1 error interrupt
	INTRCAN1REC	CAN1 transmit/receive FIFO receive completion interrupt
	INTRCAN1TRX	CAN1 transmit interrupt

25.1.5 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 25.8 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
CANmRX (m = 0, 1)	CANm receive data input	CANmRX (m = 0, 1)
CANmTX (m = 0, 1)	CANm transmit data output	CANmTX (m = 0, 1)
CANmRX_DATARATE_EN (m = 0, 1)	CANm receive data phase output	CANmRX_DATARATE_EN (m = 0, 1)
CANmTX_DATARATE_EN (m = 0, 1)	CANm transmit data phase output	CANmTX_DATARATE_EN (m = 0, 1)
CAN_CLK	Clock source for CAN communication	CAN_CLK

25.2 Overview

25.2.1 Functional Overview

Table 25.9 shows the RS-CANFD module specifications. Figure 25.1 shows the RS-CANFD module block diagram.

Table 25.9 RS-CANFD Module Specifications

Item	Specification
Number of channels	2
Protocol	ISO11898-1 compliant Using CANFD frames is selectable by switching interface modes.
Communication speed	Classical CAN mode: • Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit $\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register) CANFD mode: • Nominal bit rate: max.1 Mbps, data bit rate: max. 4.125 Mbps $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit $\text{CANmTq(N)} = \frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$ $\text{CANmTq(D)} = \frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register) m = 0, 1 Tq: Time quantum
Buffer	160 buffers in total • Individual buffers: 32 buffers (16 buffers × 2 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared buffers: 128 buffers for all channels Receive buffer: 0 to 32 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each)
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive messages according to 128 receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.

Item	Specification
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmit messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information.
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state. • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt source	8 sources • Global Interrupts (2 sources) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0, 1) - CANm transmit complete interrupt - CANm transmit abort interrupt - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) - CANm transmit history interrupt - CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.
CAN clock source	Selects the clkc or the clk_xincan. As for the range of operating frequency, see Table 25.6
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled]

25.2.2 Interface Modes

The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CANFD mode: Handles classical CAN frames and CANFD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

25.2.3 Block Diagram

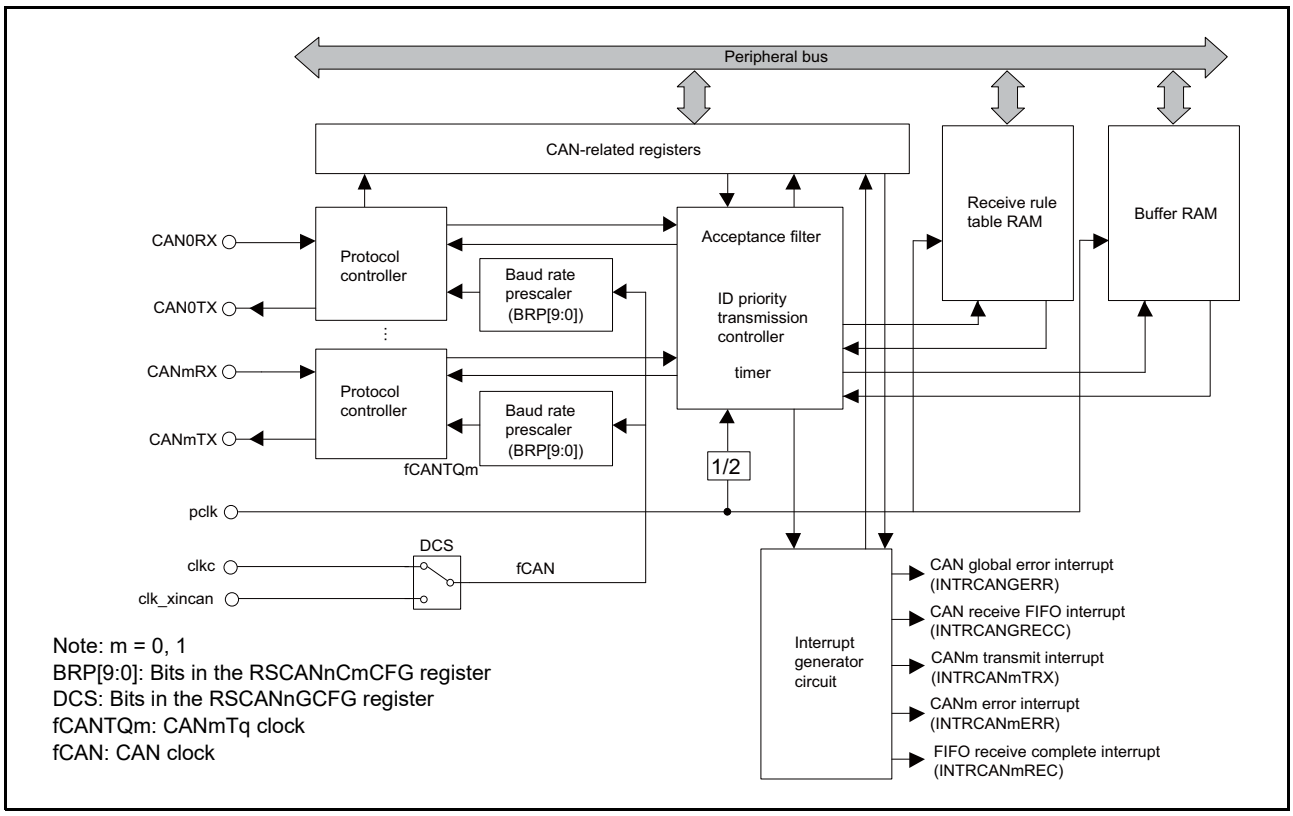

Figure 25.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CANFD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See section 25.11.1.3, Communication Speed Setting.

25.3 Registers (Classical CAN Mode)

25.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.
For details about <RSCFDn_base>, see section 25.1.2, Register Base Address.
For registers initialized in global reset mode and channel reset mode, refer to the following.

- Table 25.176, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 25.177, Registers Initialized Only in Global Reset Mode

Table 25.10 Registers

Module	Register	Symbol	Address
Interface mode-related registers			
RSCANn	Global interface mode select register	RSCANnGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCANn	Channel m Configuration Register	RSCANnCmCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCANn	Channel m control register	RSCANnCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCANn	Channel m status register	RSCANnCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCANn	Channel m error flag register	RSCANnCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
Global-related registers			
RSCANn	Global configuration register	RSCANnGCFG	<RSCFDn_base> + 0084_H
RSCANn	Global control register	RSCANnGCTR	<RSCFDn_base> + 0088_H
RSCANn	Global status register	RSCANnGSTS	<RSCFDn_base> + $008C_H$
RSCANn	Global error flag register	RSCANnGERFL	<RSCFDn_base> + 0090_H
RSCANn	Global timestamp counter register	RSCANnGTSC	<RSCFDn_base> + 0094_H
RSCANn	Global TX Interrupt Status Register 0	RSCANnGTINTSTS0	<RSCFDn_base> + 0460_H
RSCANn	Global FD Configuration Register	RSCANnGFDCFG	<RSCFDn_base> + 0474_H
Receive rule-related registers			
RSCANn	Receive Rule Entry Control Register	RSCANnGAFLECTR	<RSCFDn_base> + 0098_H
RSCANn	Receive Rule Configuration Register 0	RSCANnGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCANn	Receive Rule ID Register j	RSCANnGAFLIDj	<RSCFDn_base> + 0500_H + (10_H × j)
RSCANn	Receive Rule Mask Register j	RSCANnGAFLMj	<RSCFDn_base> + 0504_H + (10_H × j)
RSCANn	Receive Rule Pointer 0 Register j	RSCANnGAFLP0_j	<RSCFDn_base> + 0508_H + (10_H × j)
RSCANn	Receive Rule Pointer 1 Register j	RSCANnGAFLP1_j	<RSCFDn_base> + $050C_H$ + (10_H × j)
Receive buffer-related registers			
RSCANn	Receive Buffer Number Register	RSCANnRMNB	<RSCFDn_base> + $00A4_H$
RSCANn	Receive Buffer New Data Register y	RSCANnRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANn	Receive Buffer ID Register q	RSCANnRMIDq	<RSCFDn_base> + 0600_H + (10_H × q)
RSCANn	Receive Buffer Pointer Register q	RSCANnRMPTRq	<RSCFDn_base> + 0604_H + (10_H × q)
RSCANn	Receive Buffer Data Field 0 Register q	RSCANnRMDF0_q	<RSCFDn_base> + 0608_H + (10_H × q)
RSCANn	Receive Buffer Data Field 1 Register q	RSCANnRMDF1_q	<RSCFDn_base> + $060C_H$ + (10_H × q)
Receive FIFO buffer-related registers			
RSCANn	Receive FIFO Buffer Configuration and Control Register x	RSCANnRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Status Register x	RSCANnRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Pointer Control Register x	RSCANnRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Access ID Register x	RSCANnRFIDx	<RSCFDn_base> + $0E00_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Pointer Register x	RSCANnRFPTRx	<RSCFDn_base> + $0E04_H$ + (10_H × x)

Module	Register	Symbol	Address
RSCANn	Receive FIFO Buffer Access Data Field 0 Register x	RSCANnRFDF0_x	<RSCFDn_base> + $0E08_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Data Field 1 Register x	RSCANnRFDF1_x	<RSCFDn_base> + $0E0C_H$ + (10_H × x)
Transmit/Receive FIFO buffer related registers			
RSCANn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCANnCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Status Register k	RSCANnCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCANnCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Access ID Register k	RSCANnCFIDk	<RSCFDn_base> + $0E80_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCANnCFPTRk	<RSCFDn_base> + $0E84_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 0 Register k	RSCANnCFDF0_k	<RSCFDn_base> + $0E88_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 1 Register k	RSCANnCFDF1_k	<RSCFDn_base> + $0E8C_H$ + (10_H × k)
FIFO status-related registers			
RSCANn	FIFO Empty Status Register	RSCANnFESTS	<RSCFDn_base> + 0238_H
RSCANn	FIFO Full Status Register	RSCANnFFSTS	<RSCFDn_base> + $023C_H$
RSCANn	FIFO Message Lost Status Register	RSCANnFMSTS	<RSCFDn_base> + 0240_H
RSCANn	RSCANn FIFO Receive FIFO Buffer Interrupt Flag Status Register	RSCANnRFISTS	<RSCFDn_base> + 0244_H
RSCANn	Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register	RSCANnCFRISTS	<RSCFDn_base> + 0248_H
RSCANn	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register	RSCANnCFTISTS	<RSCFDn_base> + $024C_H$
Transmit buffer-related registers			
RSCANn	Transmit Buffer Control Register p	RSCANnTMCp	<RSCFDn_base> + 0250_H + (01_H × p)
RSCANn	Transmit Buffer Status Register p	RSCANnTMSTSp	<RSCFDn_base> + $02D0_H$ + (01_H × p)
RSCANn	Transmit Buffer ID Register p	RSCANnTMIDp	<RSCFDn_base> + 1000_H + (10_H × p)
RSCANn	Transmit Buffer Pointer Register p	RSCANnTMPTRp	<RSCFDn_base> + 1004_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 0 Register p	RSCANnTMDF0_p	<RSCFDn_base> + 1008_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 1 Register p	RSCANnTMDF1_p	<RSCFDn_base> + $100C_H$ + (10_H × p)
RSCANn	Transmit Buffer Interrupt Enable Configuration Register y	RSCANnTMIECy	<RSCFDn_base> + 0390_H + (04_H × y)
Transmit buffer status-related registers			
RSCANn	Transmit Buffer Transmit Request Status Register y	RSCANnTMTRSTSy	<RSCFDn_base> + 0350_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Request Status Register y	RSCANnTMTARSTSy	<RSCFDn_base> + 0360_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Complete Status Register y	RSCANnTMTCSTSy	<RSCFDn_base> + 0370_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Status Register y	RSCANnTMTASTSy	<RSCFDn_base> + 0380_H + (04_H × y)
Transmit queue-related registers			
RSCANn	Transmit Queue Configuration and Control Register m	RSCANnTXQCCm	<RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCANn	Transmit Queue Status Register m	RSCANnTXQSTSm	<RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCANn	Transmit Queue Pointer Control Register m	RSCANnTXQPCTRm	<RSCFDn_base> + $03E0_H$ + (04_H × m)
Transmit history-related registers			
RSCANn	Transmit History Configuration and Control Register m	RSCANnTHLCCm	<RSCFDn_base> + 0400_H + (04_H × m)
RSCANn	Transmit History Status Register m	RSCANnTHLSTSm	<RSCFDn_base> + 0420_H + (04_H × m)
RSCANn	Transmit History Pointer Control Register m	RSCANnTHLPCTRm	<RSCFDn_base> + 0440_H + (04_H × m)
RSCANn	Transmit History Access Register m	RSCANnTHLACCm	<RSCFDn_base> + 1800_H + (04_H × m)

Module	Register	Symbol	Address
Test-related registers

Table 25.15 RSCANnGRMCFG Register Contents

Bit	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CANFD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 places the RS-CANFD module in classical CAN mode.
Setting this bit to 1 places the RS-CANFD module in CANFD mode. To switch CANFD mode to classical CAN mode, set the value after reset in all registers and bits allocated to the register map of CANFD mode and then modify the RSCANnGRMCFG register.

25.3.3 Details of Channel-related Registers

25.3.3.1 RSCANnCmCFG — Channel Configuration Register (m = 0, 1)

Access: RSCANnCmCFG register can be read/written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read/written in 8-bit unitsa

Address: RSCANnCmCFG: <RSCFDn_base> + 0000_H + (10_H × m)
RSCANnCmCFGL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGH: <RSCFDn_base> + 0002_H + (10_H × m)
RSCANnCmCFGLL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGLH: <RSCFDn_base> + 0001_H + (10_H × m),
RSCANnCmCFGHL: <RSCFDn_base> + 0002_H + (10_H × m),

15 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Set When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before shifting to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see section 25.11.1, Initial Settings.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

25.3.3.2 RSCANnCmCTR — Channel Control Register (m = 0, 1)

Access: RSCANnCmCTR register can be read/written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read/written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read/written in 8-bit units

Address: RSCANnCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)
RSCANnCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)
RSCANnCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
RSCANnCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),
RSCANnCmCTRHH: <RSCFDn_base> + 0007_H + (10_H × m)

Value after reset: $0000\ 0005_H$

8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bit

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.
When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.
Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bit

These bits are used to select the bus off recovery mode of the RS-CANFD module.
When the BOM[1:0] bits are set to 00B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.
When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01B, the CHMDC[1:0] bits in the RSCFDnCmCTRRSCANnCmCTR register (m = 0, 1) are set to 10B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCmSTSRSCANnCmSTS register are cleared to 00H.
When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10B, the CHMDC[1:0] bits are set to 10B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00H.
When the BOM[1:0] bits are set to 11B and the CHMDC[1:0] bits are set to 10B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10B, a bus off recovery interrupt request is generated.
If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated.
Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to 00H and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in theRSCANnCmCTR register are 00B (ISO11898-1 compliant).
A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bit

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see section 25.6.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

25.3.3.3 RSCANnCmSTS — Channel Status Register (m = 0, 1)

Access: RSCANnCmSTS register can be read only in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers can be read only in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSLH, RSCANnCmSTSHL, RSCANnCmSTSHH registers can be read only in 8-bit units

Address: RSCANnCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
RSCANnCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),

Table 25.18 RSCANnCmSTS Register Contents

Bit	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	These bits are read as the value after reset.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).
These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).
These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.
This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

25.3.3.4 RSCANnCmERFL — Channel Error Flag Register (m = 0, 1)

Access: RSCANnCmERFL register can be read/written in 32-bit units
RSCANnCmERFLL, RSCANnCmERFLH registers can be read/written in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH, RSCANnCmERFLHL, RSCANnCmERFLHH registers can be read/written in 8-bit units

Address: RSCANnCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)
RSCANnCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)
RSCANnCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLLH: <RSCFDn_base> + $000D_H$ + (10_H × m),
RSCANnCmERFLHL: <RSCFDn_base> + $000E_H$ + (10_H × m),
RSCANnCmERFLHH: <RSCFDn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLF	BORF	BOEF	EPF	EWF	BEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.19 RSCANnCmERFL Register Contents

Bit	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
30 to 16	CRCREG [14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.

Bit	Bit Name	Function
6	BLF	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.
If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01B (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 10B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0, 1) set to 01B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127).
This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

Note: To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

25.3.4 Details of Global-related Registers

25.3.4.1 RSCANnGCFG — Global Configuration Register

Access: RSCANnGCFG register can be read/written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

Address: RSCANnGCFG: <RSCFDn_base> + 0084_H
RSCANnGCFGL: <RSCFDn_base> + 0084_H, RSCANnGCFGH: <RSCFDn_base> + 0086_H
RSCANnGCFGLL: <RSCFDn_base> + 0084_H, RSCANnGCFGLH: <RSCFDn_base> + 0085_H,
RSCANnGCFGHL: <RSCFDn_base> + 0086_H, RSCANnGCFGHH: <RSCFDn_base> + 0087_H

Value after reset: $0000\ 0000_H$

Bit	Bit Name	Function
7	TMTSCE	Transmission Timestamp Enable 0: Transmission timestamp is disabled. 1: Transmission timestamp is enabled.
6, 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000B.
Note 2. For the CAN clock frequency settings, see section 25.1.3, Clock Supply.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See section 25.8.3.1, Interval Transmission Function.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bits

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bits

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

DCS Bits

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).
When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).
For the CAN clock frequency settings, see Table 25.6.

MME Bits

Setting this bit to 1 makes the mirror function available.

DRE Bits

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00H is stored in each data byte beyond the DLC value of the receive rule.
The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bits

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bits

This bit is used to set the transmit priority.
When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.
While the transmit queue is in use, this bit should be set to 0.

25.3.4.2 RSCANnGCTR — Global Control Register

Access: RSCANnGCTR register can be read/written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL, RSCANnGCTRHH registers can be read/written in 8-bit units

Address: RSCANnGCTR: <RSCFDn_base> + 0088_H
RSCANnGCTRL: <RSCFDn_base> + 0088_H, RSCANnGCTRH: <RSCFDn_base> + $008A_H$
RSCANnGCTRLL: <RSCFDn_base> + 0088_H, RSCANnGCTRLH: <RSCFDn_base> + 0089_H,
RSCANnGCTRHL: <RSCFDn_base> + $008A_H$, RSCANnGCTRHH: <RSCFDn_base> + $008B_H$

Value after reset: $0000\ 0005_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSRST

Table 25.21 RSCANnGCTR Register Contents

Bit	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSCregister is cleared to 0000H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in theRSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in theRSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in theRSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bit

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see section 25.6.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

25.3.4.3 RSCANnGSTS — Global Status Register

Access: RSCANnGSTS register can be read only in 32-bit units
RSCANnGSTSL, RSCANnGSTSH registers can be read only in 16-bit units
RSCANnGSTSLL, RSCANnGSTSLH, RSCANnGSTSHL, RSCANnGSTSHH registers can be read only in 8-bit units

Address: RSCANnGSTS: <RSCFDn_base> + $008C_H$
RSCANnGSTSL: <RSCFDn_base> + $008C_H$, RSCANnGSTSH: <RSCFDn_base> + $008E_H$
RSCANnGSTSLL: <RSCFDn_base> + $008C_H$, RSCANnGSTSLH: <RSCFDn_base> + $008D_H$,
RSCANnGSTSHL: <RSCFDn_base> + $008E_H$, RSCANnGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: $0000\ 000D_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	GRAM INIT	GSLP STS	GHLT STS	GRST STS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.22 RSCANnGSTS Register Contents

Bit	Bit Name	Function
31 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.
This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

25.3.4.4 RSCANnGERFL — Global Error Flag Register

Access: RSCANnGERFL register can be read/written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLLH, RSCANnGERFLHL, RSCANnGERFLHH registers can be read/written in 8-bit units

Address: RSCANnGERFL: <RSCFDn_base> + 0090_H
RSCANnGERFLL: <RSCFDn_base> + 0090_H, RSCANnGERFLH: <RSCFDn_base> + 0092_H
RSCANnGERFLLL: <RSCFDn_base> + 0090_H, RSCANnGERFLLH: <RSCFDn_base> + 0091_H,
RSCANnGERFLHL: <RSCFDn_base> + 0092_H, RSCANnGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*

Note: The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.23 RSCANnGERFL Register Contents

Bit	Bit Name	Function
31 to 14, 7, 6, 4, 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13 to 8, 5	Reserved	When read, an undefined value is returned.The write value should be the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0, 1) is set to 1.
This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in theRSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 5) is set to 1.
This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

Note: To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”

25.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

Access: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL, RSCANnGTSCH registers can be read only in 16-bit units.

Address: RSCANnGTSC: <RSCFDn_base> + 0094_H
RSCANnGTSCL: <RSCFDn_base> + 0094_H, RSCANnGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.24 RSCANnGTSC Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.
The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the GRSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

25.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register can be read only in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCANnGTINTSTS0: <RSCFDn_base> + 0460_H
RSCANnGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0H: <RSCFDn_base> + 0462_H
RSCANnGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCANnGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCANnGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THIF1	CFTIF1	TQIF1	TAIF1	TSIF1	—	—	—	THIF0	CFTIF0	TQIF0	TAIF0	TSIF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 25.25 RSCANnGTINTSTS0 Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.

Bit	Bit Name	Function
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10B (transmit completed without abort request) or 11B (transmit completed with abort request).
When the TMTRF[1:0] flags are cleared to 00B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01B (transmit abort completed).
This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.
When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.
When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.
When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

25.3.4.7 RSCANnGFDCFG — Global FD configuration register

Access: RSCANnGFDCFG register can be read/written in 32-bit unit
RSCANnGFDCFGL and RSCANnGFDCFGH registers can be read/written in 16-bit unit
RSCANnGFDCFGLL, RSCANnGFDCFGLH, RSCANnGFDCFGHL, RSCANnGFDCFGHH registers can be read/written in 8-bit unit

Address: RSCANnGFDCFG: <RSCFDn_base> + 0474_H
RSCANnGFDCFG L: <RSCFDn_base> + 0474_H, RSCANnGFDCFG H: <RSCFDn_base> + 0476_H
RSCANnGFDCFG LL: <RSCFDn_base> + 0474_H, RSCANnGFDCFG LH: <RSCFDn_base> + 0475_H,
RSCANnGFDCFG HL: <RSCFDn_base> + 0476_H, RSCANnGFDCFG HH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSCCFG[1:0]		—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.26 RSCANnGFDCFG Register Contents

Bit	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	Reserved	When read, an undefined value is returned.The write value should be the value after reset.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

25.3.5 Details of Receive Rule-related Registers

25.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCANnGAFLECTR: <RSCFDn_base> + 0098_H
RSCANnGAFLECTRL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRH: <RSCFDn_base> + $009A_H$
RSCANnGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCANnGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCANnGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AFLDAE	—	—	—	AFLPN[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 25.27 RSCANnGAFLECTR Register Contents

Bit	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 7 (00111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.
Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.
Set these bits to a value within the range of 00000_B to 00111_B.

25.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read/written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCANnGAFLCFG0: <RSCFDn_base> + $009C_H$
RSCANnGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0H: <RSCFDn_base> + $009E_H$
RSCANnGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCANnGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCANnGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.28 RSCANnGAFLCFG0 Register Contents

Bit	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLCFG0 register only in global reset mode.
Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.
Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.
Set these bits to a value within the range of 00_H to 80_H.

25.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLIDj: <RSCFDn_base> + 0500_H + (10_H × j)
RSCANnGAFLIDjL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCFDn_base> + 0502_H + (10_H × j)
RSCANnGAFLIDjLL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + 0501H + (10_H × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + 0502H + (10_H × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + 0503H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAFLID[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.29 RSCANnGAFLIDj Register Contents

Bit	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID [28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.
When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

25.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCANnGAFLMj register can be read/written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLMj: <RSCFDn_base> + 0504_H+ (10_H × j)
RSCANnGAFLMjL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjH: <RSCFDn_base> + 0506_H + (10_H × j)
RSCANnGAFLMjLL: <RSCFDn_base> + 0504_H + (10_H × j),

Table 25.30 RSCANnGAFLMj Register Contents

Bit	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM [28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.
When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

25.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCANnGAFLP0_j register can be read/written in 32-bit units
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP0_j: <RSCFDn_base> + 0508_H + (10_H × j)
RSCANnGAFLP0_jL: <RSCFDn_base> + 0508_H + (10_H × j),

Table 25.31 RSCANnGAFLP0_j Register Contents

Bit	Bit Name	Function
31 to 28	GAFLDLC [3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR [11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP [6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

25.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCANnGAFLP1_j register can be read/written in 32-bit units
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP1_j: <RSCFDn_base> + 050CH + (10_H × j)
RSCANnGAFLP1_jL: <RSCFDn_base> + 050CH + (10_H × j),
RSCANnGAFLP1_jH: <RSCFDn_base> + 050EH + (10_H × j)
RSCANnGAFLP1_jLL: <RSCFDn_base> + 050CH + (10_H × j),
RSCANnGAFLP1_jLH: <RSCFDn_base> + 050DH + (10_H × j),
RSCANnGAFLP1_jHL: <RSCFDn_base> + 050EH + (10_H × j),
RSCANnGAFLP1_jHH: <RSCFDn_base> + 050FH + (10_H × j)

Value after reset: 0000 0000_H

Table 25.32 RSCANnGAFLP1_j Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13 to 8	GAFLFDP [13:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP [7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00B (receive mode) or 10B (gateway mode) are selectable.

25.3.6 Details of Receive Buffer-related Registers

25.3.6.1 RSCANnRMNB — Receive Buffer Number Register

Access: RSCANnRMNB register can be read/written in 32-bit units
RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units
RSCANnRMNBLL, RSCANnRMNBLH, RSCANnRMNBHL, RSCANnRMNBHH registers can be read/written in 8-bit units

Address: RSCANnRMNB: <RSCFDn_base> + $00A4_H$
RSCANnRMNBL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBH: <RSCFDn_base> + $00A6_H$
RSCANnRMNBLL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBLH: <RSCFDn_base> + $00A5_H$,
RSCANnRMNBHL: <RSCFDn_base> + $00A6_H$, RSCANnRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.33 RSCANnRMNB Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 32.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

25.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0)

Access: RSCANnRMNDy register can be read/written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

Address: RSCANnRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANnRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)
RSCANnRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyLH: <RSCFDn_base> + $00A9_H$ + (04_H × y),
RSCANnRMNDyHL: <RSCFDn_base> + $00AA_H$ + (04_H × y),

Table 25.34 RSCANnRMNDy Register Contents

Bit	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.
To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.
These flags are cleared to 0 in global reset mode.

25.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 31)

Access: RSCANnRMIDq register can be read only in 32-bit units
RSCFDnRMIDqRSCANnRMIDqL, RSCFDnRMIDqRSCANnRMIDqH registers can be read only in 16-bit units
RSCFDnRMIDqRSCANnRMIDqLL, RSCFDnRMIDqRSCANnRMIDqLH, RSCFDnRMIDqRSCANnRMIDqHL, RSCFDnRMIDqRSCAN-nRMIDqHH registers can be read only in 8-bit units

Address: RSCANnRMIDq: <RSCFDn_base> + 0600_H + (10_H × q)
RSCANnRMIDqL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqH: <RSCFDn_base> + 0602_H + (10_H × q)
RSCANnRMIDqLL: <RSCFDn_base> + 0600_H + (10_H × q),

Table 25.35 RSCANnRMIDq Register Contents

Bit	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	This bit is read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

25.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

Access: RSCANnRMPTRq register can be read only in 32-bit units
RSCFDnRMPTRqRSCANnRMPTRqL, RSCFDnRMPTRqRSCANnRMPTRqH registers can be read only in 16-bit units
RSCFDnRMPTRqRSCANnRMPTRqLL, RSCFDnRMPTRqRSCANnRMPTRqLH, RSCFDnRMPTRqRSCANnRMPTRqHL, RSCFDnRMPTRqRSCANnRMPTRqHH registers can be read only in 8-bit units

Address: RSCANnRMPTRq: <RSCFDn_base> + 0604_H + (10_H × q)
RSCANnRMPTRqL: <RSCFDn_base> + 0604_H + (10_H × q),

15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

25.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31)

Access: RSCANnRMDF0_q register can be read only in 32-bit units
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

Address:
RSCANnRMDF0_q: <RSCFDn_base> + 0608_H + (10_H × q)
RSCANnRMDF0_qL: <RSCFDn_base> + 0608_H + (10_H × q),

15 to 8	RMDB1[7:0]	Receive Buffer Data Byte 1
7 to 0	RMDB0[7:0]	Receive Buffer Data Byte 0 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

25.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 31)

Access: RSCANnRMDF1_q register can be read only in 32-bit units
RSCANnRMDF1_qL, RSCANnRMDF1_qH registers can be read only in 16-bit units
RSCANnRMDF1_qLL, RSCANnRMDF1_qLH, RSCANnRMDF1_qHL, RSCANnRMDF1_qHH registers can be read only in 8-bit units

Address: RSCANnRMDF1_q: <RSCFDn_base> + $060C_H$ + (10_H × q)
RSCANnRMDF1_qL: <RSCFDn_base> + $060C_H$ + (10_H × q),
RSCANnRMDF1_qH: <RSCFDn_base> + $060E_H$ + (10_H × q)
RSCANnRMDF1_qLL: <RSCFDn_base> + $060C_H$ + (10_H × q),
RSCANnRMDF1_qLH: <RSCFDn_base> + $060D_H$ + (10_H × q),
RSCANnRMDF1_qHL: <RSCFDn_base> + $060E_H$ + (10_H × q),
RSCANnRMDF1_qHH: <RSCFDn_base> + $060F_H$ + (10_H × q)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.38 RSCANnRMDF1_q Register Contents

Bit	Bit Name	Function
31 to 24	RMDB7[7:0]	Receive Buffer Data Byte 7
23 to 16	RMDB6[7:0]	Receive Buffer Data Byte 6
15 to 8	RMDB5[7:0]	Receive Buffer Data Byte 5
7 to 0	RMDB4[7:0]	Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

25.3.7 Details of Receive FIFO Buffer-related Registers

25.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCANnRFCCxregister can be read/written in 32-bit units
RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units

Address: RSCANnRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCANnRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxH: <RSCFDn_base> + $00BA_H$ + (04_H × x)
RSCANnRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxLH: <RSCFDn_base> + $00B9_H$ + (04_H × x),
RSCANnRFCCxHL: <RSCFDn_base> + $00BA_H$ + (04_H × x),
RSCANnRFCCxHH: <RSCFDn_base> + $00BB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 25.39 RSCANnRFCCx Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.

Bit	Bit Name	Function
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).
When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnRFSTSxRSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.
Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.
This bit is cleared to 0 in global reset mode.

25.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCANnRFSTSx register can be read/written in 32-bit units
RSCANnRFSTSxL, RSCANnRFSTSxH registers can be read/written in 16-bit units
RSCANnRFSTSxLL, RSCANnRFSTSxLH, RSCANnRFSTSxHL, RSCANnRFSTSxHH registers can be read/written in 8-bit units

Address: RSCANnRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCANnRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)
RSCANnRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x),
RSCANnRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x),
RSCANnRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.40 RSCANnRFSTSx Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0,

using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.
This flag is cleared to 0 in global reset mode or by writing 0 to this flag.
Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.
If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.
This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

Note: To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

25.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCANnRFPCTRx register can only be written in 32-bit units
RSCANnRFPCTRxL, RSCANnRFPCTRxH registers can only be written in 16-bit units
RSCANnRFPCTRxLL, RSCANnRFPCTRxLH, RSCANnRFPCTRxHL, RSCANnRFPCTRxHH registers can only be written in 8-bit units

Address: RSCANnRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCANnRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxH: <RSCFDn_base> + $00FA_H$ + (04_H × x)
RSCANnRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxLH: <RSCFDn_base> + $00F9_H$ + (04_H × x),
RSCANnRFPCTRxHL: <RSCFDn_base> + $00FA_H$ + (04_H × x),
RSCANnRFPCTRxHH: <RSCFDn_base> + $00FB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 25.41 RSCANnRFPCTRx Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.
When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

25.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCANnRFIDx register can be read only in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

Address: RSCANnRFIDx: <RSCFDn_base> + $0E00_H$ + (10_H × x)
RSCANnRFIDxL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxH: <RSCFDn_base> + $0E02_H$ + (10_H × x)
RSCANnRFIDxLL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxLH: <RSCFDn_base> + $0E01_H$ + (10_H × x),
RSCANnRFIDxHL: <RSCFDn_base> + $0E02_H$ + (10_H × x),

Table 25.42 RSCANnRFIDx Register Contents

Bit	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	This bit is read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

25.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCANnRFPTRx register can be read only in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

Address: RSCANnRFPTRx: <RSCFDn_base> + $0E04_H$ + (10_H × x)
RSCANnRFPTRxL: <RSCFDn_base> + $0E04_H$ + (10_H × x),

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

25.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

Access: RSCANnRFDF0_x register can be read only in 32-bit units
RSCANnRFDF0_xL, RSCANnRFDF0_xH registers can be read only in 16-bit units
RSCANnRFDF0_xLL, RSCANnRFDF0_xLH, RSCANnRFDF0_xHL, RSCANnRFDF0_xHH registers can be read only in 8-bit units

Address: RSCANnRFDF0_x: <RSCFDn_base> + $0E08_H$ + (10_H × x)
RSCANnRFDF0_xL: <RSCFDn_base> + $0E08_H$ + (10_H × x),

Table 25.45 RSCANnRFDF1_x Register Contents

Bit	Bit Name	Function
31 to 24	RFDB7[7:0]	Receive FIFO Buffer Data Byte 7
23 to 16	RFDB6[7:0]	Receive FIFO Buffer Data Byte 6
15 to 8	RFDB5[7:0]	Receive FIFO Buffer Data Byte 5
7 to 0	RFDB4[7:0]	Receive FIFO Buffer Data Byte 4 Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

25.3.8 Details of Transmit/Receive FIFO Buffer-related Registers

25.3.8.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

Access: RSCANnCFCCk register can be read/written in 32-bit units
RSCANnCFCCkL, RSCANnCFCCkH registers can be read/written in 16-bit units
RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read/written in 8-bit units

Address: RSCANnCFCCk: <RSCFDn_base> + 0118_H + (04_H × k)
RSCANnCFCCkL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCANnCFCCkH: <RSCFDn_base> + $011A_H$ + (04_H × k)
RSCANnCFCCkLL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCANnCFCCkLH: <RSCFDn_base> + 0119_H + (04_H × k),
RSCANnCFCCkHL: <RSCFDn_base> + $011A_H$ + (04_H × k),
RSCANnCFCCkHH: <RSCFDn_base> + $011B_H$ + (04_H × k)

Table 25.46 RSCANnCFCCk Register Contents

Bit	Bit Name	Function
31 to 24	CFITT[7:0]	Set a message transmission interval. Set Value: 00_H to FF_H
23 to 20	CFTML[3:0]	Transmit Buffer Link Configuration Set the transmit buffer number to be linked to the transmit/receive FIFO buffer.
19	CFITR	Transmit/Receive FIFO Interval Timer Resolution 0: Clock dividing pclk by (ITRCP[15:0] bits) 1: Clock dividing pclk by (ITRCP[15:0] bits × 10)
18	CFITSS	Transmit/Receive FIFO Interval Timer Clock Source Select 0: Interval timer clock source selected by the CFITR bit 1: Interval timer clock source is the bit time clock for the channel to which the FIFO is linked.
17 to 16	CFM[1:0]	Transmit/Receive FIFO Mode Select b17 b16 0 0: Receive mode 0 1: Transmit mode 1 0: Gateway mode 1 1: Setting prohibited
15 to 13	CFIGCV[2:0]	Transmit/Receive FIFO Receive Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.

Bit	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).
Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).
See Table 25.11 and Table 25.12, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.
Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.
Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.
When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.
When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.
When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.
Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).
When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.
Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.
Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.
Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.
When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.
This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

25.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

Access: RSCANnCFSTSk register can be read/written in 32-bit units
RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units
RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units

Address: RSCANnCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)
RSCANnCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)
RSCANnCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCANnCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCANnCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.47 RSCANnCFSTSk Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.
When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FFH has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

Note: To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

25.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

Access: RSCANnCFPCTRk register can only be written in 32-bit units
RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units
RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units

Address: RSCANnCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCANnCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCANnCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)

Table 25.48 RSCANnCFPCTRk Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FFH to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FFH to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00B):
  Writing FFH to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write FFH to the CFPC[7:0] bits.
  When writing FFH to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01B):
  Writing FFH to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing FFH to the CFPC[7:0] bits.
  When writing FFH to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the

CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
  Setting prohibited

25.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

Access: RSCANnCFIDk register can be read/written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units

Address: RSCANnCFIDk: <RSCFDn_base> + $0E80_H$ + (10_H × k)
RSCANnCFIDkL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkH: <RSCFDn_base> + $0E82_H$ + (10_H × k)
RSCANnCFIDkLL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkLH: <RSCFDn_base> + $0E81_H$ + (10_H × k),
RSCANnCFIDkHL: <RSCFDn_base> + $0E82_H$ + (10_H × k),
RSCANnCFIDkHH: <RSCFDn_base> + $0E83_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 25.49 RSCANnCFIDk Register Contents

Bit	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFIDk register should not be read or written when the CFM[1:0] value is 10B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.
This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.
When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

25.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

Access: RSCANnCFPTRk register can be read/written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

Address: RSCANnCFPTRk: <RSCFDn_base> + $0E84_H$ + (10_H × k)
RSCANnCFPTRkL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkH: <RSCFDn_base> + $0E86_H$ + (10_H × k)
RSCANnCFPTRkLL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkLH: <RSCFDn_base> + $0E85_H$ + (10_H × k),
RSCANnCFPTRkHL: <RSCFDn_base> + $0E86_H$ + (10_H × k),
RSCANnCFPTRkHH: <RSCFDn_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFDLC[3:0]				CFPTR[11:0]

Table 25.50 RSCANnCFPTRk Register Contents

Bit	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.
These bits are valid when the CFM[1:0] value is 00_B.

25.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 5)

Access: RSCANnCFDF0_k register can be read/written in 32-bit units
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units

Address: RSCANnCFDF0_k: <RSCFDn_base> + $0E88_H$ + (10_H × k)
RSCANnCFDF0_kL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kH: <RSCFDn_base> + $0E8A_H$ + (10_H × k)
RSCANnCFDF0_kLL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + $0E89_H$ + (10_H × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + $0E8A_H$ + (10_H × k),
RSCANnCFDF0_kHH: <RSCFDn_base> + $0E8B_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.52 RSCANnCFDF1_k Register Contents

Bit	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7
23 to 16	CFDB6[7:0]	Transmit/Receive FIFO Buffer Data Byte 6
15 to 8	CFDB5[7:0]	Transmit/Receive FIFO Buffer Data Byte 5
7 to 0	CFDB4[7:0]	Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).
This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.
This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

25.3.9 Details of FIFO Status-related Registers

25.3.9.1 RSCANnFESTS — FIFO Empty Status Register

Access: RSCANnFESTS register can be read only in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units

Address: RSCANnFESTS: <RSCFDn_base> + 0238_H
RSCANnFESTSL: <RSCFDn_base> + 0238_H, RSCANnFESTSH: <RSCFDn_base> + $023A_H$
RSCANnFESTSLL: <RSCFDn_base> + 0238_H, RSCANnFESTSLH: <RSCFDn_base> + 0239_H,
RSCANnFESTSHL: <RSCFDn_base> + $023A_H$, RSCANnFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: 03FF $FFFF_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CF5 EMP	CF4 EMP	CF3 EMP	CF2 EMP	CF1 EMP	CF0 EMP	RF7 EMP	RF6 EMP	RF5 EMP	RF4 EMP	RF3 EMP	RF2 EMP	RF1 EMP	RF0 EMP

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.53 RSCANnFESTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 5)
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains a unread messages. 1: Receive FIFO buffer x contains no unread message. (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCANnFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer

contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

25.3.9.2 RSCANnFFSTS — FIFO Full Status Register

Access: RSCANnFFSTS register can be read only in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units

Address: RSCANnFFSTS: <RSCFDn_base> + $023C_H$
RSCANnFFSTSL: <RSCFDn_base> + $023C_H$, RSCANnFFSTSH: <RSCFDn_base> + $023E_H$
RSCANnFFSTSLL: <RSCFDn_base> + $023C_H$, RSCANnFFSTSLH: <RSCFDn_base> + $023D_H$,
RSCANnFFSTSHL: <RSCFDn_base> + $023E_H$, RSCANnFFSTSHH: <RSCFDn_base> + $023F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.54 RSCANnFFSTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 5)
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCANnFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

25.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access: RSCANnFMSTS register can be read only in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units

Address: RSCANnFMSTS: <RSCFDn_base> + 0240_H
RSCANnFMSTSL: <RSCFDn_base> + 0240_H, RSCANnFMSTSH: <RSCFDn_base> + 0242_H
RSCANnFMSTSLL: <RSCFDn_base> + 0240_H, RSCANnFMSTSLH: <RSCFDn_base> + 0241_H,
RSCANnFMSTSHL: <RSCFDn_base> + 0242_H, RSCANnFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CF5 MLT	CF4 MLT	CF3 MLT	CF2 MLT	CF1 MLT	CF0 MLT	RF7 MLT	RF6 MLT	RF5 MLT	RF4 MLT	RF3 MLT	RF2 MLT	RF1 MLT	RF0 MLT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.55 RSCANnFMSTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 5)
12	CF4MLT	
11	CF3MLT	
10	CF2MLT	
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCANnFMSTS register is cleared to 0000 0000H in global reset mode.

CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

25.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register can be read only in 32-bit units
RSCANnRFISTSL, RSCANnRFISTSH registers can be read only in 16-bit units

Table 25.56 RSCANnRFISTS Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

25.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register can be read only in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units

Address: RSCANnCFRISTS: <RSCFDn_base> + 0248_H
RSCANnCFRISTSL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSH: <RSCFDn_base> + $024A_H$
RSCANnCFRISTSLL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSLH: <RSCFDn_base> + 0249_H,

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.57 RSCANnCFRISTS Register Contents

Bit	Bit Name	Function
31 to 6	Reserved	These bits are read as the value after reset.
5	CF5RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 5)
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCANnCFRISTS register is cleared to 0000 0000H in global reset mode.

CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

25.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register can be read only in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units

Address: RSCANnCFTISTS: <RSCFDn_base> + $024C_H$
RSCANnCFTISTSL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSH: <RSCFDn_base> + $024E_H$
RSCANnCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSLH: <RSCFDn_base> + $024D_H$,
RSCANnCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCANnCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	CF5 TXIF	CF4 TXIF	CF3 TXIF	CF2 TXIF	CF1 TXIF	CF0 TXIF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.58 RSCANnCFTISTS Register Contents

Bit	Bit Name	Function
31 to 6	Reserved	These bits are read as the value after reset.
5	CF5TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 5)
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCANnCFTISTS register is cleared to 0000 0000H in global reset mode.

CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

25.3.10 Details of Transmit Buffer-related Registers

25.3.10.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 31)

Access: RSCANnTMCp registers can be read/written in 8-bit units

Address: RSCANnTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W *1	R/W *1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 25.59 RSCANnTMCp Register Contents

Bit	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.
Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.
The TMTAR bit can be set to 1 when TMTR bit is 1.
The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.
The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

25.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

Access: RSCANnTMSTSp registers can be read/written in 8-bit units

Address: RSCANnTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R

Table 25.60 RSCANnTMSTSp Register Contents

Bit	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.
The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.
The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.
00B: Transmission is in progress or no transmit request is present.
01B: Transmission from the transmit buffer was aborted.
10B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).
11B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).
Write 00B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

25.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 31)

Access: RSCANnTMIDp register can be read/written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

Address: RSCANnTMIDp: <RSCFDn_base> + 1000_H + (10_H × p)
RSCANnTMIDpL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpH: <RSCFDn_base> + 1002_H + (10_H × p)
RSCANnTMIDpLL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpLH: <RSCFDn_base> + 1001_H + (10_H × p),
RSCANnTMIDpHL: <RSCFDn_base> + 1002_H + (10_H × p),
RSCANnTMIDpHH: <RSCFDn_base> + 1003_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	TMID[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.61 RSCANnTMIDp Register Contents

Bit	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the

transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

25.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

Access: RSCANnTMPTRp register can be read/written in 32-bit units
RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units
RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

Address: RSCANnTMPTRp: <RSCFDn_base> + 1004_H + (10_H × p)
RSCANnTMPTRpL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpH: <RSCFDn_base> + 1006_H + (10_H × p)
RSCANnTMPTRpLL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpLH: <RSCFDn_base> + 1005_H + (10_H × p),
RSCANnTMPTRpHL: <RSCFDn_base> + 1006_H + (10_H × p),
RSCANnTMPTRpHH: <RSCFDn_base> + 1007_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDLC[3:0]				—	—	—	—	TMPTR[7:0]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.62 RSCANnTMPTRp Register Contents

Bit	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001B or more, the transmit data is 8 bytes long.
When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

25.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 31)

Access: RSCANnTMDF0_p register can be read/written in 32-bit units
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

Address: RSCANnTMDF0_p: <RSCFDn_base> + 1008_H + (10_H × p)
RSCANnTMDF0_pL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pH: <RSCFDn_base> + $100A_H$ + (10_H × p)
RSCANnTMDF0_pLL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + 1009_H + (10_H × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + $100A_H$ + (10_H × p),
RSCANnTMDF0_pHH: <RSCFDn_base> + $100B_H$ + (10_H × p)

Value after reset: $0000\ 0000_H$

Table 25.64 RSCANnTMDF1_p Register Contents

Bit	Bit Name	Function
31 to 24	TMDB7[7:0]	Transmit Buffer Data Byte 7
23 to 16	TMDB6[7:0]	Transmit Buffer Data Byte 6
15 to 8	TMDB5[7:0]	Transmit Buffer Data Byte 5
7 to 0	TMDB4[7:0]	Transmit Buffer Data Byte 4 Set the transmit buffer data.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

25.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0)

Access: RSCANnTMIECy register can be read/written in 32-bit units
RSCANnTMIECyL, RSCANnTMIECyH registers can be read/written in 16-bit units
RSCANnTMIECyLL, RSCANnTMIECyLH, RSCANnTMIECyHL, RSCANnTMIECyHH registers can be read/written in 8-bit units

Address: RSCANnTMIECy: <RSCFDn_base> + 0390_H + (04_H × y)
RSCANnTMIECyL: <RSCFDn_base> + 0390_H + (04_H × y),

Table 25.65 RSCANnTMIECy Register Contents

Bit	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 25.66 shows the bit assignment.

Table 25.67 RSCANnTMTRSTSy Register Contents

Bit	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 25.68 shows the bit assignment.

Table 25.75 RSCANnTXQCCm Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.
Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see Figure 25.9. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.
Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

25.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0, 1)

Access: RSCANnTXQSTSm register can be read/written in 32-bit units
RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units
RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCANnTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m),

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.76 RSCANnTXQSTSm Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	Reserved	When read, an undefined value is returned.The write value should be the value after reset.
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred. The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.
This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.
This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

25.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

Access: RSCANnTXQPCTRm register can only be written in 32-bit units
RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units
RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCANnTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmH: <RSCFDn_base> + $03E2_H$ + (04_H × m)
RSCANnTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmLH: <RSCFDn_base> + $03E1_H$ + (04_H × m),
RSCANnTXQPCTRmHL: <RSCFDn_base> + $03E2_H$ + (04_H × m),
RSCANnTXQPCTRmHH: <RSCFDn_base> + $03E3_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 25.77 RSCANnTXQPCTRm Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FFH to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FFH to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31) before writing FFH to the TXQPC[7:0] bits.
When writing FFH to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

25.3.13 Details of Transmit history-related Registers

25.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

Access: RSCANnTHLCCm register can be read/written in 32-bit units
RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units

Address: RSCANnTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)
RSCANnTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)
RSCANnTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
RSCANnTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),
RSCANnTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.78 RSCANnTHLCCm Register Contents

Bit	Bit Name	Function
31 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.
Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer. Modify this bit in channel communication mode or channel halt mode.
This bit is cleared to 0 in channel reset mode.

25.3.13.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0, 1)

Access: RSCANnTHLSTSm register can be read/written in 32-bit units
RSCANnTHLSTSmL, RSCANnTHLSTSmH registers can be read/written in 16-bit units
RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)
RSCANnTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)
RSCANnTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
RSCANnTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
RSCANnTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.79 RSCANnTHLSTSm Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

HLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

HLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.
When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.
When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.
This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

Note: To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

25.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

Access: RSCANnTHLPCTRm register can only be written in 32-bit units
RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units
RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)
RSCANnTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)
RSCANnTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
RSCANnTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
RSCANnTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	THLPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 25.80 RSCANnTHLPCTRm Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FFH to these bits moves the read pointer to the next unread data in the transmit history buffer.

HLPC[7:0] Bits

When the THLPC[7:0] bits are set to FFH, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write FFH to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.
When writing FFH to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

25.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0, 1)

Access: RSCANnTHLACCm register can be read only in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

Address: RSCANnTHLACCm: <RSCFDn_base> + 1800_H + (04_H × m)
RSCANnTHLACCmL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmH: <RSCFDn_base> + 1802_H + (04_H × m)
RSCANnTHLACCmLL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmLH: <RSCFDn_base> + 1801_H + (04_H × m),
RSCANnTHLACCmHL: <RSCFDn_base> + 1802_H + (04_H × m),
RSCANnTHLACCmHH: <RSCFDn_base> + 1803_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TID[7:0]								—	BN[3:0]				BT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.81 RSCANnTHLACCm Register Contents

Bit	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	This bit is read as the value after reset.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

25.3.14 Details of Test-related Registers

25.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read/written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCFG: <RSCFDn_base> + 0468_H
RSCANnGTSTCFGL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGH: <RSCFDn_base> + $046A_H$
RSCANnGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGLH: <RSCFDn_base> + 0469_H,
RSCANnGTSTCFGHL: <RSCFDn_base> + $046A_H$, RSCANnGTSTCFGHH: <RSCFDn_base> + $046B_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	RTMPS[6:0]

Table 25.82 RSCANnGTSTCFG Register Contents

Bit	Bit Name	Function
31 to 23	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 19 (13_H).
15 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 13_H, inclusive.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

25.3.14.2 RSCANnGTSTCTR — Global Test Control Register

Access: RSCANnGTSTCTR register can be read/written in 32-bit units
RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units
RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCTR: <RSCFDn_base> + $046C_H$
RSCANnGTSTCTRL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRH: <RSCFDn_base> + $046E_H$
RSCANnGTSTCTRLL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRLH: <RSCFDn_base> + $046D_H$,
RSCANnGTSTCTRHL: <RSCFDn_base> + $046E_H$, RSCANnGTSTCTRHH: <RSCFDn_base> + $046F_H$

Value after reset: $0000\ 0000_H$

	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 25.83 RSCANnGTSTCTR Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.
This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.
This bit is cleared to 0 in global reset mode.

25.3.14.3 RSCANnGLOCKK — Global Lock Key Register

Access: RSCANnGLOCKK register can only be written in 32-bit units
RSCANnGLOCKKL, RSCANnGLOCKKH registers can only be written in 16-bit units

Address: RSCANnGLOCKK: <RSCFDn_base> + $047C_H$
RSCANnGLOCKKL: <RSCFDn_base> + $047C_H$, RSCANnGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 25.84 RSCANnGLOCKK Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.
For the protection release data, see section 25.11.4.2, Procedure for Releasing the Protection.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.
After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000H to <RSCFDn_base> + 04FFH) of the CAN (except the RAM) enables the protection again.
Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

25.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCANnRPGACCr register can be read/written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units

Address: RSCANnRPGACCr: <RSCFDn_base> + 1900_H + (04_H × r)
RSCANnRPGACCrL: <RSCFDn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrH: <RSCFDn_base> + 1902_H + (04_H × r)
RSCANnRPGACCrLL: <RSCFDn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrLH: <RSCFDn_base> + 1901_H + (04_H × r),
RSCANnRPGACCrHL: <RSCFDn_base> + 1902_H + (04_H × r),
RSCANnRPGACCrHH: <RSCFDn_base> + 1903_H + (04_H × r)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDTA[31:16]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDTA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.85 RSCANnRPGACCr Register Contents

Bit	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).
The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

25.4 Registers (CANFD Mode)

This section describes all registers to be used when the RS-CANFD is used in CANFD mode.

25.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CANFD mode.
For details about <RSCFDn_base>, see section 25.1.2, Register Base Address.

- Table 25.176, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 25.177, Registers Initialized Only in Global Reset Mode

Table 25.86 Registers

Module	Register	Symbol	Address
Interface mode-related register			
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCFDn	Channel m control register	RSCFDnCFDCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCFDn	Channel m status register	RSCFDnCFDCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCFDn	Channel m error flag register	RSCFDnCFDCmERFL	<RSCFDn_base> + $000C_H$ + (10_H× m)
RSCFDn	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCFDn_base> + 0500_H + (20_H × m)
RSCFDn	Channel m CANFD configuration register	RSCFDnCFDCmFDCFG	<RSCFDn_base> + 0504_H + (20_H × m)
RSCFDn	Channel m CANFD control register	RSCFDnCFDCmFDCTR	<RSCFDn_base> + 0508_H + (20_H × m)
RSCFDn	Channel m CANFD status register	RSCFDnCFDCmFDSTS	<RSCFDn_base> + $050C_H$ + (20_H × m)
RSCFDn	Channel m CANFD CRC register	RSCFDnCFDCmFDCRC	<RSCFDn_base> + 0510_H + (20_H × m)
Global-related registers			
RSCFDn	Global configuration register	RSCFDnCFDGCFG	<RSCFDn_base> + 0084_H
RSCFDn	Global control register	RSCFDnCFDGCTR	<RSCFDn_base> + 0088_H
RSCFDn	Global status register	RSCFDnCFDGSTS	<RSCFDn_base> + $008C_H$
RSCFDn	Global error flag register	RSCFDnCFDGERFL	<RSCFDn_base> + 0090_H
RSCFDn	Global timestamp counter register	RSCFDnCFDGTSC	<RSCFDn_base> + 0094_H
RSCFDn	Global TX Interrupt Status Register 0	RSCFDnCFDGTINTSTS0	<RSCFDn_base> + 0460_H
RSCFDn	Global FD configuration register	RSCFDnCFDGFDCFG	<RSCFDn_base> + 0474_H
Receive rule-related registers			
RSCFDn	Receive Rule Entry Control Register	RSCFDnCFDGAFLECTR	<RSCFDn_base> + 0098_H
RSCFDn	Receive Rule Configuration Register 0	RSCFDnCFDGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCFDn	Receive Rule ID Register j	RSCFDnCFDGAFLIDj	<RSCFDn_base> + 1000_H + (10_H × j)
RSCFDn	Receive Rule Mask Register j	RSCFDnCFDGAFLMj	<RSCFDn_base> + 1004_H + (10_H × j)
RSCFDn	Receive Rule Pointer 0 Register j	RSCFDnCFDGAFLP0_j	<RSCFDn_base> + 1008_H + (10_H × j)
RSCFDn	Receive Rule Pointer 1 Register j	RSCFDnCFDGAFLP1_j	<RSCFDn_base> + $100C_H$ + (10_H × j)
Receive buffer-related registers			
RSCFDn	Receive Buffer Number Register	RSCFDnCFDRMNB	<RSCFDn_base> + $00A4_H$
RSCFDn	Receive Buffer New Data Register y	RSCFDnCFDRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDn	Receive Buffer ID Register q	RSCFDnCFDRMIDq	<RSCFDn_base> + 2000_H + (20_H × q)
RSCFDn	Receive Buffer Pointer Register q	RSCFDnCFDRMPTRq	<RSCFDn_base> + 2004_H + (20_H × q)
RSCFDn	Receive Buffer CANFD status register q	RSCFDnCFDRMFDSTSq	<RSCFDn_base> + 2008_H + (20_H × q)
RSCFDn	Receive Buffer Data Field b Register q	RSCFDnCFDRMDFb_q	<RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)

Module	Register	Symbol	Address
Receive FIFO buffer-related registers			
RSCFDn	Receive FIFO Buffer Configuration and Control Register x	RSCFDnCFDRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Status Register x	RSCFDnCFDRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Pointer Control Register x	RSCFDnCFDRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Access ID Register x	RSCFDnCFDRFIDx	<RSCFDn_base> + 3000_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Pointer Register x	RSCFDnCFDRFPTRx	<RSCFDn_base> + 3004_H + (80_H × x)
RSCFDn	Receive FIFO CANFD status register x	RSCFDnCFDRFFDSTSx	<RSCFDn_base> + 3008_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Data Field d Register x	RSCFDnCFDRFDFd_x	<RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
Transmit/Receive FIFO buffer related registers			
RSCFDn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCFDnCFDCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Status Register k	RSCFDnCFDCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCFDnCFDCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access ID Register k	RSCFDnCFDCFIDk	<RSCFDn_base> + 3400_H + (80_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCFDnCFDCFPTRk	<RSCFDn_base> + 3404_H + (80_H × k)
RSCFDn	Transmit/receive FIFO CANFD configuration/status register k	RSCFDnCFDCFFDCSTSk	<RSCFDn_base> + 3408_H + (80_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access Data Field d Register k	RSCFDnCFDCFDFd_k	<RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
FIFO status-related registers			
RSCFDn	FIFO Empty Status Register	RSCFDnCFDFESTS	<RSCFDn_base> + 0238_H
RSCFDn	FIFO Full Status Register	RSCFDnCFDFFSTS	<RSCFDn_base> + $023C_H$
RSCFDn	FIFO Message Lost Status Register	RSCFDnCFDFMSTS	<RSCFDn_base> + 0240_H
RSCFDn	Receive FIFO Buffer Interrupt Flag Status Register	RSCFDnCFDRFISTS	<RSCFDn_base> + 0244_H
RSCFDn	Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register	RSCFDnCFDCFRISTS	<RSCFDn_base> + 0248_H
RSCFDn	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register	RSCFDnCFDCFTISTS	<RSCFDn_base> + $024C_H$
FIFO DMA-related registers			
RSCFDn	DMA enable register	RSCFDnCFDCDTCT	<RSCFDn_base> + 0490_H
RSCFDn	DMA status register	RSCFDnCFDCDTSTS	<RSCFDn_base> + 0494_H
Transmit buffer-related registers			
RSCFDn	Transmit Buffer Control Register p	RSCFDnCFDTMCp	<RSCFDn_base> + 0250_H + (01_H × p)
RSCFDn	Transmit Buffer Status Register p	RSCFDnCFDTMSTSp	<RSCFDn_base> + $02D0_H$ + (01_H × p)
RSCFDn	Transmit Buffer ID Register p	RSCFDnCFDTMIDp	<RSCFDn_base> + 4000_H + (20_H × p)
RSCFDn	Transmit Buffer Pointer Register p	RSCFDnCFDTMPTRp	<RSCFDn_base> + 4004_H + (20_H × p)
RSCFDn	Transmit Buffer CANFD configuration register p	RSCFDnCFDTMFDCTRp	<RSCFDn_base> + 4008_H + (20_H × p)
RSCFDn	Transmit Buffer Data Field b Register p	RSCFDnCFDTMDFb_p	<RSCFDn_base> + $400C_H$ + (04_H × b) + (20H × p)
RSCFDn	Transmit Buffer Interrupt Enable Configuration Register y	RSCFDnCFDTMIECy	<RSCFDn_base> + 0390_H + (04_H × y)
Transmit buffer status-related registers			
RSCFDn	Transmit Buffer Transmit Request Status Register y	RSCFDnCFDTMTRSTSy	<RSCFDn_base> + 0350_H + (04_H × y)
RSCFDn	Transmit Buffer Transmit Abort Request Status Register y	RSCFDnCFDTMTARSTSy	<RSCFDn_base> + 0360_H + (04_H × y)
RSCFDn	Transmit Buffer Transmit Complete Status Register y	RSCFDnCFDTMTCSTSy	<RSCFDn_base> + 0370_H + (04_H × y)

Module	Register	Symbol	Address
RSCFDn	Transmit Buffer Transmit Abort Status Register y	RSCFDnCFDTMTASTSy	<RSCFDn_base> + 0380_H + (04_H × y)
Transmit queue-related registers			
RSCFDn	Transmit Queue Configuration and Control Register m	RSCFDnCFDTXQCCm	<RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCFDn	Transmit Queue Status Register m	RSCFDnCFDTXQSTSm	<RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDn	Transmit Queue Pointer Control Register m	RSCFDnCFDTXQPCTRm	<RSCFDn_base> + $03E0_H$ + (04_H × m)
Transmit history-related registers			
RSCFDn	Transmit History Configuration and Control Register m	RSCFDnCFDTHLCCm	<RSCFDn_base> + 0400_H + (04_H × m)
RSCFDn	Transmit History Status Register m	RSCFDnCFDTHLSTSm	<RSCFDn_base> + 0420_H + (04_H × m)
RSCFDn	Transmit History Pointer Control Register m	RSCFDnCFDTHLPCTRm	<RSCFDn_base> + 0440_H + (04_H × m)
RSCFDn	Transmit History Access Register m	RSCFDnCFDTHLACCm	<RSCFDn_base> + 6000_H + (04_H × m)
Test-related registers			
RSCFDn	Global Test Configuration Register	RSCFDnCFDGTSTCFG	<RSCFDn_base> + 0468_H
RSCFDn	Global Test Control Register	RSCFDnCFDGTSTCTR	<RSCFDn_base> + $046C_H$
RSCFDn	Global Lock Key Register	RSCFDnCFDGLOCKK	<RSCFDn_base> + $047C_H$
RSCFDn	RAM Test Page Access Register r	RSCFDnCFDRPGACCr	<RSCFDn_base> + 6400_H + (04_H × r)

25.4.2 Details of Interface Mode-related Registers

25.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

Access: RSCFDnCFDGRMCFG register can be read/written in 32-bit units
RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units
RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL, RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGRMCFG: <RSCFDn_base> + $04FC_H$
RSCFDnCFDGRMCFGL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGH: <RSCFDn_base> + $04FE_H$
RSCFDnCFDGRMCFGLL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGLH: <RSCFDn_base> + $04FD_H$,
RSCFDnCFDGRMCFGHL: <RSCFDn_base> + $04FE_H$,
RSCFDnCFDGRMCFGHH: <RSCFDn_base> + $04FF_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCMC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 25.91 RSCFDnCFDGRMCFG Register Contents

Bit	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CANFD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 places the RS-CANFD module in classical CAN mode. Setting this bit to 1 places the RS-CANFD module in CANFD mode. To switch classical CAN mode to CANFD mode, set the value after reset in all registers and bits allocated to the register map of classical CAN mode and then modify the RSCFDnCFDGRMCFG register.

25.4.3 Details of Channel-related Registers

25.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0, 1)

Access: RSCFDnCFDCmNCFG register can be read/written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + (10_H × m)
RSCFDnCFDCmNCFGL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCFDnCFDCmNCFGH: <RSCFDn_base> + 0002_H + (10_H × m)
RSCFDnCFDCmNCFGLL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCFDnCFDCmNCFGLH: <RSCFDn_base> + 0001_H + (10_H × m),
RSCFDnCFDCmNCFGHL: <RSCFDn_base> + 0002_H + (10_H × m),
RSCFDnCFDCmNCFGHH: <RSCFDn_base> + 0003_H + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	Bit Name	Function
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see section 25.11.1, Initial Settings.

NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.
Allowed values are 2 Tq to 32 Tq, inclusive.
Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.
A value of 4 to 128 Tq is settable.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable.
Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

25.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0, 1)

Access: RSCFDnCFDCmCTR register can be read/written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)
RSCFDnCFDCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)

7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.
When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.
Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.
When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.
When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.
When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.
When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.
If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1 compliant). A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Figure 25.5. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

25.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0, 1)

Access: RSCFDnCFDCmSTS register can be read/written in 32-bit units
RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
RSCFDnCFDCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + $000A_H$ + (10_H × m)
RSCFDnCFDCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + $000A_H$ + (10_H × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.94 RSCFDnCFDCmSTS Register Contents

Bit	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	ESIF	Error State Indication Flag 0: No CANFD message whose ESI bit is recessive has been received. 1: At least one CANFD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode

Bit	Bit Name	Function
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).
These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).
These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.
This flag is 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.
This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

25.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0, 1)

Access: RSCFDnCFDCmERFL register can be read/written in 32-bit units
RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)
RSCFDnCFDCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)
RSCFDnCFDCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.95 RSCFDnCFDCmERFL Register Contents

Bit	Bit Name	Function
31	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
30 to 16	CRCREG [14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.

Bit	Bit Name	Function
6	BLF	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.
If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CANFD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127).
This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

Note: To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

25.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1)

Access: RSCFDnCFDCmDCFG register can be read/written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmDCFG: <RSCFDn_base> + 0500_H + (20_H × m)
RSCFDnCFDCmDCFGL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + 0502_H + (20_H × m)
RSCFDnCFDCmDCFGLL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGLH: <RSCFDn_base> + 0501_H + (20_H × m),
RSCFDnCFDCmDCFGHL: <RSCFDn_base> + 0502_H + (20_H × m),
RSCFDnCFDCmDCFGHH: <RSCFDn_base> + 0503_H + (20_H × m)

Table 25.96 RSCFDnCFDCmDCFG Register Contents

Bit	Bit Name	Function
31 to 27	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
26 to 24	DSJW[2:0]	Data Bit Rate Resynchronization Jump Width Control b26 b25 b24 0 0 0: 1 Tq 0 0 1: 2 Tq 0 1 0: 3 Tq 0 1 1: 4 Tq 1 0 0: 5 Tq 1 0 1: 6 Tq 1 1 0: 7 Tq 1 1 1: 8 Tq
23	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
22 to 20	DTSEG2[2:0]	Data Bit Rate Time Segment 2 Control b22 b21 b20 0 0 0: Setting prohibited 0 0 1: 2 Tq 0 1 0: 3 Tq 0 1 1: 4 Tq 1 0 0: 5 Tq 1 0 1: 6 Tq 1 1 0: 7 Tq 1 1 1: 8 Tq

Bit	Bit Name	Function
19 to 16	DTSEG1[3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see section 25.11.1, Initial Settings.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq is settable. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.
A value of 2 to 16 Tq is settable.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).
Make sure to set the same value in the NBRP[9:0] bits and the DBRP[7:0] bits. To set the nominal bit rate and data bit rate of different values, change the NTSEG 1 bit and NTSEG 2 bit in the RSCFDnCFDCmNCFG register and the DTSEG 1 bit and DTSEG 2 bit in the RSCFDnCFDCmDCFG register to the desired bit rate values respectively. When the TDCE bit of the RSCFDnCFDCmFDCFG register is 1 (transmission delay correction enabled), set the same value of 1 or less to the NBRP [9:0] and DBRP [7:0] bits.

25.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1)

Access: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCFG: <RSCFDn_base> + 0504_H + (20_H × m)
RSCFDnCFDCmFDCFGL: <RSCFDn_base> + 0504_H + (20_H × m),

Table 25.97 RSCFDnCFDCmFDCFG Register Contents

Bit	Bit Name	Function
31, 30	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
29	REFE	Reception data edge filter enable bit 0: Reception data edge filter disabled 1: Reception data edge filter enabled
28	FDOE	FD-only mode enable bit 0: FD-only mode disabled 1: FD-only mode enabled
27	TMME	Transmit Buffer Merge Mode Enable 0: Transmit buffer merge mode is disabled. 1: Transmit buffer merge mode is enabled.
26	GWBRS	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWFDF	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CANFD frame.
24	GWEN	CAN-CANFD Gateway Enable 0: The CAN-CANFD gateway is disabled. 1: The CAN-CANFD gateway is enabled.
23	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10	ESIC	Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state.

Bit	Bit Name	Function
9	TDCE	Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2 to 0	EOCCFG [2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CANFD message 1 0 1: Only data phase of transmitted CANFD message 1 1 0: Only data phase of received CANFD message 1 1 1: Setting prohibited

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CANFD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CANFD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CANFD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10_B (gateway mode).
Setting this bit to 1 enables the CAN-CANFD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000_B.
While this bit is 1, do not perform routing the following frames by using the gateway function.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.

- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

Table 25.98 shows the settings and formats of transmit frame and receive frame while the CAN-CANFD gateway is enabled.

Table 25.98 Operation when the CAN-CANFD Gateway is Enabled

Receive Frame				Transmit Frame		
Format	BRS Bit	Received DLC Value	GWFDF Bit	Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CANFD	Arbitrary	DLC ≤ 1000_B				
Classical CAN	None	DLC ≤ 1000_B	1	CANFD	According to GWBRS bit setting	Not replaced
		DLC > 1000_B				Replaced with 1000_B
CANFD	Arbitrary	DLC ≤ 1000_B				Not replaced

TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 25.99 **ESI Value to Be Transmitted**

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).
When this bit is 1, the SSP position is defined only by the SSP offset value.
Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.
Modify these bits only in channel reset mode or channel halt mode.

25.4.3.7 RSCFDnCFDCmFDCTR — Channel CANFD Control Register (m = 0, 1)

Access: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCTRLL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL, RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCTR: <RSCFDn_base> + 0508_H + (20_H × m)
RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m),

Table 25.100 RSCFDnCFDCmFDCTR Register Contents

Bit	Bit Name	Function
31 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

25.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1)

Access: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDSTS: <RSCFDn_base> + $050C_H$ + (20_H × m)
RSCFDnCFDCmFDSTSL: <RSCFDn_base> + $050C_H$ + (20_H × m),

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.101 RSCFDnCFDCmFDSTS Register Contents

Bit	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FFH. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FFH.
These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.
This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H.
This flag is 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.
This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FFH. This flag is 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.
The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.
This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 Tq (CANm bit time and Tq are the values of data bit rate).
This flag is 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).
This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.
This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.
This flag is 0 in channel reset mode.

25.4.3.9 RSCFDnCFDCmFDCRC — Channel CANFD CRC Register (m = 0, 1)

Access: RSCFDnCFDCmFDCRC register can be read only in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

Address: RSCFDnCFDCmFDCRC: <RSCFDn_base> + 0510_H + (20_H × m)
RSCFDnCFDCmFDCRCL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + 0512_H + (20_H × m)
RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + 0511_H + (20_H × m),
RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + 0512_H + (20_H × m),
RSCFDnCFDCmFDCRCHH: <RSCFDn_base> + 0513_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCNT[3:0]				—	—	—	CRCREG[20:16]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRCREG[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.102 RSCFDnCFDCmFDCRC Register Contents

Bit	Bit Name	Function
31 to 28	Reserved	These bits are read as the value after reset.
27 to 24	SCNT[3:0]	Stuff count Indicate a value of the stuff count in a CANFD frame. Bits 25 to 27 indicate the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27.
23 to 21	Reserved	These bits are read as the value after reset.
20 to 0	CRCREG [20:0]	CRC Calculation Data (CRC Length:17 Bits or 21 Bits) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CANFD frame can be read if a message transmitted/received is a CANFD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CANFD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CANFD frame (CRC length = 17 or 21 bits), this flag is updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

25.4.4 Details of Global-related Registers

25.4.4.1 SCFDnCFDGCFG — Global Configuration Register

Access: RSCFDnCFDGCFG register can be read/written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCFG: <RSCFDn_base> + 0084_H
RSCFDnCFDGCFGL: <RSCFDn_base> + 0084_H, RSCFDnCFDGCFGH: <RSCFDn_base> + 0086_H
RSCFDnCFDGCFGLL: <RSCFDn_base> + 0084_H, RSCFDnCFDGCFGLH: <RSCFDn_base> + 0085_H,
RSCFDnCFDGCFGHL: <RSCFDn_base> + 0086_H, RSCFDnCFDGCFGHH: <RSCFDn_base> + 0087_H

Value after reset: $0000\ 0000_H$

Table 25.103 RSCFDnCFDGCFG Register Contents

Bit	Bit Name	Function
31 to 16	ITRCP[15:0]	Interval Timer Prescaler Set When these bits are set to M, the pclk is divided by M. Setting 0000_H is prohibited when the interval timer is in use.
15 to 13	TSBTCS[2:0]	Timestamp Clock Source Select b15 b14 b13 0 0 0: Channel 0 nominal bit time clock 0 0 1: Channel 1 nominal bit time clock 0 1 0: Channel 2 nominal bit time clock 0 1 1: Channel 3 nominal bit time clock 1 0 0: Channel 4 nominal bit time clock 1 0 1: Channel 5 nominal bit time clock 1 1 0: Setting prohibited 1 1 1: Setting prohibited
12	TSSS	Timestamp Source Select 0: pclk/2*1 1: Nominal bit time clock
11 to 8	TSP[3:0]	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768

Bit	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.
Note 2. For the CAN clock frequency settings, see section 25, Clock Supply.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See section 25.8.3.1, Interval Transmission Function.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CANFD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.
When this bit is 0, the received message in which the payload overflows is not stored in the buffer.
When this bit is 1, the received message in which the payload overflows is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.
The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).
When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).
For the CAN clock frequency settings, see Table 25.6, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.
The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.
When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.
While the transmit queue is in use, this bit should be set to 0.

25.4.4.2 RSCFDnCFDGCTR — Global Control Register

Access: RSCFDnCFDGCTR register can be read/written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCTR: <RSCFDn_base> + 0088_H
RSCFDnCFDGCTRL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRH: <RSCFDn_base> + $008A_H$
RSCFDnCFDGCTRLL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRLH: <RSCFDn_base> + 0089_H,
RSCFDnCFDGCTRHL: <RSCFDn_base> + $008A_H$, RSCFDnCFDGCTRHH: <RSCFDn_base> + $008B_H$

Value after reset: $0000\ 0005_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSRST

Table 25.104 RSCFDnCFDGCTR Register Contents

Bit	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see section 25.6.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

25.4.4.3 RSCFDnCFDGSTS — Global Status Register

Access: RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units
RSCFDnCFDGSTSLL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDGSTS: <RSCFDn_base> + $008C_H$
RSCFDnCFDGSTSL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSH: <RSCFDn_base> + $008E_H$
RSCFDnCFDGSTSLL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSLH: <RSCFDn_base> + $008D_H$,
RSCFDnCFDGSTSHL: <RSCFDn_base> + $008E_H$, RSCFDnCFDGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: $0000\ 000D_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.105 RSCFDnCFDGSTS Register Contents

Bit	Bit Name	Function
31 to 4	Reserved	These bits are read as the value after reset.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.
This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

25.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read/written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGERFL: <RSCFDn_base> + 0090_H
RSCFDnCFDGERFLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLH: <RSCFDn_base> + 0092_H
RSCFDnCFDGERFLLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLLH: <RSCFDn_base> + 0091_H,
RSCFDnCFDGERFLHL: <RSCFDn_base> + 0092_H, RSCFDnCFDGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.106 RSCFDnCFDGERFL Register Contents

Bit	Bit Name	Function
31 to 14, 7, 6, 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13 to 8, 5	Reserved	When read, an undefined value is returned.The write value should be the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0, 1), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0, 1) is set to 1.
This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 5) is set to 1.
This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

Note: To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

25.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register can be read only in 32-bit units
RSCFDnCFDGTSCL, RSCFDnCFDGTSCH registers can be read only in 16-bit units

Address: RSCFDnCFDGTSC: <RSCFDn_base> + 0094_H
RSCFDnCFDGTSCL: <RSCFDn_base> + 0094_H, RSCFDnCFDGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.107 RSCFDnCFDGTSC Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

25.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCFDnCFDGTINTSTS0: <RSCFDn_base> + 0460_H
RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + 0462_H
RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCFDnCFDGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	THIF1	CFTIF1	TQIF1	TAIF1	TSIF1	—	—	—	THIF0	CFTIF0	TQIF0	TAIF0	TSIF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 25.108 RSCFDnCFDGTINTSTS0 Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.

Bit	Bit Name	Function
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).
When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).
This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.
When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.
When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.
When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

25.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register

Access: RSCFDnCFDGFDCFG register can be read/written in 32-bit units
RSCFDnCFDGFDCFG L, RSCFDnCFDGFDCFG H registers can be read/written in 16-bit units
RSCFDnCFDGFDCFG LL, RSCFDnCFDGFDCFG LH, RSCFDnCFDGFDCFG HL, RSCFDnCFDGFDCFG HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGFDCFG: <RSCFDn_base> + 0474_H
RSCFDnCFDGFDCFG L: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG H: <RSCFDn_base> + 0476_H
RSCFDnCFDGFDCFG LL: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + 0475_H,
RSCFDnCFDGFDCFG HL: <RSCFDn_base> + 0476_H, RSCFDnCFDGFDCFG HH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSCCFG[1:0]		—	—	—	—	—	—	—	RPED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.109 RSCFDnCFDGFDCFG Register Contents

Bit	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit. *1 1 1: Setting prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG[1:0] Bits

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

PRED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame is output. Modify this bit only in global reset mode.

25.4.5 Details of Receive Rule-related Registers

25.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL, RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLECTR: <RSCFDn_base> + 0098_H
RSCFDnCFDGAFLECTRL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRH: <RSCFDn_base> + $009A_H$
RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AFLDAE	—	—	—	AFLPN[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 25.110 RSCFDnCFDGAFLECTR Register Contents

Bit	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 7 (00111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.
Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.
Set these bits to a value within the range of 00000_B to 00111_B.

25.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL, RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + $009C_H$
RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + $009E_H$
RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.111 RSCFDnCFDGAFLCFG0 Register Contents

Bit	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.
Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.
Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.
Set these bits to a value within the range of 00_H to 80_H.

25.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLIDj: <RSCFDn_base> + 1000_H + (10_H × j)
RSCFDnCFDGAFLIDjL: <RSCFDn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjH: <RSCFDn_base> + 1002_H + (10_H × j)
RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + 1001_H + (10_H × j),
RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + 1002_H + (10_H × j),
RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + 1003_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFL IDE	GAFL RTR	GAFL LB	GAFLID[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAFLID[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.112 RSCFDnCFDGAFLIDj Register Contents

Bit	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID [28:0]	ID Set Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.
When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

25.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read/written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLMj: <RSCFDn_base> + 1004_H + (10_H × j)
RSCFDnCFDGAFLMjL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjH: <RSCFDn_base> + 1006_H + (10_H × j)
RSCFDnCFDGAFLMjLL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + 1005_H + (10_H × j),
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + 1006_H + (10_H × j),
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + 1007_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFL IDEM	GAFL RTRM	—	GAFLIDM[28:16]

Table 25.113 RSCFDnCFDGAFLMj Register Contents

Bit	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.
When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

25.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP0_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP0jLL, RSCFDnCFDGAFLP0jLH, RSCFDnCFDGAFLP0jHL, RSCFDnCFDGAFLP0jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP0_j: <RSCFDn_base> + 1008_H + (10_H × j)
RSCFDnCFDGAFLP0_jL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jH: <RSCFDn_base> + $100A_H$ + (10_H × j)
RSCFDnCFDGAFLP0_jLL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jLH: <RSCFDn_base> + 1009_H + (10_H × j),
RSCFDnCFDGAFLP0_jHL: <RSCFDn_base> + $100A_H$ + (10_H × j),
RSCFDnCFDGAFLP0_jHH: <RSCFDn_base> + $100B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

0 1 1 0	6 data bytes	
0 1 1 1	7 data bytes	
1 0 0 0	8 data bytes	
1 0 0 1	8 data bytes	12 data bytes
1 0 1 0		16 data bytes
1 0 1 1		20 data bytes
1 1 0 0		24 data bytes
1 1 0 1		32 data bytes
1 1 1 0		48 data bytes
1 1 1 1		64 data bytes

27 to 16	GAFLPTR [11:0]	Receive Rule Label Set the 12-bit label information.

Bit	Bit Name	Function
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP [6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

25.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL, RSCFDnCFDGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP1_j: <RSCFDn_base> + $100C_H$ + (10_H × j)
RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + $100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + $100E_H$ + (10_H × j)
RSCFDnCFDGAFLP1_jLL: <RSCFDn_base> + $100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jLH: <RSCFDn_base> + $100D_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jHL: <RSCFDn_base> + $100E_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + $100F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 25.115 RSCFDnCFDGAFLP1_j Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13 to 8	GAFLFDP [13:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP [7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

25.4.6 Details of Receive Buffer-related Registers

25.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read/written in 32-bit units
RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNB: <RSCFDn_base> + $00A4_H$
RSCFDnCFDRMNBL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBH: <RSCFDn_base> + $00A6_H$
RSCFDnCFDRMNBLL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBLH: <RSCFDn_base> + $00A5_H$,
RSCFDnCFDRMNBHL: <RSCFDn_base> + $00A6_H$, RSCFDnCFDRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.116 RSCFDnCFDRMNB Register Contents

Bit	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	RMPLS[1:0]	Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 32.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).
Setting these bits all to 0 makes receive buffers unavailable.

25.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0)

Access: RSCFDnCFDRMNDy register can be read/written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDnCFDRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)
RSCFDnCFDRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyLH: <RSCFDn_base> + $00A9_H$ + (04_H × y),
RSCFDnCFDRMNDyHL: <RSCFDn_base> + $00AA_H$ + (04_H × y),
RSCFDnCFDRMNDyHH: <RSCFDn_base> + $00AB_H$ + (04_H × y)

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.117 RSCFDnCFDRMNDy Register Contents

Bit	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.
To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).
These flags are cleared to 0 in global reset mode.

25.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)

Access: RSCFDnCFDRMIDq register can be read only in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMIDq: <RSCFDn_base> + 2000_H + (20_H × q)
RSCFDnCFDRMIDqL: <RSCFDn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqH: <RSCFDn_base> + 2002_H + (20_H × q)
RSCFDnCFDRMIDqLL: <RSCFDn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqLH: <RSCFDn_base> + 2001_H + (20_H × q),
RSCFDnCFDRMIDqHL: <RSCFDn_base> + 2002_H + (20_H × q),
RSCFDnCFDRMIDqHH: <RSCFDn_base> + 2003_H + (20_H × q)

Value after reset: $0000\ 0000_H$

Table 25.118 RSCFDnCFDRMIDq Register Contents

Bit	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CANFD frame The RRS bit value of the received message can be read.
29	Reserved	This bit is read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

25.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

Access: RSCFDnCFDRMPTRq register can be read only in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMPTRq: <RSCFDn_base> + 2004_H + (20_H × q)
RSCFDnCFDRMPTRqL: <RSCFDn_base> + 2004_H + (20_H × q),

1 0 1 0		16 data bytes
1 0 1 1		20 data bytes
1 1 0 0		24 data bytes
1 1 0 1		32 data bytes
1 1 1 0		48 data bytes
1 1 1 1		64 data bytes

27 to 16	RMPTR [11:0]	Receive Buffer Label Data Label information of the received message.

Bit	Bit Name	Function
15 to 0	RMTS [15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

25.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CANFD Status Register (q = 0 to 31)

Access: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units
RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL, RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMFDSTSq: <RSCFDn_base> + 2008_H + (20_H × q)
RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + 2008_H + (20_H × q),
RSCFDnCFDRMFDSTSqH: <RSCFDn_base> + $200A_H$ + (20_H × q)
RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + 2008_H + (20_H × q),
RSCFDnCFDRMFDSTSqLH: <RSCFDn_base> + 2009_H + (20_H × q),
RSCFDnCFDRMFDSTSqHL: <RSCFDn_base> + $200A_H$ + (20_H × q),

Table 25.120 RSCFDnCFDRMFDSTSq Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset.
2	RMFDF	FDF 0: Classical CAN frame 1: CANFD frame
1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

25.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 31)

Access: RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMDFb_q: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qH: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qLL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qLH: <RSCFDn_base> + $200D_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHL: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHH: <RSCFDn_base> + $200F_H$ + (04_H × b) + (20_H × q)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDB4 × b + 3 [7:0]								RMDB4 × b + 2 [7:0]

Table 25.121 RSCFDnCFDRMDFb_q Register Contents

Bit	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3
23 to 16	RMDB4 × b + 2 [7:0]	Receive Buffer Data Byte 4 × b + 2
15 to 8	RMDB4 × b + 1 [7:0]	Receive Buffer Data Byte 4 × b + 1
7 to 0	RMDB4 × b + 0 [7:0]	Receive Buffer Data Byte 4 × b + 0 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.
Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

25.4.7 Details of Receive FIFO Buffer-related Registers

25.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read/written in 32-bit units
RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDnCFDRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCFDnCFDRFCCxH: <RSCFDn_base> + $00BA_H$ + (04_H × x)
RSCFDnCFDRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCFDnCFDRFCCxLH: <RSCFDn_base> + $00B9_H$ + (04_H × x),
RSCFDnCFDRFCCxHL: <RSCFDn_base> + $00BA_H$ + (04_H × x),
RSCFDnCFDRFCCxHH: <RSCFDn_base> + $00BB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 25.122 RSCFDnCFDRFCCx Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	This bit is read as the value after reset. The write value should be the value after reset.

Bit	Bit Name	Function
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3, 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).
When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

25.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read/written in 32-bit units
RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units
RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDnCFDRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)
RSCFDnCFDRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x),
RSCFDnCFDRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x),
RSCFDnCFDRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.123 RSCFDnCFDRFSTSx Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.
This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.
This flag is cleared to 0 in global reset mode or by writing 0 to this flag.
Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.
If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.
This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

Note: To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

25.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCFDnCFDRFPCTRx register can only be written in 32-bit units
RSCFDnCFDRFPCTRxL, RSCFDnCFDRFPCTRxH registers can only be written in 16-bit units
RSCFDnCFDRFPCTRxLL, RSCFDnCFDRFPCTRxLH, RSCFDnCFDRFPCTRxHL, RSCFDnCFDRFPCTRxHH registers can only be written in 8-bit units

Address: RSCFDnCFDRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDnCFDRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCFDnCFDRFPCTRxH: <RSCFDn_base> + $00FA_H$ + (04_H × x)
RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCFDnCFDRFPCTRxLH: <RSCFDn_base> + $00F9_H$ + (04_H × x),
RSCFDnCFDRFPCTRxHL: <RSCFDn_base> + $00FA_H$ + (04_H × x),
RSCFDnCFDRFPCTRxHH: <RSCFDn_base> + $00FB_H$ + (04_H × x)

Value after reset: 0000 0000H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RFPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 25.124 RSCFDnCFDRFPCTRx Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits. When writing FF_H to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

25.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCFDnCFDRFIDx register can be read only in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFIDx: <RSCFDn_base> + 3000_H + (80_H × x)
RSCFDnCFDRFIDxL: <RSCFDn_base> + 3000_H + (80_H × x),
RSCFDnCFDRFIDxH: <RSCFDn_base> + 3002_H + (80_H × x)
RSCFDnCFDRFIDxLL: <RSCFDn_base> + 3000_H + (80_H × x),

30	RFRTR	Receive FIFO Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CANFD frame The RRS bit value of the received message can be read.
29	Reserved	This bit is read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

25.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register can be read only in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8-bit units

1 1 0 0		24 data bytes
1 1 0 1		32 data bytes
1 1 1 0		48 data bytes
1 1 1 1		64 data bytes

27 to 16	RFPTR[11:0]	Receive FIFO Buffer Label Data Label information of the received message can be read.
15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

25.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CANFD Status Register (x = 0 to 7)

Access: RSCFDnCFDRFFDSTSx register can be read only in 32-bit units
RSCFDnCFDRFFDSTSxL, RSCFDnCFDRFFDSTSxH registers can be read only in 16-bit units
RSCFDnCFDRFFDSTSxLL, RSCFDnCFDRFFDSTSxLH, RSCFDnCFDRFFDSTSxHL, RSCFDnCFDRFFDSTSxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFFDSTSx: <RSCFDn_base> + 3008_H + (80_H × x)
RSCFDnCFDRFFDSTSxL: <RSCFDn_base> + 3008_H + (80_H × x),
RSCFDnCFDRFFDSTSxH: <RSCFDn_base> + $300A_H$ + (80_H × x)
RSCFDnCFDRFFDSTSxLL: <RSCFDn_base> + 3008_H + (80_H × x),
RSCFDnCFDRFFDSTSxLH: <RSCFDn_base> + 3009_H + (80_H × x),
RSCFDnCFDRFFDSTSxHL: <RSCFDn_base> + $300A_H$ + (80_H × x),
RSCFDnCFDRFFDSTSxHH: <RSCFDn_base> + $300B_H$ + (80_H × x)

Value after reset: $0000\ 0000_H$

Table 25.127 RSCFDnCFDRFFDSTSx Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset.
2	RFFDF	FDF 0: Classical CAN frame 1: CANFD frame
1	RFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RFESI	ESI 0: Error active node 1: Error passive node

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

25.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

Access: RSCFDnCFDRFDFd_x register can be read only in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers can be read only in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFDFd_x: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
RSCFDnCFDRFDFd_xL: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x),
RSCFDnCFDRFDFd_xH: <RSCFDn_base> + $300E_H$ + (04_H × d) + (80_H× x)
RSCFDnCFDRFDFd_xLL: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x),
RSCFDnCFDRFDFd_xLH: <RSCFDn_base> + $300D_H$ + (04_H × d) + (80_H × x),

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.128 RSCFDnCFDRFDFd_x Register Contents

Bit	Bit Name	Function
31 to 24	RFDB4 × d + 3 [7:0]	Receive Buffer Data Byte 4 × d + 3
23 to 16	RFDB4 × d + 2 [7:0]	Receive Buffer Data Byte 4 × d + 2
15 to 8	RFDB4 × d + 1 [7:0]	Receive Buffer Data Byte 4 × d + 1
7 to 0	RFDB4 × d + 0 [7:0]	Receive Buffer Data Byte 4 × d + 0 Data for a message stored in the receive buffer can be read.

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00_H.
Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register.
Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

25.4.8 Transmit/Receive FIFO Buffer-related Registers

25.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

Access: RSCFDnCFDCFCCk register can be read/written in 32-bit units
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read/written in 16-bit units
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFCCk: <RSCFDn_base> + 0118_H + (04_H × k)
RSCFDnCFDCFCCkL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCFDnCFDCFCCkH: <RSCFDn_base> + $011A_H$ + (04_H × k)
RSCFDnCFDCFCCkLL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCFDnCFDCFCCkLH: <RSCFDn_base> + 0119_H + (04_H × k),
RSCFDnCFDCFCCkHL: <RSCFDn_base> + $011A_H$ + (04_H × k),

Table 25.129 RSCFDnCFDCFCCk Register Contents

Bit	Bit Name	Function
31 to 24	CFITT[7:0]	Set a message transmission interval. Set Value: 00_H to FF_H
23 to 20	CFTML[3:0]	Transmit Buffer Link Configuration Set the transmit buffer number to be linked to the transmit/receive FIFO buffer.
19	CFITR	Transmit/Receive FIFO Interval Timer Resolution 0: Clock dividing pclk by (ITRCP[15:0] bits) 1: Clock dividing pclk by (ITRCP[15:0] bits × 10)
18	CFITSS	Transmit/Receive FIFO Interval Timer Clock Source Select 0: Interval timer clock source selected by the CFITR bit 1: Interval timer clock source is the nominal bit time clock for the channel to which the FIFO is linked.
17 to 16	CFM[1:0]	Transmit/Receive FIFO Mode Select b17 b16 0 0: Receive mode 0 1: Transmit mode 1 0: Gateway mode 1 1: Setting prohibited
15 to 13	CFIGCV[2:0]	Transmit/Receive FIFO Receive Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.

Bit	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
6 to 4	CFPLS[2:0]	Transmit/Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).
Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See Table 25.11 and Table 25.12, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.
Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.
Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.
When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.
When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).
Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.
When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel that does not handle the CANFD frames.
Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).
When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.
Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.
Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.
Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.
When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.
This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

25.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

Access: RSCFDnCFDCFSTSk register can be read/written in 32-bit units
RSCFDnCFDCFSTSkL, RSCFDnCFDCFSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFSTSkLL, RSCFDnCFDCFSTSkLH, RSCFDnCFDCFSTSkHL, RSCFDnCFDCFSTSkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)
RSCFDnCFDCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)
RSCFDnCFDCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCFDnCFDCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCFDnCFDCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.130 RSCFDnCFDCFSTSk Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00B or 10B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

Note: To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

25.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

Access: RSCFDnCFDCFPCTRk register can only be written in 32-bit units
RSCFDnCFDCFPCTRkL, RSCFDnCFDCFPCTRkH registers can only be written in 16-bit units
RSCFDnCFDCFPCTRkLL, RSCFDnCFDCFPCTRkLH, RSCFDnCFDCFPCTRkHL, RSCFDnCFDCFPCTRkHH registers can only be written in 8-bit units

Address: RSCFDnCFDCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDnCFDCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCFDnCFDCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)
RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCFDnCFDCFPCTRkLH: <RSCFDn_base> + $01D9_H$ + (04_H × k),
RSCFDnCFDCFPCTRkHL: <RSCFDn_base> + $01DA_H$ + (04_H × k),
RSCFDnCFDCFPCTRkHH: <RSCFDn_base> + $01DB_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Table 25.131 RSCFDnCFDCFPCTRk Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10_B):
  Setting prohibited

25.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

Access: RSCFDnCFDCFIDk register can be read/written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read/written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFIDk: <RSCFDn_base> + 3400_H + (80_H × k)
RSCFDnCFDCFIDkL: <RSCFDn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkH: <RSCFDn_base> + 3402_H + (80_H × k)
RSCFDnCFDCFIDkLL: <RSCFDn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkLH: <RSCFDn_base> + 3401_H + (80_H × k),
RSCFDnCFDCFIDkHL: <RSCFDn_base> + 3402_H + (80_H × k),
RSCFDnCFDCFIDkHH: <RSCFDn_base> + 3403_H + (80_H × k)

Table 25.132 RSCFDnCFDCFIDk Register Contents

Bit	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01_B (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CANFD frame Write 0 to this bit. • When the CFM[1:0] value is 00_B (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CANFD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CANFD frame, this bit indicates the RRS bit value of the received message.
When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.
When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CANFD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.
This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.
When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

25.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

Access: RSCFDnCFDCFPTRk register can be read/written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFPTRk: <RSCFDn_base> + 3404_H + (80_H × k)
RSCFDnCFDCFPTRkL: <RSCFDn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkH: <RSCFDn_base> + 3406_H + (80_H × k)
RSCFDnCFDCFPTRkLL: <RSCFDn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkLH: <RSCFDn_base> + 3405_H + (80_H × k),
RSCFDnCFDCFPTRkHL: <RSCFDn_base> + 3406_H + (80_H × k),
RSCFDnCFDCFPTRkHH: <RSCFDn_base> + 3407_H + (80_H × k)

Table 25.133 RSCFDnCFDCFPTRk Register Contents

Bit	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data

b31 b30 b29 b28	Classical CAN Frame	CANFD Frame
0 0 0 0	0 data bytes	
0 0 0 1	1 data byte	
0 0 1 0	2 data bytes	
0 0 1 1	3 data bytes	
0 1 0 0	4 data bytes	
0 1 0 1	5 data bytes	
0 1 1 0	6 data bytes	
0 1 1 1	7 data bytes	
1 0 0 0	8 data bytes	
1 0 0 1	8 data bytes	12 data bytes
1 0 1 0		16 data bytes
1 0 1 1		20 data bytes
1 1 0 0		24 data bytes
1 1 0 1		32 data bytes
1 1 1 0		48 data bytes
1 1 1 1		64 data bytes

Bit	Bit Name	Function
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.
When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.
When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CANFD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.
These bits are valid when the CFM[1:0] value is 00_B.

25.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CANFD Configuration/ Status Register (k = 0 to 5)

Access: RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units
RSCFDnCFDCFFDCSTSkL, RSCFDnCFDCFFDCSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFFDCSTSkLL, RSCFDnCFDCFFDCSTSkLH, RSCFDnCFDCFFDCSTSkHL, RSCFDnCFDCFFDCSTSkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + 3408_H + (80_H × k)
RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + 3408_H + (80_H × k),
RSCFDnCFDCFFDCSTSkH: <RSCFDn_base> + $340A_H$ + (80_H × k)
RSCFDnCFDCFFDCSTSkLL: <RSCFDn_base> + 3408_H + (80_H × k),
RSCFDnCFDCFFDCSTSkLH: <RSCFDn_base> + 3409_H + (80_H × k),
RSCFDnCFDCFFDCSTSkHL: <RSCFDn_base> + $340A_H$ + (80_H × k),
RSCFDnCFDCFFDCSTSkHH: <RSCFDn_base> + $340B_H$ + (80_H × k)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	CFFDF	CFBRS	CFESI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 25.134 RSCFDnCFDCFFDCSTSk Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CANFD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	ESI 0: Error active node 1: Error passive node

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.
When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00B, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.
When the CFM[1:0] value is 01B, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

25.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5)

Access: RSCFDnCFDCFDFd_k register can be read/written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFDFd_k: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kH: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kLL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kLH: <RSCFDn_base> + $340D_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHL: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHH: <RSCFDn_base> + $340F_H$ + (04_H × d) + (80_H × k)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFDB4 × d + 3 [7:0]								CFDB4 × d + 2 [7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.135 RSCFDnCFDCFDFd_k Register Contents

Bit	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.
Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size. This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

25.4.9 Details of FIFO Status-related Registers

25.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Access: RSCFDnCFDFESTS register can be read only in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFESTS: <RSCFDn_base> + 0238_H
RSCFDnCFDFESTSL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSH: <RSCFDn_base> + $023A_H$
RSCFDnCFDFESTSLL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSLH: <RSCFDn_base> + 0239_H,
RSCFDnCFDFESTSHL: <RSCFDn_base> + $023A_H$, RSCFDnCFDFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: 03FF $FFFF_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.136 RSCFDnCFDFESTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 5)
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

This RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

25.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

Access: RSCFDnCFDFFSTS register can be read only in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFFSTS: <RSCFDn_base> + $023C_H$
RSCFDnCFDFFSTSL: <RSCFDn_base> + $023C_H$, RSCFDnCFDFFSTSH: <RSCFDn_base> + $023E_H$
RSCFDnCFDFFSTSLL: <RSCFDn_base> + $023C_H$, RSCFDnCFDFFSTSLH: <RSCFDn_base> + $023D_H$,
RSCFDnCFDFFSTSHL: <RSCFDn_base> + $023E_H$, RSCFDnCFDFFSTSHH: <RSCFDn_base> + $023F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.137 RSCFDnCFDFFSTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 5)
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCFDnCFDFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

25.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Access: RSCFDnCFDFMSTS register can be read only in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFMSTS: <RSCFDn_base> + 0240_H
RSCFDnCFDFMSTSL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSH: <RSCFDn_base> + 0242_H
RSCFDnCFDFMSTSLL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSLH: <RSCFDn_base> + 0241_H,
RSCFDnCFDFMSTSHL: <RSCFDn_base> + 0242_H, RSCFDnCFDFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CF5 MLT	CF4 MLT	CF3 MLT	CF2 MLT	CF1 MLT	CF0 MLT	RF7 MLT	RF6 MLT	RF5 MLT	RF4 MLT	RF3 MLT	RF2 MLT	RF1 MLT	RF0 MLT

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.138 RSCFDnCFDFMSTS Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset.
13	CF5MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 5)
12	CF4MLT	
11	CF3MLT	
10	CF2MLT	
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCFDnCFDFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

25.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCFDnCFDRFISTS register can be read only in 32-bit units
RSCFDnCFDRFISTSL, RSCFDnCFDRFISTSH registers can be read only in 16-bit units
RSCFDnCFDRFISTSLL, RSCFDnCFDRFISTSLH, RSCFDnCFDRFISTSHL, RSCFDnCFDRFISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFISTS: <RSCFDn_base> + 0244_H
RSCFDnCFDRFISTSL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSH: <RSCFDn_base> + 0246_H
RSCFDnCFDRFISTSLL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSLH: <RSCFDn_base> + 0245_H,
RSCFDnCFDRFISTSHL: <RSCFDn_base> + 0246_H, RSCFDnCFDRFISTSHH: <RSCFDn_base> + 0247_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.139 RSCFDnCFDRFISTS Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCFDnCFDRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

25.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCFDnCFDCFRISTS register can be read only in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers can be read only in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL, RSCFDnCFDCFRISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCFRISTS: <RSCFDn_base> + 0248_H
RSCFDnCFDCFRISTSL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSH: <RSCFDn_base> + $024A_H$
RSCFDnCFDCFRISTSLL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSLH: <RSCFDn_base> + 0249_H,
RSCFDnCFDCFRISTSHL: <RSCFDn_base> + $024A_H$, RSCFDnCFDCFRISTSHH: <RSCFDn_base> + $024B_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.140 RSCFDnCFDCFRISTS Register Contents

Bit	Bit Name	Function
31 to 6	Reserved	These bits are read as the value after reset.
5	CF5RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 5)
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCFDnCFDCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

25.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCFDnCFDCFTISTS register can be read only in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers can be read only in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL, RSCFDnCFDCFTISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCFTISTS: <RSCFDn_base> + $024C_H$
RSCFDnCFDCFTISTSL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSH: <RSCFDn_base> + $024E_H$
RSCFDnCFDCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSLH: <RSCFDn_base> + $024D_H$,
RSCFDnCFDCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCFDnCFDCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: $0000\ 0000_H$

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.141 RSCFDnCFDCFTISTS Register Contents

Bit	Bit Name	Function
31 to 6	Reserved	These bits are read as the value after reset.
5	CF5TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 5)
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCFDnCFDCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

25.4.10 Details of FIFO DMA-related Registers

25.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register

Access: RSCFDnCFDCDTCT register can be read/written in 32-bit units
RSCFDnCFDCDTCTL, RSCFDnCFDCDTCTH registers can be read/written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH, RSCFDnCFDCDTCTHL, RSCFDnCFDCDTCTHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCDTCT: <RSCFDn_base> + 0490_H
RSCFDnCFDCDTCTL: <RSCFDn_base> + 0490_H
RSCFDnCFDCDTCTH: <RSCFDn_base> + 0492_H
RSCFDnCFDCDTCTLL: <RSCFDn_base> + 0490_H,
RSCFDnCFDCDTCTLH: <RSCFDn_base> + 0491_H,
RSCFDnCFDCDTCTHL: <RSCFDn_base> + 0492_H,
RSCFDnCFDCDTCTHH: <RSCFDn_base> + 0493_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.142 RSCFDnCFDCDTCT Register Contents

Bit	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9	CFDMAE1	Transmit/Receive FIFO Buffer 3 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 3 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 3 is enabled.
8	CFDMAE0	Transmit/Receive FIFO Buffer 0 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 0 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 0 is enabled.
7	RFDMAE7	Receive FIFO Buffer x DMA Enable 0: A DMA transfer request of receive FIFO buffer x is disabled. 1: A DMA transfer request of receive FIFO buffer x is enabled. (x = 0 to 7)
6	RFDMAE6	
5	RFDMAE5	
4	RFDMAE4	
3	RFDMAE3	
2	RFDMAE2	
1	RFDMAE1	
0	RFDMAE0	

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00_B (receive mode). Set this bit to 0 when the CFM[1:0] value is 01_B (transmit mode) or 10_B (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

25.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register

Access: RSCFDnCFDCDTSTS register can be read only in 32-bit units
RSCFDnCFDCDTSTSL, RSCFDnCFDCDTSTSH registers can be read only in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH, RSCFDnCFDCDTSTSHL, RSCFDnCFDCDTSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCDTSTS: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSL: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSH: <RSCFDn_base> + 0496_H
RSCFDnCFDCDTSTSLL: <RSCFDn_base> + 0494_H,
RSCFDnCFDCDTSTSLH: <RSCFDn_base> + 0495_H,
RSCFDnCFDCDTSTSHL: <RSCFDn_base> + 0496_H,
RSCFDnCFDCDTSTSHH: <RSCFDn_base> + 0497_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CFDMASTS1	CFDMASTS0	RFDMASTS7	RFDMASTS6	RFDMASTS5	RFDMASTS4	RFDMASTS3	RFDMASTS2	RFDMASTS1	RFDMASTS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.143 RSCFDnCFDCDTSTS Register Contents

Bit	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset.
9	CFDMASTS1	Transmit/Receive FIFO Buffer 3 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 3 is in progress.
8	CFDMASTS0	Transmit/Receive FIFO Buffer 0 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 0 is in progress.
7	RFDMASTS7	Receive FIFO Buffer x DMA Status 0: DMA transfer of receive FIFO buffer x is not in progress. 1: DMA transfer of receive FIFO buffer x is in progress. (x = 0 to 7)
6	RFDMASTS6	
5	RFDMASTS5	
4	RFDMASTS4	
3	RFDMASTS3	
2	RFDMASTS2	
1	RFDMASTS1	
0	RFDMASTS0	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.
When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).
These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMAEx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area)

These bits are cleared to 0 in global reset mode.

25.4.11 Details of Transmit Buffer-related Registers

25.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31)

Access: RSCFDnCFDTMCp registers can be read/written in 8-bit units

Address: RSCFDnCFDTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 25.144 RSCFDnCFDTMCp Register Contents

Bit	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 . the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.
The TMTAR bit can be set to 1 when TMTR bit is 1.
The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.
The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00_B.

25.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

Access: RSCFDnCFDTMSTSp registers can be read/written in 8-bit units

Address: RSCFDnCFDTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R

Table 25.145 RSCFDnCFDTMSTSp Register Contents

Bit	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.
The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.
The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.
00_B: Transmission is in progress or no transmit request is present.
01_B: Transmission from the transmit buffer was aborted.
10_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).
11_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).
Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

25.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 31)

Access: RSCFDnCFDTMIDp register can be read/written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMIDp: <RSCFDn_base> + 4000_H + (20_H × p)
RSCFDnCFDTMIDpL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpH: <RSCFDn_base> + 4002_H + (20_H × p)
RSCFDnCFDTMIDpLL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpLH: <RSCFDn_base> + 4001_H + (20_H × p),
RSCFDnCFDTMIDpHL: <RSCFDn_base> + 4002_H + (20_H × p),
RSCFDnCFDTMIDpHH: <RSCFDn_base> + 4003_H + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMID[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.146 RSCFDnCFDTMIDp Register Contents

Bit	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CANFD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.
Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CANFD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

25.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

Access: RSCFDnCFDTMPTRp register can be read/written in 32-bit units
RSCFDnCFDTMPTRpL, RSCFDnCFDTMPTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMPTRpLL, RSCFDnCFDTMPTRpLH, RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMPTRp: <RSCFDn_base> + 4004_H + (20_H × p)
RSCFDnCFDTMPTRpL: <RSCFDn_base> + 4004_H + (20_H × p),
RSCFDnCFDTMPTRpH: <RSCFDn_base> + 4006_H + (20_H × p)
RSCFDnCFDTMPTRpLL: <RSCFDn_base> + 4004_H + (20_H × p),
RSCFDnCFDTMPTRpLH: <RSCFDn_base> + 4005_H + (20_H × p),
RSCFDnCFDTMPTRpHL: <RSCFDn_base> + 4006_H + (20_H × p),
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + 4007_H + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDLC[3:0]				—	—	—	—	TMPTR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.147 RSCFDnCFDTMPTRp Register Contents

Bit	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data

b31 b30 b29 b28	Classical CAN Frame	CANFD Frame
0 0 0 0	0 data bytes	
0 0 0 1	1 data byte	
0 0 1 0	2 data bytes	
0 0 1 1	3 data bytes	
0 1 0 0	4 data bytes	
0 1 0 1	5 data bytes	
0 1 1 0	6 data bytes	
0 1 1 1	7 data bytes	
1 0 0 0	8 data bytes	
1 0 0 1	8 data bytes	12 data bytes
1 0 1 0		16 data bytes
1 0 1 1		20 data bytes
1 1 0 0		24 data bytes
1 1 0 1		32 data bytes
1 1 1 0		48 data bytes
1 1 1 1		64 data bytes

27 to 24	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).
When the TMDLC[3:0] bits are set to 1001_B or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the MFDF bit is 1 (CANFD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If a value larger than 1100_B is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000_B to 1111_B is settable. In other cases, set a value of 0000_B to 1011_B (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

25.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CANFD Configuration Register (p = 0 to 31)

Access: RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units
RSCFDnCFDTMFDCTRpL, RSCFDnCFDTMFDCTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMFDCTRpLL, RSCFDnCFDTMFDCTRpLH, RSCFDnCFDTMFDCTRpHL, RSCFDnCFDTMFDCTRpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMFDCTRp: <RSCFDn_base> + 4008_H + (20_H × p)
RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + 4008_H + (20_H × p),
RSCFDnCFDTMFDCTRpH: <RSCFDn_base> + $400A_H$ + (20_H × p)
RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + 4008_H + (20_H × p),
RSCFDnCFDTMFDCTRpLH: <RSCFDn_base> + 4009_H + (20_H × p),
RSCFDnCFDTMFDCTRpHL: <RSCFDn_base> + $400A_H$ + (20_H × p),
RSCFDnCFDTMFDCTRpHH: <RSCFDn_base> + $400B_H$ + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TMFDF	TMBRS	TMESI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 25.148 RSCFDnCFDTMFDCTRp Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CANFD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

25.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 31)

Access: RSCFDnCFDTMDFb_p register can be read/written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMDFb_p: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + $400D_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + $400F_H$ + (04_H × b) + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.150 RSCFDnCFDTMIECy Register Contents

Bit	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 25.151 shows the bit assignment.

25.4.12 Details of Transmit Buffer Status-related Registers

25.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

Access: RSCFDnCFDTMTRSTSy register can be read only in 32-bit units
RSCFDnCFDTMTRSTSyL, RSCFDnCFDTMTRSTSyH registers can be read only in 16-bit units
RSCFDnCFDTMTRSTSyLL, RSCFDnCFDTMTRSTSyLH, RSCFDnCFDTMTRSTSyHL, RSCFDnCFDTMTRSTSyHH registers can be read only in 8-bit units

Address: RSCFDnCFDTMTRSTSy: <RSCFDn_base> + 0350_H + (04_H × y)
RSCFDnCFDTMTRSTSyL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCFDnCFDTMTRSTSyH: <RSCFDn_base> + 0352_H + (04_H × y)
RSCFDnCFDTMTRSTSyLL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCFDnCFDTMTRSTSyLH: <RSCFDn_base> + 0351_H + (04_H × y),
RSCFDnCFDTMTRSTSyHL: <RSCFDn_base> + 0352_H + (04_H × y),
RSCFDnCFDTMTRSTSyHH: <RSCFDn_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0))															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.152 RSCFDnCFDTMTRSTSy Register Contents

Bit	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 25.153 shows the bit assignment.

Table 25.160 RSCFDnCFDTXQCCm Register Contents

Bit	Bit Name	Function
31 to 14	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.
Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see Figure 25.9.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

25.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0, 1)

Access: RSCFDnCFDTXQSTSm register can be read/written in 32-bit units
RSCFDnCFDTXQSTSmL, RSCFDnCFDTXQSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTXQSTSmLL, RSCFDnCFDTXQSTSmLH, RSCFDnCFDTXQSTSmHL, RSCFDnCFDTXQSTSmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDnCFDTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCFDnCFDTXQSTSmH: <RSCFDn_base> + $03C2_H$ + (04_H × m)
RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCFDnCFDTXQSTSmLH: <RSCFDn_base> + $03C1_H$ + (04_H × m),
RSCFDnCFDTXQSTSmHL: <RSCFDn_base> + $03C2_H$ + (04_H × m),
RSCFDnCFDTXQSTSmHH: <RSCFDn_base> + $03C3_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 25.161 RSCFDnCFDTXQSTSm Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.
This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.
This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

25.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

Access: RSCFDnCFDTXQPCTRm register can only be written in 32-bit units
RSCFDnCFDTXQPCTRmL, RSCFDnCFDTXQPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTXQPCTRmLL, RSCFDnCFDTXQPCTRmLH, RSCFDnCFDTXQPCTRmHL, RSCFDnCFDTXQPCTRmHH registers can only be written in 8-bit units

Address: RSCFDnCFDTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m),

Table 25.162 RSCFDnCFDTXQPCTRm Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15 and 31) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

25.4.14 Details of Transmit History-related Registers

25.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

Access: RSCFDnCFDTHLCCm register can be read/written in 32-bit units
RSCFDnCFDTHLCCmL, RSCFDnCFDTHLCCmH registers can be read/written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH, RSCFDnCFDTHLCCmHL, RSCFDnCFDTHLCCmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)
RSCFDnCFDTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)
RSCFDnCFDTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
RSCFDnCFDTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),
RSCFDnCFDTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Table 25.163 RSCFDnCFDTHLCCm Register Contents

Bit	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.
Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer. Modify this bit in channel communication mode or channel halt mode.
This bit is cleared to 0 in channel reset mode.

25.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0, 1)

Access: RSCFDnCFDTHLSTSm register can be read/written in 32-bit units
RSCFDnCFDTHLSTSmL, RSCFDnCFDTHLSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTHLSTSmLL, RSCFDnCFDTHLSTSmLH, RSCFDnCFDTHLSTSmHL, RSCFDnCFDTHLSTSmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)
RSCFDnCFDTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)
RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
RSCFDnCFDTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
RSCFDnCFDTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state

Table 25.164 RSCFDnCFDTHLSTSm Register Contents

Bit	Bit Name	Function
31 to 13	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.
This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.
When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.
When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.
This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

Note: To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

25.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

Access: RSCFDnCFDTHLPCTRm register can only be written in 32-bit units
RSCFDnCFDTHLPCTRmL, RSCFDnCFDTHLPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTHLPCTRmLL, RSCFDnCFDTHLPCTRmLH, RSCFDnCFDTHLPCTRmHL, RSCFDnCFDTHLPCTRmHH registers can only be written in 8-bit units

Address: RSCFDnCFDTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)
RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCFDnCFDTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)
RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCFDnCFDTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
RSCFDnCFDTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
RSCFDnCFDTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	THLPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 25.165 RSCFDnCFDTHLPCTRm Register Contents

Bit	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.
When writing FF_H to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

25.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0, 1)

Access: RSCFDnCFDTHLACCm register can be read only in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units

Address: RSCFDnCFDTHLACCm: <RSCFDn_base> + 6000_H + (04_H × m)
RSCFDnCFDTHLACCmL: <RSCFDn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmH: <RSCFDn_base> + 6002_H + (04_H × m)
RSCFDnCFDTHLACCmLL: <RSCFDn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmLH: <RSCFDn_base> + 6001_H + (04_H × m),
RSCFDnCFDTHLACCmHL: <RSCFDn_base> + 6002_H + (04_H × m),
RSCFDnCFDTHLACCmHH: <RSCFDn_base> + 6003_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 25.166 RSCFDnCFDTHLACCm Register Contents

Bit	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	This bit is read as the value after reset.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

25.4.15 Details of Test-related Registers

25.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

Access: RSCFDnCFDGTSTCFG register can be read/written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGLH, RSCFDnCFDGTSTCFGHL, RSCFDnCFDGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCFG: <RSCFDn_base> + 0468_H
RSCFDnCFDGTSTCFGL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGH: <RSCFDn_base> + $046A_H$
RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGLH: <RSCFDn_base> + 0469_H,
RSCFDnCFDGTSTCFGHL: <RSCFDn_base> + $046A_H$, RSCFDnCFDGTSTCFGHH: <RSCFDn_base> + $046B_H$

Value after reset: $0000\ 0000_H$

Table 25.167 RSCFDnCFDGTSTCFG Register Contents

Bit	Bit Name	Function
31 to 23	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 27 ($1B_H$).
15 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $1B_H$, inclusive. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is $1B_H$).

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

25.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

Access: RSCFDnCFDGTSTCTR register can be read/written in 32-bit units
RSCFDnCFDGTSTCTRL, RSCFDnCFDGTSTCTRH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCTRLL, RSCFDnCFDGTSTCTRLH, RSCFDnCFDGTSTCTRHL, RSCFDnCFDGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCTR: <RSCFDn_base> + $046C_H$
RSCFDnCFDGTSTCTRL: <RSCFDn_base> + $046C_H$, RSCFDnCFDGTSTCTRH: <RSCFDn_base> + $046E_H$
RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + $046C_H$, RSCFDnCFDGTSTCTRLH: <RSCFDn_base> + $046D_H$,
RSCFDnCFDGTSTCTRHL: <RSCFDn_base> + $046E_H$, RSCFDnCFDGTSTCTRHH: <RSCFDn_base> + $046F_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 25.168 RSCFDnCFDGTSTCTR Register Contents

Bit	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.
This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.
This bit is cleared to 0 in global reset mode.

25.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Access: RSCFDnCFDGLOCKK register can only be written in 32-bit units
RSCFDnCFDGLOCKKL, RSCFDnCFDGLOCKKH registers can only be written in 16-bit units

Address: RSCFDnCFDGLOCKK: <RSCFDn_base> + $047C_H$
RSCFDnCFDGLOCKKL: <RSCFDn_base> + $047C_H$, RSCFDnCFDGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 25.169 RSCFDnCFDGLOCKK Register Contents

Bit	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.
For the protection release data, see section 25.11.4.2, Procedure for Releasing the Protection.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.
After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $05FF_H$) of the CAN (except the RAM) enables the protection again.
Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

25.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCFDnCFDRPGACCr register can be read/written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL, RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRPGACCr: <RSCFDn_base> + 6400_H + (04_H × r)
RSCFDnCFDRPGACCrL: <RSCFDn_base> + 6400_H + (04_H × r),
RSCFDnCFDRPGACCrH: <RSCFDn_base> + 6402_H + (04_H × r)
RSCFDnCFDRPGACCrLL: <RSCFDn_base> + 6400_H + (04_H × r),
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + 6401_H + (04_H × r),
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + 6402_H + (04_H × r),
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + 6403_H + (04_H × r)

Table 25.170 RSCFDnCFDRPGACCr Register Contents

Bit	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).
The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

25.5 Interrupt Sources and DMA Trigger

25.5.1 Interrupt Sources

The RS-CANFD module has 8 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0, 1)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)
Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.
Table 25.171 lists the CAN interrupt sources. Figure 25.2 shows the CAN global interrupt block diagram. Figure 25.3 shows the CAN channel interrupt block diagram.

Table 25.171 List of CAN Interrupt Sources

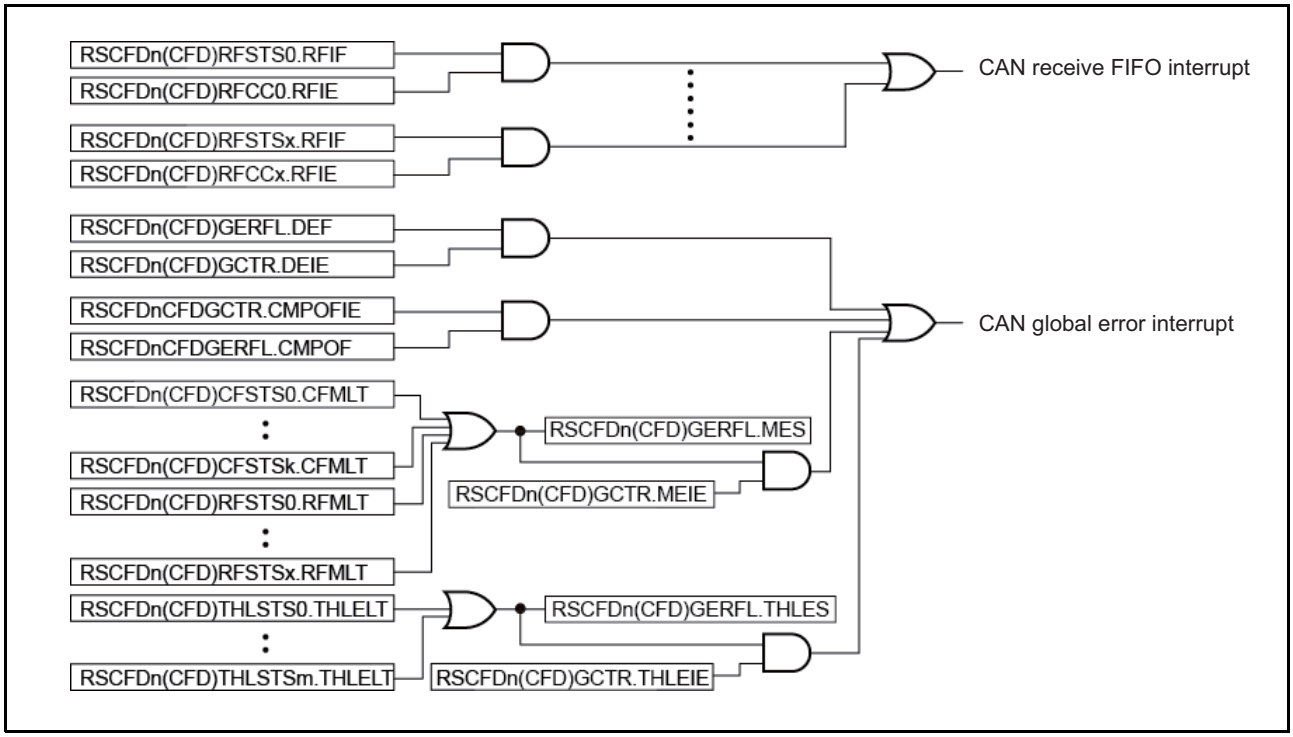

Figure 25.2 CAN Global Interrupt Block Diagram

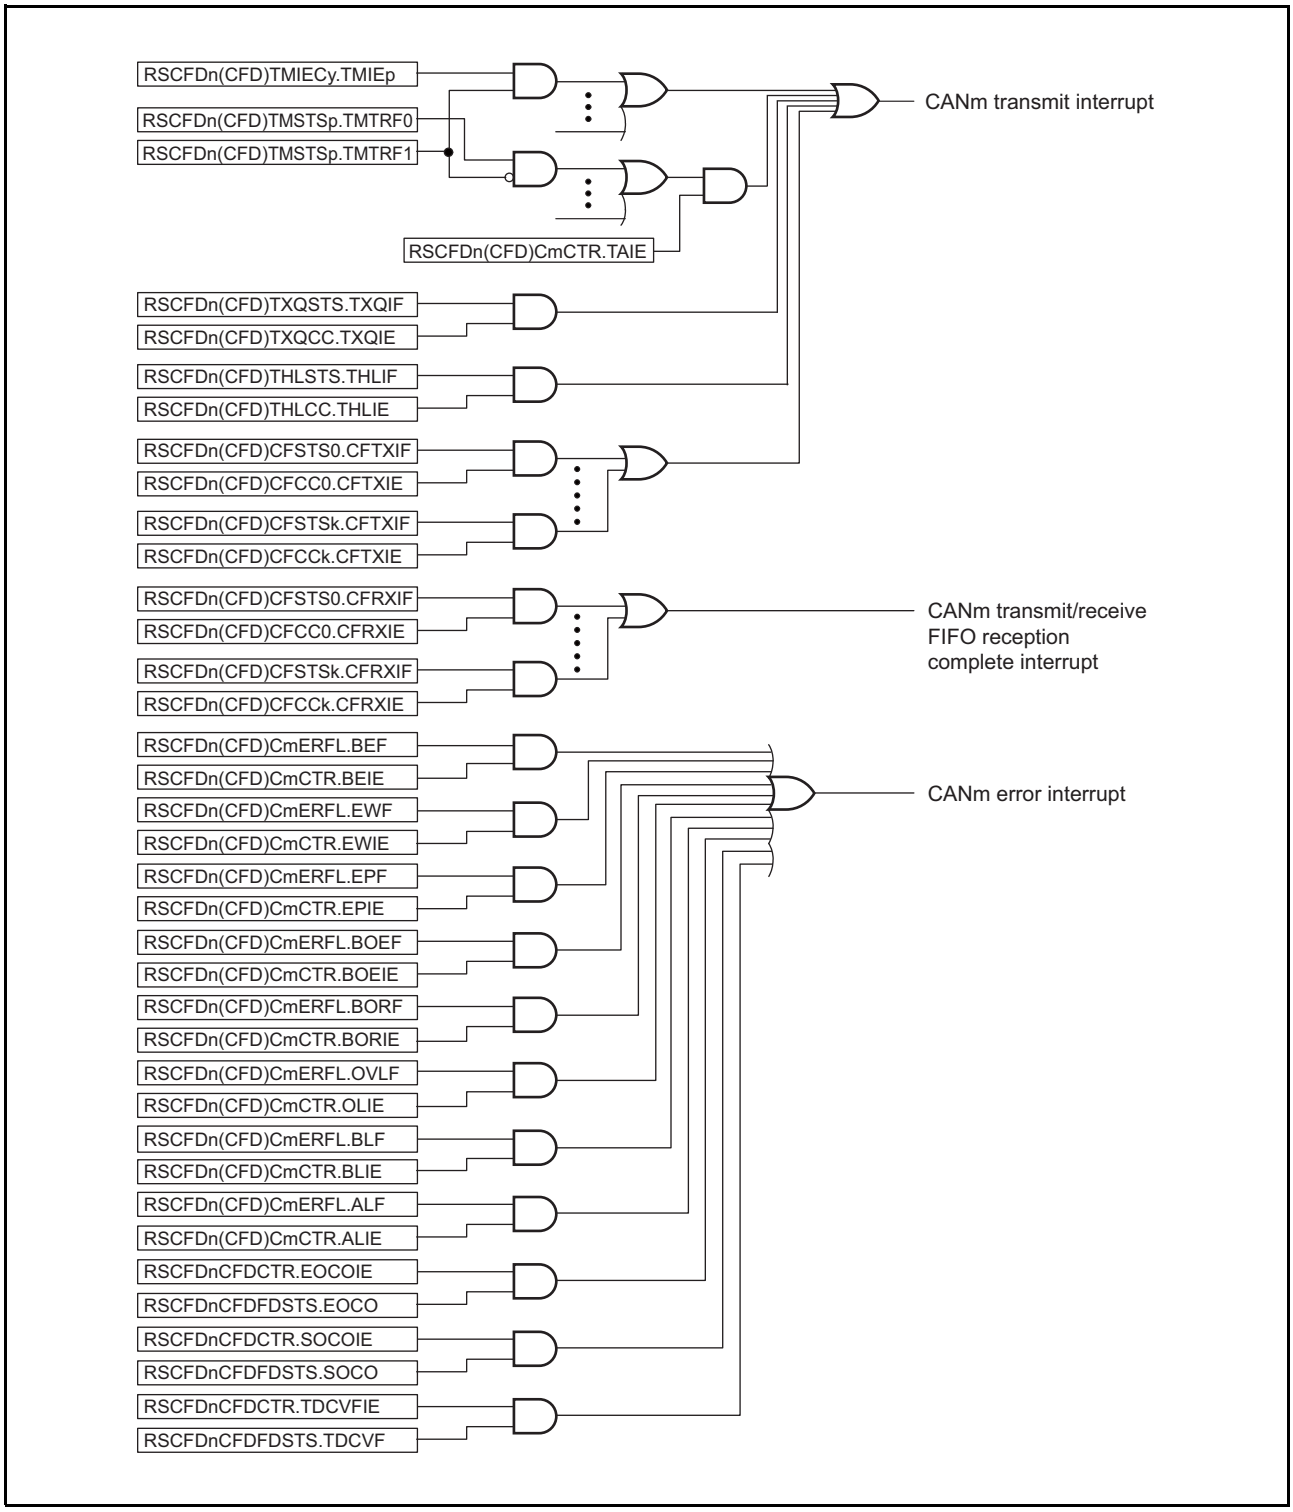

Figure 25.3 CAN Channel Interrupt Block Diagram

25.5.2 DMA Trigger (Only in CANFD Mode)

In CANFD mode, receive FIFO buffers can be related to DMA channels. The following 10 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0, 1) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

25.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in section 25.6.1, Global Modes, and details of channel modes are described in section 25.6.2, Table 25.5, Channel Mode State Transition Chart.

- Global stop mode:Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode:Performs initial settings for the entire module.
- Global test mode:Performs test settings and performs the RAM test.
- Global operating mode:Makes the entire module operable.
- Channel stop mode:Stops the channel clock.
- Channel reset mode:Performs initial settings for the channels.
- Channel halt mode:Stops CAN communication and allows channel testing.
- Channel communication mode:Performs CAN communication.

25.6.1 Global Modes

Figure 25.4 shows the transitions of global modes.

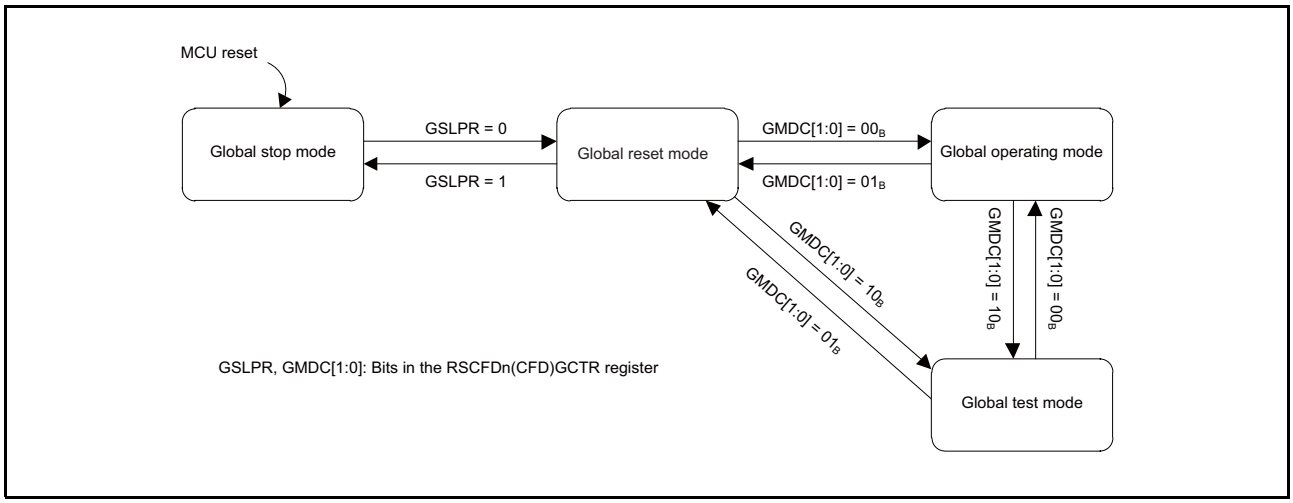

Figure 25.4 **Transitions of Global Modes**

In some cases, global mode transitions also force channel mode transitions. Table 25.172 shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 25.172 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

	Channel Mode after Setting			
Channel Mode before Setting	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note 1. GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 25.173 shows the global mode transition time.

Table 25.173 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times,*1, *2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times,*1, *2
Global operating	Global test	Two CAN frames,*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use
Note 2. In CANFD mode, this time value is the CAN bit time of the nominal bit rate.

25.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.
After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

25.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see Table 25.176, Registers Initialized in Global Reset Mode or Channel Reset Mode and Table 25.177, Registers Initialized Only in Global Reset Mode.
Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0, 1) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

25.6.1.3 Global Test Mode

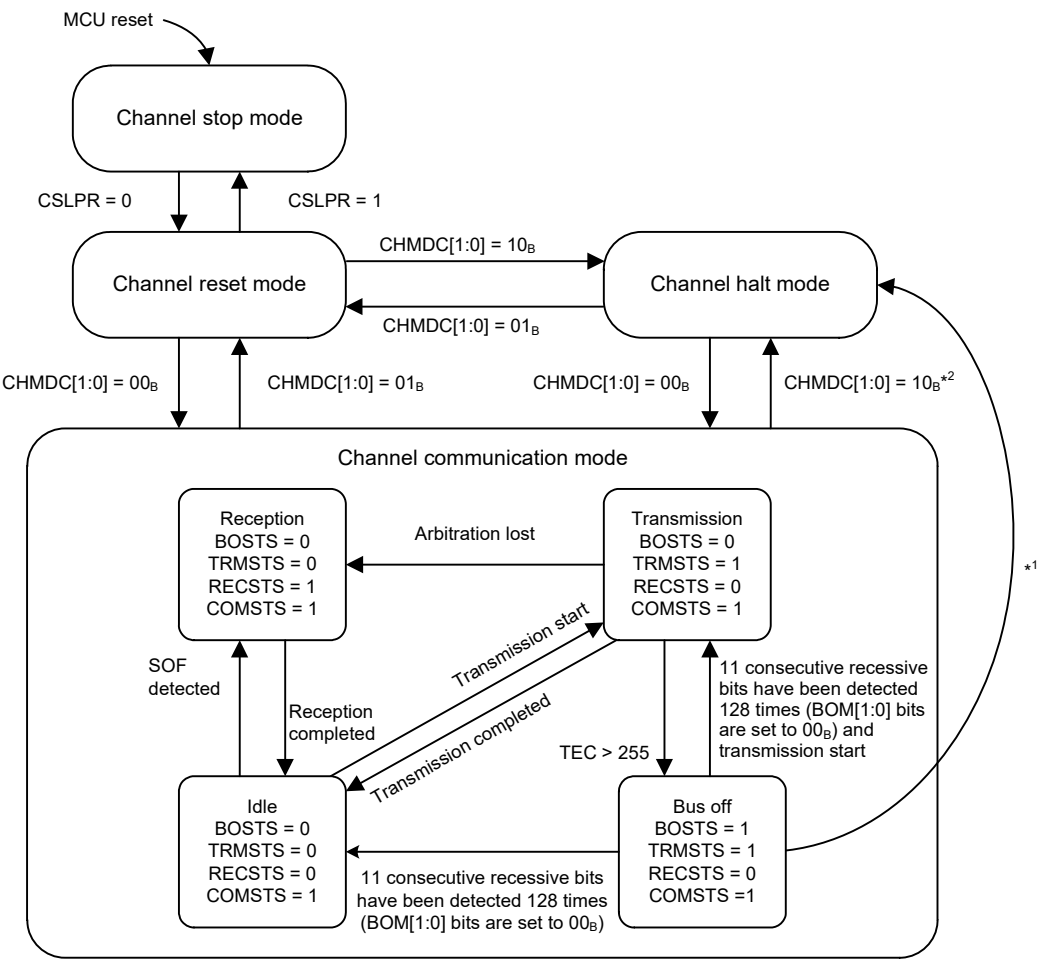
In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.
Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

25.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.
When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

25.6.2 Channel Modes

Figure 25.5 shows a channel mode state transition chart. Table 25.174 shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 1)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 25.5 Channel Mode State Transition Chart

Table 25.174 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CANFD mode, this time value is the CANm bit time of the nominal bit rate.

25.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.
Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the GSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0, 1) is set to 1 (channel stop mode) in channel reset mode. The GSLPR bit should not be modified in channel communication mode and channel halt mode.

25.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see Table 25.176, Registers Initialized in Global Reset Mode or Channel Reset Mode.
When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. Table 25.175 shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

25.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.
Table 25.175 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 25.175 Operation in Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.
Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.
Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CANFD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

25.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0, 1) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

25.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.
The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to 00_H, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode). Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

25.6.3 Initializing Registers by Transition to CAN Mode

Table 25.176 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, Table 25.177 lists bits and flags to be initialized only by a transition to global reset mode.

Table 25.176 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit/Flag
RSCFDn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCFDn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]
RSCFDn(CFD)CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF

RSCFDn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers for use in CANFD mode.

25.7 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 32 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

25.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.
Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 128 receive rules can be registered in this module that has two channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. Figure 25.6 illustrates how receive rules are registered.

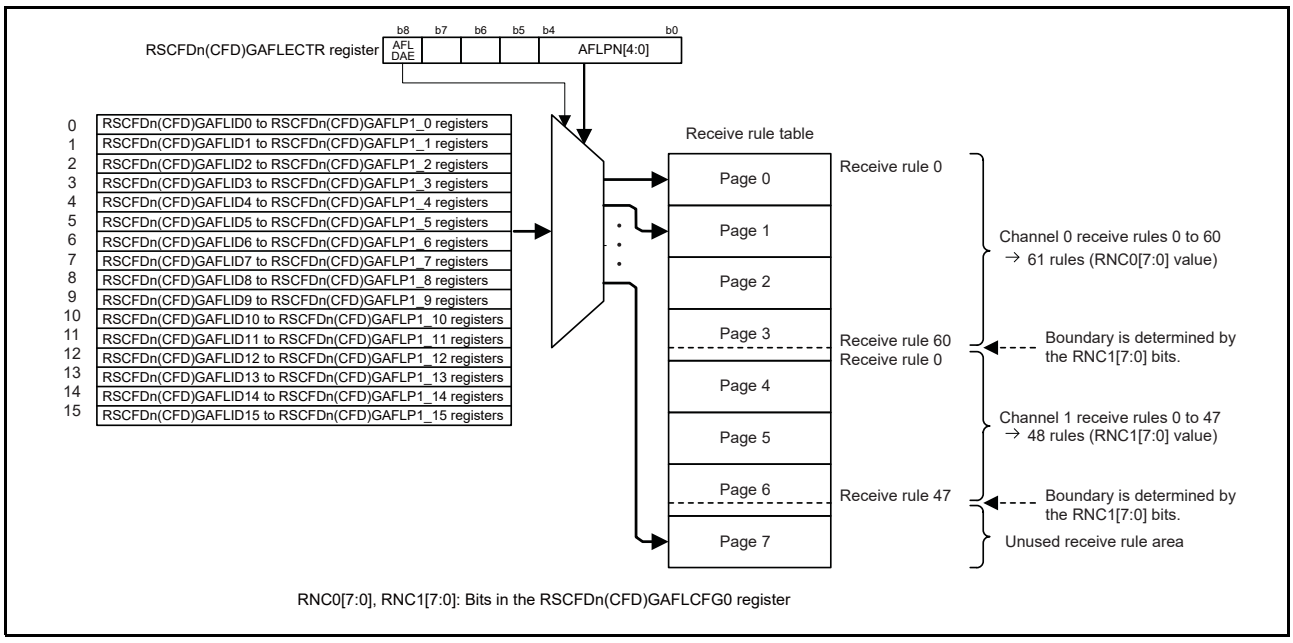

Figure 25.6 Entry of Receive Rules (for Setting Channels 0 and 1)

Note: Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

25.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

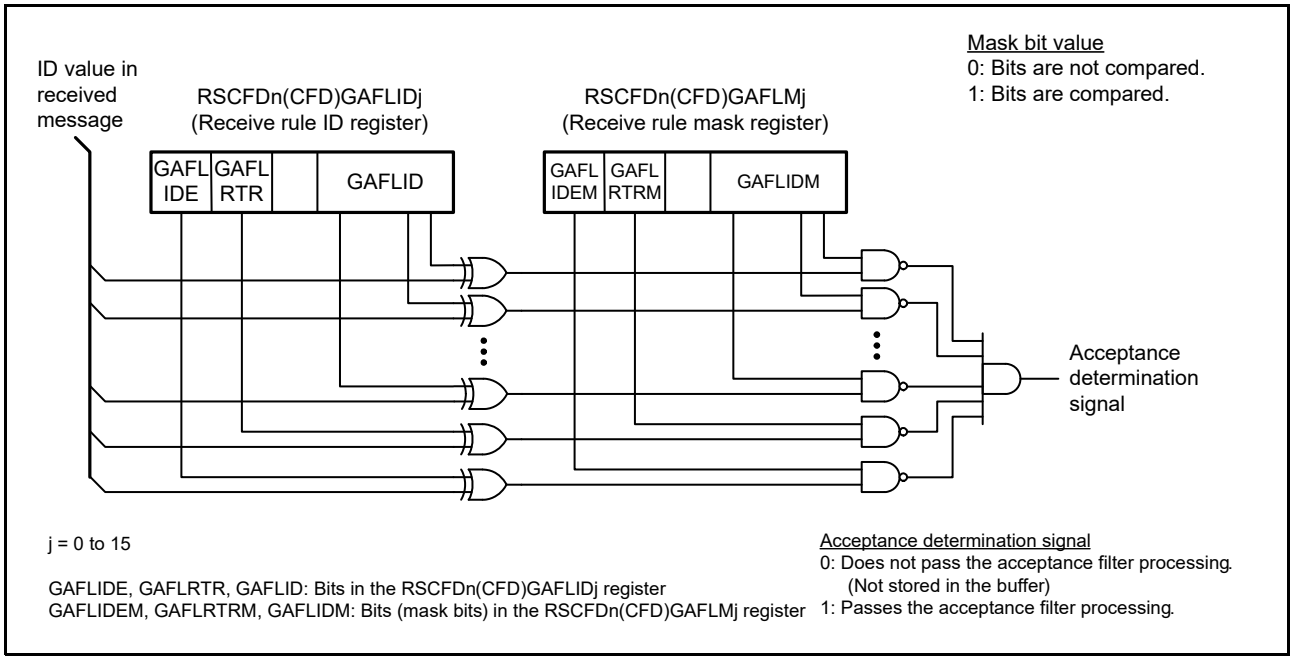

Figure 25.7 Acceptance Filter Function

25.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

25.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.
In CANFD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded.

25.7.1.4 Label Addition Processing

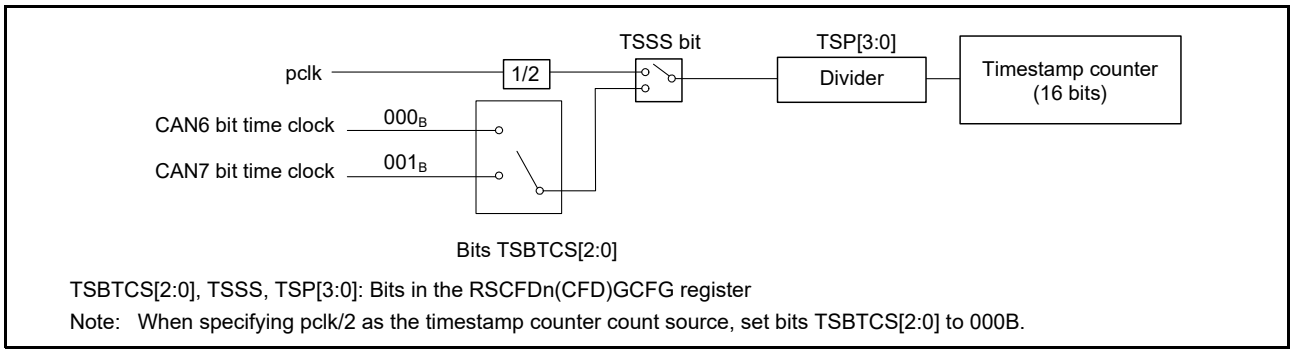
It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

25.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

25.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0, 1). In CANFD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CANFD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.
When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.
The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.



TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000B.

Figure 25.8 Timestamp Function Block Diagram

25.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CANFD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CANFD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CANFD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CANFD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 25.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

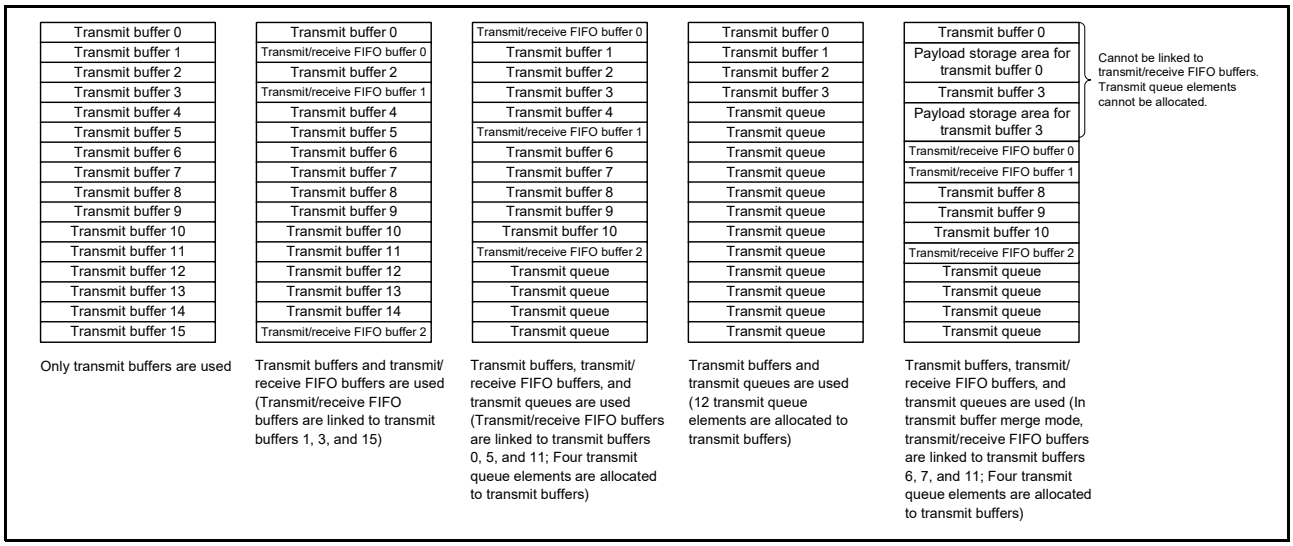


Figure 25.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

25.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.
The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.
When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.
When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.
When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit.

25.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.
The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 31). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

25.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).
A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

25.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.
The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10B or 11B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01B (transmit abort has been completed).

25.8.2.3 Transmit Buffer Merge Mode (Only in CANFD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.
Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.
While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to the merged buffers or allocate it to the transmit queue.

25.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5). Messages are transmitted sequentially on a first-in, first-out basis.
Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.
When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

25.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.
Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.
The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.
Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CANFD mode. Use this count source only for the channel that does not handle the CANFD frames.
The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

$$\text{Classical CAN mode: } \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CANFD mode: } \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

Figure 25.10 shows the interval timer block diagram.

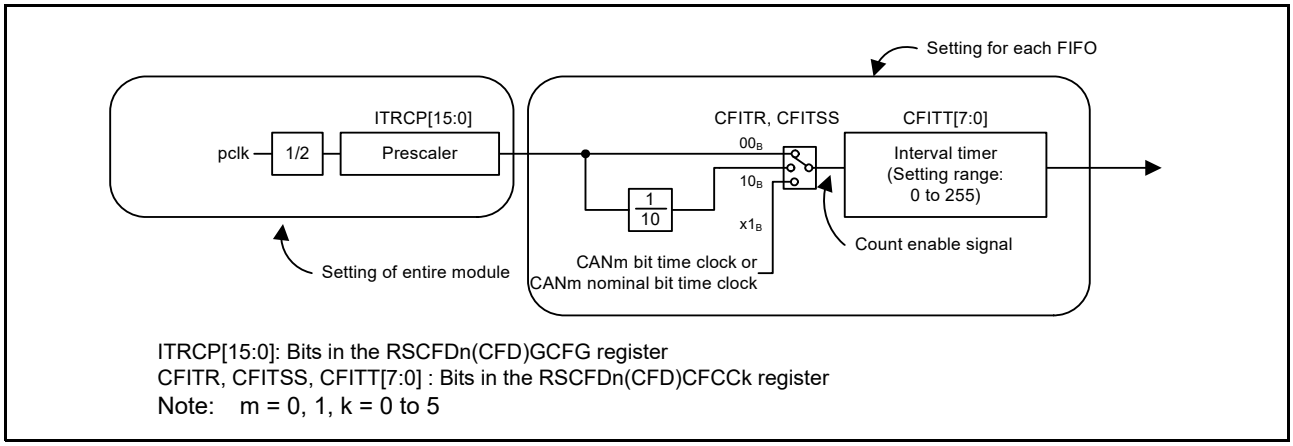

Figure 25.10 Interval Timer Block Diagram

Figure 25.11 shows the interval timer timing diagram.

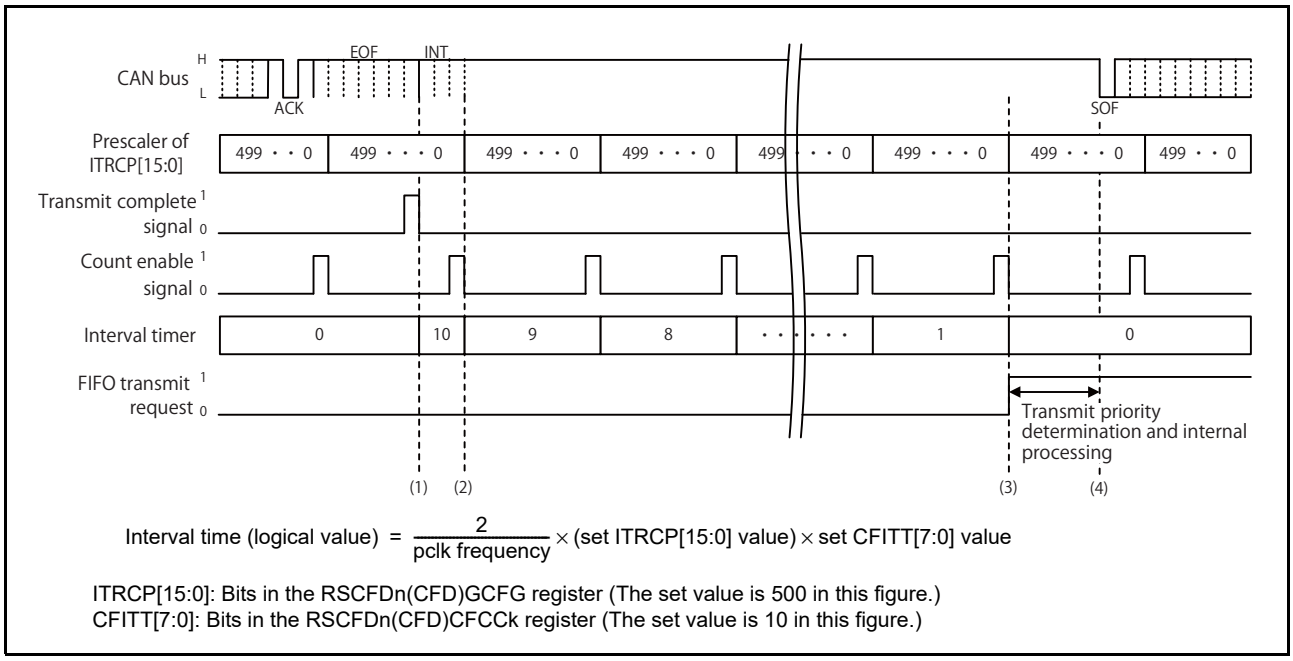

Figure 25.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.
(2) The interval timer is decremented by the next count enable signal.
(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.
(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 644 cycles of the pclk may be generated.

25.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.
All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.
Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

25.8.5 Transmit Data Padding (Only in CANFD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.
This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

25.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.
A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 5) determines whether transmit history data is stored for each message.
In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CANFD mode, a timestamp value is always included.
The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.
Storage of the transmit history data after the successful completion of transmission may take up to 128 cycles of pclk in classical CAN mode or 396 cycles of pclk in CANFD mode.

- Buffer type 001_B: Transmit buffer
  010_B: Transmit/receive FIFO buffer
  100_B: Transmit queue
- Buffer number: Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See Table 25.178.
- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message (When the TMTSCE bit is 1 in classical CAN mode)

Table 25.178 Transmit History Data Buffer Numbers

Buffer Type Buffer No.	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.
The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see section 25.7.1.6, Timestamp.
Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

25.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.
When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10_B (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.
Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.
Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

25.9.1 CAN-CANFD Gateway (Only in CANFD Mode)

When the gateway function is used in CANFD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CANFD frame.
Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CANFD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register.
When the DLC value of the received CAN frame is 1001_B or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000_B.
When the CAN-CANFD gateway is enabled, do not perform routing for the following frames.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CANFD gateway is enabled, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.
- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

25.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CANFD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

25.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CANFD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see section 25.10.6.1, CRC Error Test.

25.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.
Listen-only mode is available for detecting the communication speed.
Do not make a transmit request from any buffer or queue in listen-only mode.
Figure 25.12 shows the connection when listen-only mode is selected.

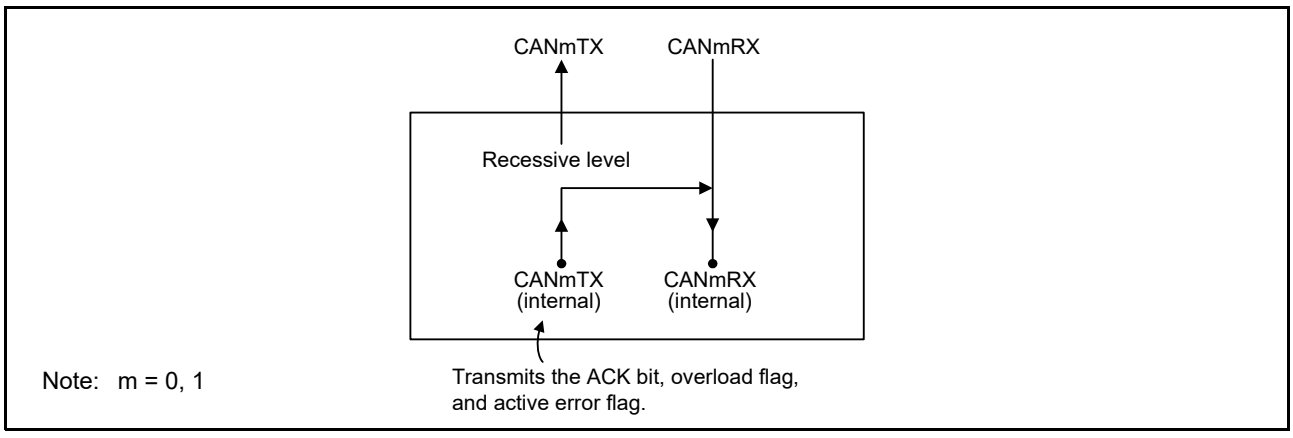

Figure 25.12 Connection when Listen-Only Mode is Selected

25.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

25.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.
In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.
Figure 25.13 shows the connection when self-test mode 0 is selected.

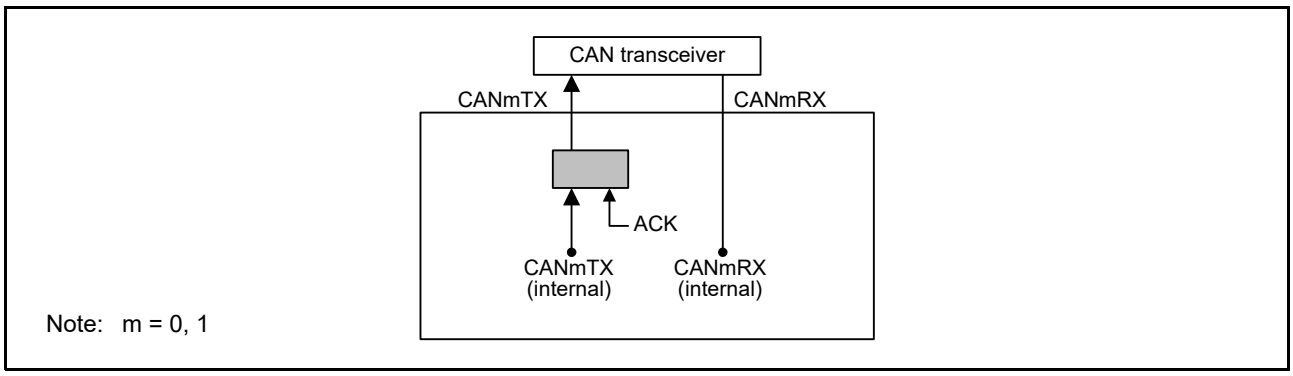

Figure 25.13 Connection when Self-Test Mode 0 is Selected

25.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.
In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0, 1) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.
Figure 25.14 shows the connection when self-test mode 1 is selected.

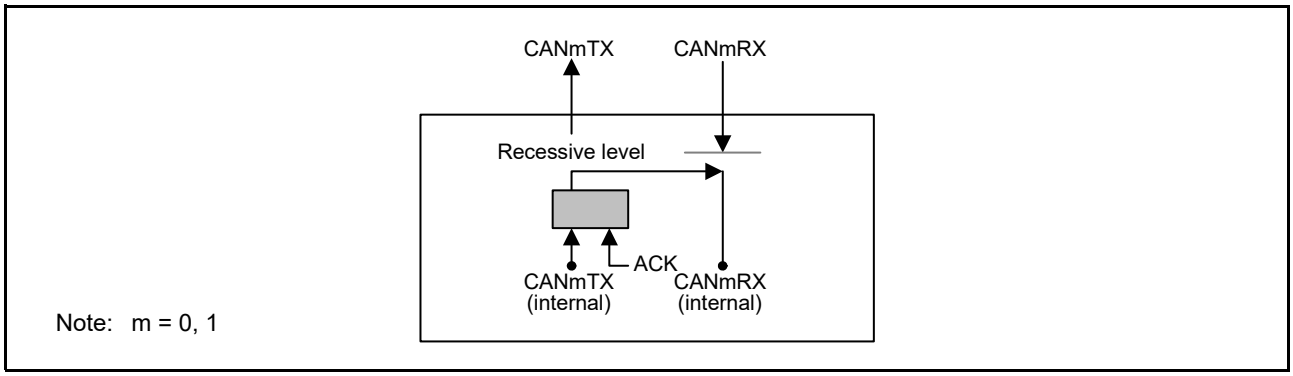

Figure 25.14 Connection when Self-Test Mode 1 is Selected

25.10.4 Restricted Operation Mode (Only in CANFD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error. A desired transmission request can be made for transmission without restrictions.

25.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.
When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 5120 bytes (1400_H) in classical CAN mode or 7104 bytes ($1BC0_H$) in CANFD mode. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is $1B_H$) in CANFD mode.

25.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.
Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.
Figure 25.15 shows the connection for inter-channel communication test.

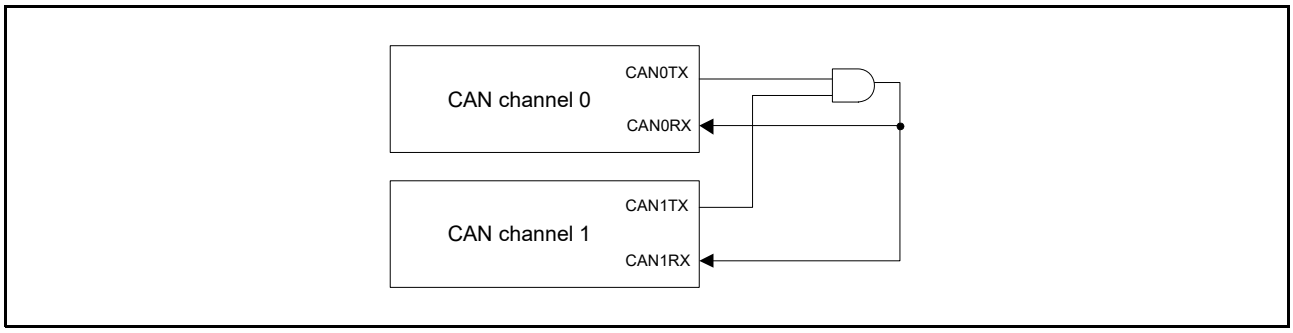

Figure 25.15 Connection for Inter-Channel Communication Test

25.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is 10000B or ID's upper 6-bit value is 011111B is received.
The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

25.11 RS-CANFD Setting Procedure

25.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 2530 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. Figure 25.16 shows the CAN setting procedure after the MCU is reset.

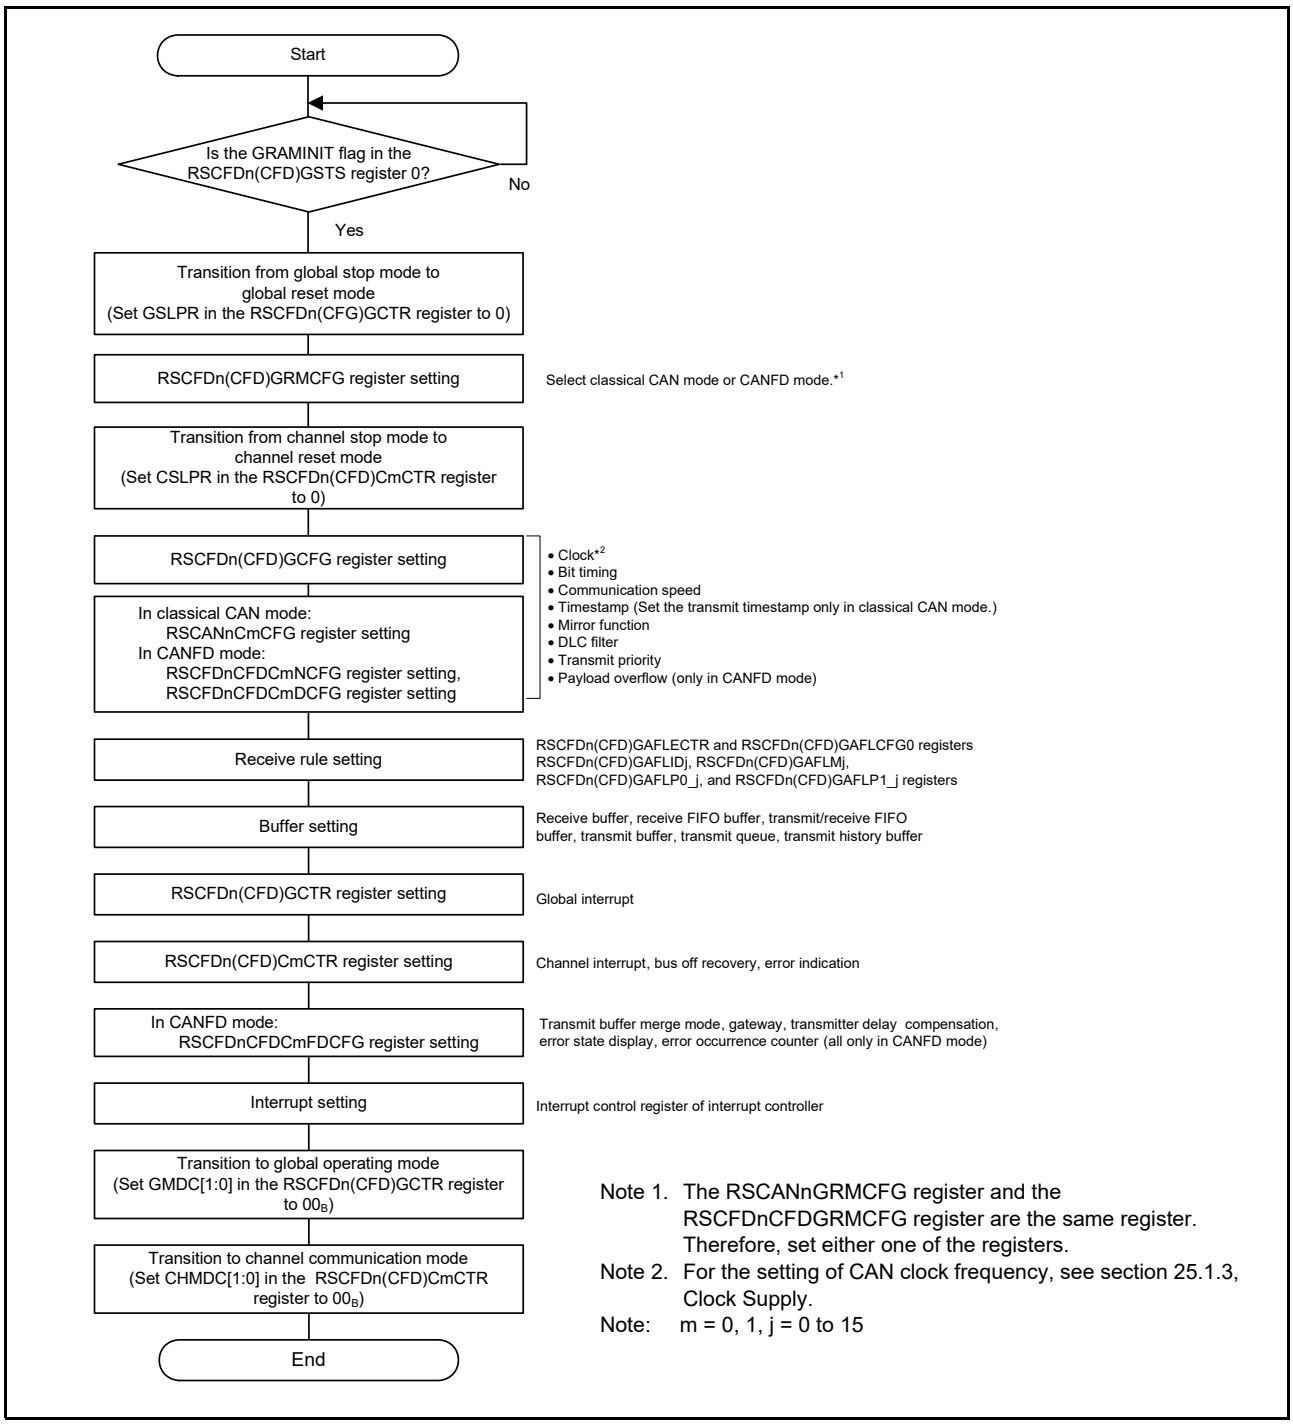

Figure 25.16 CAN Setting Procedure after the MCU is Reset

25.11.1.1 Clock Setting

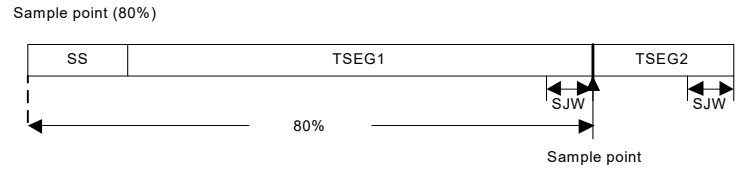
Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

25.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CANFD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CANFD mode (CANmTq(N) clock and CANmTq(D) clock). Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0]. To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

Figure 25.17 shows the bit timing chart. Table 25.179 shows an example of bit timing setting.



Classical CAN mode:
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 4 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 > TSEG2 ≥ SJW

CANFD mode:

<Nominal bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 128 Tq
- Set TSEG2 to a range of 2 Tq to 32 Tq
- Set SJW to a range of 1 Tq to 32 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
- TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 2 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 8 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 25.17 Bit Timing Chart

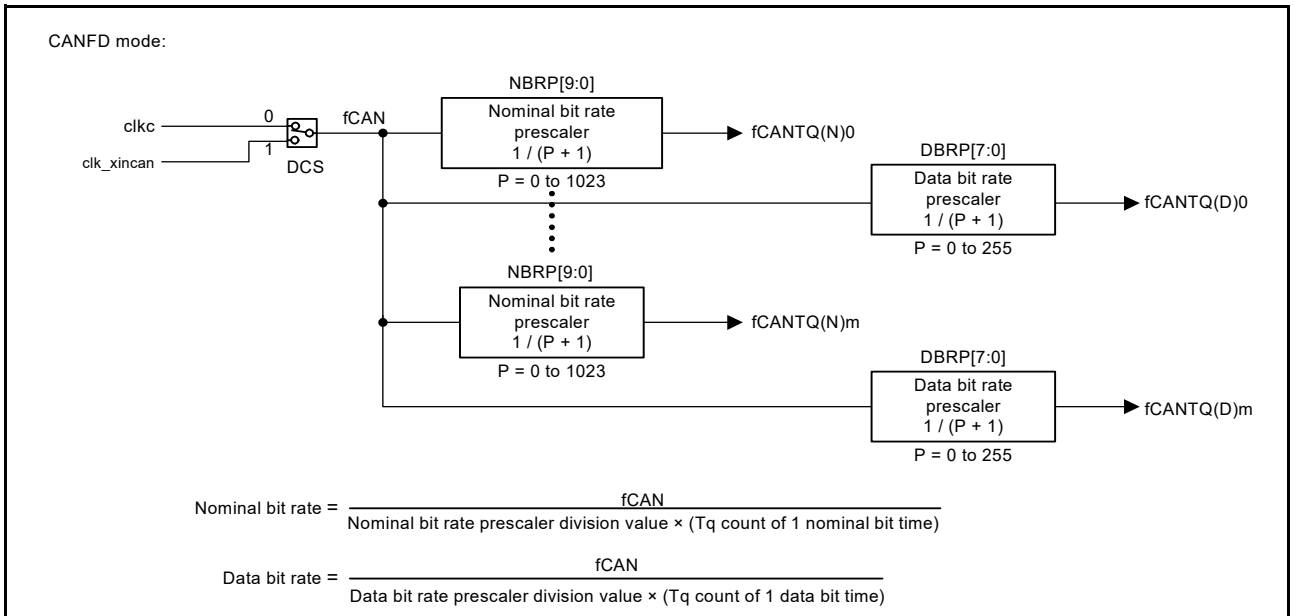
Table 25.179 Example of Bit Timing Setting

1 Bit	Set Value (Tq) SS	TSEG1	TSEG2	SJW	Sample Point (%) Note: See Figure 25.17.
	1	4	3	1	62.50
8 Tq	1	5	2	1	75.00
	1	6	3	1	70.00
10 Tq	1	7	2	1	80.00
	1	10	5	1	68.75
16 Tq	1	11	4	1	75.00
	1	12	7	1	65.00
20 Tq	1	13	6	1	70.00
50 Tq*1	1	39	10	4	80.00

Note 1. Only in CANFD mode

25.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CANFD mode, set two types of transmission rate (arbitration phase and data phase) for each channel. Figure 25.18 shows the CAN clock control block diagram, and Table 25.180 and Table 25.181 show examples of the communication speed setting.



Note. m = 0, 1
DCS: Bit in the RSCFDn(CFD)GCFG register
BRP[9:0]: Bits in the RSCFDnCmCFG RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register
DBRP[7:0]: Bits in the RSCFDnCFDCmDCFG register
fCAN: CAN clock
fCANTQm: CANmTq clock
fCANTQ(N)m: CANmTq(N) clock
fCANTQ(D)m: CANmTq(D) clock

Figure 25.18 CAN Clock Control Block Diagram

Table 25.180 Example of Communication Speed Setting (Classical CAN Mode)

Communication Speed \ fCAN	32 MHz	16 MHz	8 MHz
1 Mbps	8 Tq (4) 16 Tq (2)	8 Tq (2) 16 Tq (1)	8 Tq (1)
500 Kbps	8 Tq (8) 16 Tq (4)	8 Tq (4) 16 Tq (2)	8 Tq (2) 16 Tq (1)
250 Kbps	8 Tq (16) 16 Tq (8)	8 Tq (8) 16 Tq (4)	8 Tq (4) 16 Tq (2)
125 Kbps	8 Tq (32) 16 Tq (16)	8 Tq (16) 16 Tq (8)	8 Tq (8) 16 Tq (4)

Table 25.181 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CANFD Mode)

Communication Speed \ fCAN	32 MHz	16 MHz
Nominal bit rate 1 Mbps Data bit rate 4 Mbps	Nominal bit rate 32 Tq (1) Data bit rate 8 Tq (1)	None
Nominal bit rate 500 Kbps Data bit rate 2 Mbps	Nominal bit rate 64 Tq (1) Data bit rate 16 Tq (1)	Nominal bit rate 32 Tq (1) Data bit rate 8 Tq (1)

Note: Values in ( ) are baud rate prescaler division values.

25.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.
Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.
Figure 25.19 shows the receive rule setting procedure.

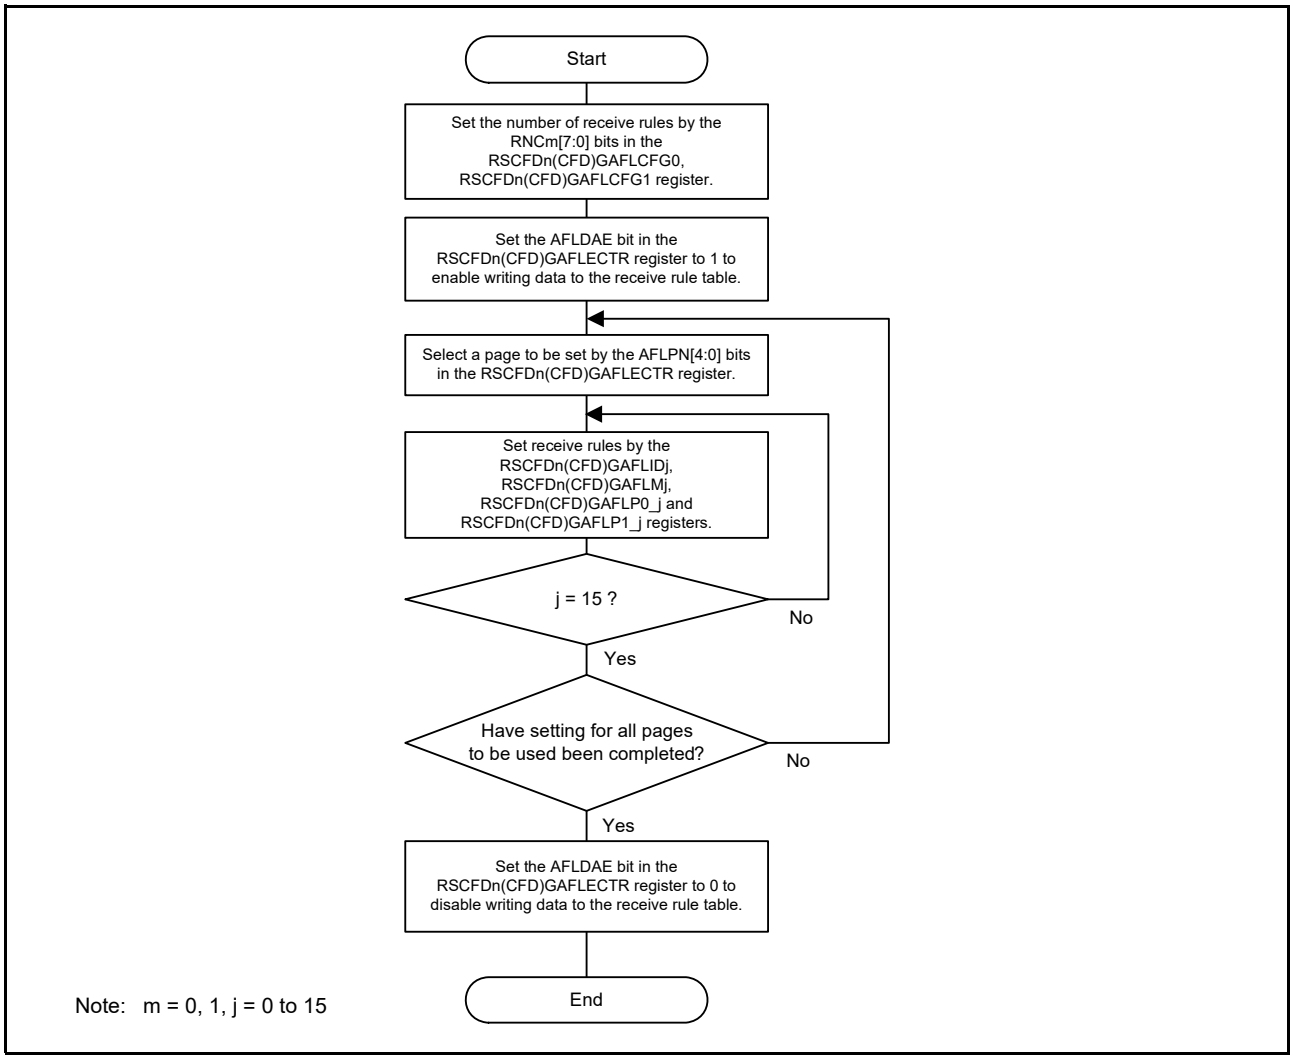


Figure 25.19 Receive Rule Setting Procedure

25.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CANFD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

In classical CAN mode, up to 2048 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 128 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x + total number of depth of transmit/receive FIFO buffers k ≤ 128 buffers

In CANFD mode, up to 3584 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 3584 bytes

Figure 25.20 shows the buffer configuration. Figure 25.21 shows the buffer setting procedure.

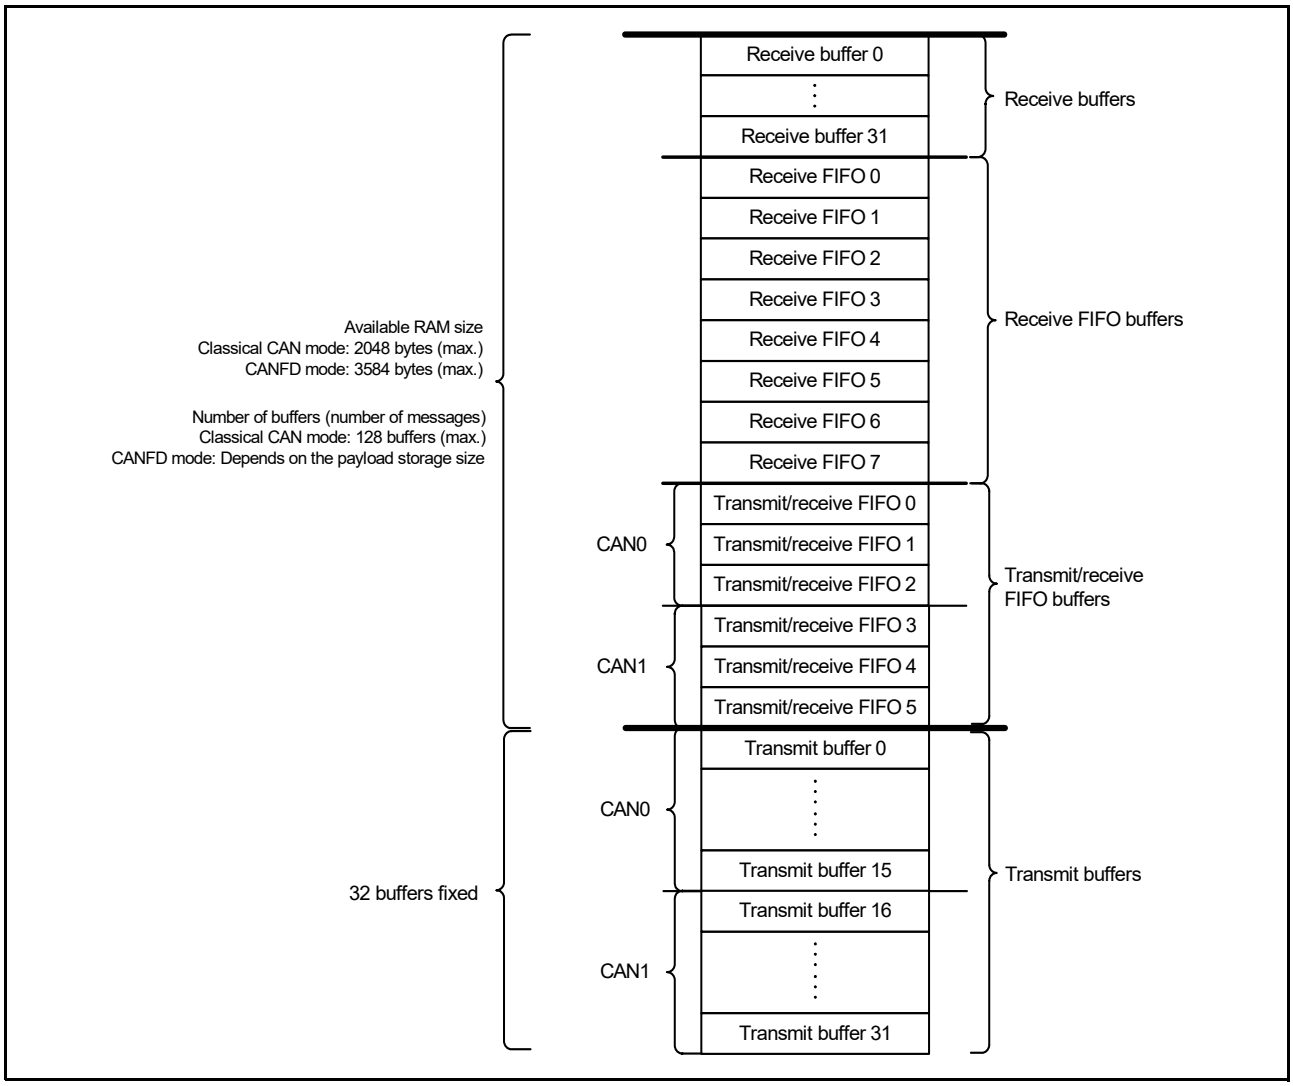

Figure 25.20 Buffer Configuration

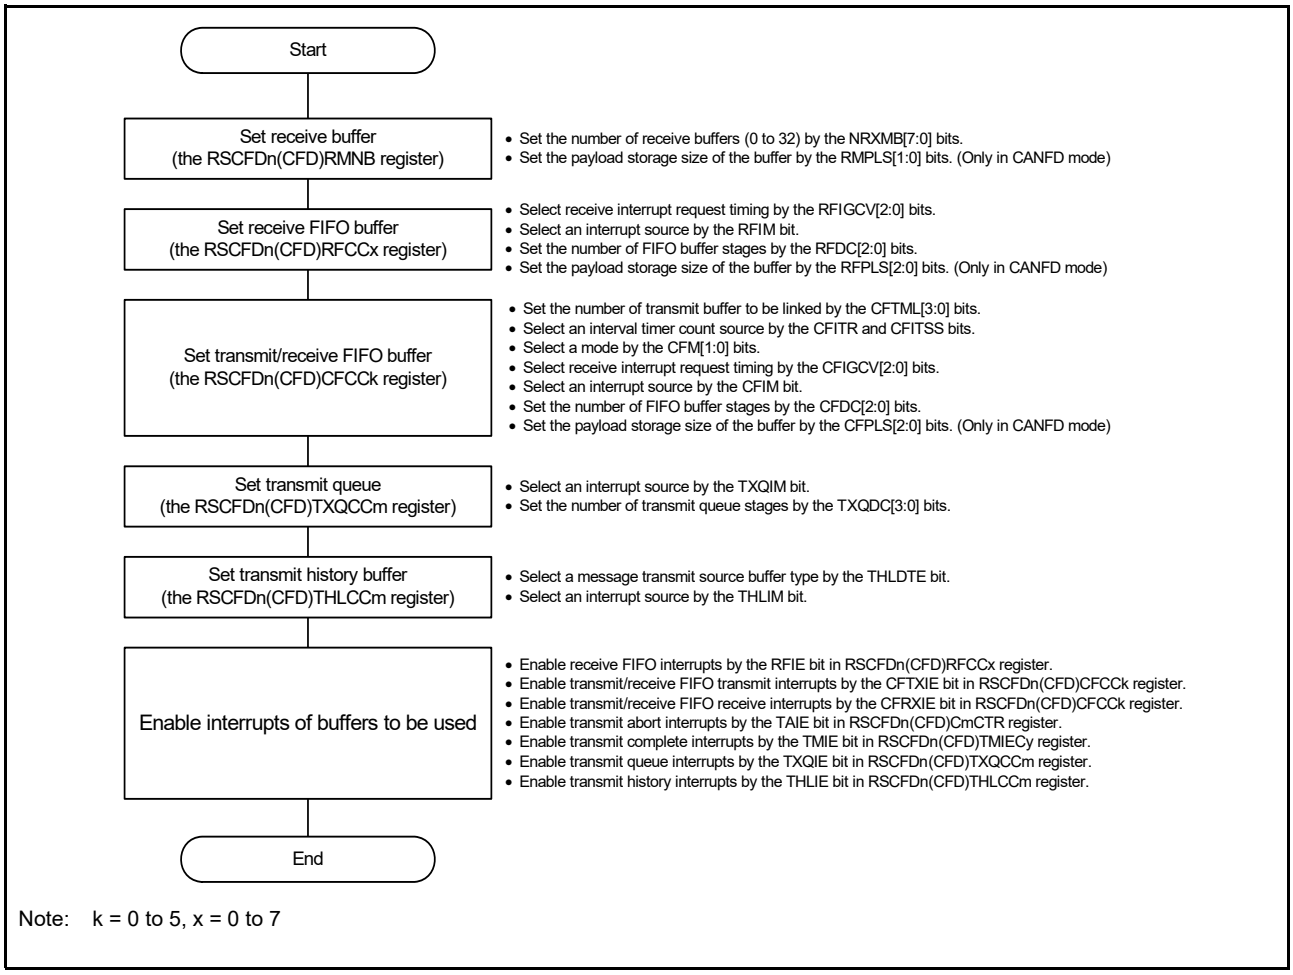
Note: Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

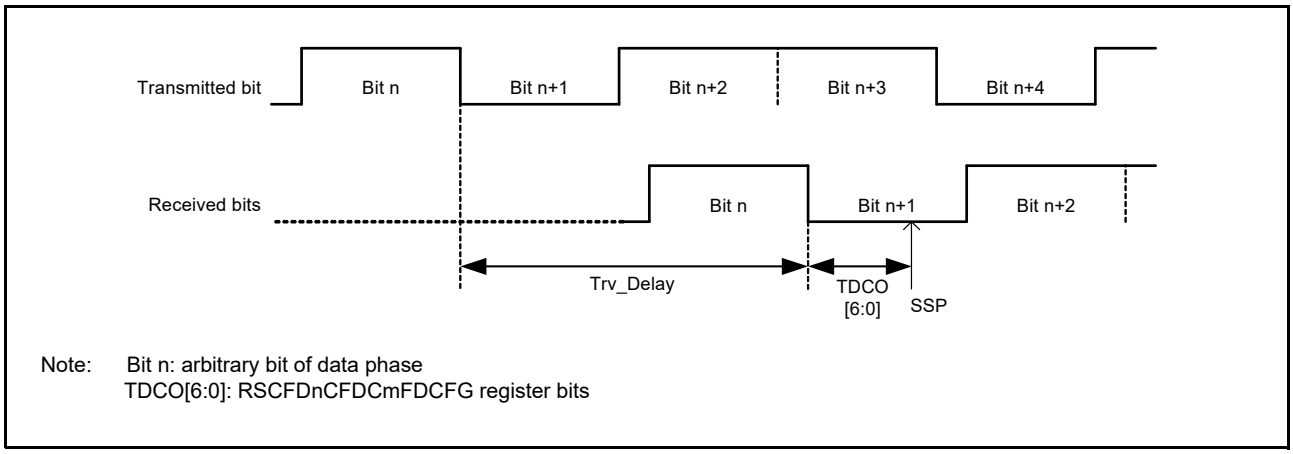


Note: k = 0 to 5, x = 0 to 7

Figure 25.21 Buffer Setting Procedure

25.11.1.6 Transmitter Delay Compensation (Only in CANFD Mode)

A high baud rate is used in CANFD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.
To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.
When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.



Note: Bit n: arbitrary bit of data phase
TDCO[6:0]: RSCFDnCFDCmFDCFG register bits

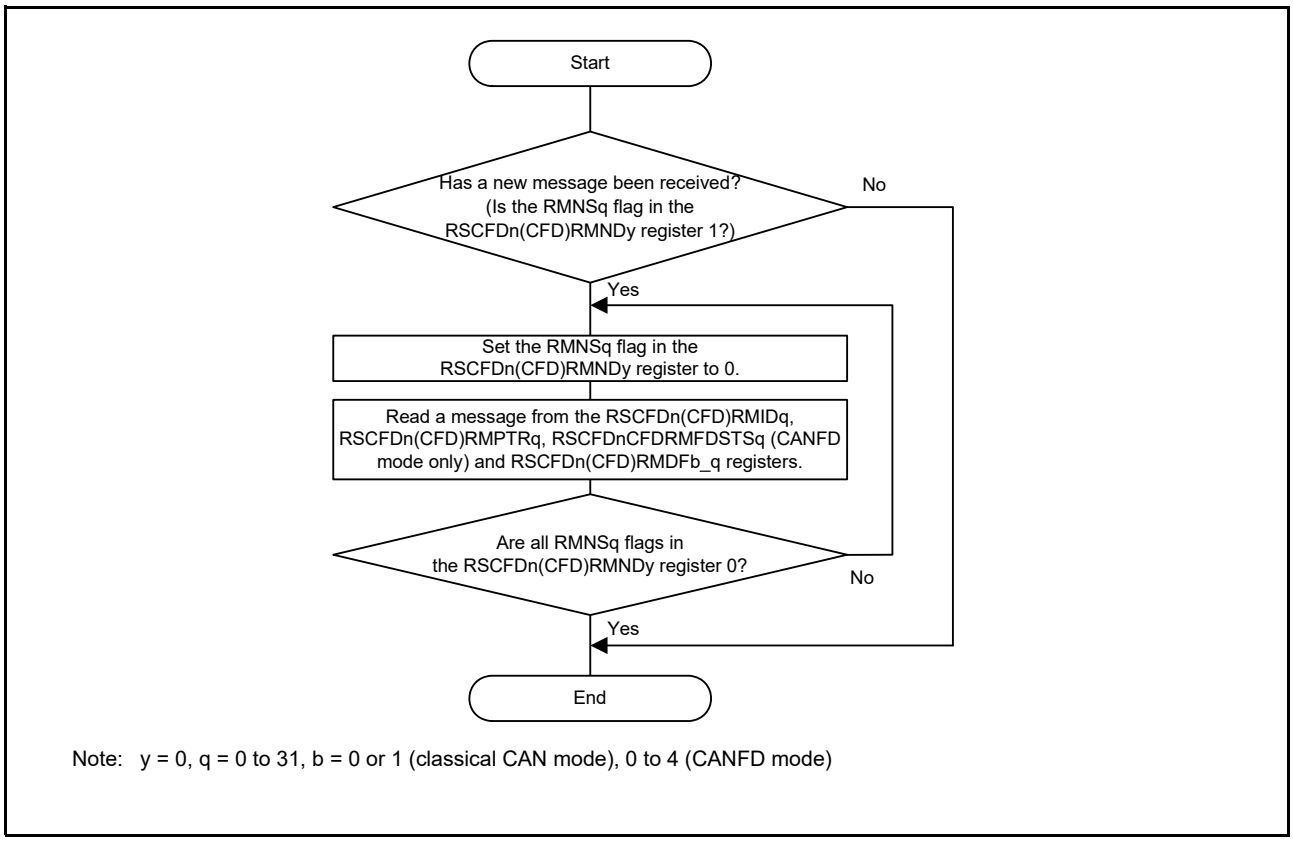
Figure 25.22 SSP Timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)
The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 Tq). (Both CANm bit time and Tq are data bit rate values.)
When the TDCE bit in RSCFDnCFDCmFDCFG register is 1 (transmitter delay compensation is enabled), set bits NBRP[9:0] and DBRP[7:0] to the same value that is less than 1.

25.11.2 Reception Procedure

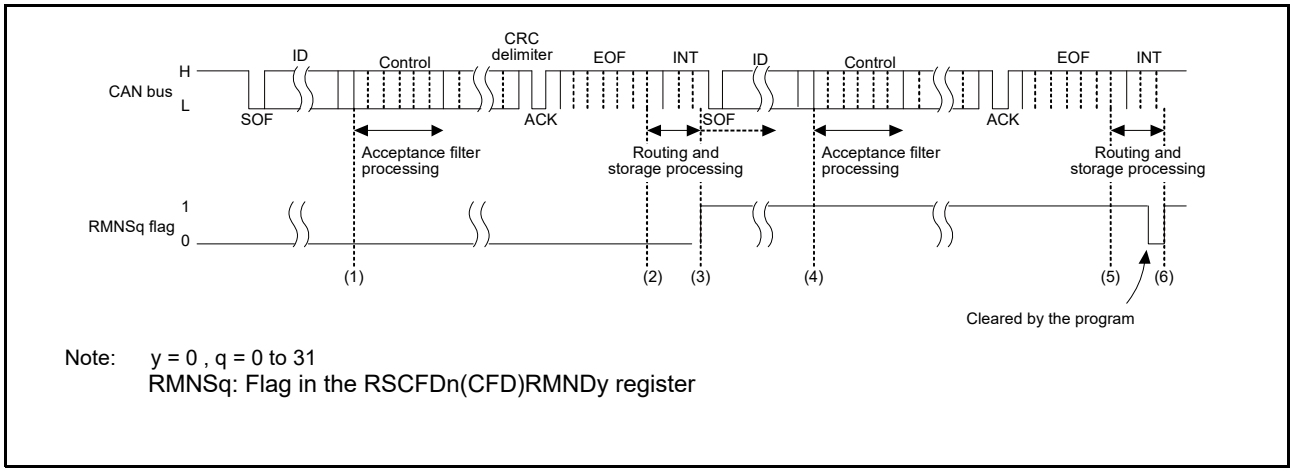
25.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, q = 0 to 31) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CANFD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CANFD mode). Figure 25.23 shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.



Note: y = 0, q = 0 to 31, b = 0 or 1 (classical CAN mode), 0 to 4 (CANFD mode)

Figure 25.23 Receive Buffer Reading Procedure



Note: y = 0 , q = 0 to 31
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 25.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.
(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.
(4) When the ID field of the next message has been received, the acceptance filter processing starts.
(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

25.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 17)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CANFD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CANFD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CANFD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

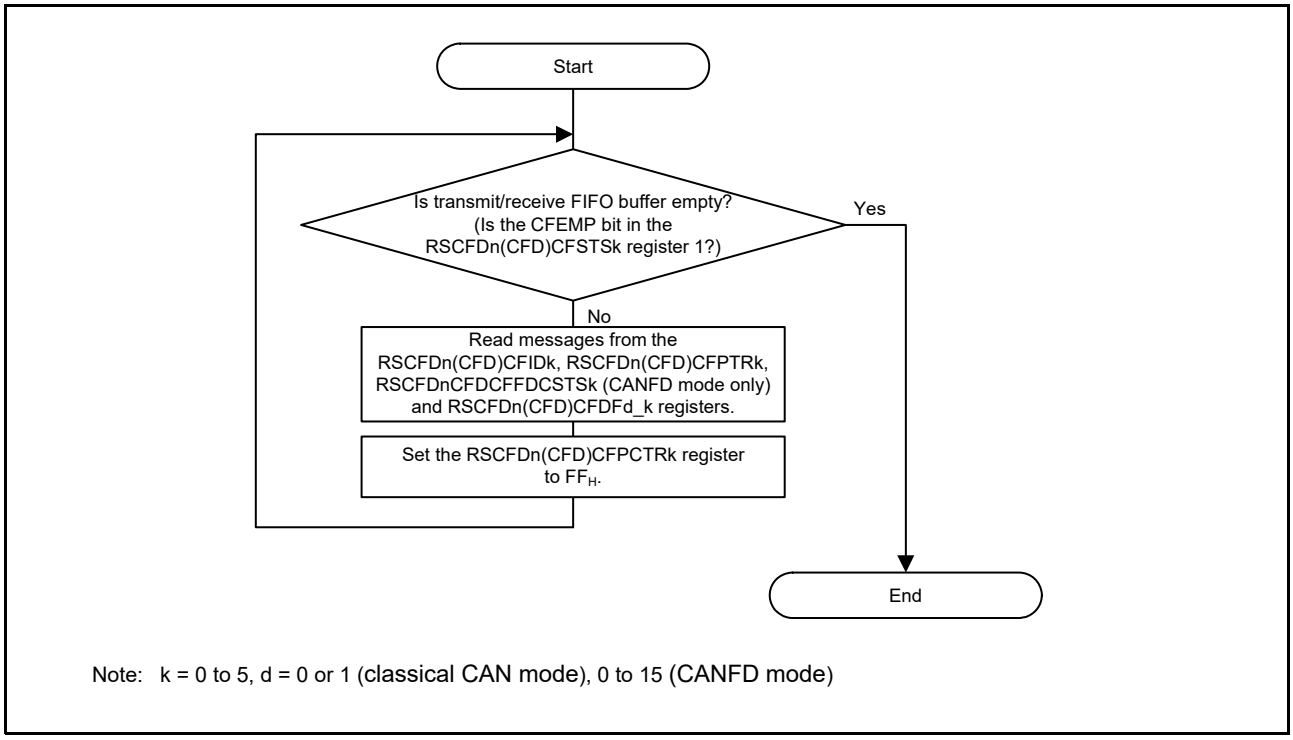


Figure 25.25 Transmit/Receive FIFO Buffer Reading Procedure

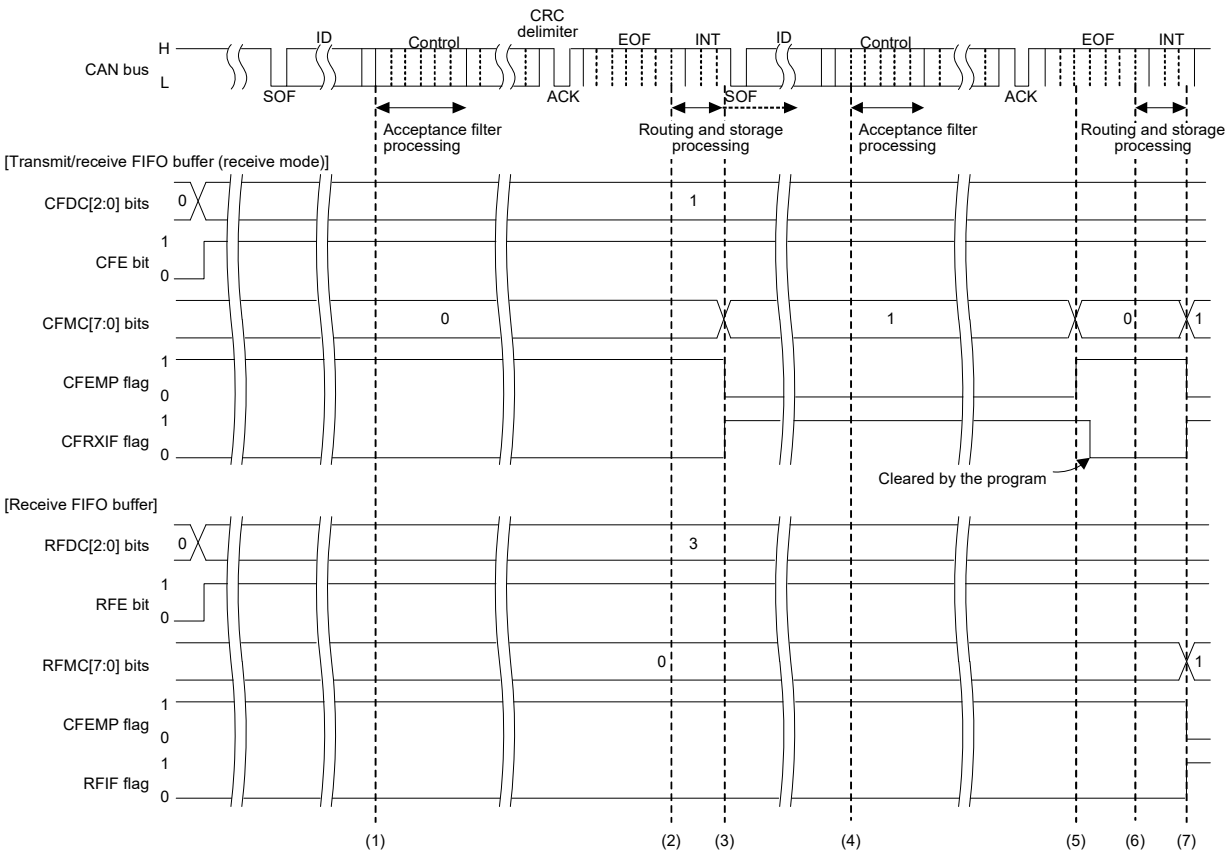
When reading a message in CANFD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 25.182 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001_B	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010_B	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011_B	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100_B	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101_B	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110_B	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111_B	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 25.183 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register

Note: k = 0 to 5, x = 0 to 7

Figure 25.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write FF_H to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

25.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CANFD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0, 1)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

25.11.3 Transmission Procedure

25.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 25.27 shows the procedure for transmission from transmit buffers.
Figure 25.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. Figure 25.29 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

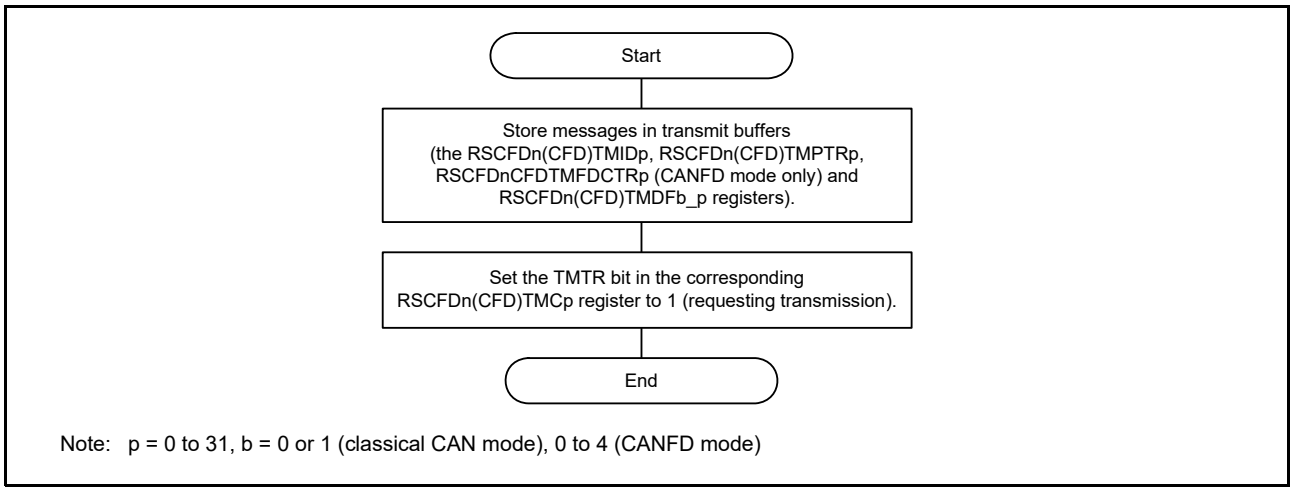


Figure 25.27 Procedure for Transmission from Transmit Buffers

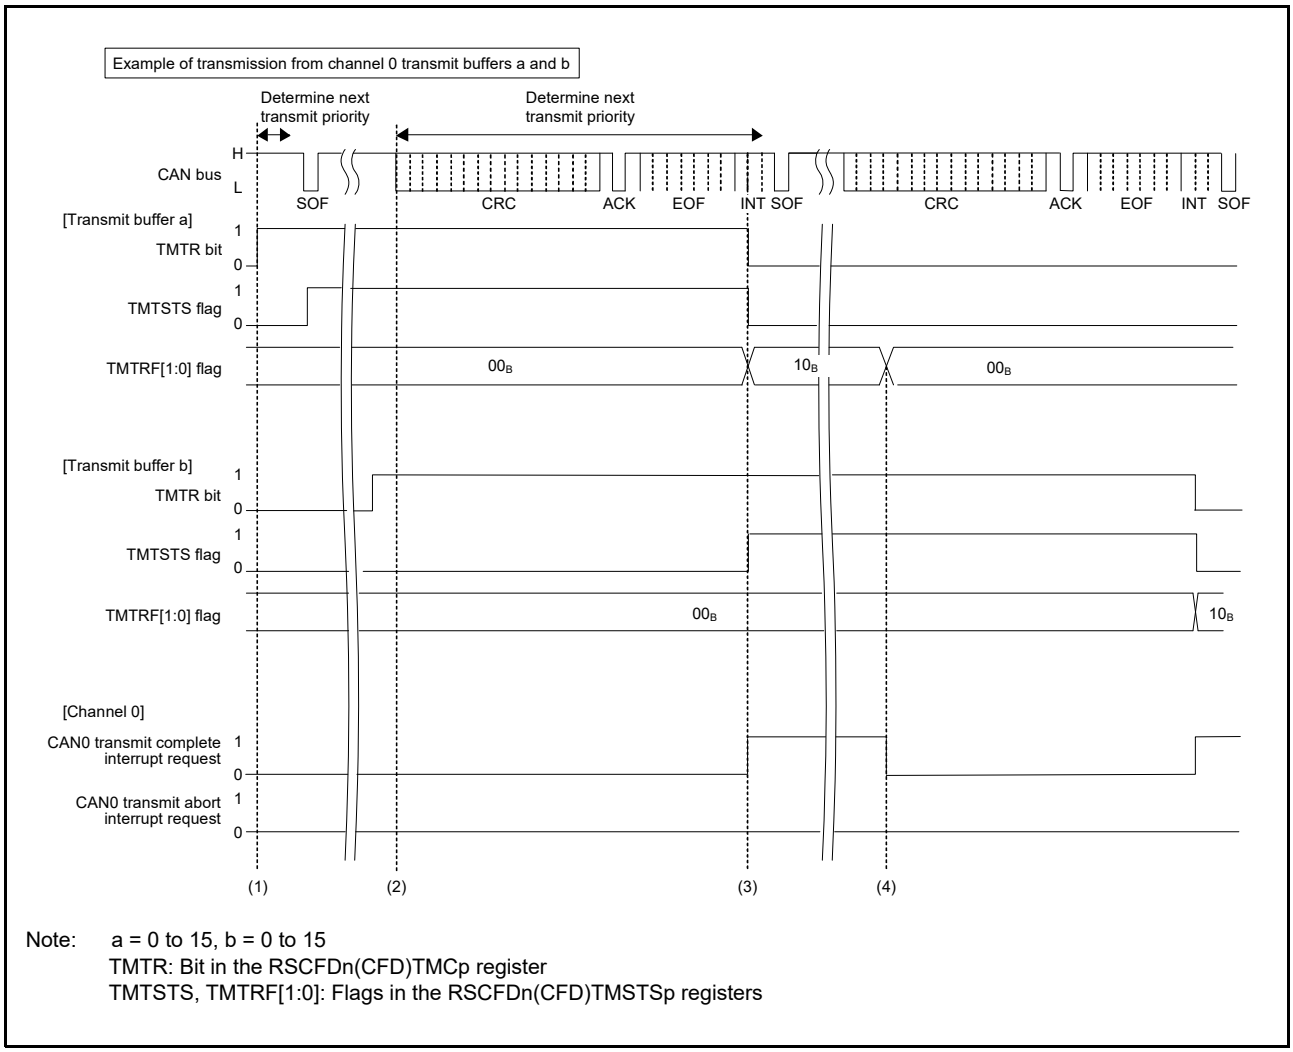
In CANFD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. Table 25.184 shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

Table 25.184 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	4000_H	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	4004_H	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	4008_H	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	$400C_H$ to $401C_H$	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	4020_H	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	4024_H	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	4028_H	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	$402C_H$ to $403C_H$	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	4040_H	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	4044_H	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	4048_H	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	$404C_H$ to $405C_H$	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used



Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 25.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

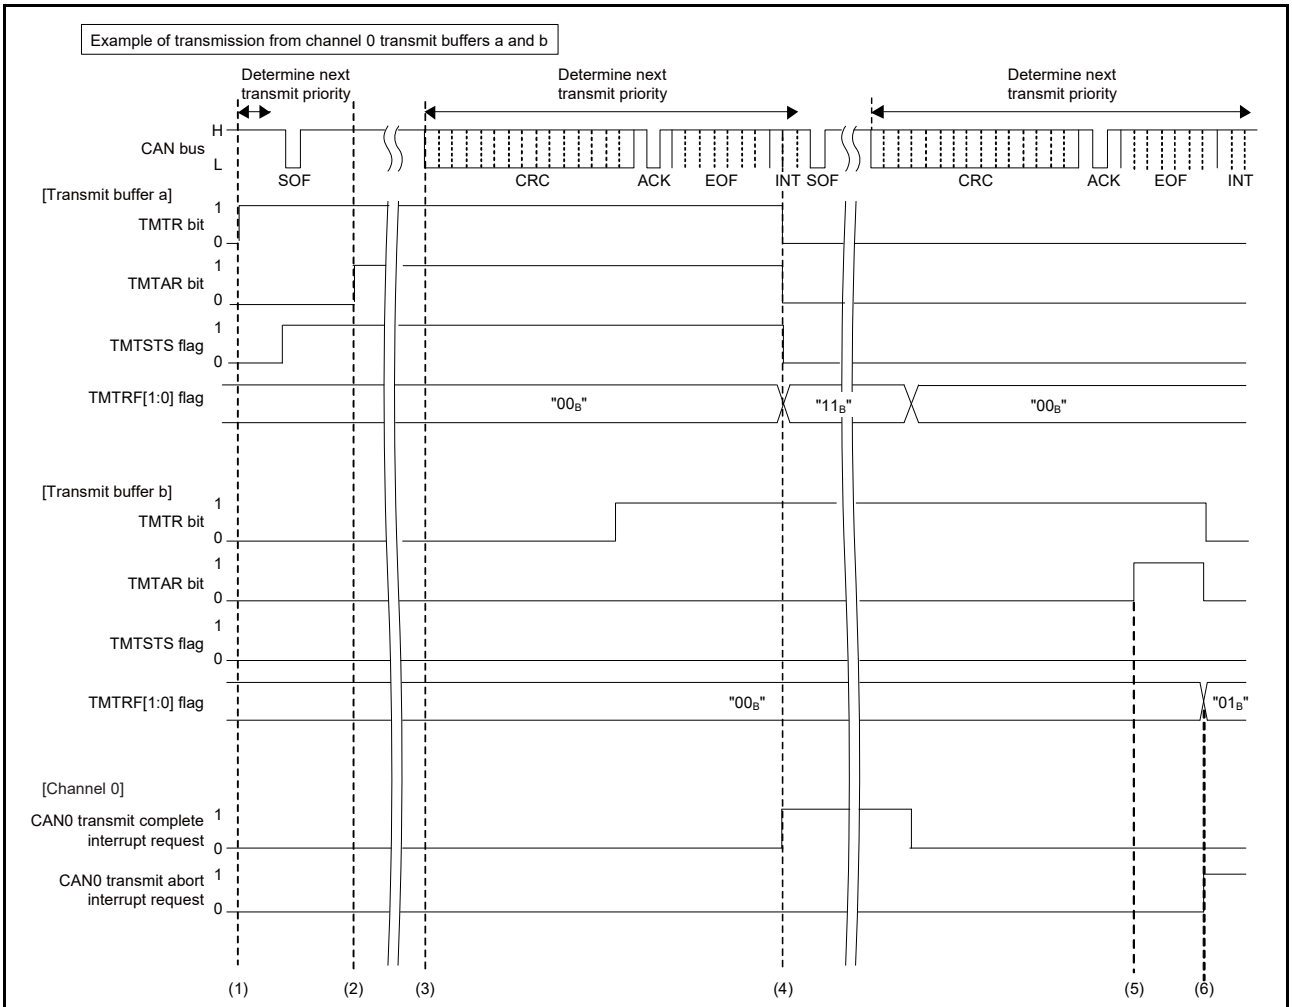
(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.



Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 25.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register is 1

(transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

25.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 25.30 shows the procedure for transmission from transmit/receive FIFO buffers.
Figure 25.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. Figure 25.32 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

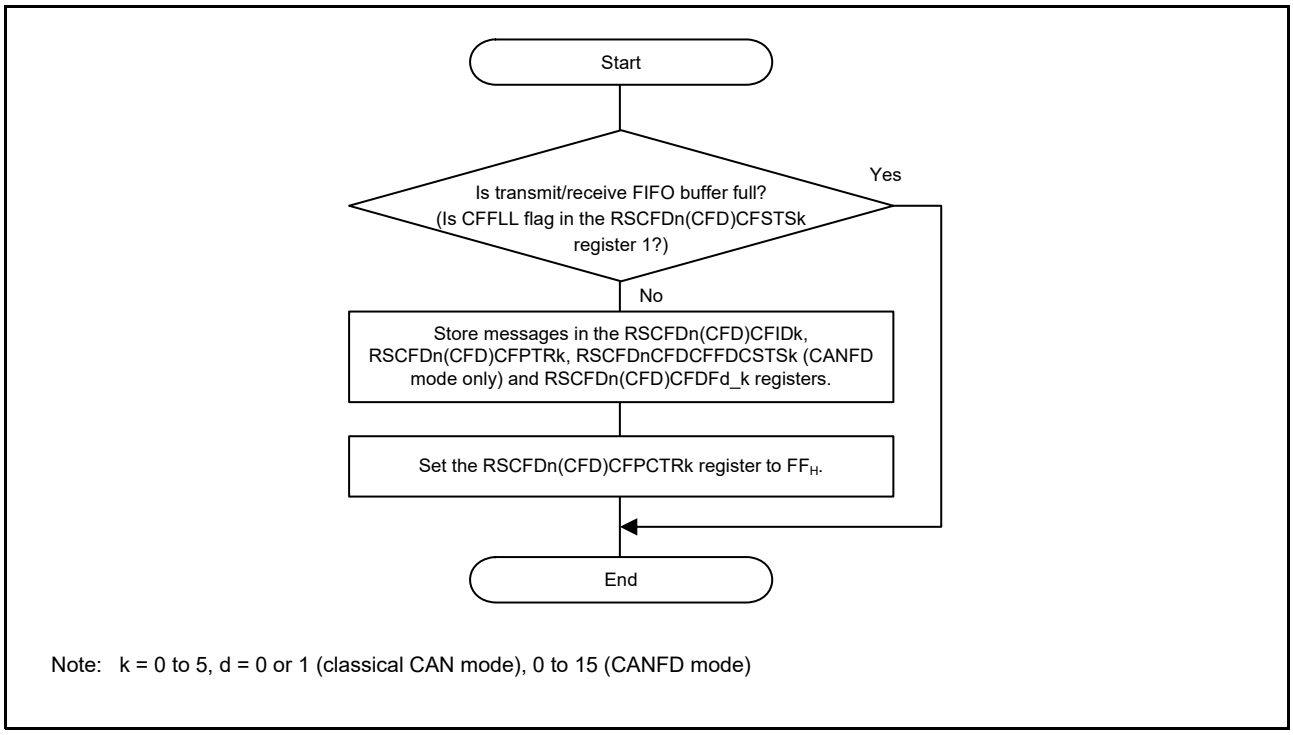


Figure 25.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

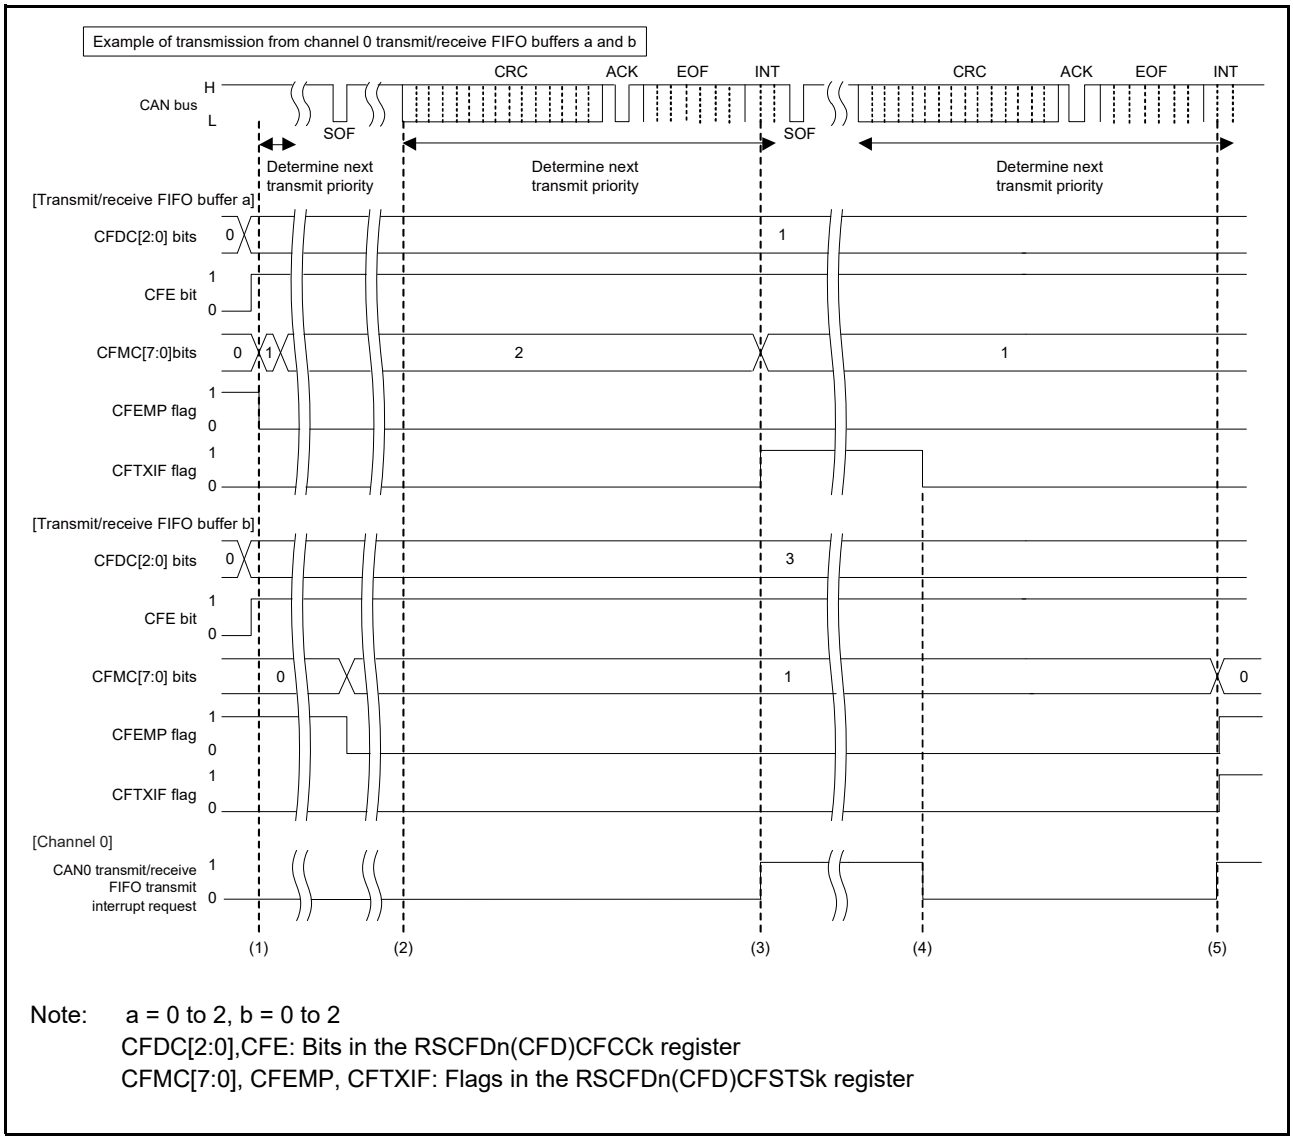
When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 25.185 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 25.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

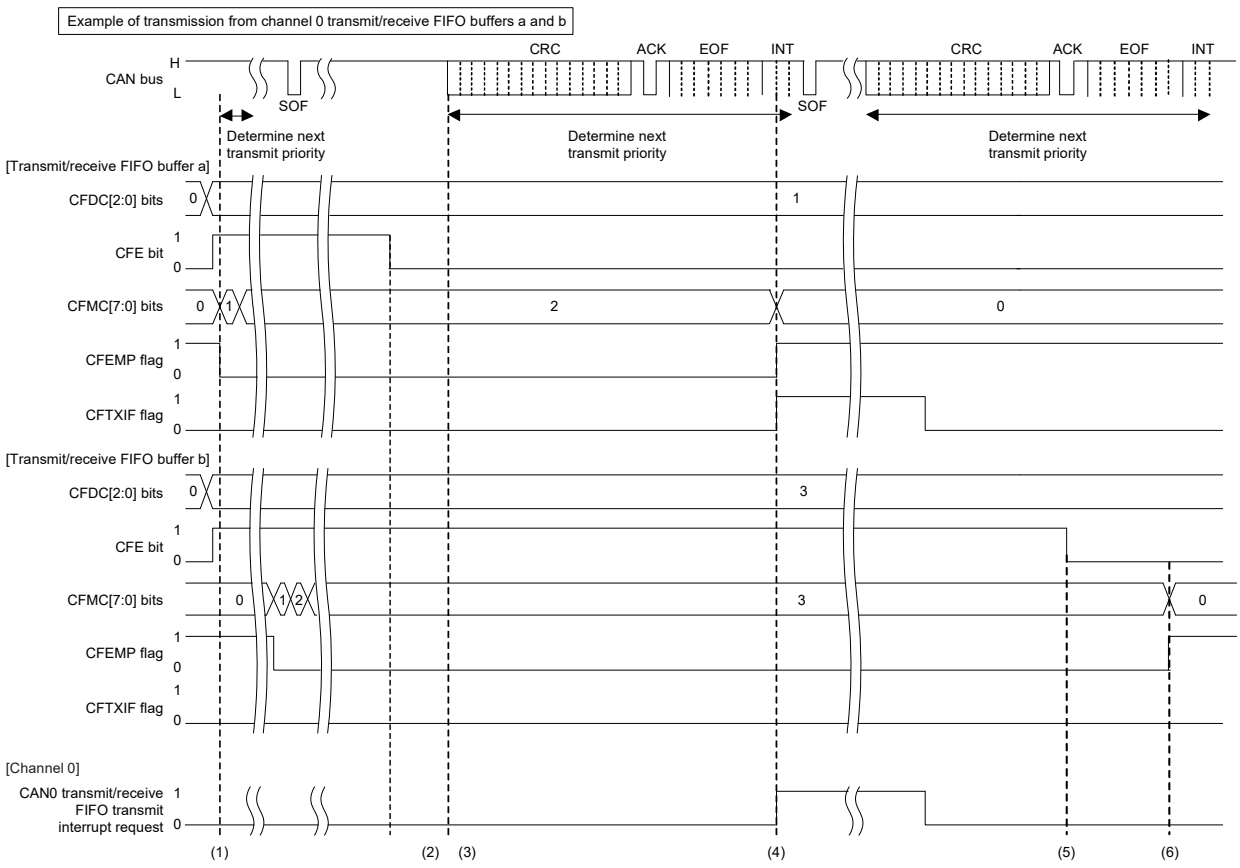
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).



*a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 25.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

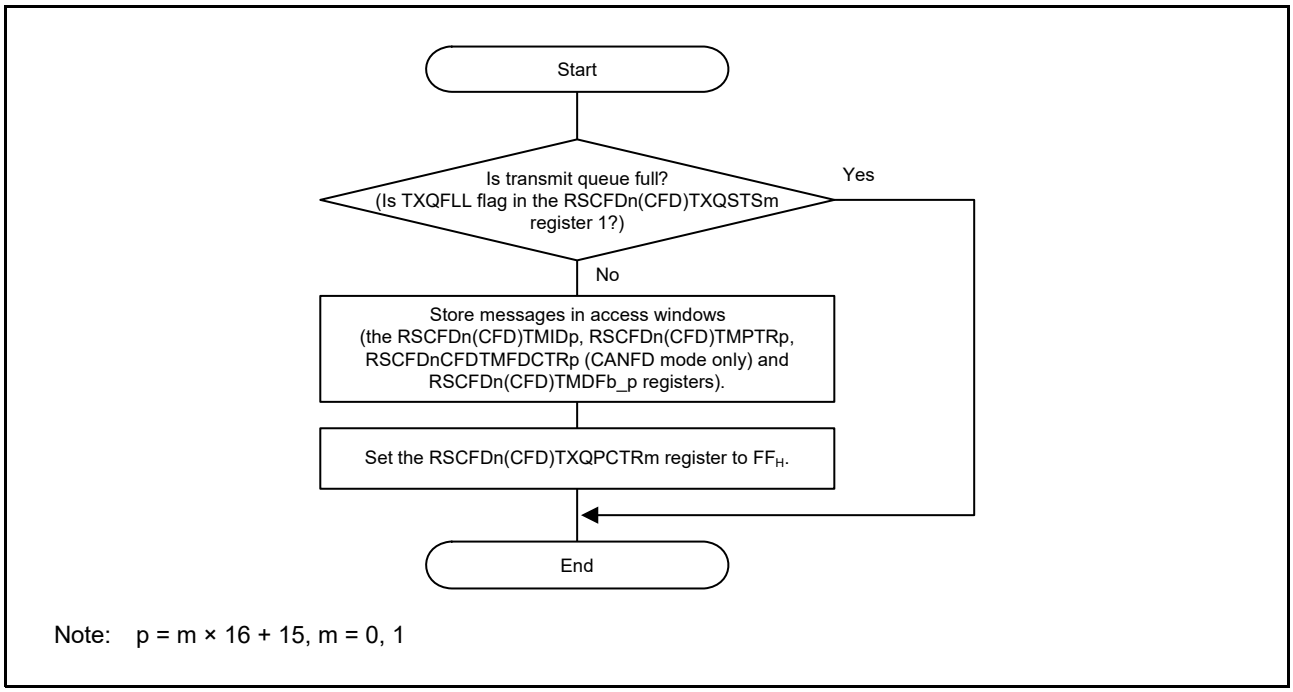
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

25.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 25.33 shows the procedure for transmission from the transmit queue.



Note: p = m × 16 + 15, m = 0, 1

Figure 25.33 Procedure for Transmission from the Transmit Queue

25.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0, 1) after reading a set of data. Figure 25.34 shows the transmit history buffer reading procedure.

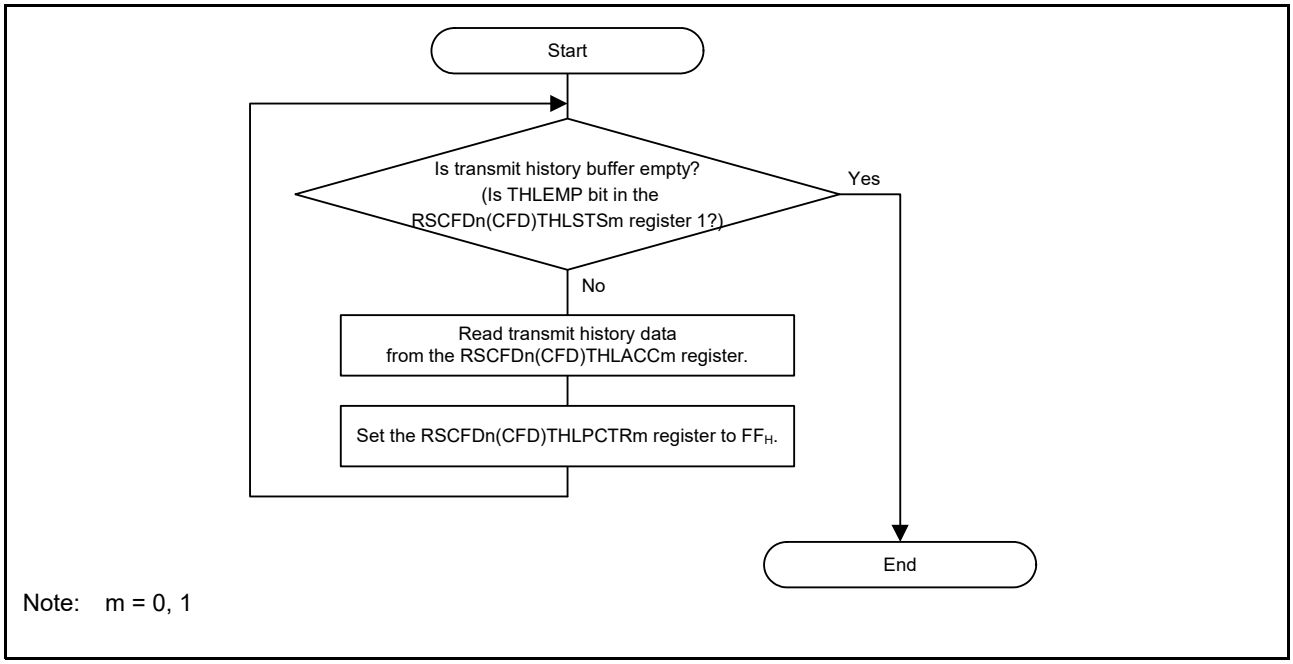


Figure 25.34 Transmit History Buffer Reading Procedure

25.11.4 Test Settings

25.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 25.35 shows the self-test mode setting procedure.

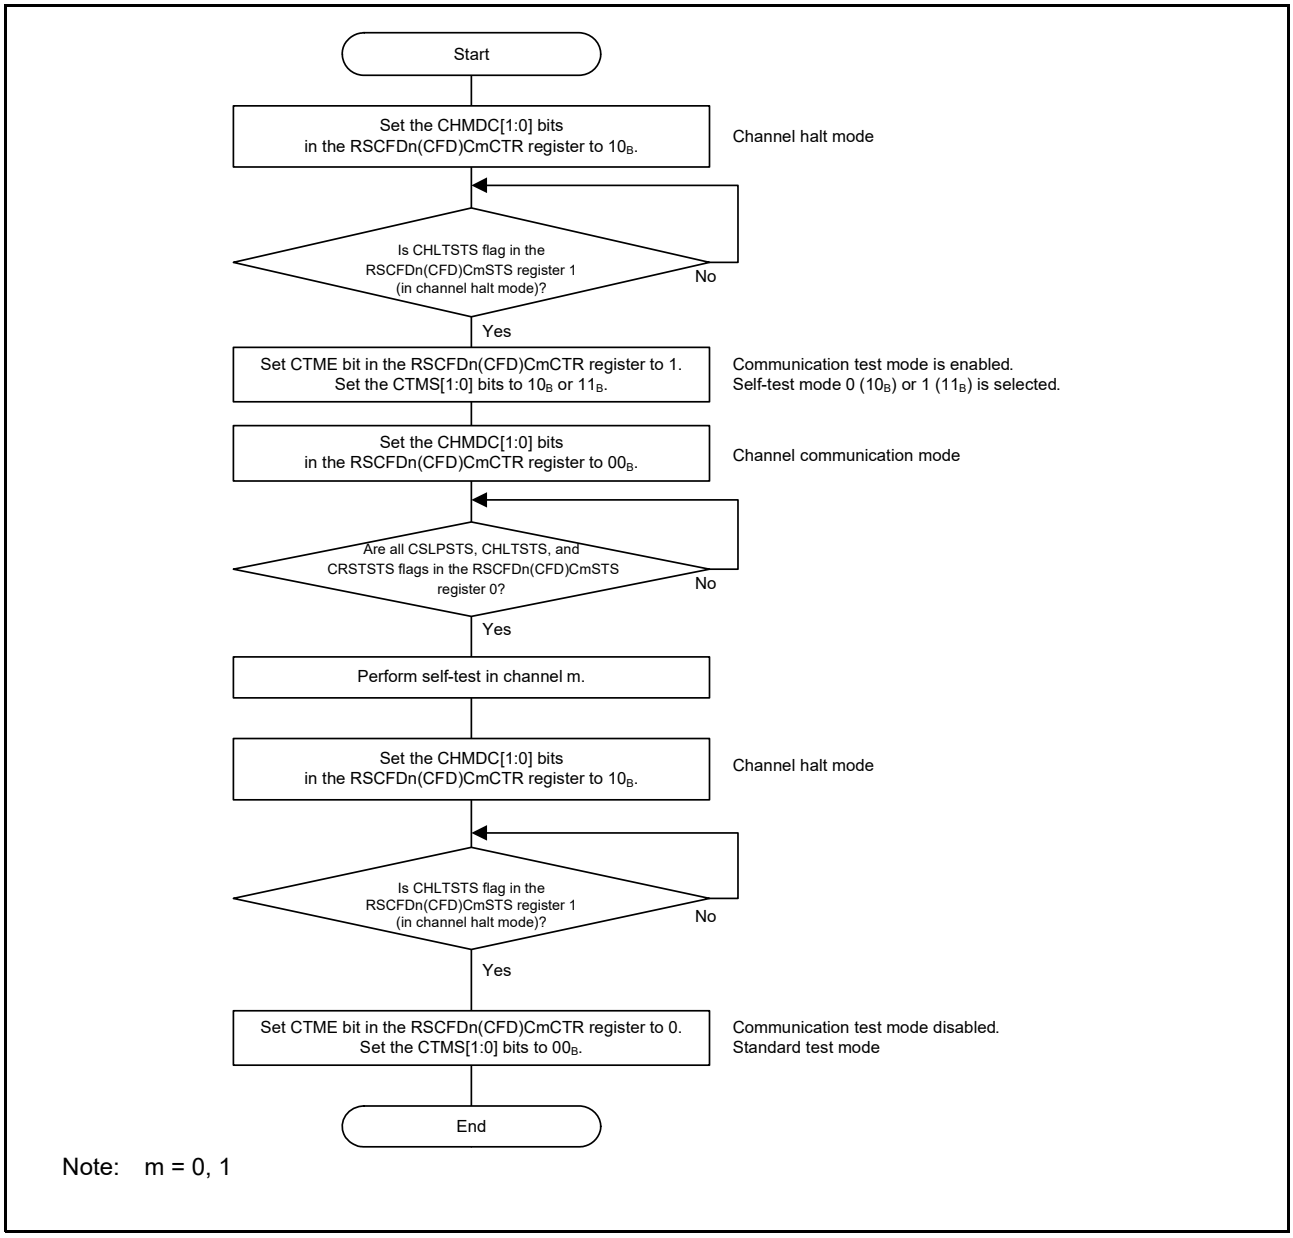

Figure 25.35 Self-Test Mode Setting Procedure

25.11.4.2 Procedure for Releasing the Protection

Since the global test function in Table 25.186 is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 25.186 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCFDn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. Figure 25.36 shows the procedure for releasing the protection.

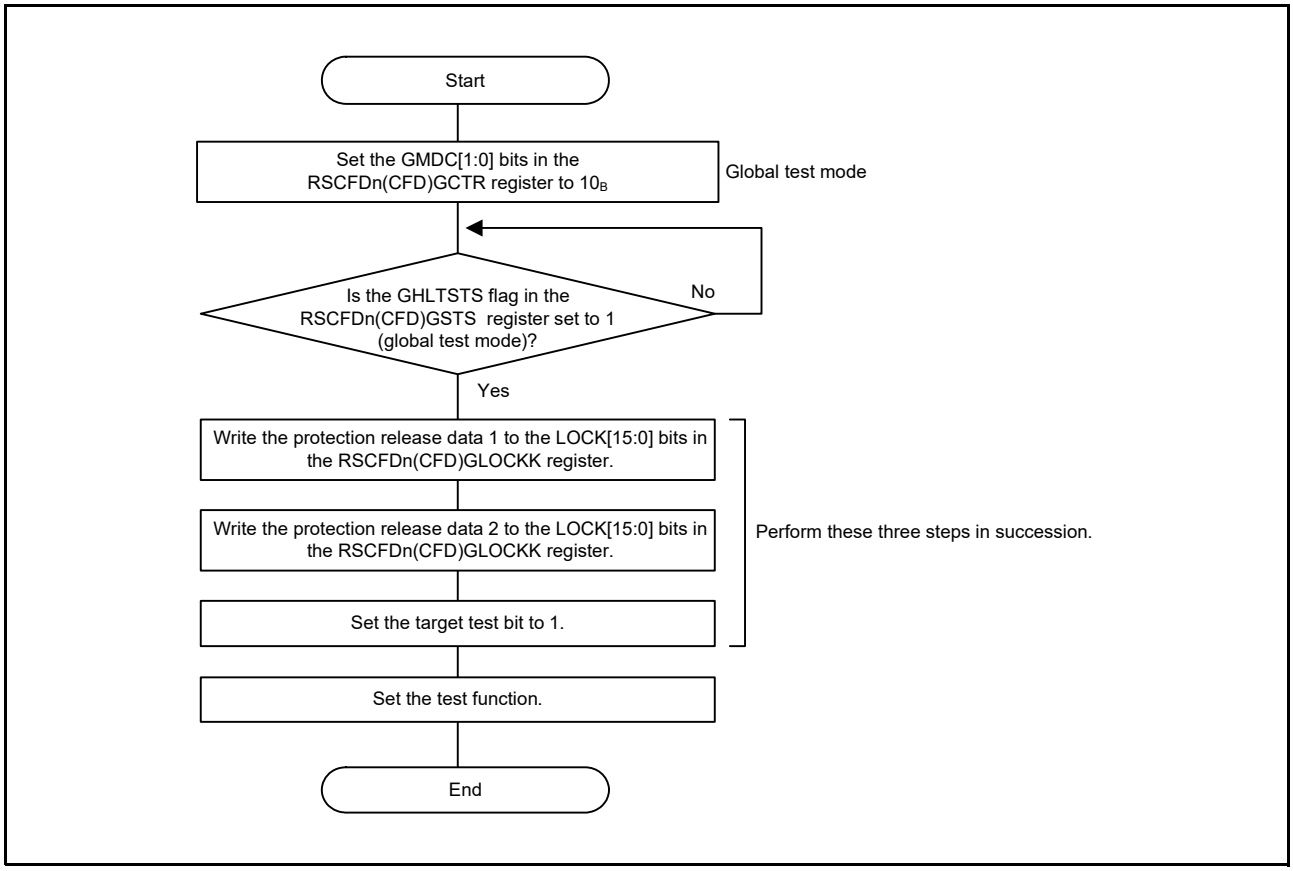

Figure 25.36 Protection Release Procedure

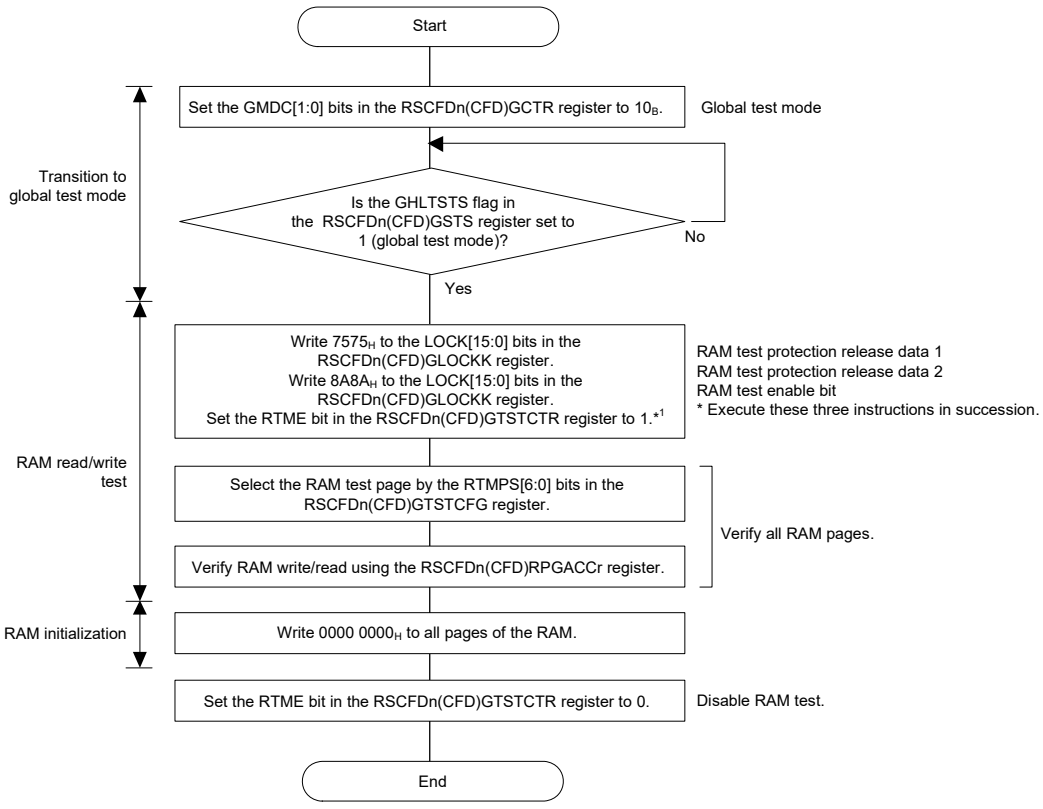
25.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.
Figure 25.37 shows the RAM test setting procedure.



Note 1. Before transitioning to the RAM test, perform the following.
- Cancel transmission request.
- Disable of each FIFO and transmission queue
- Clear flag of receive buffer

Note: r = 0 to 63

Figure 25.37 RAM Test Setting Procedure

25.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.
Figure 25.38 shows the inter-channel communication test setting procedure.

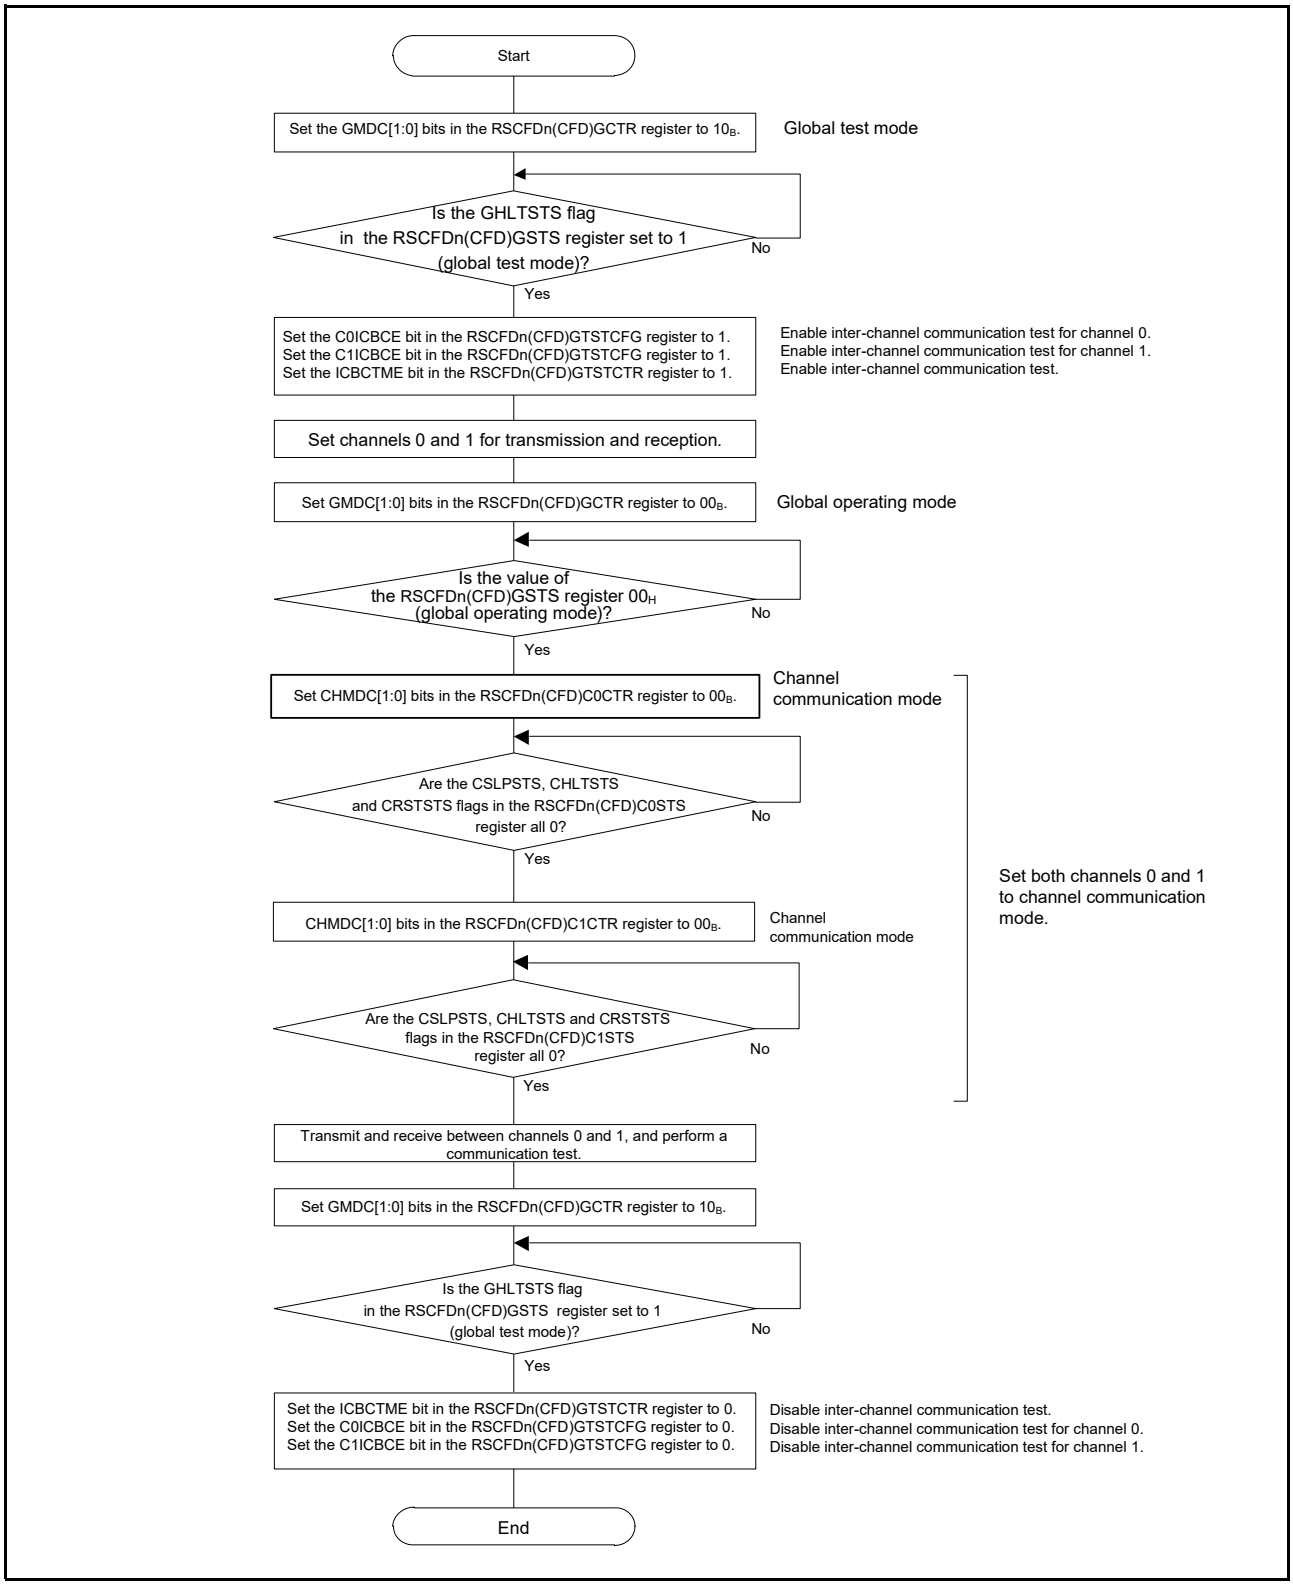


Figure 25.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

25.12 Notes on the RS-CANFD Module

- When changing the interface mode without applying a power-on reset, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0, 1) for transitions.
- When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS2, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS2, RSCFDn(CFD)TMTCSTS0 to RSCFDn(CFD)TMTCSTS2, and RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CANFD mode), write 00H to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not bet allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CANFD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/ receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in section 25.3, Registers (Classical CAN Mode) and section 25.4, Registers (CANFD Mode) indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
  - Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)
  - Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
  - Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)

  - Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
  - Transmit history access register (RSCFDn(CFD)THLACCm registers)
  - RAM test page access register (RSCFDn(CFD)RPGACCr registers)
- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

26. Renesas SPDIF Interface

26.1 Overview

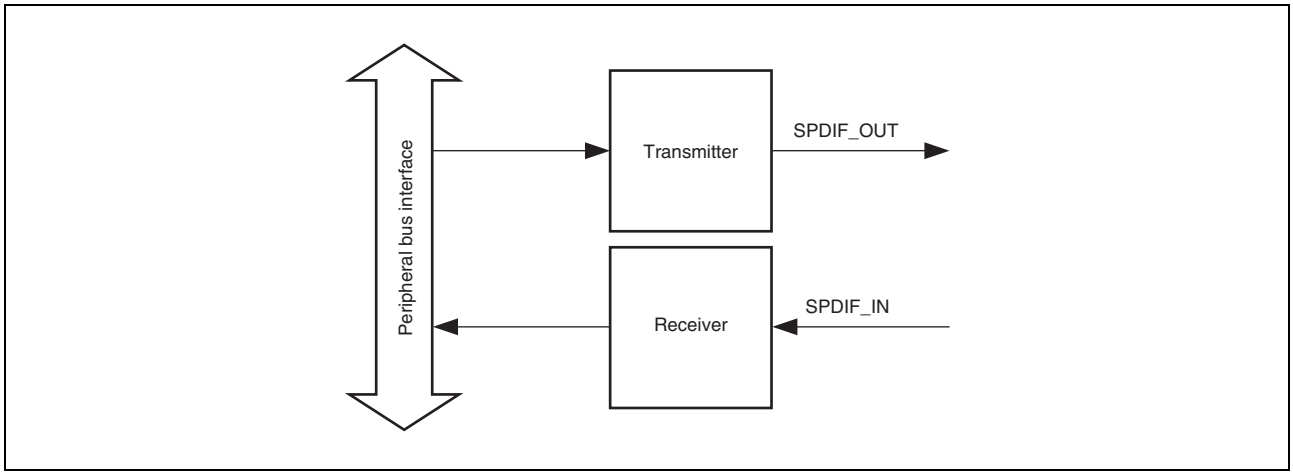

Figure 26.1 Overview Block Diagram

26.2 Features

- Supports the IEC 60958 standard (stereo and consumer use modes only).
- Supports sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz.
- Supports audio word sizes of 16 to 24 bits per sample.
- Biphase mark encoding.
- Double buffered data.
- Parity encoded serial data.
- Simultaneous transmit and receive
- Receiver autodetects IEC 61937 compressed mode data

26.3 Functional Block Diagram

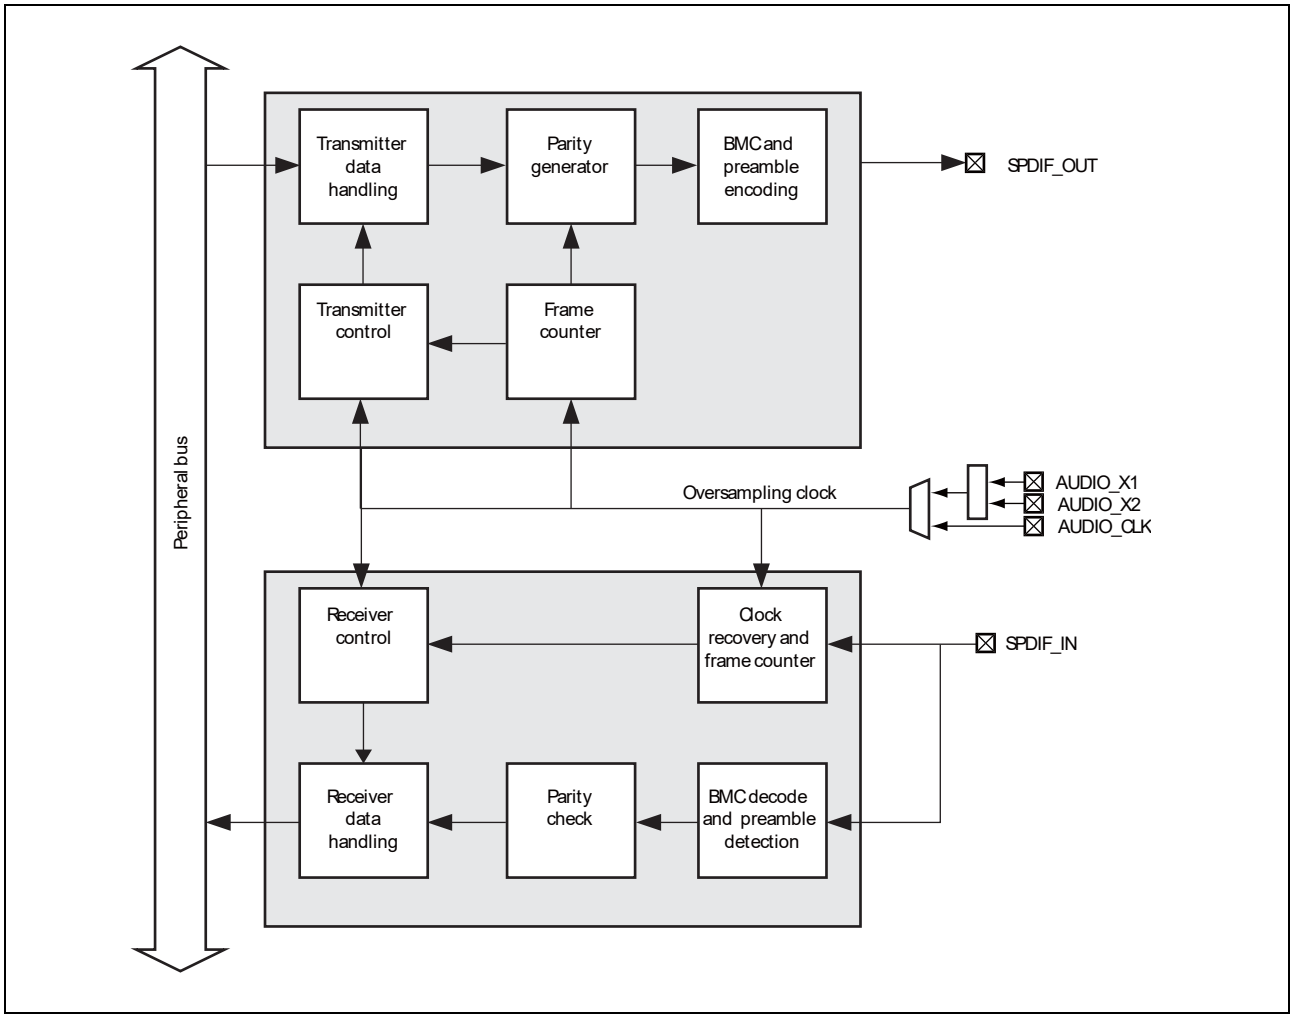

Figure 26.2 Functional Block Diagram

26.4 Input/Output Pins

Table 26.1 shows the pin configuration.

Table 26.1 Pin Configuration

Channel	Pin Name	I/O	Description
0	SPDIF_OUT	Output	Transmitter biphase-mark encoded SPDIF bitstream
1	SPDIF_IN	Input	Receiver biphase-mark encoded SPDIF bitstream
0, 1 (Common)	AUDIO_CLK	Input	External clock for audio
	AUDIO_X1	Input	Crystal resonator/external clock for audio
	AUDIO_X2	Output	

26.5 Renesas SPDIF (IEC60958) Frame Format

The Renesas SPDIF frame consists of two subframes (for channels 1 and 2), each of which contains a 4-bit preamble, audio data of up to 24 bits, a V flag, a user bit, a channel status bit, and an even parity bit. Figure 26.3 shows the subframe format. According to this format, the Renesas SPDIF performs biphase-mark modulation (channel coding) that will make the transmission line's DC component a minimum value.

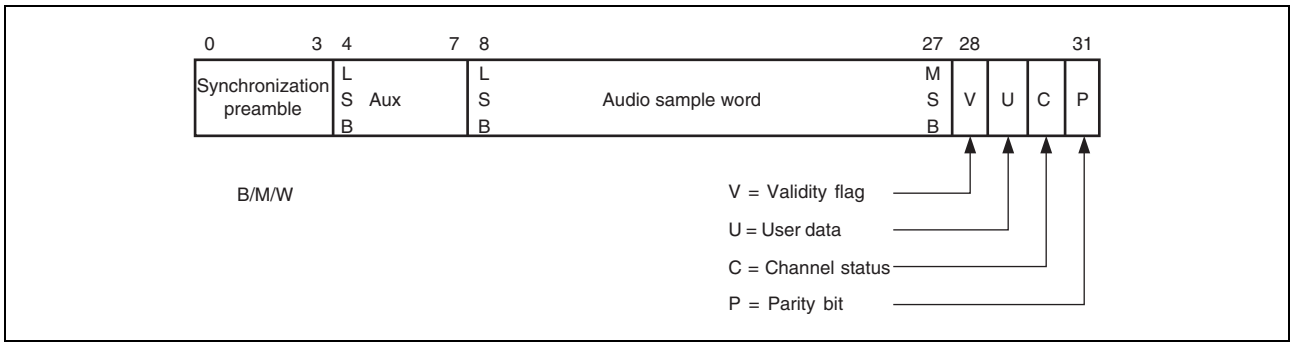

Figure 26.3 Subframe Format

Figure 26.4 shows the block format, which consists of 192 continuous frames. One block begins at the starting frame (preamble B) and ends at the 192nd frame (frame 191), and the preamble is used to identify all subframes. Each block has a total of 384 subframes, which are classified into three categories: subframe 0 indicating the beginning of a new block, subframe 1 (usually the channel 1), and subframe 2 (usually the channel 2). Usually, the music data sent and received by the SPDIF is continuous so that continuous blocks appear.

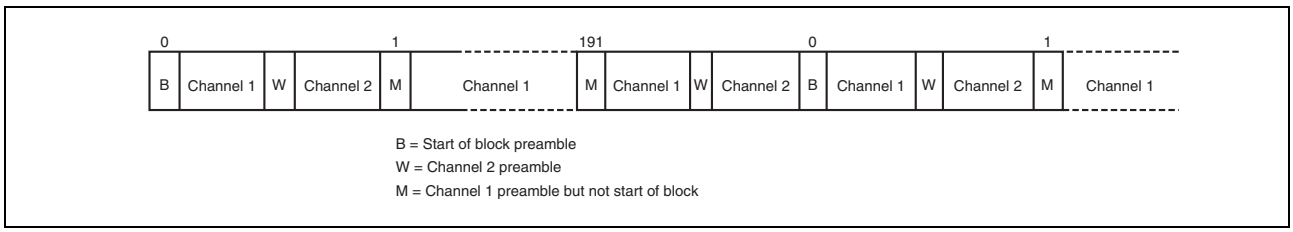

Figure 26.4 Block Format

Table 26.2 shows the binary values of the Renesas SPDIF preambles. The polarity of these preambles differs depending on the status of the preceding symbol (parity bit).

Table 26.2 Binary Preamble Values

Preamble	Preceding Symbol's Status = 0	Preceding Symbol's Status = 1
B	11101000	00010111
M	11100010	00011101
W	11100100	00011011

Note: As shown in Figure 26.3, the even parity bit at time slot 31 of a subframe determines the type of a preamble for one cycle of transmission. Usually, therefore, any one is selected from the set states that are sent through the Renesas SPDIF. However, IEC60958 requires decoding both types in view of connection with the preamble polarity reversed; the Renesas SPDIF has preambles decoded according to Table 26.2.

Channel status information is encoded at the rate of one bit per subframe, making the channel status information per block have a total of 192 bits for each of subframes 1 and 2. For the format of the channel status, refer to the IEC 60958 standard.

26.6 Register

Table 26.3 shows the register configuration.

Table 26.3 Register Configuration

Channel	Register Name	Abbreviation	Address	Access Size
0 (Transmit)	Transmitter channel 1 audio register	TLCA	H'E804 F000	32
	Transmitter channel 2 audio register	TRCA	H'E804 F004	32
	Transmitter channel 1 status register	TLCS	H'E804 F008	32
	Transmitter channel 2 status register	TRCS	H'E804 F00C	32
	Transmitter user data register	TUI	H'E804 F010	32
1 (Receive)	Receiver channel 1 audio register	RLCA	H'E804 F014	32
	Receiver channel 2 audio register	RRCA	H'E804 F018	32
	Receiver channel 1 status register	RLCS	H'E804 F01C	32
	Receiver channel 2 status register	RRCS	H'E804 F020	32
	Receiver user data register	RUI	H'E804 F024	32
0, 1 (Common)	Control register	CTRL	H'E804 F028	32
	Status register	STAT	H'E804 F02C	32
0, 1 (Common)	Transmitter DMA audio data register	TDAD	H'E804 F030	32
	Receiver DMA audio data register	RDAD	H'E804 F034	32

Note: All registers are longword registers and must be accessed as such.
A register diagram containing a 0 indicates that the write value should always be 0 (if the register is writable) and that the read value should always be 0 (if readable).

26.7 Register Descriptions

Legend:

Initial Value:	Register value after reset
—:	Undefined value
R/W:	Readable/writable register. The write value can be read.
R:	Read only register. The write value should always be 0.
R/WC0:	Readable/writable register. Writing 0 initializes the bit, but writing 1 is ignored.
R/WC1:	Readable/writable register. Writing 1 initializes the bit, but writing 0 is ignored.
W:	Write only register. Reading is prohibited. If this bit is reserved, the write value should always be 0.
—/W:	Write only, Read value undefined

26.7.1 Control Register (CTRL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CKS	—	PB	RASS		TASS		RDE	TDE	NCSI	AOS	RME	TME

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved
28	CKS	0	R/W	Oversampling clock select Selects oversampling clock supply source. 0: AUDIO_X1 1: AUDIO CLK
27	—	0	R	Reserved
26	PB	0	R/W	Pass Back Passes transmitter SPDIF output into SPDIF receiver in SPDIF module. 0: Pass Back disabled 1: Pass Back enabled
25, 24	RASS	All 0	R/W	Receiver Audio Sample Bit Size These bits Indicate the receiver audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved
23, 22	TASS	All 0	R/W	Transmitter Audio Sample Bit Size These bits Indicate the transmitter audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved
21	RDE	0	R/W	Receiver DMA Enable Enables DMA requests for the receiver. 0: Receiver DMA disabled 1: Receiver DMA enabled
20	TDE	0	R/W	Transmitter DMA Enable Enables the DMA requests for the transmitter. 0: Transmitter DMA disabled 1: Transmitter DMA enabled
19	NCSI	0	R/W	New Channel Status Information Set this bit to 1 when new channel status information to be corrected is in the transmitter. 0: New channel status information has not been in transmitter 1: New channel status information has been in transmitter
18	AOS	0	R/W	Audio Only Samples Clear this bit to 0 when audio channel 1 and channel 2 registers contain user information. When this bit is set to 1, all user bits are cleared to 0. 0: User information present 1: User information not present
17	RME	0	R/W	Receiver Module Enable Enables the receiver module. 0: Receiver module disabled 1: Receiver module enabled

Bit	Bit Name	Initial Value	R/W	Description
16	TME	0	R/W	Transmitter Module Enable Enables the transmitter module. 0: Transmitter module disabled 1: Transmitter module enabled
15	REIE	0	R/W	Receiver Error Interrupt Enable Enables the receiver error interrupts. 0: Receiver error interrupt disabled 1: Receiver error interrupt enabled
14	TEIE	0	R/W	Transmitter Error Interrupt Enable Enables the transmitter error interrupts. 0: Transmitter error interrupt disabled 1: Transmitter error interrupt enabled
13	UBOI	0	R/W	User Buffer Overrun Interrupt Enable Enables the user buffer overrun interrupts. 0: User buffer overrun interrupt disabled 1: User buffer overrun interrupt enabled
12	UBUI	0	R/W	User Buffer Underrun Interrupt Enable Enables the user buffer underrun interrupts. 0: User buffer underrun interrupt disabled 1: User buffer underrun interrupt enabled
11	CREI	0	R/W	Clock Recovery Error Interrupt Enable Enables the clock recovery error interrupts. 0: Clock recovery error interrupt disabled 1: Clock recovery error interrupt enabled
10	PAEI	0	R/W	Parity Error Interrupt Enable Enables the parity check error interrupts. 0: Parity check error interrupt disabled 1: Parity check error interrupt enabled
9	PREI	0	R/W	Preamble Error Interrupt Enable Enables the preamble check error interrupts. 0: Preamble error interrupt disabled 1: Preamble error interrupt enabled
8	CSEI	0	R/W	Channel Status Error Interrupt Enable Enables the channel status error interrupts. 0: Channel status error interrupt disabled 1: Channel status error interrupt enabled
7	ABOI	0	R/W	Audio Buffer Overrun Interrupt Enable Enables the receiver audio buffer overrun interrupts. 0: Audio buffer overrun interrupt disabled 1: Audio buffer overrun interrupt enabled
6	ABUI	0	R/W	Audio Buffer Underrun Interrupt Enable Enables the transmitter audio buffer underrun interrupts. 0: Audio buffer underrun interrupt disabled 1: Audio buffer underrun interrupt enabled
5	RUII	0	R/W	Receiver User Information Interrupt Enable Enables the receiver user information register full interrupts. 0: Receiver user information interrupt disabled 1: Receiver user information interrupt enabled
4	TUII	0	R/W	Transmitter User Information Interrupt Enable Enables the transmitter user information register empty interrupts. 0: Transmitter user information interrupt disabled 1: Transmitter user information interrupt enabled
3	RCSI	0	R/W	Receiver Channel Status Interrupt Enable Enables the receiver channel status register full interrupts. 0: Receiver channel status interrupt disabled 1: Receiver channel status interrupt enabled
2	RCBI	0	R/W	Receiver Channel Buffer Interrupt Enable Enables the receiver audio channel buffer full interrupts. 0: Receiver audio channel interrupt disabled 1: Receiver audio channel interrupt enabled

Bit	Bit Name	Initial Value	R/W	Description
1	TCSI	0	R/W	Transmitter Channel Status Interrupt Enable Enables the transmitter channel status register empty interrupts. 0: Transmitter channel status interrupt disabled 1: Transmitter channel status interrupt enabled
0	TCBI	0	R/W	Transmitter Channel Buffer Interrupt Enable Enables the transmitter audio channel buffer empty interrupts. 0: Transmitter audio channel interrupt disabled 1: Transmitter audio channel interrupt enabled

26.7.2 Status Register (STAT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RIS	TIS	UBO	UBU	CE	PARE	PREE	CSE	ABO	ABU	RUIR	TUIR	CSRX	CBRX	CSTX	CBTX
Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved
16	CMD	0	R	Compressed Mode Data Sets if the data being received is compressed mode data (When bit 1 = 1 in the V flag and channel status). 0: Data is not in compressed mode 1: Data is in compressed mode
15	RIS	1	R	Receiver Idle State Sets if the receiver is in the idle state. 0: Receiver is not in idle state 1: Receiver in idle state
14	TIS	1	R	Transmitter Idle State Sets if the transmitter is in the idle state. 0: Transmitter is not in idle state 1: Transmitter is in idle state
13	UBO	0	R/WC0	User Buffer Overrun* Sets if the receiver user buffer overruns. This bit is cleared by writing 0 to the register. If bit REIE and bit UBOI in the control register are set this causes an interrupt. 0: User buffer has not overrun 1: User buffer has overrun
12	UBU	0	R/WC0	User Buffer Underrun* Sets if the transmitter user buffer underrun. This bit is cleared by writing 0. If bits TEIE and UBUI in the control register are set this causes an interrupt. 0: User buffer has not underrun 1: User buffer has underrun
11	CE	0	R/WC0	Clock Error* Sets when the clock recovery falls out of synchronization. This bit is cleared by writing 0. If bits REIE and CREI in the control register are set this causes an interrupt. 0: Clock recovery stable 1: Clock recovery error
10	PARE	0	R/WC0	Parity Error* Sets when the parity checker produces a fail result. This bit is cleared by writing 0. If bits REIE and PAEI in the control register are set this causes an interrupt. 0: Parity check correct 1: Parity error
9	PREE	0	R/WC0	Preamble Error* Sets when the start of word preamble fails to appear in the correct place. This bit is cleared by writing 0. If bits REIE and PREI in the control register are set this causes an interrupt. Note: Only set after a start of block preamble has occurred. 0: Preamble is in the correct place 1: Preamble error

Bit	Bit Name	Initial Value	R/W	Description
8	CSE	0	R/WC0	Channel Status Error*1 Sets when the channel status information is written before the 32nd frame of the current block. This bit is cleared by writing 0. If bits TEIE and CSEI in the control register are set this causes an interrupt. 0: Channel status correct 1: Channel status error
7	ABO	0	R/WC0	Audio Buffer Overrun*1 Indicates that the receiver audio buffer is full in both the first and second stages and that data has been overwritten. This bit is cleared by writing 0. If bits REIE and ABOI in the control register are set then this causes an interrupt. 0: Receiver audio buffer has not overrun 1: Receiver audio buffer has overrun
6	ABU	0	R/WC0	Audio Buffer Underrun*1 Indicates that the transmitter audio buffer is empty in both the first and second stages and that the last data transmission has been repeated. This bit is cleared by writing 0. If bits TEIE and ABUI in the control register are set then this causes an interrupt. 0: Transmitter audio buffer has not underrun 1: Transmitter audio buffer has underrun
5	RUIR	0	R	Receiver User Information Register Status Indicates the status of the receiver user information register. This bit is cleared by reading from the receiver user register. If bit RUII in the control register is set then this causes an interrupt. 0: Receiver user information register is empty 1: Receiver user information register is full
4	TUIR	0	R	Transmitter User Information Register Status Indicates the status of the transmitter user information register. This bit is cleared by writing to the transmitter user register. If bit TUII in the control register is set then this causes an interrupt. 0: Transmitter user information register is full 1: Transmitter user information register is empty
3	CSRX	0	R	Channel 1 and Channel 2 Status for Receiver Indicates the status of the receiver channel status registers. This bit is cleared by reading from the receiver channel status registers. If bit RCSI in the control register is set this causes an interrupt. 0: Receiver channel status registers are empty 1: Receiver channel status registers are full
2	CBRX	0	R	Channel 1 and Channel 2 Buffers for Receiver Indicates the status of the receiver audio channel registers. This bit is cleared by reading from the receiver audio channel registers. If bit RCBI in the control register is set this causes an interrupt. 0: Receiver audio channel registers are empty 1: Receiver audio channel registers are full
1	CSTX	0	R	Channel 1 and Channel 2 Status for Transmitter Indicates the status of the transmitter channel status registers. This bit is cleared by writing to the transmitter channel status registers. If bit TCSI in the control register is set this causes an interrupt. 0: Transmitter channel status register is full 1: Transmitter channel status register is empty
0	CBTX	0	R	Channel 1 and Channel 2 Buffers for Transmitter Indicates the status of the transmitter audio channel registers. This bit is cleared by writing to the transmitter audio channel registers. If bit TCBI in the control register is set this causes an interrupt. 0: Transmitter audio channel registers are full 1: Transmitter audio channel registers are empty

Note 1. When an error bit is detected during DMA transfer, DMA transfer settings must be made again. In this case, the Renesas SPDIF's module enable bit (either the RME or TME bit) and the DMA enable bit (either the RDE or TDE bit) must be disabled and the error status must be cleared before making DMA transfer settings again. Then the module enable bit should be set and DMA transfer can be started again.

26.7.3 Transmitter Channel 1 Audio Register (TLCA)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	Audio PCM Data

R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

26.7.6 Transmitter User Data Register (TUI)

U-bit data in subframes is written in to this register. Because U-bit data is transmitted in a sequence of subframes 1 and 2, you need to update the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use. The user bits to be transmitted are set in sequence starting at the LSB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	User Byte 4								User Byte 3							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	User Byte 2								User Byte 1							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	W	U-bit information is stored here.
23 to 16	User Byte 3	All 0	W	
15 to 8	User Byte 2	All 0	W	
7 to 0	User Byte 1	All 0	W	

26.7.7 Transmitter Channel 1 Status Register (TLCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CLAC[1:0]		FS[3:0]				CHNO[3:0]				SRCNO[3:0]			
Initial value:	—	—	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATCD[7:0]								—	—	CTL[4:0]					—

15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

26.7.8 Transmitter Channel 2 Status Register (TRCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CLAC[1:0]		FS[3:0]				CHNO[3:0]				SRCNO[3:0]

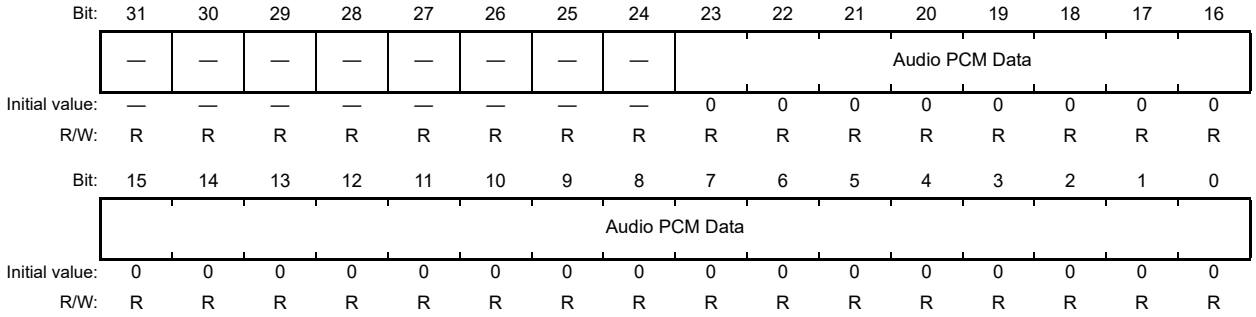
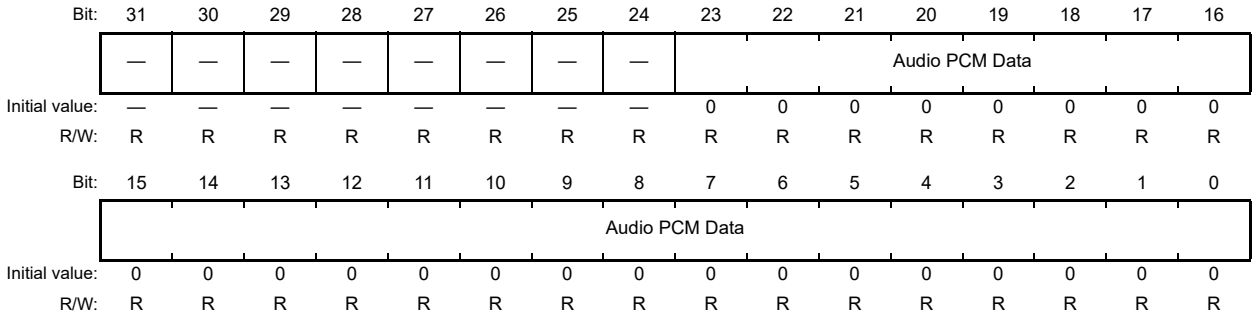
Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	—	W	Reserved
29, 28	CLAC[1:0]	All 0	W	Clock Accuracy 00: Level 2 01: Level 1 10: Level 3 11: Reserved
27 to 24	FS[3:0]	All 0	W	Sample Frequency (FS) 0000: 44.1 kHz 0010: 48 kHz 0011: 32 kHz
23 to 20	CHNO[3:0]	All 0	W	Channel Number 0000: Don't care 0001: A (left channel) 0010: B (right channel) 0011: C
19 to 16	SRCNO[3:0]	All 0	W	Source Number 0000: Don't care 0001: 1 0010: 2 0011: 3
15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

26.7.9 Receiver Channel 1 Audio Register (RLCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

26.7.10 Receiver Channel 2 Audio Register (RRCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

26.7.11 Receiver DMA Audio Data (RDAD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	Audio PCM Data							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Audio PCM Data															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

26.7.12 Receiver User Data Register (RUI)

The register stores the U-bit data received through the Renesas SPDIF. Because U-bit data is stored in a sequence of subframes 1 and 2 starting at the LSB, you need to read the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	User Byte 4								User Byte 3							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	User Byte 2								User Byte 1							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	R	U-bit information is stored here.
23 to 16	User Byte 3	All 0	R	
15 to 8	User Byte 2	All 0	R	
7 to 0	User Byte 1	All 0	R	

26.7.13 Receiver Channel 1 Status Register (RLCS)

The channel status is stored starting at the register's LSB in a way that subframe 1 received from the beginning of the block is stored. For the contents of the channel status register, refer to the IEC-60958 standard.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CLAC[1:0]		FS[3:0]				CHNO[3:0]				SRCNO[3:0]			
Initial value:	—	—	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

26.8 Functional Description—Transmitter

26.8.1 Transmitter Module

The transmitter module transmits PCM data and auxiliary information after encoding it according to the method of biphase-mark modulation that complies with the IEC60958 standard (SPDIF).
The clock for the transmitter module is an oversampling clock supplied from the outside. This clock usually selects a value that serves as an oversample at a frequency eight times larger than the clock frequency required for biphase-mark encoding. In this case, the clock frequency required to transmit 32 time slots in a subframe is 512 times as large as the sample frequency for audio data.
Audio data and channel status information are first written into the module's channel 1 and then into channel 2.
Generally, the channel status need to be written only when the information changes. The SPDIF module requests that the channel status be written in 30 frames -- when all the current channel status data have been transmitted. You need to write somewhere between frame 31 and the beginning of the next block of 192 frames.
The audio data is stored in a double buffer arrangement. To make sure that the first stage buffer is empty, you can send an interrupt request or poll the status register. DMA transfers send channel 1 audio data on the first request and channel 2 data on the second.
The channel status information is stored in the 30-bit registers of channels 1 and 2. For each channel, the channel status information per frame consists of 192 bits. Because necessary data covers only 30 bits, zeros continue to be sent after the transmission of the first 30 bits until the block is completed.
User data forms a 32-bit double buffer arrangement. You can make sure that the first stage buffer is empty by either sending an interrupt request or polling the status register. Usually, information about the user data will become insufficient with the length of data between blocks. Transmission takes place in a sequence of channels 1 and 2. For the user data within a block, 384 bits are transmitted before the next block is continuously transmitted.
The audio data handled by the Renesas SPDIF module is a linear PCM, making it possible to set up to 24 bits. For this reason, the V flag indicating that audio data is a linear PCM remains to be 0. The V flag involves no register-based setting. An even parity is created for each 32 bits of serial output data (excluding the preamble).

Note: When transmitter user buffer underrun occurs, the current data in the buffer data of SPDIF is transmitted until the next data is filled.

26.8.2 Transmitter Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state when 0 is written to the TME bit in the CTRL register. When the transmitter module is idle, it has the following settings:

- The transmitter idle status bit (TIS) is set to 1, all other status bits are cleared to 0.
- Preamble generation is invalid.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both word_count and frame_count are set to 0.
- The output from the biphase-mark encoder is set to 0.

Channel status, user and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the TME bit in the CTRL register.

26.8.3 Initial Settings for Transmitter Module

When the TME bit is set to 1, the TUIR and CSTX bits are set to 1. After that, if data is written in the order of 1) TUI and 2) TLCS and TRCS, a channel status error will occur. To avoid this, be sure to write data in the order of 1) TLCS and TRCS and 2) TUI.
Before writing the first audio data (write access to TLCA or TRCA by the CPU or write access to TDAD by the DMA transfer) after setting the TME bit to 1, be sure to check that the CSTX and TUIR bits are cleared by writing to TLCS, TRCS, and TUI.

26.8.4 Transmitter Module Data Transfer

Once the transmitter module has left the idle state, it is ready for data transfer. Data transfer timing can be achieved in three ways. Either the transfer is done by interrupts, DMA requests or by polling the status register. There is a shared interrupt line (for both transmit and receive) and a single transmitter DMA request line.
Figure 26.5 shows a data transfer with an interrupt for the transmitter.

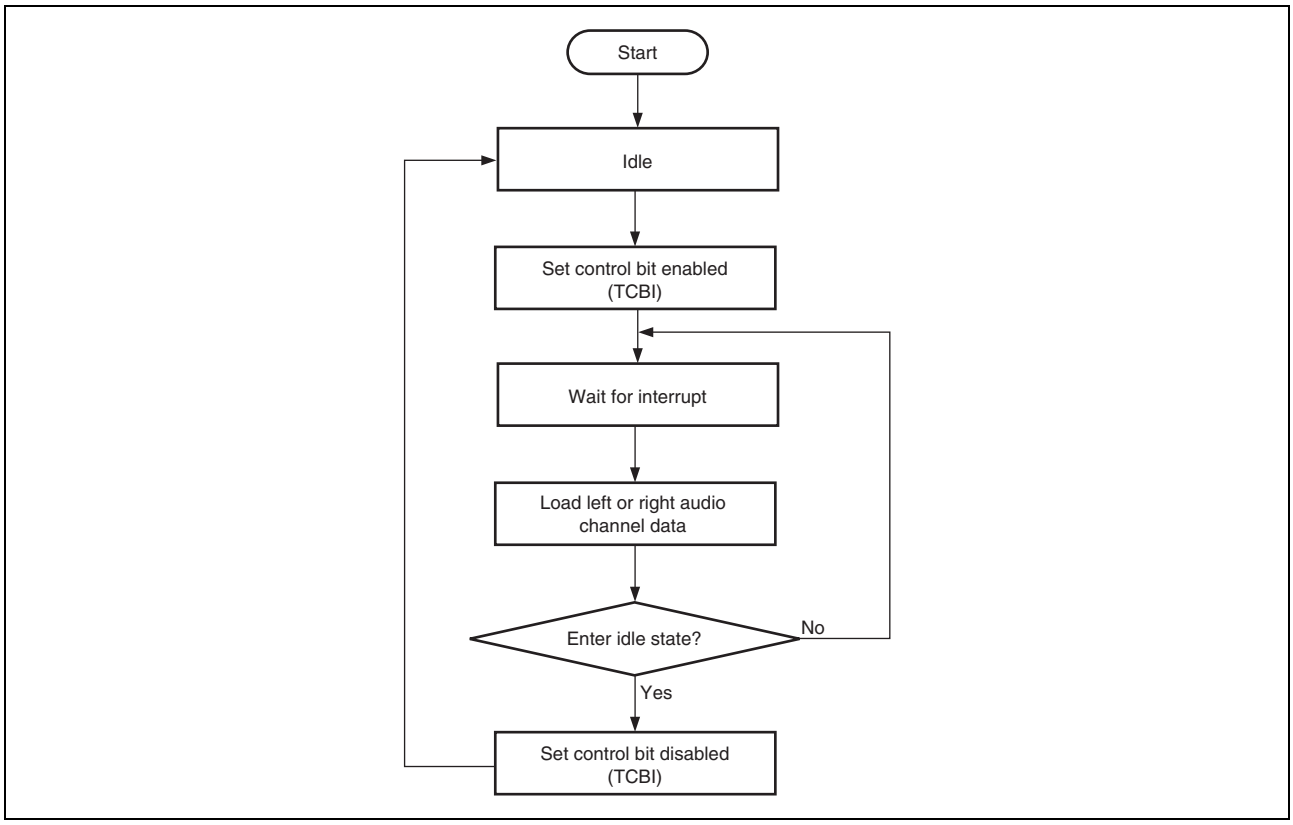

Figure 26.5 Transmitter Data Transfer Flow Diagram - Interrupt Driven

Figure 26.6 shows a data transfer with a DMA transfer for the transmitter.

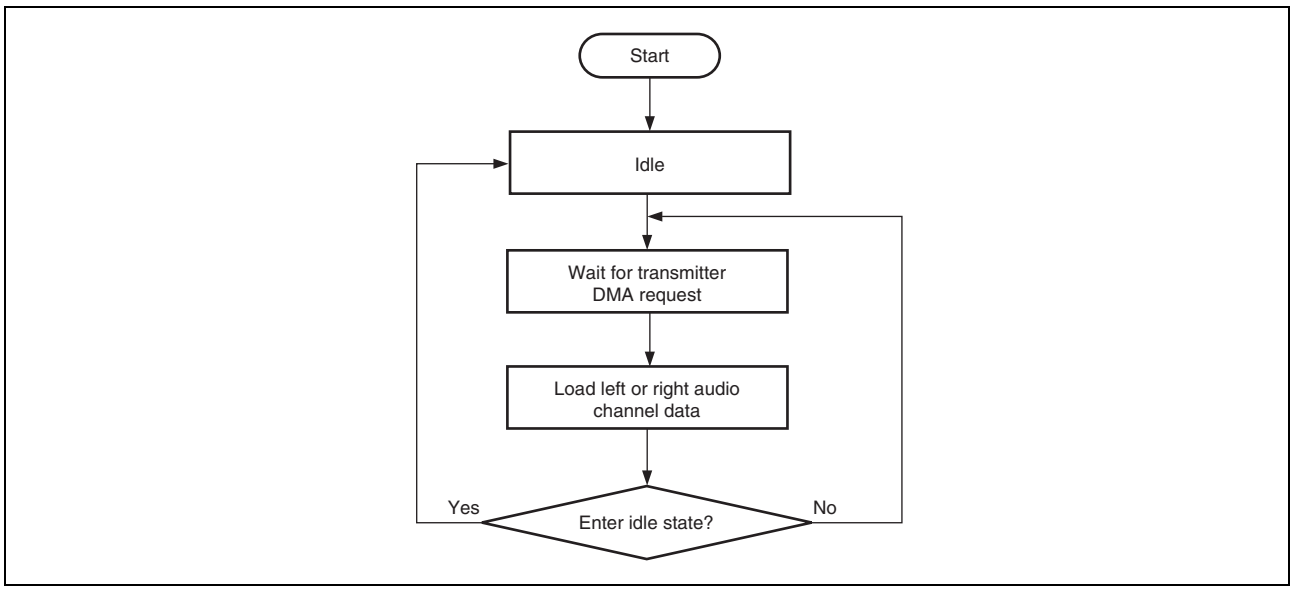

Figure 26.6 Transmitter Data Transfer Flow Diagram—DMA Request Driven

Channel status information is required to be updated when the information has changed. Because the updating needs to be done before the transmission of the next block, the channel status to be updated should be written after 30 frames have been sent; this is indicated either by an interrupt or by polling the status bit. If channel status is written before 30 frames have been sent (while current information is being sent) then an interrupt indicates that the channel status error bit (CSE) in the status register has been set.

Note: 30 frames contains all the valid information in a single channel status block.

26.9 Functional Description—Receiver

26.9.1 Receiver Module

The receiver module demodulates data and clock signals from the input encoded according to the IEC60958 standard. The encoded data, shown in linear PCM format, is stored into the audio data register. The register also stores the channel status and user information being received simultaneously as auxiliary information.
The main clock for the receiver module is an oversampling clock supplied from the outside. The module operates at a frequency four times as large as the oversampling clock.

Note: The oversampling clock is the same for the transmitter and receiver.

Clock recovery is performed using a pulse width counter and averaging filters to produce a sampling pulse in the middle of each bit in the datastream. A clock error status bit indicates clock synchronization loss. Synchronization is achieved when a preamble occurs on the data stream for the first time. Continuous adjustment prevents jitter and/or clock drift from affecting clock recovery, provided that they fall within the clock recovery specifications.
Once the clock recovery is successful the biphase-mark decoder initiates its preamble detection. The decoder searches for the start of block preamble (see Table 26.2). A preamble error status bit indicates that following preambles have not appeared at the correct time, such failures are most likely caused by transmission loss or interference.
Even parity checking is performed on the decoded data. A discrepancy will result in the parity error status bit being set.
The SPDIF module acquires user data and channel status information in addition to audio data. The audio is stored in a double buffer arrangement. Either an interrupt request because of a full buffer or polling of the status bit will indicate when the data is ready to be read. DMA transfers receive channel 1 audio data on the first request and channel 2 data on the second.
Channel status is stored in a 30-bit register. Channel status information is received at 1-bit per subframe. Therefore the registers will not be full until a total of 30 frames for each channel have been received. New channel status is compared with the current data to see if it has changed and is only read by the processor if it has. User data, which is also received at the same time, is stored into the register on a subframe basis, so that the reception is completed when 16 frames are reached.

Note 1. Channel status data requests do not support DMA.
Note 2. When receiver user buffer overrun occurs, the current data in the buffer data of SPDIF is overwritten by the next incoming data from SPDIF interface.

26.9.2 Receiver Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state by writing 0 to bit RME in the CTRL register. Whilst idle the module has the following settings:

- The receiver idle status bit is set to 1, all other status bits are cleared to 0.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both Word_count and frame_count are set to 0.

Channel status registers, user data registers and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the bit RME in the CTRL register.

26.9.3 Receiver Module Data Transfer

Once the module has left the idle state it is ready for data transfer. Data transfer timing can be achieved in three ways. The transfer can be done by interrupts, or by polling the status register, or by DMA. There is a shared interrupt line (transmit and receive) and a single receiver DMA request line. Data transfer for the receiver can be interrupted by error signals caused by:

1. Clock recovery failure.
2. Transmission loss or interference – indicated by a preamble error.
3. Parity check failure.

Transmission loss or interference can cause the start of subframe or start of block preamble to be misplaced or not present.
Parity check failure occurs when the parity bit is incorrect, this can be caused by any of the above.

- Clock Recovery Deviation
  The receive margin for clock recovery is based on the following equation:

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5)\, F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

where M = receive margin
N = oversampling rate
L = frame length = 33
D = duty cycle = 0.6
F = oversampling clock deviation = Level II accuracy = 1000 in $10e^{-6}$

Figure 26.7 indicates what the receive margin M represents

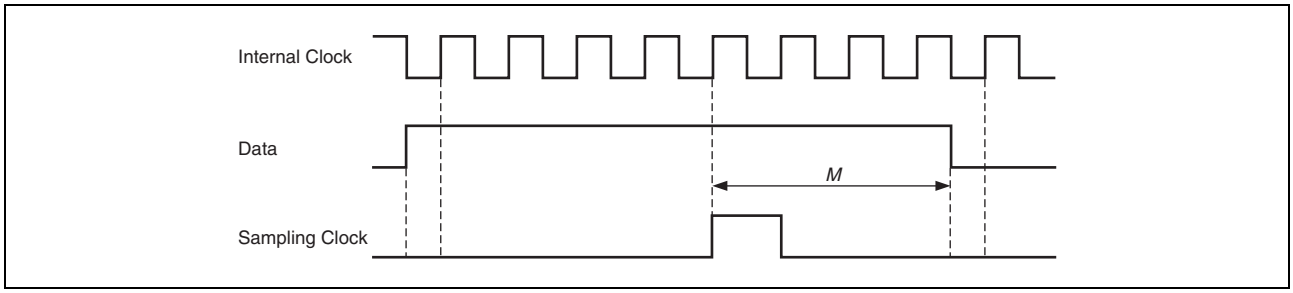

Figure 26.7 Receive Margin

Introducing jitter into the equation gives the following inequality.

$$j \leq \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)\,F - \frac{|D - 0.5|}{N}\,(1 + F) \right| \times 100\%$$

J = clock jitter
Eight times oversampling produces a receive margin = 39.25%
Four times oversampling produces a receive margin = 31.75%
Two times oversampling produces a receive margin = 16.75%

The fastest sample frequency is 48 kHz. This requires a clock speed of 128 × 48 kHz = 6.144 MHz. The worst case jitter in one cycle is specified at 40 ns = 24.5% of the period. This means that an oversampling rate of 4 or more will satisfy the inequality and therefore be sufficient for clock recovery.

Figure 26.8 illustrates the receiver data transfer using interrupts.

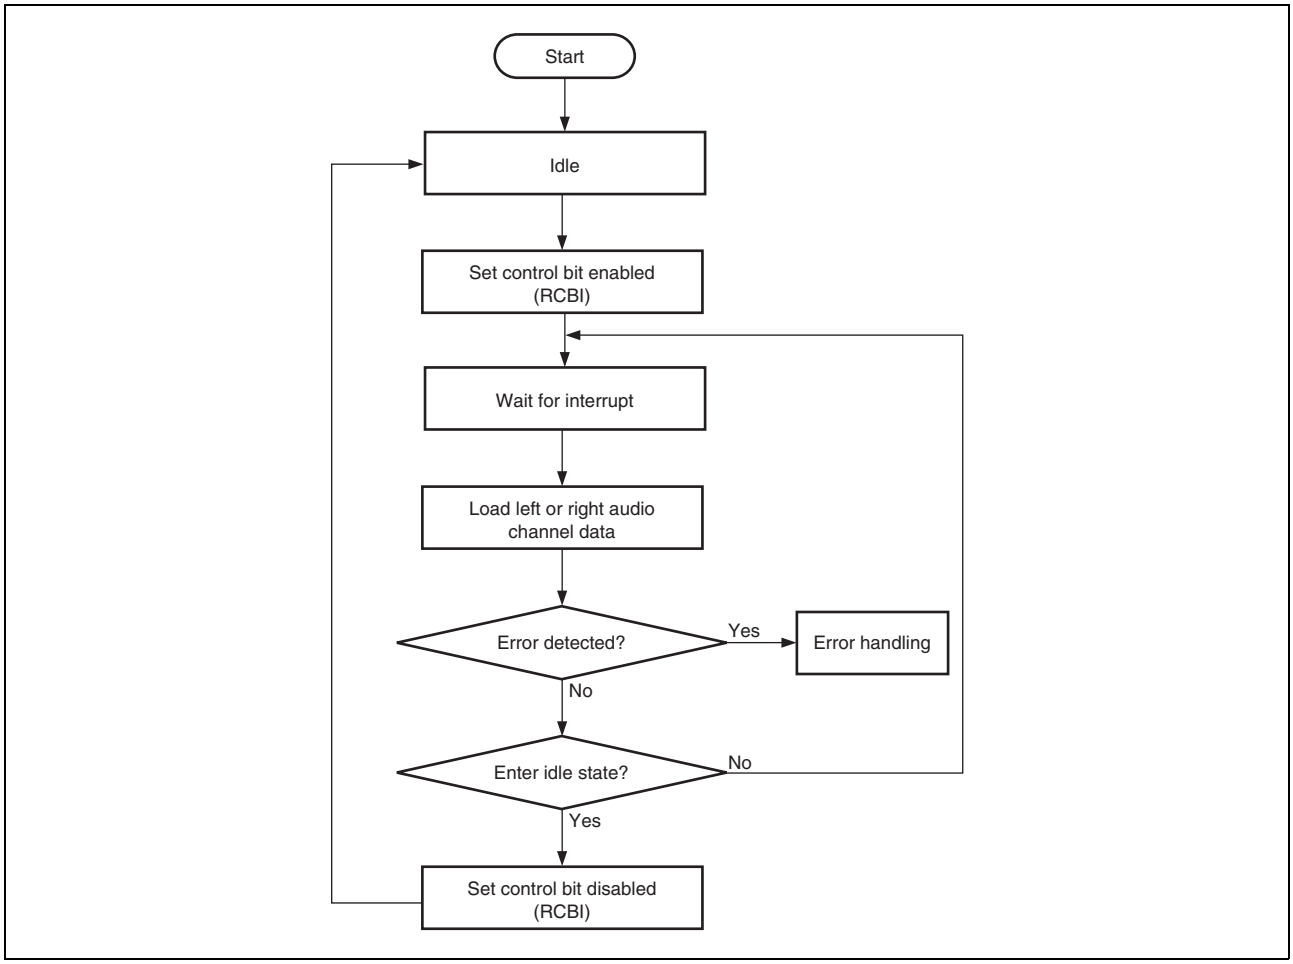

Figure 26.8 Receiver Data Transfer Flow Diagram - Interrupt Driven

Interrupts to indicate that the channel status information register is full occur after frame 30 has been received and only if the information has changed. When the first four bytes have been stored an interrupt occurs.

26.10 Disabling the Module

26.10.1 Transmitter and Receiver Idle

The transmitter or receiver modules can be disabled by writing 0 to the idle bit in the control register (TME for the transmitter and RME for the receiver). The idle state can be detected by polling the idle bit in the status register (TIS and RIS).

26.11 Compressed Mode Data

Compressed mode data is defined in the IEC 61937 specification. This module only detects compressed mode data. This is done by checking the parity flag (V flag) and bit 1 in the channel status data. If both are one then the data is in compressed mode. This is indicated by the setting of the CMD bit in the status register.

Note: Only the receiver detects compressed mode data since the information is not relevant to the transmitter.

IEC61937 Compressed Mode Digital Audio Interface

26.13 Usage Notes

26.13.1 Clearing TUIR

After TUI is written to, the TUIR bit is cleared only after transmission of a maximum of one frame is completed. When using a transmitter user information interrupt to write data to TUI, check that the TUIR bit is cleared before terminating the interrupt handling routine so that the interrupt is not unexpectedly accepted again.

26.13.2 Frequency of Clock Input for Audio

The frequency of the clock input to the AUDIO_X1 and AUDIO_X2 or AUDIO_CLK must be lower than the P1φ frequency.

27. Ethernet Controller (ETHERC)

27.1 Overview

This MCU has a two-channel Ethernet controller (ETHERC) compliant with the Ethernet or IEEE802.3 Media Access Control (MAC) layer protocol. Each ETHERC channel has one channel of the MAC layer interface, and connecting the MCU to the physical layer LSI (PHY-LSI) allows transmission and reception of frames compliant with the Ethernet/ IEEE802.3 standard. The ETHERC is connected to the Ethernet controller direct memory access controller (EDMAC), so data can be transferred without using the CPU.
Table 27.1 lists the ETHERC specifications. Figure 27.1 shows the ETHERC configuration. Table 27.2 lists the ETHERC I/O pins.
Figure 27.2 and Figure 27.3 show examples of connecting the MCU to the PHY-LSI.

Table 27.1 ETHERC Specifications

Item	Description
Number of channels	Two channels
Protocol	Flow control compliant with IEEE802.3x
Data transmission/reception	Frames compliant with the Ethernet/IEEE802.3 standard can be transmitted and received.
Bit rate	Supports 10 Mbps and 100 Mbps
Operation modes	Supports full-duplex and half-duplex modes
Interfaces	Media Independent Interface (MII), Reduced Media Independent Interface (RMII), compliant with the IEEE802.3u standard
Functions	Magic Packet™ *1 detection, Wake-On-LAN (WOL) signal output

Note 1. Magic Packet is a trademark of Advanced Micro Devices, Inc.

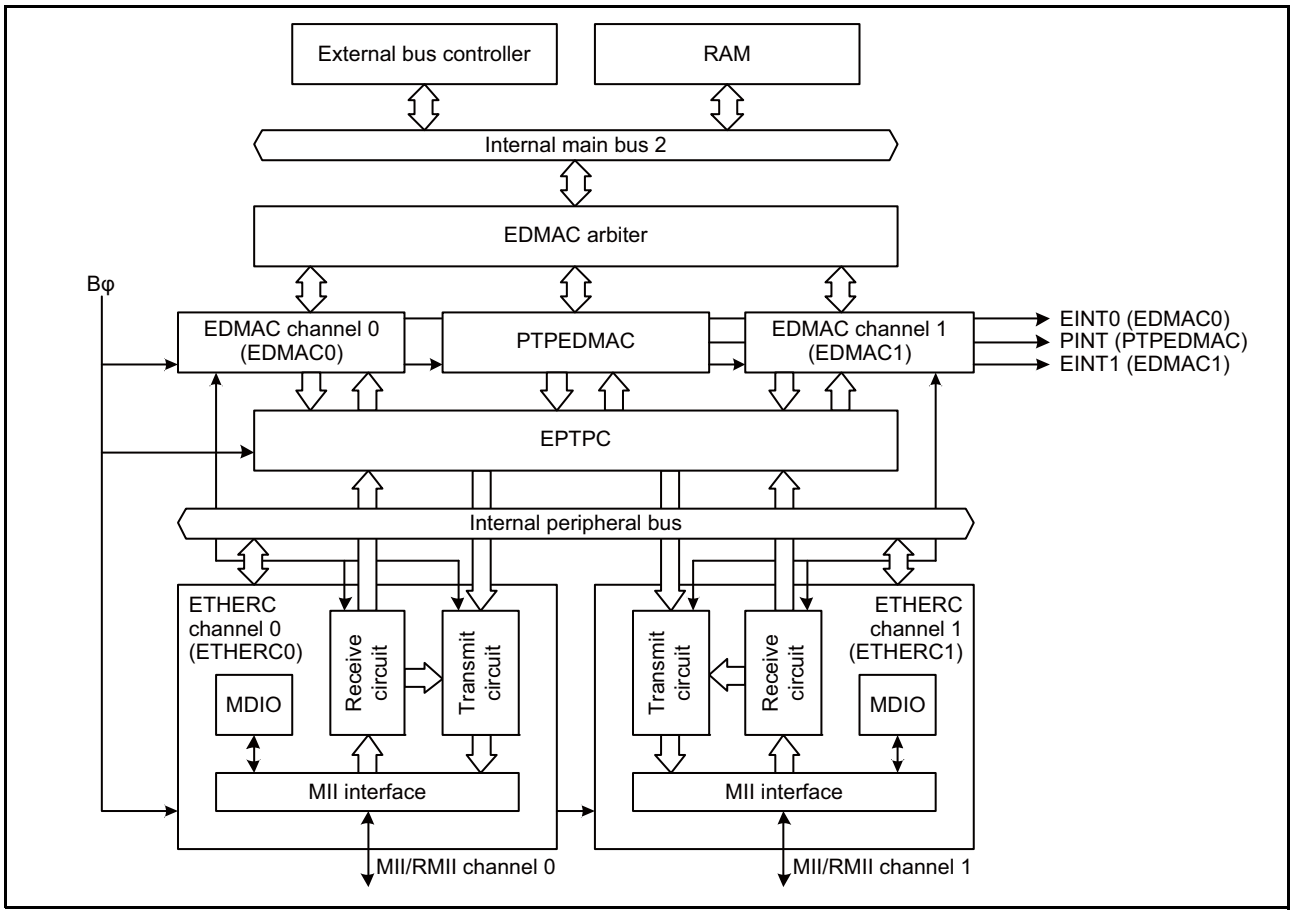

Figure 27.1 ETHERC Configuration

Table 27.2 ETHERC I/O Pins (n = 0, 1)

Operating Mode	Pin Name	I/O	Description
MII	ETn_TX_CLK *1	Input	Transmit clock Timing reference signal for outputting the ETn_TX_EN, ETn_ETXD3 to ETn_ETXD0, and ETn_TX_ER signals.
	ETn_RX_CLK *1	Input	Receive clock Timing reference signal for inputting the ETn_RX_DV, ETn_ERXD3 to ETn_ERXD0, and ETn_RX_ER signals
	ETn_TX_EN *1	Output	Transmit data valid This signal indicates that valid transmit data has been output on pins ETn_ETXD3 to ETn_ETXD0.
	ETn_ETXD3 to ETn_ETXD0 *1	Output	4-bit transmit data
	ETn_TX_ER *1	Output	This signal notifies the PHY-LSI that an error occurred during transmission.
	ETn_RX_DV *1	Input	Receive data valid This signal indicates that valid receive data is on pins ETn_ERXD3 to ETn_ERXD0.
	ETn_ERXD3 to ETn_ERXD0 *1	Input	4-bit receive data
	ETn_RX_ER *1	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC.
	ETn_CRS *1	Input	Carrier sense
	ETn_COL *1	Input	Collision detection signal
	ETn_MDC *1	Output	Management data clock Reference clock signal for transfer of information on the ETn_MDIO pin.
	ETn_MDIO *1	I/O	Management data I/O Bidirectional data signal for exchanging management data with the PHY-LSI.
	ETn_LINKSTA	Input	Link status input from the PHY-LSI
	ETn_EXOUT/ ETn_SCLKIN	Input/ Output	General output pin/STCA clock input
	ETn_WOL	Output	Wake-On-LAN. This signal indicates that a Magic Packet has been received.

Table 27.2 ETHERC I/O Pins (n = 0, 1)

Operating Mode	Pin Name	I/O	Description
RMII	REF50CKn*2	Input	Reference clock Timing reference signal for pins RMIIn_TXD_EN, RMIIn_TXD1 to RMIIn_TXD0, RMIIn_CRS_DV, RMIIn_RXD1 to RMIIn_RXD0, and RMIIn_RX_ER.
	RMIIn_TXD_EN *2	Output	Transmit data valid This signal indicates that valid transmit data has been output on pins RMIIn_TXD1 and RMIIn_TXD0.
	RMIIn_TXD1 to RMIIn_TXD0 *2	Output	2-bit transmit data
	RMIIn_CRS_DV *2	Input	Carrier sense/receive data valid This signal indicates that valid receive data is on pins RMIIn_RXD1 and RMIIn_RXD0.
	RMIIn_RXD1 to RMIIn_RXD0*2	Input	2-bit receive data
	RMIIn_RX_ER*2	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC.
	ETn_MDC *2	Output	Management data clock Reference clock signal for transfer of information on the ETn_MDIO pin
	ETn_MDIO*2	Input/ Output	Management data I/O Bidirectional data signal for exchanging management data with the PHYLSI.
	ETn_LINKSTA	Input	Link status input from the PHY-LSI.
	ETn_EXOUT/ ETn_SCLKIN	Input/ Output	General output pin/STCA clock input
	ETn_WOL	Output	Wake-On-LAN This signal indicates that a Magic Packet has been received.

Note 1. MII signal compliant with IEEE802.3u
Note 2. RMII signal compliant with IEEE802.3u

b31 to b21	—	Reserved	The read value is 0. The write value should be 0.	R/W

The ECMR register controls the ETHERC operation.

Set bits in the ECMR register, excluding bits TE and RE, during initialization after a reset. When rewriting this register outside the initialization process, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again.

PRM Bit (Promiscuous Mode)

When the PRM bit is set to 1, the ETHERC operates in promiscuous mode where all Ethernet frames are received. In promiscuous mode, the ETHERC receives all valid frames regardless of whether or not the address matches the destination address or broadcast address and regardless of the multicast bit setting.

RTM Bit (Bit Rate)

The RTM bit sets the bit rate when the RMII is selected.

ILB Bit (Internal Loopback Mode)

When the ILB bit is set to 1, transmit frames can be looped back in the MCU. Set the DM bit to 1 (full-duplex mode) to perform a loopback test.

TE Bit (Transmission Enable)

When the TE bit is set to 1, the ETHERC transmit function is enabled.
When the TE bit is set to 0, the transmit function is disabled after the frame being processed is completely transmitted.

RE Bit (Reception Enable)

When the RE bit is set to 1, the ETHERC receive function is enabled.
When the RE bit is set to 0, the receive function is disabled after the frame being processed is completely received.

PRCEF Bit (CRC Error Frame Receive Mode)

When the PRCEF bit is set to 1, the EDMAC is not notified that a CRC error has occurred even when the error is detected in a receive frame. Accordingly, the EDMACn.EESR.CERF flag and RFS0 bit in receive descriptor 0 (RD0) do not become 1.

ZPF Bit (0 Time PAUSE Frame Enable)

When the ZPF bit is 1, a PAUSE frame that contains the pause_time parameter of 0 is transmitted when the PAUSE frame transmit request is canceled before the PAUSE time of the previously transmitted PAUSE frame has not elapsed. After the PAUSE frame that contains the pause_time parameter of 0 is received, the ETHERC is ready for transmission. When the ZPF bit is 0, even if the PAUSE frame transmit request from the receive FIFO is canceled, the next PAUSE frame is not transmitted until the PAUSE time of the previously transmitted PAUSE frame has elapsed. When a PAUSE frame that contains the pause_time parameter of 0 is received, the PAUSE frame is discarded.

27.2.2 Receive Frame Maximum Length Register (RFLR)

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	RFL[11:0]	Receive Frame Maximum Length	The set value becomes the maximum frame length. Values that are less than 1,518 bytes are regarded as 1,518 bytes, and values larger than 2,048 bytes are regarded as 2,048 bytes.	R/W
b31 to b12	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RFLR register sets the maximum frame length that can be received by the MCU. Set the length in bytes.
Do not rewrite this register while the ECMR.RE bit is 1 (receive function is enabled).

RFL[11:0] Bits (Receive Frame Maximum Length)

The RFL[11:0] bits set a frame length to be checked. When the number of bytes for fields from the destination address to the frame check sequence (FCS) of the received frame exceeds the RFL[11:0] bit value, the EDMAC is notified of a frame-too-long error.
When the received frame length exceeds the RFL[11:0] bit value, the excess data is discarded.

27.2.3 ETHERC Status Register (ECSR)

Address: ETHERC0.ECSR E820 4110h, ETHERC1.ECSR E820 4310h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	BFR	PSRTO	—	LCHNG	MPD	ICD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ICD	False Carrier Detect Flag	0: PHY-LSI has not detected a false carrier on the line. 1: PHY-LSI has detected a false carrier on the line.	R/W *1
b1	MPD	Magic Packet Detect Flag	0: Magic Packet has not been detected. 1: Magic Packet has been detected.	R/W *1
b2	LCHNG	Link Signal Change Flag	0: Change in the ETn_LINKSTA signal has not been detected. 1: Change in the ETn_LINKSTA signal has been detected (high to low, or low to high).	R/W *1
b3	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	PSRTO	PAUSE Frame Retransmit Over Flag	0: PAUSE frame retransmit count has not reached the upper limit. 1: PAUSE frame retransmit count has reached the upper limit.	R/W *1
b5	BFR	Continuous Broadcast Frame Reception Flag	0: Continuous reception of broadcast frames has not been detected. 1: Continuous reception of broadcast frames has been detected.	R/W *1
b31 to b6	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. Write 1 to clear the flag.

The ECSR register indicates the status of the ETHERC.
When any flag in the ECSR register becomes 1 while the corresponding bit in the ECSIPR register is 1 (interrupt is notified), the EDMACn.EESR.ECI flag becomes 1.

ICD Flag (False Carrier Detect Flag)

The ICD flag indicates that the PHY-LSI has detected a false carrier on the line.
The ICD flag becomes 1 when a receive error signal shown in Figure 1.11 is received from the PHY-LSI. Note that the information may not be correct when signals input from the PHY-LSI change faster than software recognizes the change. Check the timing of the PHY-LSI.

LCHNG Flag (Link Signal Change Flag)

The LCHNG flag indicates that ETn_LINKSTA signal input from the PHY-LSI has changed from high to low, or from low to high.
Refer to the PSR.LMON flag for the current link status.

PSRTO Flag (PAUSE Frame Retransmit Over Flag)

The PSRTO flag indicates that the number of retransmissions reaches the value set in the TPAUSER register when retransmitting a PAUSE frame while automatic PAUSE frame transmission is enabled.

27.2.4 ETHERC Interrupt Enable Register (ECSIPR)

Address: ETHERC0.ECSIPR E820 4118h, ETHERC1.ECSIPR E820 4318h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	BFSIPR	PSRTOIP	—	LCHNGIP	MPDIP	ICDIP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ICDIP	False Carrier Detect Interrupt Enable	0: Notification of the false carrier detect interrupt is disabled. 1: Notification of the false carrier detect interrupt is enabled.	R/W
b1	MPDIP	Magic Packet Detect Interrupt Enable	0: Notification of the Magic Packet detect interrupt is disabled. 1: Notification of the Magic Packet detect interrupt is enabled.	R/W
b2	LCHNGIP	LINK Signal Change Interrupt Enable	0: Notification of ETn_LINKSTA signal change interrupt is disabled. 1: Notification of ETn_LINKSTA signal change interrupt is enabled.	R/W
b3	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	PSRTOIP	PAUSE Frame Retransmit Over Interrupt Enable	0: Notification of PAUSE frame retransmit over interrupt is disabled. 1: Notification of PAUSE frame retransmit over interrupt is enabled.	
b5	BFSIPR	Continuous Broadcast Frame Reception Interrupt Enable	0: Notification of continuous broadcast frame reception interrupt is disabled. 1: Notification of continuous broadcast frame reception interrupt is enabled.	R/W
b31 to b6	—	Reserved	The read value is 0. The write value should be 0.	R/W

The ECSIPR register selects whether or not to notify the EDMAC of the status indicated by the ECSR register. Each bit corresponds to the flag in the ECSR register that has the same bit number.

27.2.5 PHY Interface Register (PIR)

Address: ETHERC0.PIR E820 4120h, ETHERC1.PIR E820 4320h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MDC	MII/RMII Management Data Clock	The MDC bit value is output from the ETn_MDC pin to supply the management data clock to the MII or RMII.	R/W
b1	MMD	MII/RMII Management Mode	0: Read 1: Write	R/W
b2	MDO	MII/RMII Management Data-Out	The MDO bit value is output from the ETn_MDIO pin when the MMD bit is 1 (write). The value is not output when the MMD bit is 0 (read).	R/W
b3	MDI	MII/RMII Management Data-In	This bit indicates the level of the ETn_MDIO pin. The write value should be 0.	R/W
b31 to b4	—	Reserved	The read value is 0. The write value should be 0.	R/W

The PIR register is used to access registers in the PHY-LSI via the MII or RMII. The management clock and management data are controlled by software.
Refer to section 27.3.4, Accessing MII/RMII Registers for details on accessing MII and RMII registers.

27.2.6 PHY Status Register (PSR)

Address: ETHERC0.PSR E820 4128h, ETHERC1.PSR E820 4328h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LMON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LMON	ETn_LINKSTA Pin Status Flag	The link status can be read by connecting the link signal output from the PHY-LSI to the ETn_LINKSTA pin. For details on the polarity, refer to the specifications of the connected PHY-LSI.	R
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R

The PSR register is used to monitor interface signals from the PHY-LSI.

27.2.7 Random Number Generation Counter Limit Setting Register (RDMLR)

Address: ETHERC0.RDMLR E820 4140h, ETHERC1.RDMLR E820 4340h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	RMD[19:16]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RMD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b19 to b0	RMD[19:0]	Random Number Generation Counter	00000h: Normal operation 00001h to FFFFFh: Setting prohibited	R/W
b31 to b20	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RDMLR register sets the maximum value for the counter used in the random number generator.
Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled) or while the ECMR.RE bit is 1 (receive function is enabled).

27.2.8 Interpacket Gap Register (IPGR)

Address: ETHERC0.IPGR E820 4150h, ETHERC1.IPGR E820 4350h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	IPG[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	IPG[4:0]	Interpacket Gap	00h: 16 bit time 01h: 20 bit time : : 14h: 96 bit time (initial value) : : 1Fh: 140 bit time	R/W
b31 to b5	—	Reserved	The read value is 0. The write value should be 0.	R/W

The IPGR register sets the interpacket gap (IPG) value.
Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled) or while the ECMR.RE bit is 1 (receive function is enabled).
Refer to section 27.3.6, Adjusting Transmission Efficiency by Changing the IPG.

27.2.9 Automatic PAUSE Frame Register (APR)

Address: ETHERC0.APR E820 4154h, ETHERC1.APR E820 4354h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	AP[15:0]	Automatic PAUSE Time Setting	These bits set the value of the pause_time parameter for a PAUSE frame that is automatically transmitted. Transmission is not performed until the set value multiplied by 512 bit time has elapsed.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The APR register sets the PAUSE time of the PAUSE frame that is automatically transmitted. The value set in the APR register is used for the pause_time parameter of the PAUSE frame.
Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled) or while the ECMR.RE bit is 1 (receive function is enabled).

27.2.10 Manual PAUSE Frame Register (MPR)

Address: ETHERC0.MPR E820 4158h, ETHERC1.MPR E820 4358h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MP[15:0]	Manual PAUSE Time Setting	These bits set the value of the pause_time parameter for a PAUSE frame that is manually transmitted. Transmission is not performed until the set value multiplied by 512 bit time has elapsed. The read value is undefined.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The MPR register sets the PAUSE time of the PAUSE frame that is manually transmitted. The value set in the MPR register is used for the pause_time parameter of the PAUSE frame.
When a value is set to this register, a PAUSE frame is transmitted. Rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled).

27.2.11 Received PAUSE Frame Counter (RFCF)

Address: ETHERC0.RFCF E820 4160h, ETHERC1.RFCF E820 4360h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RPAUSE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	RPAUSE [7:0]	Manual PAUSE Time Setting	Received PAUSE Frame CountNumber of received PAUSE frames	R
b31 to b8	—	Reserved	The read value is 0.	R

The RFCF register is a counter indicating the number of received PAUSE frames. The counter is reset after this register is read.

27.2.12 PAUSE Frame Retransmit Count Setting Register (TPAUSER)

Address: ETHERC0.TPAUSER E820 4164h, ETHERC1.TPAUSER E820 4364h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TPAUSE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TPAUSE [15:0]	Automatic PAUSE Frame Retransmit Setting	0000h: Number of retransmissions is unlimited 0001h: Maximum number of retransmissions is 1 : : FFFFh: Maximum number of retransmissions is 65,535	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The TPAUSER register selects the maximum number of times a PAUSE frame is automatically transmitted.
Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled).

27.2.13 PAUSE Frame Retransmit Counter (TPAUSECR)

Address: ETHERC0.TPAUSECR E820 4168h, ETHERC1.TPAUSECR E820 4368h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TXP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	TXP[7:0]	PAUSE Frame Retransmit Count	Number of times a PAUSE frame was retransmitted	R
b31 to b8	—	Reserved	The read value is 0.	R

The TPAUSECR register is a counter indicating the number of times a PAUSE frame was automatically retransmitted. The counter is reset after this register is read.

27.2.14 Broadcast Frame Receive Count Setting Register (BCFRR)

Address: ETHERC0.BCFRR E820 416Ch, ETHERC1.BCFRR E820 436Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BCF[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	BCF[15:0]	Broadcast Frame Continuous Receive Count Setting	0000h: Number of receptions is unlimited. 0001h: Receive 1 frame. : FFFFh: Receive 65,535 frames.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The BCFRR register sets the number of times broadcast frames can be received continuously. When the number of received frames exceeds the BCF[15:0] bit value, the ECSR.BFR flag is set to 1 and the subsequent broadcast frames are discarded. Note that the internal counter that counts the continuous reception of broadcast frames is reset if it receives the frames other than broadcast frames.
Do not rewrite this register while the ECMR.RE bit is 1 (receive function is enabled).

27.2.15 MAC Address Upper Bit Register (MAHR)

Address: ETHERC0.MAHR E820 41C0h, ETHERC1.MAHR E820 43C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The MAHR register sets the upper 32 bits (b47 to b16) of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0123 4567h.
Set the MAHR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled) or while the ECMR.RE bit is 1 (receive function is enabled). When rewriting this register, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC and then set this register again.

27.2.16 MAC Address Lower Bit Register (MALR)

Address: ETHERC0.MALR E820 41C8h, ETHERC1.MALR E820 43C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	—	These bits set the lower 16 bits of the MAC address.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The MALR register sets the lower 16 bits of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0000 89ABh.
Set the MALR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function is enabled) or while the ECMR.RE bit is 1 (receive function is enabled). When rewriting this register, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC and then set this register again.

27.2.17 Transmit Retry Over Counter Register (TROCR)

Address: ETHERC0.TROCR E820 41D0h, ETHERC1.TROCR E820 43D0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TROCR register is a counter indicating the number of frames that fail to be retransmitted.
The TROCR register is incremented by 1 when a frame fails to be retransmitted 15 times. The counter stops when the TROCR register value becomes FFFF FFFFh. The counter value becomes 0 by writing any value to the TROCR register.

27.2.18 Late Collision Detect Counter Register (CDCR)

Address: ETHERC0.CDCR E820 41D4h, ETHERC1.CDCR E820 43D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CDCR register is a counter indicating the number of late collisions that have been detected after transmission starts. When the CDCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the CDCR register.

27.2.19 Lost Carrier Counter Register (LCCR)

Address: ETHERC0.LCCR E820 41D8h, ETHERC1.LCCR E820 43D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The LCCR register is a counter indicating the number of times a loss of carrier is detected during frame transmission. When the LCCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the LCCR register.

27.2.20 Carrier Not Detect Counter Register (CNDCR)

Address: ETHERC0.CNDCR E820 41DCh, ETHERC1.CNDCR E820 43DCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CNDCR register is a counter indicating the number of times a carrier is not detected during preamble transmission. When the CNDCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the CNDCR register.

27.2.21 CRC Error Frame Receive Counter Register (CEFCR)

Address: ETHERC0.CEFCR E820 41E4h, ETHERC1.CEFCR E820 43E4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CEFCR register is a counter indicating the number of received frames where a CRC error has been detected. When the CEFCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the CEFCR register.

27.2.22 Frame Receive Error Counter Register (FRECR)

Address: ETHERC0.FRECR E820 41E8h, ETHERC1.FRECR E820 43E8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The FRECR register is a counter indicating the number of times a frame receive error has occurred. The PHY-LSI notifies the ETHERC of the frame receive error using the ETn_RX_ER pin.
The FRECR register is incremented each time the ETn_RX_ER pin becomes high. When the FRECR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the FRECR register.
The SYSR.INFABT flag of the EPTPC may be set to 1 when a frame receive error occurs, regardless of whether or not the EPTPC is in use. In such cases, reset the EPTPC, PTPEDMAC, and respective channel of the ETHERC and EDMAC. For the procedure of resetting, see section 27, Handling when Control Information Included a Mismatch.

27.2.23 Too-Short Frame Receive Counter Register (TSFRCR)

Address: ETHERC0.TSFRCR E820 41ECh, ETHERC1.TSFRCR E820 43ECh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TSFRCR register is a counter indicating the number of times a short frame that is shorter than 64 bytes has been received. When the TSFRCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the TSFRCR register.

27.2.24 Too-Long Frame Receive Counter Register (TLFRCR)

Address: ETHERC0.TLFRCR E820 41F0h, ETHERC1.TLFRCR E820 43F0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TLFRCR register is a counter indicating the number of times a long frame that is longer than the RFLR register value has been received.
When the TLFRCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the TLFRCR register.
Note that the TLFRCR register is not incremented when a frame is received with the alignment error. In this case, the RFCR register is incremented.

27.2.25 Received Alignment Error Frame Counter Register (RFCR)

Address: ETHERC0.RFCR E820 41F4h, ETHERC1.RFCR E820 43F4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The RFCR register is a counter indicating the number of times a frame has been received with the alignment error (frame is not an integral number of octets).
When the RFCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the RFCR register.
The SYSR.INFABT flag of the EPTPC may be set to 1 when an alignment error is detected, regardless of whether or not the EPTPC is in use. In such cases, reset the EPTPC, PTPEDMAC, and respective channel of the ETHERC and EDMAC. For the procedure of resetting, see section 27, Handling when Control Information Included a Mismatch.

27.2.26 Multicast Address Frame Receive Counter Register (MAFCR)

Address: ETHERC0.MAFCR E820 41F8h, ETHERC1.MAFCR E820 43F8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

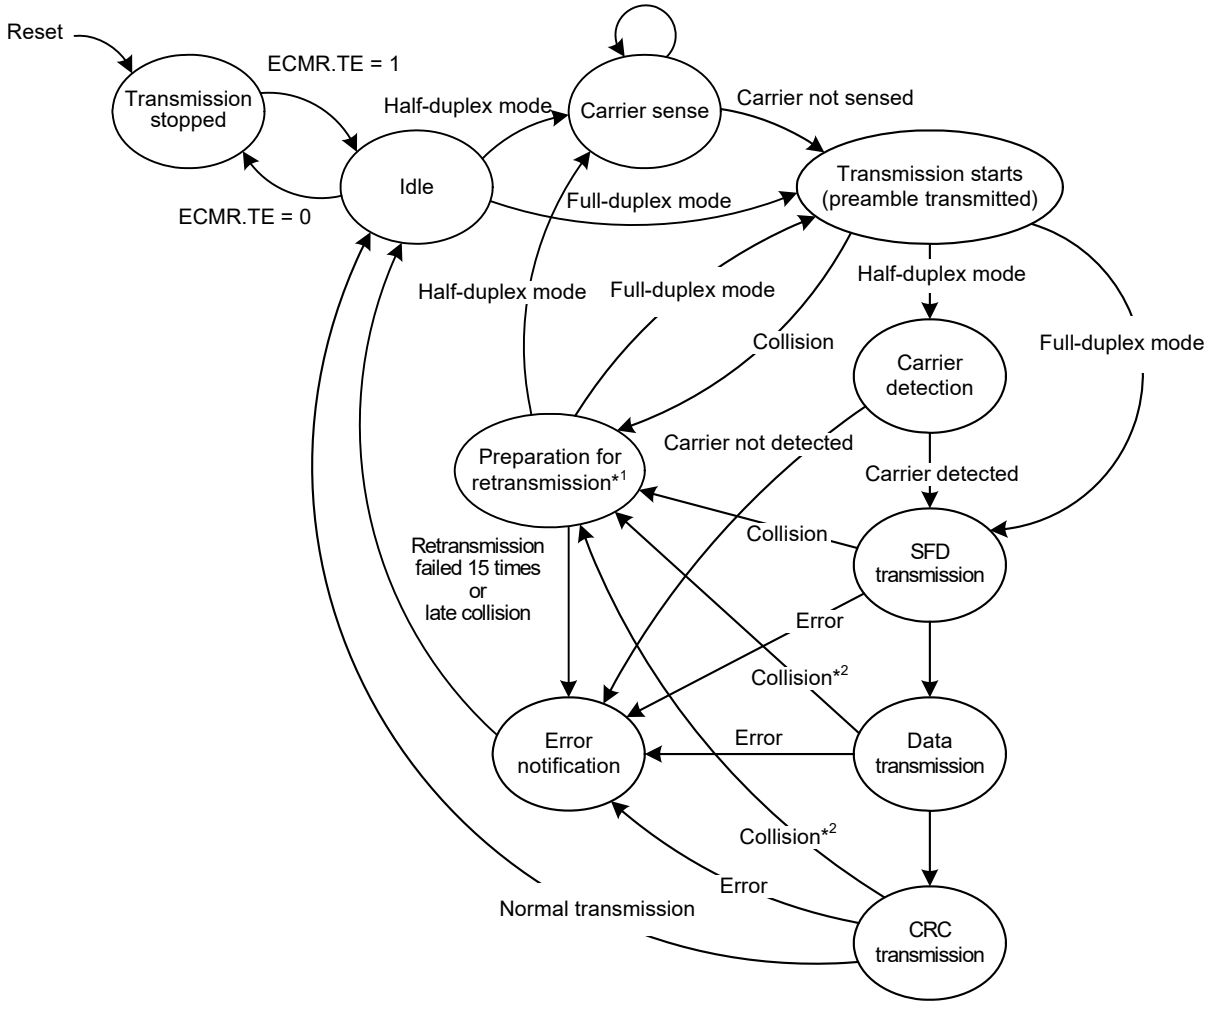
The MAFCR register is a counter indicating the number of times a frame where the multicast address is set has been received.
When the RFCR register value becomes FFFF FFFFh, the counter stops. The counter value becomes 0 by writing any value to the RFCR register.

27.3 Operation

This section is an overview of the ETHERC operations. The ETHERC supports flow control compliant with IEEE802.3x, and can transmit and receive PAUSE frames.

27.3.1 Transmission

The ETHERC transmitter assembles transmit data into a frame and outputs it to the MII/RMII when a transmit request is received from the EDMAC. The frame transmitted via the MII/RMII is transmitted on the line by the PHY-LSI. Figure 27.4 shows the state transitions of the ETHERC transmit-ter.



Note 1. Preparation for retransmission includes transmitting a jam signal and adjusting transmission time intervals using the backoff algorithm after a collision is detected.
Note 2. Preparation for retransmission is performed only when a collision is detected within 512 bit time after preamble transmission starts. When a collision is detected after 512 bit time, only a jam signal is transmitted and processing using the backoff algorithm is not performed.

Figure 27.4 ETHERC Transmitter State Transitions

1. When setting the ECMR.TE bit to 1, the ETHERC enters the transmit idle state.
2. When a transmit request is received from the EDMAC, the ETHERC enters the carrier sense state. The ETHERC waits for the interpacket gap and then transmits a preamble to the MII/RMII. When full-duplex mode is selected, it is not required to sense a carrier, so the ETHERC transmits a preamble immediately after receiving a transmit request from the EDMAC.
3. The ETHERC transmits the Start Frame Delimiter (SFD), transmit data, and CRC sequentially. When the transmission is completed successfully, the ETHERC notifies the EDMAC of successful completion, and the EDMAC sets the EDMACn.EESR.TC flag to 1. When a late collision or loss of carrier is detected during data transmission, the ETHERC stops the transmission and notifies the EDMAC of the error.
4. After the time for the interpacket gap has elapsed, the ETHERC enters the idle state and continues transmission when transmit data remains.

27.3.2 Reception

The ETHERC receiver separates the frame input from the MII/RMII into the preamble, SFD, receive data, and CRC, and transmits only receive data (destination address, source address, type/length, data/LLC). Figure 27.5 shows the state transitions of the ETHERC receiver.

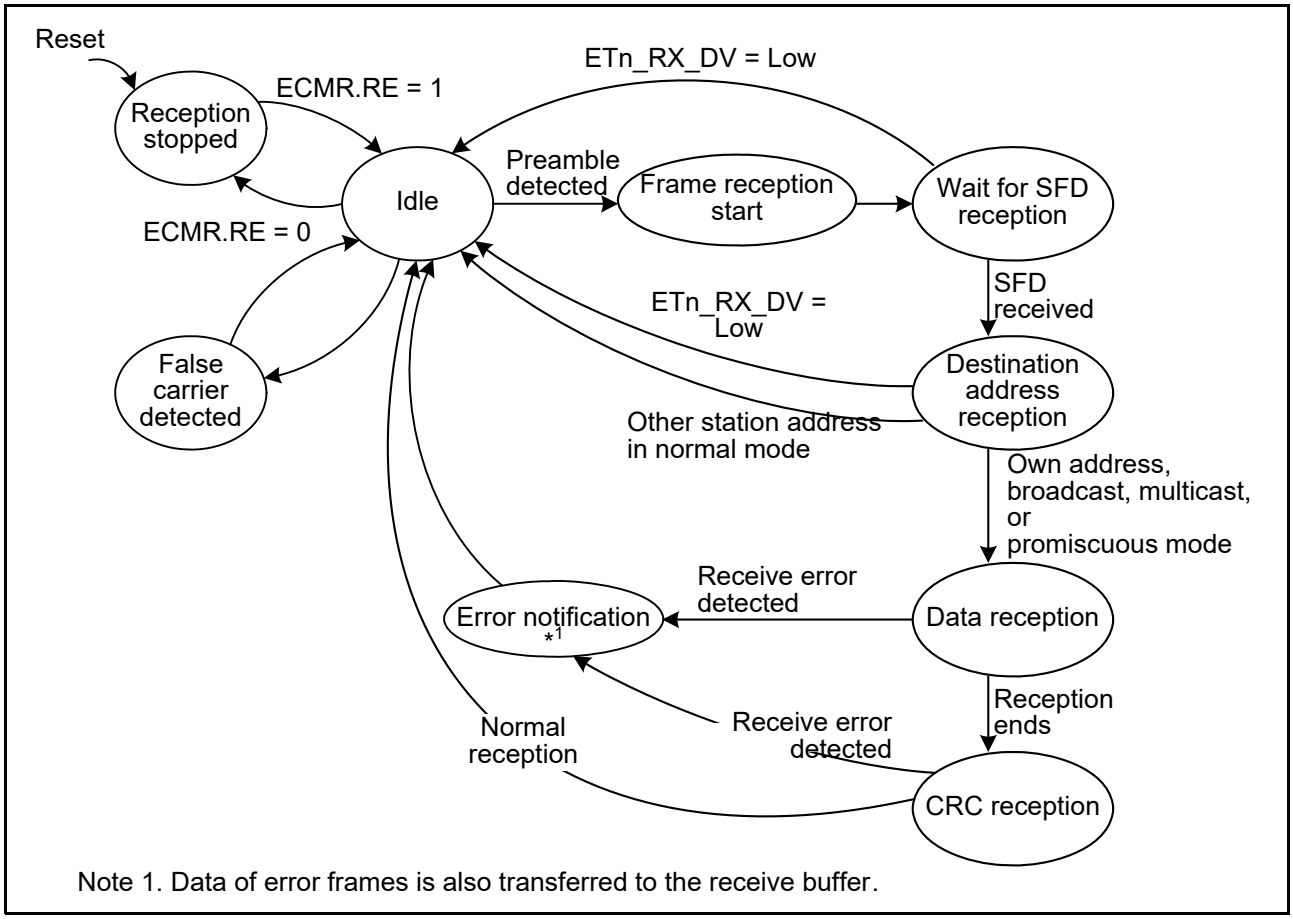


Figure 27.5 ETHERC Receiver State Transitions

1. When setting the ECMR.RE bit to 1, the ETHERC enters the receive idle state.
2. When the SFD following the preamble of the receive packet is detected, the ETHERC starts reception. If the received SFD is invalid, the ETHERC discards the frame.
3. In normal mode, the ETHERC starts data reception when the destination address of the receive frame is the address of the MCU or the receive frame is broadcast frame or multicast frame. In promiscuous mode, the ETHERC starts data reception regardless of the receive frame type.
4. After receiving data from the MII/RMII, the ETHERC performs the CRC check. The ETHERC notifies the EDMAC of the CRC check result. After the received data is transferred to the receive buffer, the CRC check result is written back to the receive descriptor as a status. The result is also reflected in the EDMACn.EESR.CERF flag.
5. When the ECMR.RE bit is 1 after one frame has been received, the ETHERC prepares to receive the next frame.

27.3.3 Frame Timing

27.3.3.1 MII Frame Timing

Figure 27.6 to Figure 27.11 show the MII frame timing.

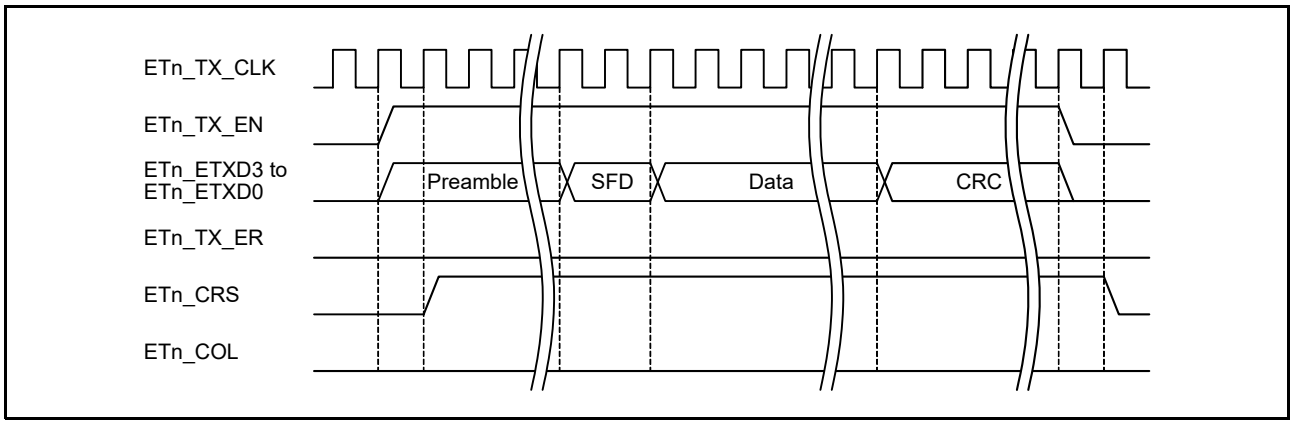

Figure 27.6 MII Frame Transmit Timing During Normal Transmission

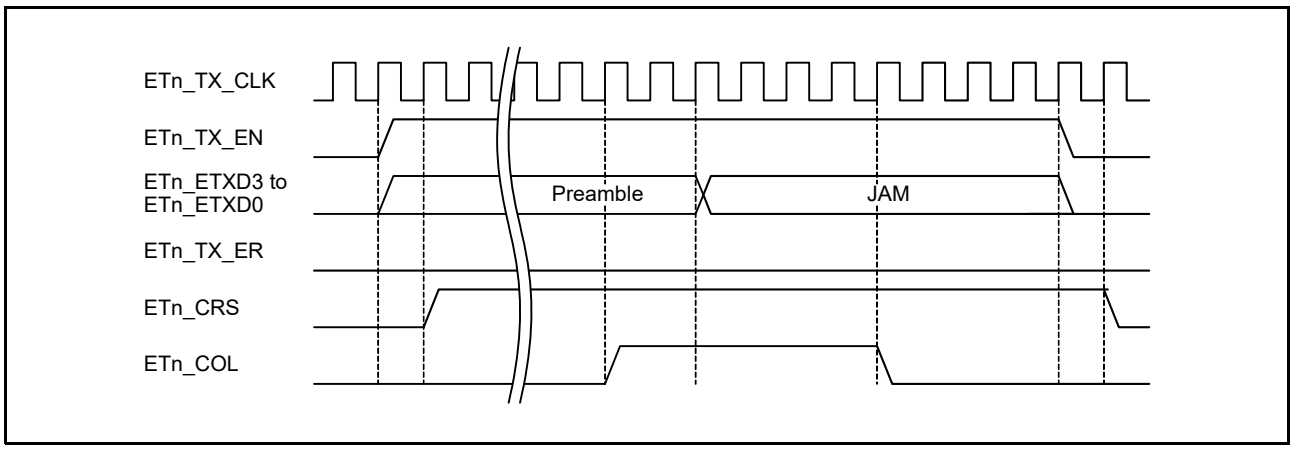

Figure 27.7 MII Frame Transmit Timing When Collision Occurs

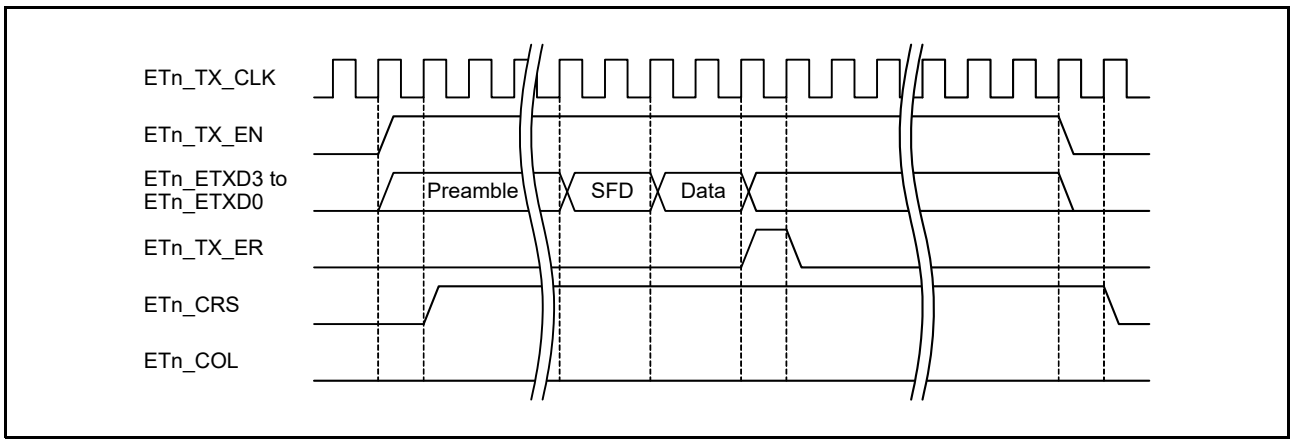

Figure 27.8 MII Frame Transmit Timing When Transmit Error Occurs

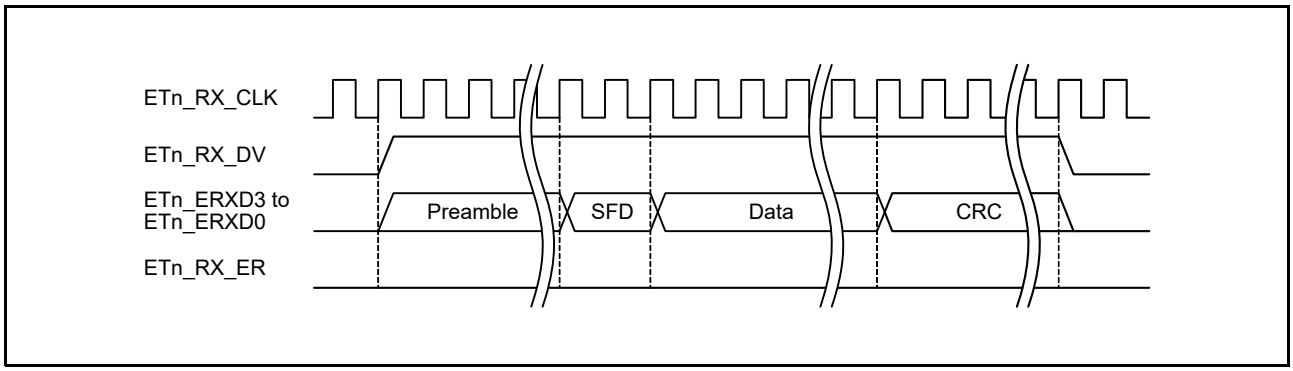

Figure 27.9 MII Frame Receive Timing During Normal Reception

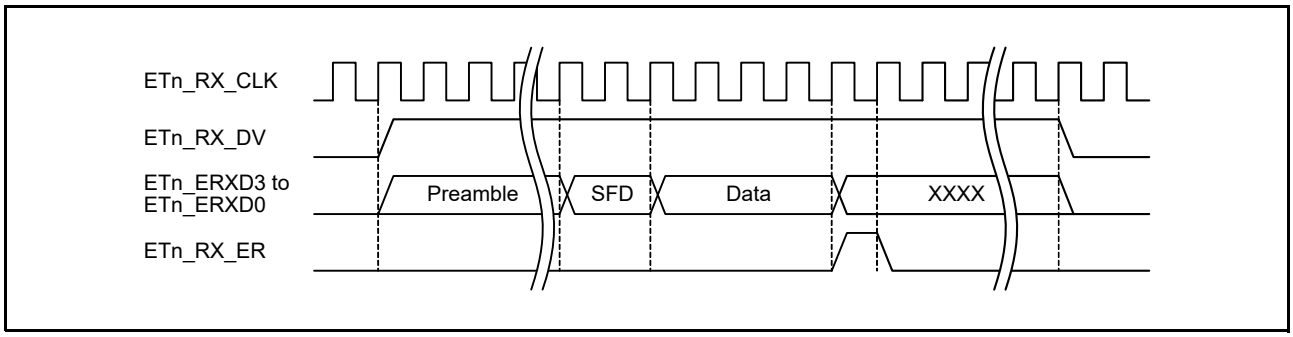

Figure 27.10 MII Frame Receive Timing for Receive Error Notification

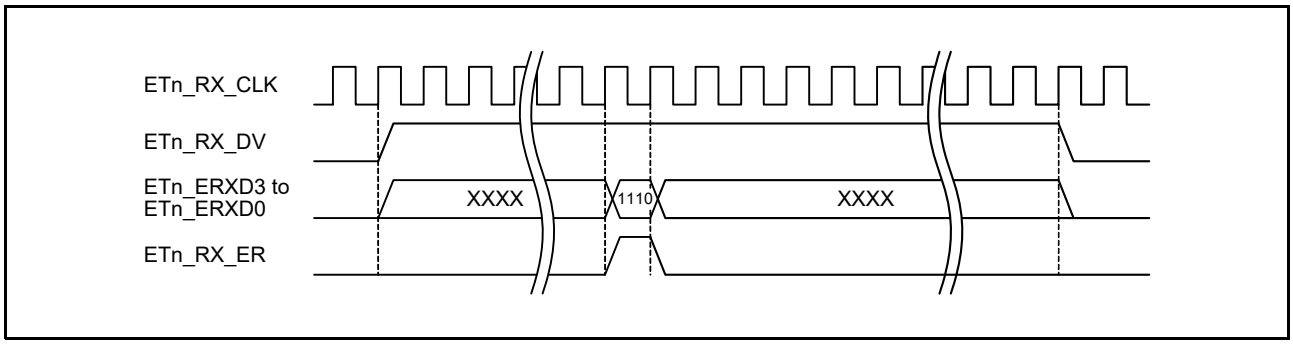

Figure 27.11 MII Fame Receive Timing for False Carrier Notification

27.3.3.2 RMII Frame Timing

The RMII frame timing is shown in Figure 27.12 to Figure 27.14.

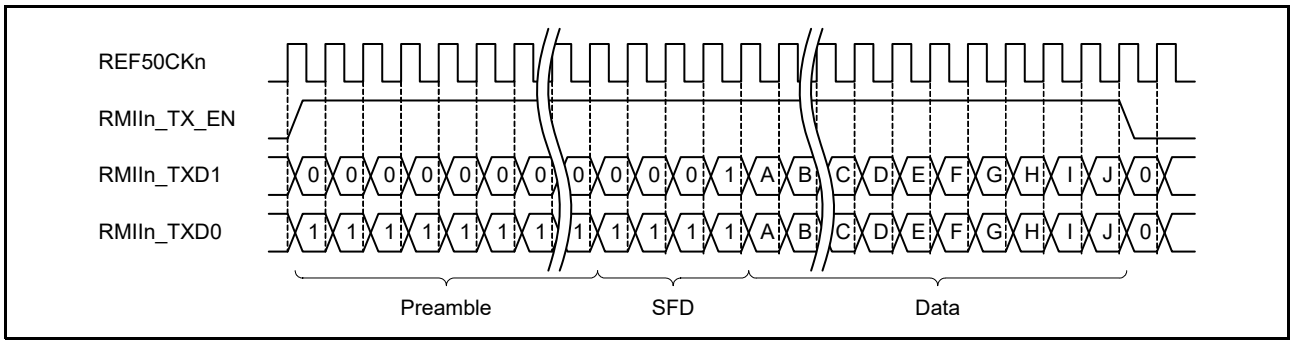

Figure 27.12 RMII Frame Transmit Timing During Normal Transmission

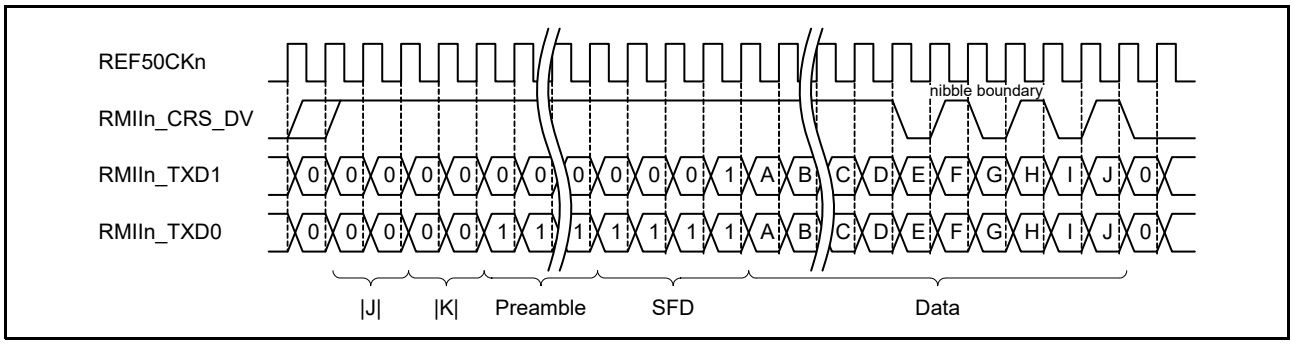

Figure 27.13 RMII Frame Receive Timing During Normal Reception

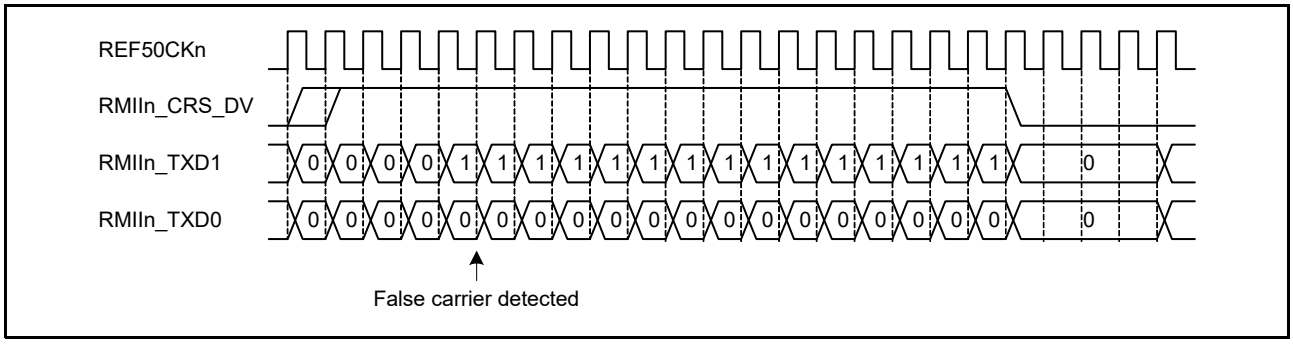

Figure 27.14 RMII Frame Receive Timing When False Carrier Is Detected

27.3.4 Accessing MII/RMII Registers

Use the PIR register to access the MII/RMII registers in the PHY-LSI. Serial data in the MII/RMII management frame format is transmitted and received via the ETn_MDC and ETn_MDIO pins controlled by software.

27.3.4.1 MII/RMII Management Frame Format

Table 27.4 lists the MII/RMII management frame format.

Table 27.4 MII/RMII Management Frame Format

Access Type	MII/RMII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	1
Read	1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write	1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

PRE (preamble): Send 32 consecutive 1's.

ST (start of frame): Send 01b.

OP (operation code): Send 10b for read or 01b for write.

PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits.
When the PHY-LSI address is 1, send 00001b.

REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI.
When the register address is 1, send 00001b.

TA (turnaround): 2-bit turnaround time to avoid contention between the register address and data during a read operation
(a) Send 10b during a write operation.
(b) Release the bus for 1 bit during a read operation (Z is output)
(indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle).

DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.

IDLE (IDLE condition): Wait time to input the next MII/RMII management format
(a) Release the bus during a write operation (Z is output).
(b) No control is required since a bus has already been released during a read operation.

27.3.4.2 MII/RMII Register Access Procedure

Access to the MII/RMII registers includes writing data in 1-bit units, reading data in 1-bit units, and releasing the bus. Figure 27.15 to Figure 27.18 show examples of the MII/RMII register access timing. The access timing differ with the PHY-LSI type.

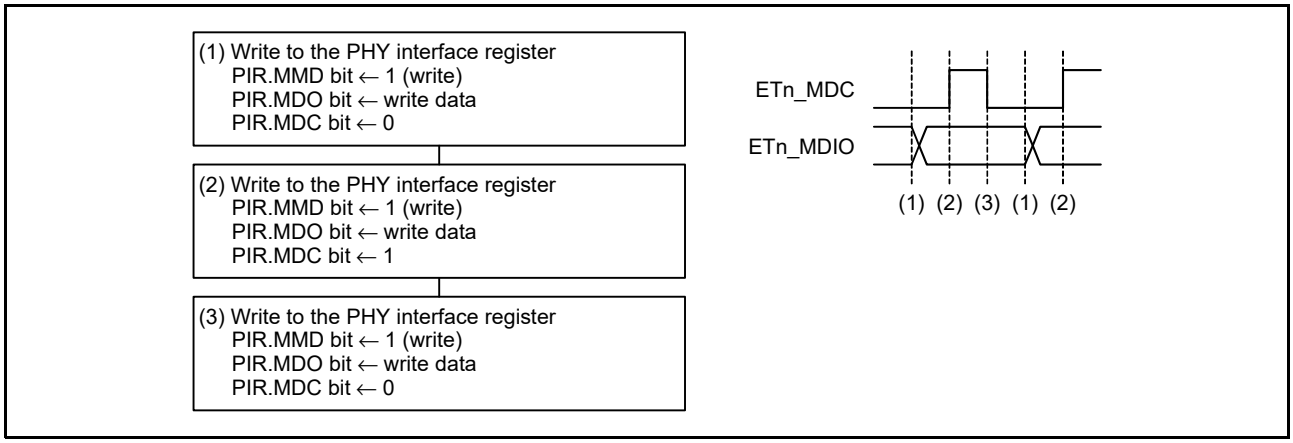

Figure 27.15 1-Bit Data Write Flow

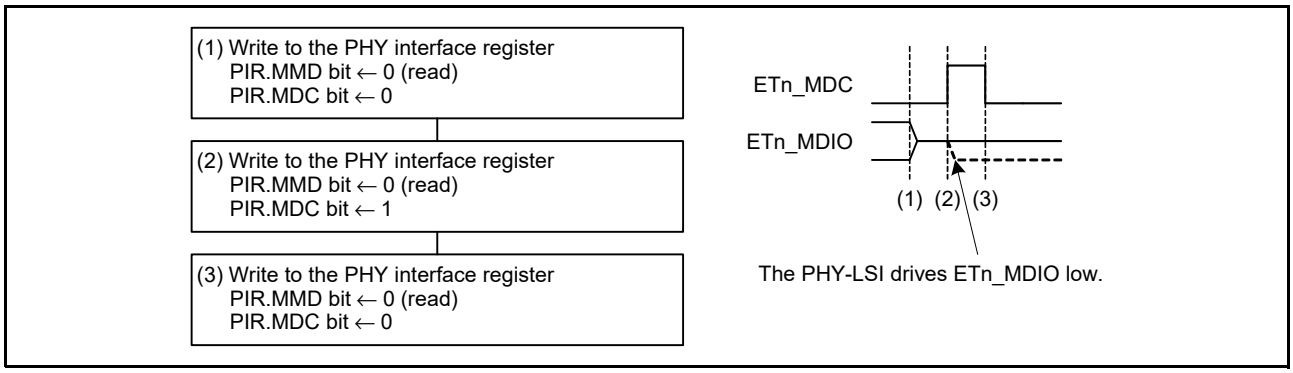

Figure 27.16 Bus Release Flow (TA in Read Operation in Table 1.3)

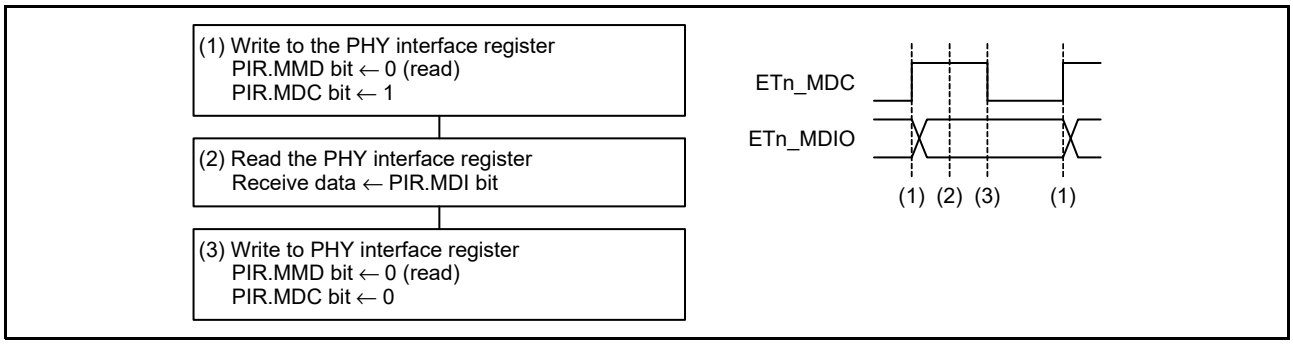

Figure 27.17 1-Bit Data Read Flow

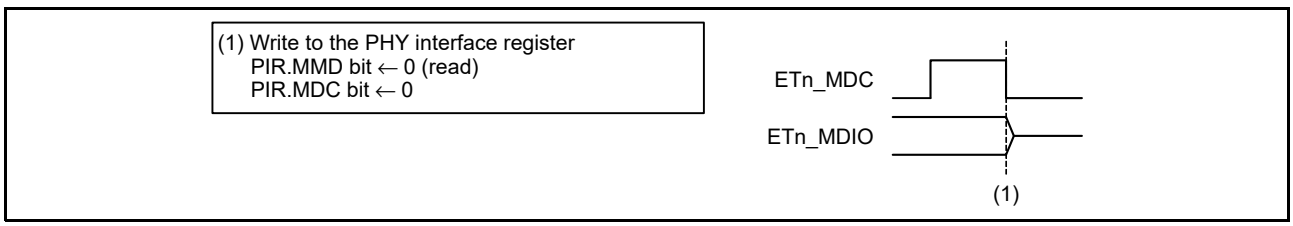

Figure 27.18 Bus Release Flow (IDLE in Write Operation in Table 1.3)

27.3.5 Magic Packet Detection

The ETHERC supports Wake-On-LAN (WOL). WOL is a function to detect a Magic Packet transmitted from a host device or other device and exit a low power consumption state such as sleep mode. When the ETHERC detects a Magic Packet, high is output from the ETn_WOL pin. Write 1 to the EDMACn.EDMR.SWR bit to set the ETn_WOL pin to low.

Since a Magic Packet is transmitted in broadcast mode, the Magic Packet is received regardless of the destination MAC address selected in the format. The ETHERC outputs high from the ETn_WOL pin only when the destination MAC address matches its own MAC address. Refer to the technical documentation provided by Advanced Micro Devices, Inc. for details on the Magic Packet. The following describes an example of the procedure to use WOL in the MCU.

1. Set the interrupt controller to disable the EINTn interrupt request.
2. Set the ECMR.MPDE bit to 1 to enable Magic Packet detection. Set the ECMR.RE bit to 1 to enable reception.
3. Set the ECSIPR.MPDIP bit to 1 to enable notification of the Magic Packet detect interrupt.
4. Set the EDMACn.EESIPR.ECIIP bit to 1 to enable the ETHERC status register source interrupt.
5. Set the interrupt controller to enable the EINTn interrupt request.
6. Change the CPU operating mode to sleep mode or place unused peripherals in the module stop state as needed.
7. When a Magic Packet is detected, an interrupt request is sent to the CPU. High is output from the ETn_WOL pin to notify peripheral devices that the Magic Packet has been detected.

27.3.5.1 Notes on Magic Packet Detection

The ETHERC receives packets, including broadcast packets, even when waiting to receive a Magic Packet. Therefore, receive data may have been stored in the receive FIFO of the EDMAC when a Magic Packet is detected. Also, flags in registers ECSR and EDMACn.EESR may have been changed. When returning to normal operation by detecting a Magic Packet, set the EDMACn.EDMR.SWR bit to 1 to reset the ETHERC and EDMAC.

27.3.6 Adjusting Transmission Efficiency by Changing the IPG

The IPG is a non-transmit period between transmit frames. The ETHERC can change the value of the IPG. Transmission efficiency can be increased or decreased by setting the IPGR register. The typical value of the IPG is specified by the IEEE802.3 standard. When changing the setting, confirm that all devices operate normally in the same network.

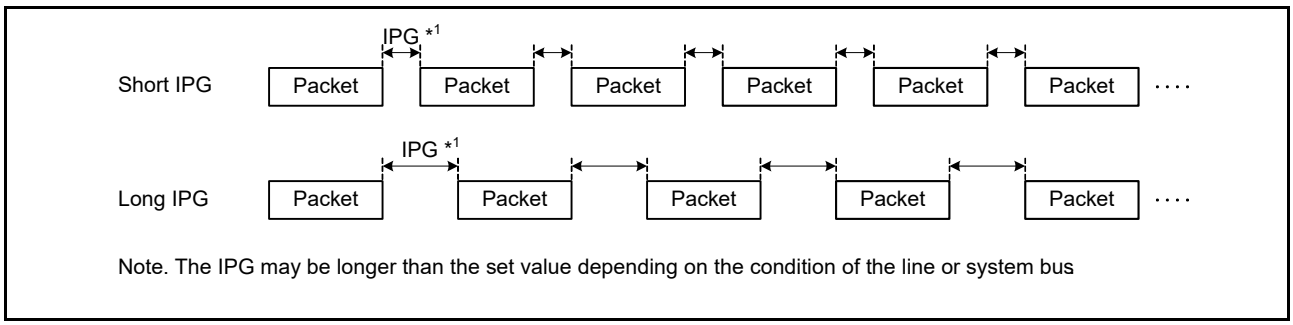

Figure 27.19 Differences in Transmission Efficiency Based on Changes in the IPG

27.3.7 Flow Control

The ETHERC can perform flow control compliant with IEEE802.3x in full-duplex mode, and the receiver and transmitter can be set individually. PAUSE frames can be transmitted automatically or manually.

27.3.7.1 Automatic PAUSE Frame Transmission

When the ECMR.TXF bit is set to 1, automatic PAUSE frame transmission is enabled. A PAUSE frame is automatically transmitted by a PAUSE frame transmit request from the EDMAC. The APR.AP[15:0] bit value is used for the pause_time parameter of the PAUSE frame.
After a PAUSE frame is transmitted, if the EDMAC is still requesting PAUSE frame transmission when the PAUSE time elapses, a PAUSE frame is transmitted again. The maximum number of PAUSE frame retransmissions can be set in the TPAUSER.TPAUSE[15:0] bits. If the maximum number of retransmissions is reached, subsequent PAUSE frames are not transmitted.
Figure 27.20 shows the procedure to set automatic PAUSE frame transmission.

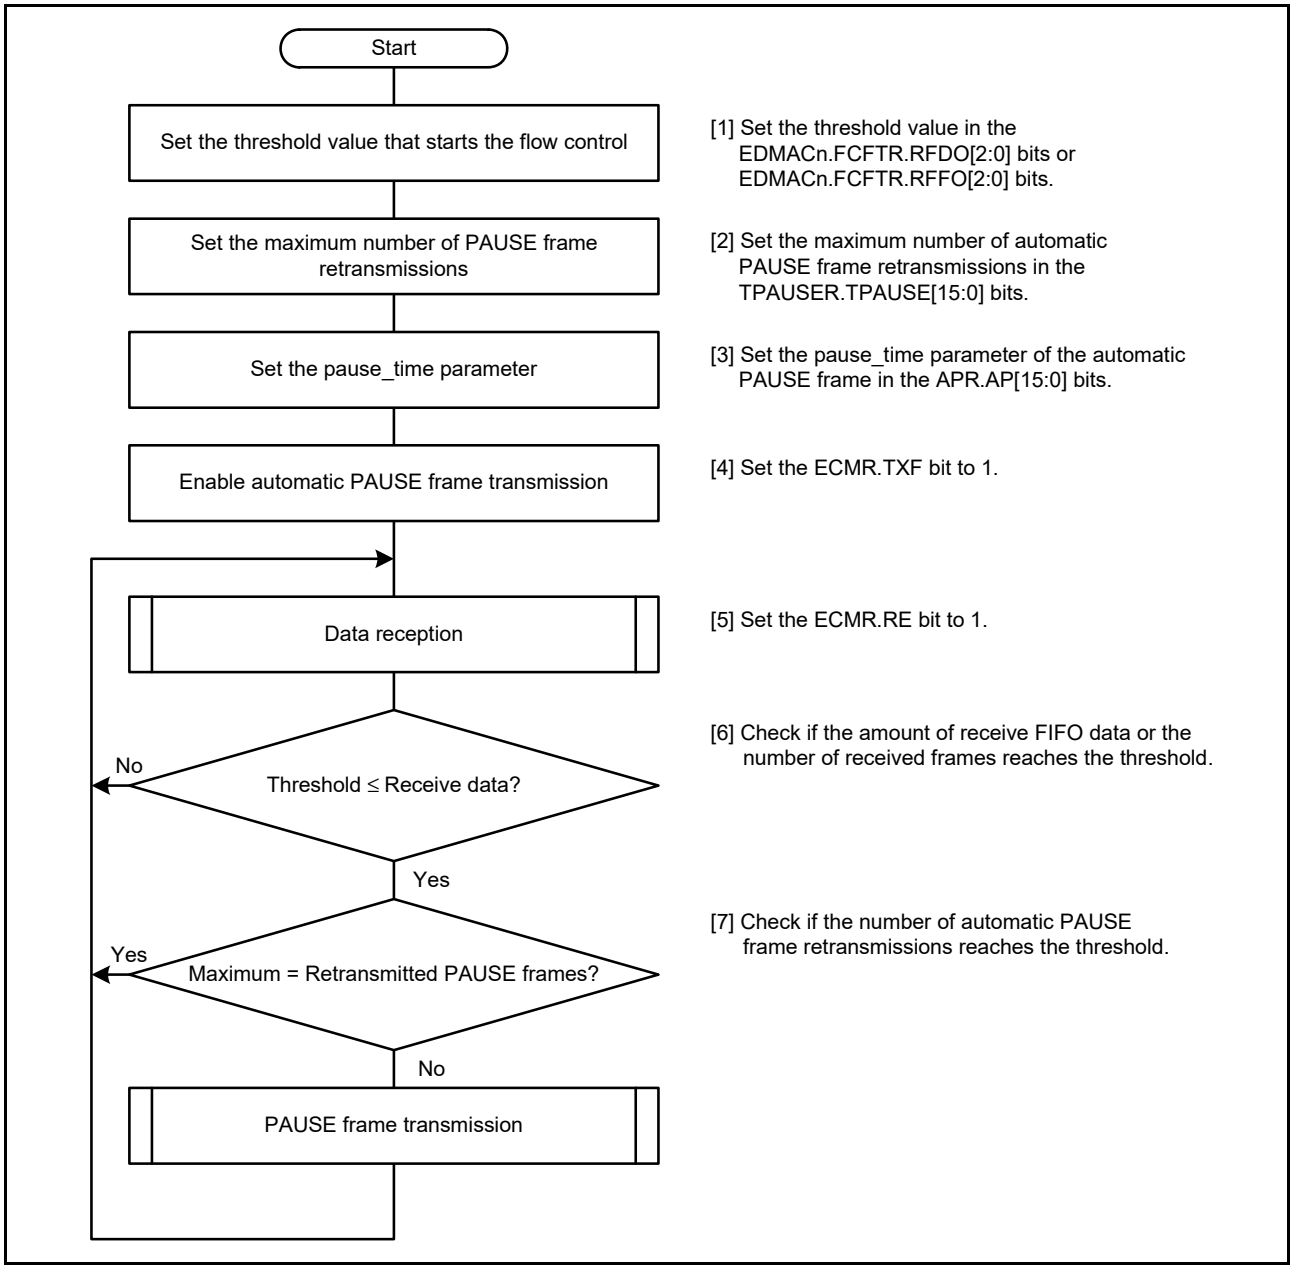

Figure 27.20 Example of Procedure to Set Automatic PAUSE Frame Transmission

27.3.7.2 Manual PAUSE Frame Transmission

A PAUSE frame can be manually transmitted at any time. When writing the pause_time parameter of the PAUSE frame to the MPR.MP[15:0] bits by software, the ETHERC transmits a PAUSE frame once. When transmitting a PAUSE frame more than once, write to the MPR.MP[15:0] bits for each transmission.

27.3.7.3 PAUSE Frame Reception

When setting the ECMR.RXF bit to 1, PAUSE frame detection is enabled. After a PAUSE frame is received, the ETHERC completes transmitting the current frame and waits for the PAUSE time of the received PAUSE frame to elapse before the next frame can be transmitted. Also, the ETHERC increments the RFCF.RPAUSE[7:0] bit value.
However, while waiting for the PAUSE time to elapse, if a PAUSE frame that contains a pause_time parameter of 0 is received and the ECMR.ZPF bit is 1, the ETHERC becomes ready to transmit.

27.4 Interrupts

When a flag in the ECSR register becomes 1 and the corresponding bit in the ECSIPR register is 1, the ETHERC notifies the EDMAC of the status as an interrupt source. After receiving the notification, the EDMAC sets the EDMACn.EESR.ECI flag to 1. When the EDMACn.EESIPR.ECIIP bit is 1, the EDMAC sends an EINTn interrupt request to the CPU. Refer to section 29, DMA Controller for the Ethernet Controller (EDMACa) for details.

27.5 Usage Notes

27.5.1 Conditions for the LCHNG Flag to Become 1

The ECSR.LCHNG flag may become 1 even when the input level of the ETn_LINKSTA pin remains the same. In this case, high is input to the ETn_LINKSTA pin when setting the GPIO.PmnPFS register to assign the ETn_LINKSTA signal to a port or when releasing the ETHERC and EDMAC software reset using the EDMACn.EDMR.SWR bit. The ECSR.LCHNG flag becomes 1 because the ETn_LINKSTA signal in the ETHERC is fixed low regardless of the input level to the external pin while the GPIO does not assign the ETn_LINKSTA signal or during the ETHERC and EDMAC software reset.
To avoid wrongly generating a link signal change interrupt, clear the ECSR.LCHNG flag and then set the ECSIPR.LCHNGIP bit to 1.

27.5.2 Input to the RMIIn_RX_ER Pin While the RMII is Selected

When the width of a reception error signal received from the PHY-LSI is only one cycle of the REF50CKn clock (50 MHz) while the RMII is selected, the signal is not recognized as an error signal.

27.5.3 Handling when Control Information Included a Mismatch

When the setting of the BYPASS.BYPASSn bit of the EPTPC is 0, the SYSR.INFABT flag of the EPTPCn might be set to 1 on reception of an alignment error or a frame error. In such cases, reset the EPTPC, PTPEDMAC, and respective channel of the ETHERC and EDMAC. For the procedure of resetting, see section 27, Procedure of Resetting the Ethernet Controller.

27.5.4 Points to Note when the EPTPC Is not in Use

When the EPTPC is not to be used, set the BYPASS0 and BYPASS1 bits in the BYPASS register of the EPTPC to 1.

27.5.5 Procedure of Resetting the Ethernet Controller

Follow the steps below to reset the ETHERC, EPTPC, and EDMAC.

(a) When the EPTPC is not in use:

(1) Write 0000 0001h to the EDMR register in the respective channel of the EDMAC (resetting the ETHERCn and EDMACn).
(2) Wait for 64 cycles of Bφ until initialization is completed.

(b) When the EPTPC is in use:

(1) Write 0000 0001h to the PTRSTR register of the EPTPC (resetting the EPTPC).
(2) Write 0000 0001h to the EDMR register of the PTPEDMAC (resetting the PTPEDMAC).
(3) Write 0000 0001h to the EDMR register of the respective channel of EDMAC (resetting the ETHERCn and EDMACn).
(4) Wait for 64 cycles of Bφ until initialization is completed.
(5) Write 0000 0000h to the PTRSTR register of the EPTPC (releasing the EPTPC from the reset state).
(6) Wait for 256 cycles of Bφ until the EPTPC is released from the reset state.

28. PTP Module for the Ethernet Controller (EPTPCa)

28.1 Overview

This MCU has an on-chip Precision Time Protocol (PTP) module for the Ethernet controller (EPTPC). The module applies the PTP defined in version 2 of the IEEE 1588-2008 standard to handle timing and synchronization between devices. The EPTPC is composed of synchronization frame processing units (SYNFP0 and SYNFP1), a packet relation controller unit (PRC-TC), and a statistical time correction algorithm unit (STCA).
Use the EPTPC in combination with the on-chip Ethernet controller (ETHERC) and the DMA controller for the PTP Ethernet controller (PTPEDMAC).
Table 28.1 lists the EPTPC specifications, and Figure 28.1 shows the EPTPC configuration.

Table 28.1 EPTPC Specifications

Item	Description
Protocol	Compliant with the Precision Time Protocol (PTP) defined in IEEE 1588
Synchronization frame processing units (SYNFP0 and SYNFP1)	• Transmits and receives PTP messages as a master or slave. • The following four clock devices are supported: Ordinary clock (OC) Boundary clock (BC) End-to-end transparent clock (E2E TC) Peer-to-peer transparent clock (P2P TC) • Calculates the meanPathDelay and offsetFromMaster values defined in IEEE 1588. • Capable of generating a master clock. • Hardware filtering of received multicast packets with a MAC address • Capable of hardware filtering in accord with the type of PTP message • Supports PTP message frames in layer 4 (IPv4 and UDP) and layer 2 (Ethernet frames). • Can be used as a normal Ethernet port when time synchronization is not in use.
Packet relation controller unit (PRC-TC)	• Relaying of received data between Ethernet ports 0 and 1 • Setting the same MAC address for Ethernet ports 0 and 1 allows transmission of data from the two ports or from only one of them. • Store-and-forward method or cut-through method selectable for the relaying of packets
Statistical time correction algorithm unit (STCA)	• Frequency of the clock signal supplied to the statistical time correction algorithm unit is selectable as 20, 25, or 50 MHz. The clock source can be selected from the external clock ETn_SCLKIN (20, 25, or 50 MHz), REF50CKn (50 MHz), or ETn_RX_CLK (25 MHz). Note: When ETn_RX_CLK is selected, ETn_RX_CLK must be fixed to 25 MHz (100 Mbps). • In slave operation, the synchronized state can be indicated from the offsetFromMaster value staying below a previously specified threshold. Additionally, the threshold can be calculated statistically from collected positive and negative gradient values (worst-10 acquisition). • The local clock counter holds corrected time information obtained from a master clock. • The STCA clock can be used as the clock source for generating pulse signals from pulse output timer m (m = 0 to 5).
Interrupt sources	MINT interrupt • Requested when the state of the individual modules is changed. • Requested on rising edges of the pulse signal generated by the pulse output timer. IPLS interrupt • Requested on rising or falling edges of the pulse signal generated by the previously selected pulse output timer group. • Can be requested on every edge or only once.

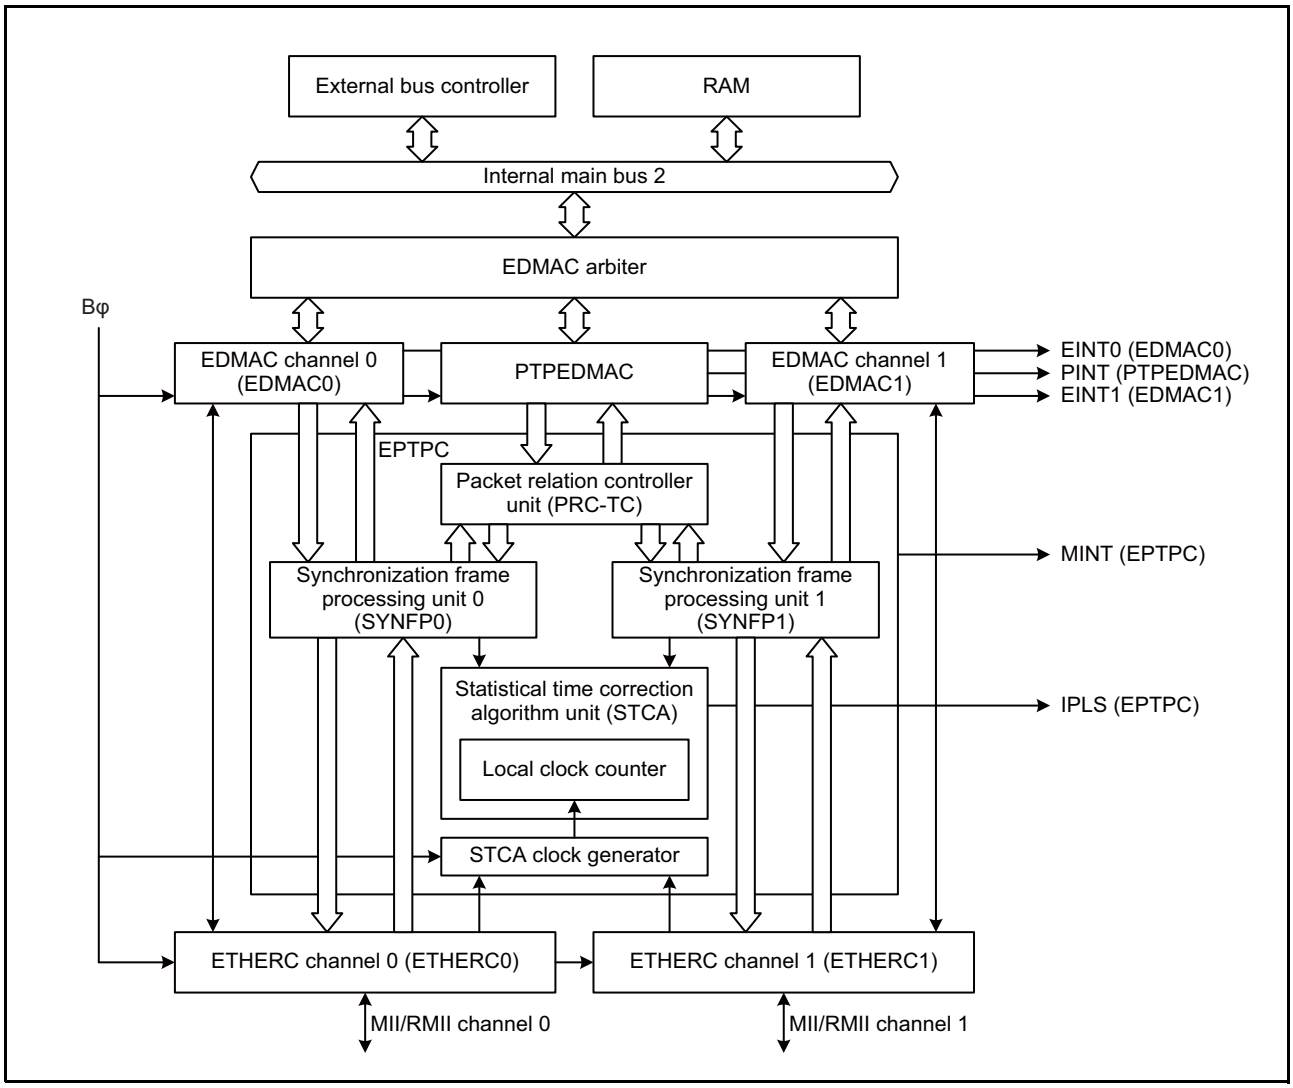

Figure 28.1 EPTPC Configuration

In this section, channels may not be mentioned in overall descriptions of modules that have multiple channels. Examples of the notation are listed in Table 28.2.

Table 28.2 Examples of the Notation

Module Name	Channel	Meaning
SYNFPn module	n = 0, 1	Synchronization processing units 0 and 1 (SYNFP0 and SYNFP1)
Pulse output timer m	m = 0 to 5	Pulse output timer channels 0 to 5

28.1.1 Combination of Clock Device and Ethernet Port

The EPTPC supports operation as three types of clock device: an ordinary clock (OC), boundary clock (BC), or transparent clock (TC). Furthermore, it supports both end-to-end (E2E) and peer-to-peer (P2P) operation for all three clock devices.
Available combinations for usage of Ethernet ports 0 and 1 are listed in Table 28.3.

Table 28.3 Combination of Clock Device and Ethernet Port

Clock Device	Ethernet Port 0		Ethernet Port 1	
EPTPC control disabled	PTP packets are not handled.			
Only Ethernet port 0 is used for handling PTP packets Ordinary Clock (OC)	Master	End-to-end (E2E)	PTP packets are not handled.	
		Peer-to-peer (P2P)		
	Slave	E2E		
		P2P		
Only Ethernet port 1 is used for handling PTP packets (OC)	PTP packets are not handled.		Master	E2E
				P2P
			Slave	E2E
				P2P
Boundary clock (BC)	Master	E2E	Master	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
	Master	E2E	Slave	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
	Slave	E2E	Master	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
Transparent clock (TC)	E2E TC			
	P2P TC			

28.1.2 Frame Format of PTP Messages

The frame format of PTP messages can be selected from the four/two types by setting the FORM0 and FORM1 bits in the SYNFP frame format setting register (SYFORMR).
Figure 28.2 shows the PTP message formats for transmission and reception by the EPTPC.

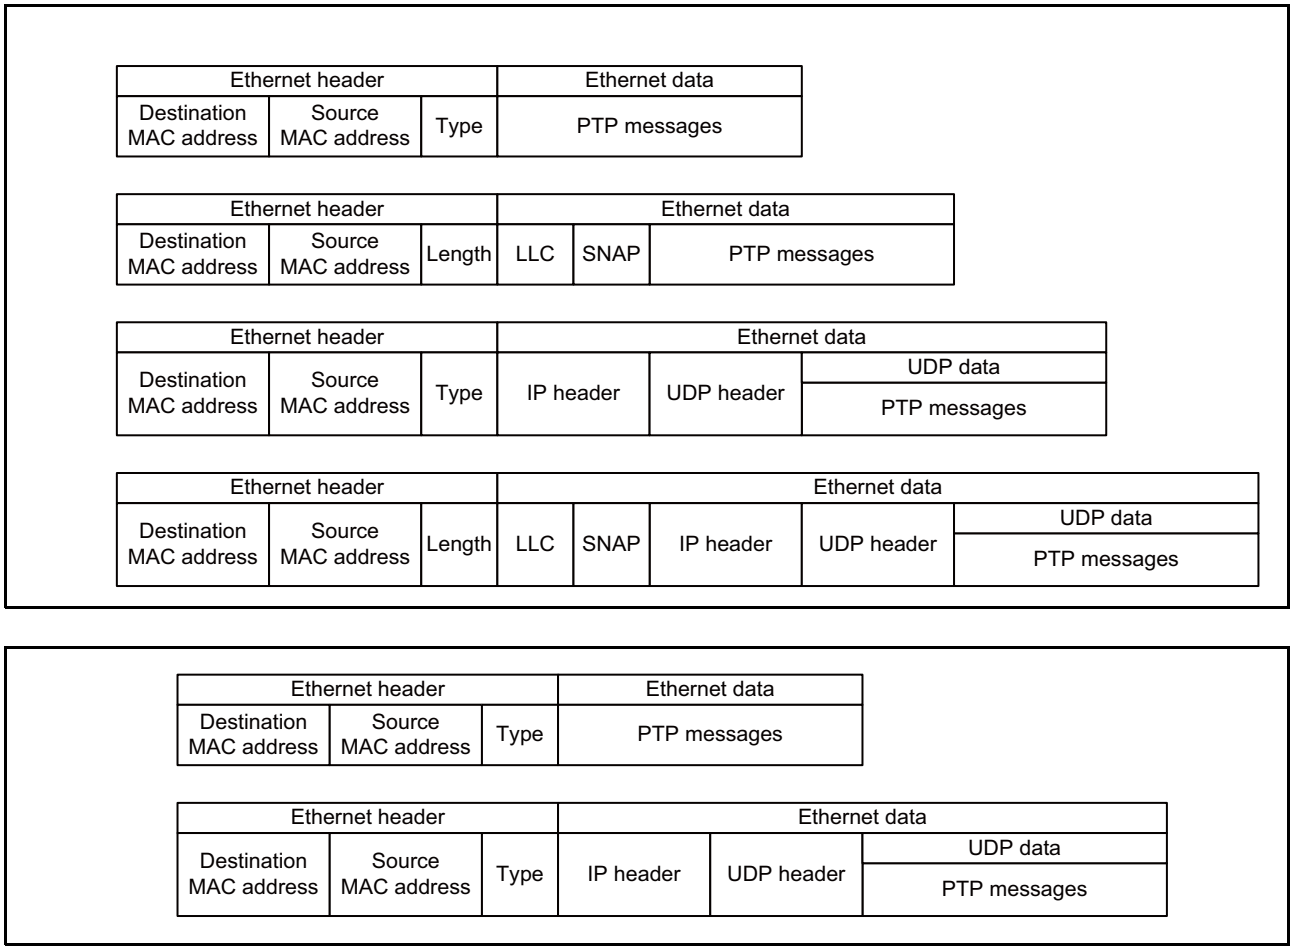

Figure 28.2 Frame Format of PTP Messages

The EPTPC sends PTP messages. The MAC and IP addresses that indicate the destination of each PTP message should usually be multicast addresses defined by IEEE 1588 in accord with the type of the PTP message.
The port number, which must be specified when a PTP message is encapsulated for use with the UDP, is also defined by IEEE 1588 and should be selected in accord with the type of the PTP message.
Table 28.4 lists the types of PTP messages and values that need to be specified for respective Ethernet frame formats.

Table 28.4 Type of PTP Message for Multicast and Information to Specify the Ethernet Frame Format

Type of PTP Message			IEEE802.3 Frame Format (SYFORMR.FORM0 Bit = 1)		Ethernet II Frame Format (SYFORMR.FORM0 Bit = 0)		UDP Port No.*1
			MAC Address	IP Address	MAC Address	Ethertype	
PTP-primary	Event messages	Sync	01-00-5E-00-01-81	224.0.1.129	01-1B-19-00-00-00	88F7h	319
		Delay_Req					
PTP-pdelay		Pdelay_Req	01-00-5E-00-00-6B	224.0.0.107	01-80-C2-00-00-0E		
		Pdelay_Resp					
	General messages	Pdelay_Resp_Follow_Up					320
PTP-primary		Announce	01-00-5E-00-01-81	224.0.1.129	01-1B-19-00-00-00		
		Follow_Up					
		Delay_Resp					
		Signaling					
		Management					

Note 1. The port number must be specified only when a PTP message is encapsulated for use with the UDP (i.e. the SYFORMR.FORM1 bit = 1).

28.1.3 Type of PTP Message and Details of Processing

Table 28.5 and Table 28.6 respectively give details of processing by the EPTPC for receiving and transmitting PTP messages.

Table 28.5 List of PTP Messages for Reception by the EPTPC

Message Type	Message	Details of Processing
Event	Sync	Calculates the value of offsetFromMaster if twoStepFlag in flagField is FALSE.
	Delay_Req	Responds to Delay_Resp.
	Pdelay_Req	Responds to Pdelay_Resp.
	Pdelay_Resp	Calculates the value of meanPathDelay if twoStepFlag in flagField is FALSE.
General	Announce	—
	Follow_Up	Calculates the value of offsetFromMaster if twoStepFlag in flagField of the most recently received Sync message was TRUE and the value of meanPathDelay is fixed.
	Delay_Resp	Calculates the value of meanPathDelay.
	Pdelay_Resp_Follow_Up	Calculates the value of meanPathDelay if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE.
	Management	—
	Signaling	—

Table 28.6 List of PTP Messages for Transmission by the EPTPC

Message Type	Message	Details of Processing
Event	Sync	Sync messages are transmitted at the fixed interval specified by the SYTLIR.SYNC[7:0] bits.
	Delay_Req	Transmission proceeds with an interval from 0 to twice the interval set by the value of the SYTLIR.DREQ[7:0] bits and determined by a random number.
	Pdelay_Req	Pdelay_Req messages are transmitted at the fixed interval specified by the SYTLIR.DREQ[7:0] bits.
	Pdelay_Resp	Transmission of responses to Pdelay_Req.
General	Announce	Announce messages are transmitted at the fixed interval specified by the SYTLIR.ANCE[7:0] bits.
	Follow_Up	—
	Delay_Resp	Transmission of responses to Delay_Req
	Pdelay_Resp_Follow_Up	—
	Management	—
	Signaling	—

28.2 Register Descriptions

Table 28.7 shows the register configuration.

Table 28.7 Register Configuration

Module	Register Name	Abbreviation	Address	Access size
EPTPC	PTP reset register	PTRSTR	E820 4500h	32
	STCA clock select register	STCSELR	E820 4504h	32
	1588 module bypass register	BYPASS	E820 4508h	32
	MINT interrupt source status register	MIESR	E820 5000h	32
	MINT interrupt request enable register	MIEIPR	E820 5004h	32
	IPLS interrupt request enable register	ELIPPR	E820 5010h	32
	IPLS interrupt enable automatic clearing register	ELIPACR	E820 5014h	32
	STCA status register	STSR	E820 5040h	32
	STCA status notification enable register	STIPR	E820 5044h	32
	STCA clock frequency setting register	STCFR	E820 5050h	32
	STCA operating mode register	STMR	E820 5054h	32
	Sync message reception timeout register	SYNTOR	E820 5058h	32
	IPLS interrupt request timer select register	IPTSELR	E820 5060h	32
	MINT interrupt request timer select register	MITSELR	E820 5064h	32
	Time synchronization channel select register	STCHSELR	E820 506Ch	32
	Slave time synchronization start register	SYNSTARTR	E820 5080h	32
	Local clock counter initial value load directive register	LCIVLDR	E820 5084h	32

28.2.1 MINT Interrupt Source Status Register (MIESR)

Address: EPTPC.MIESR E820 5000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	CYC5	CYC4	CYC3	CYC2	CYC1	CYC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	PRC	SY1	SY0	ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ST	STCA Status Flag	0: No change in the state of the STCA module 1: A change in the state of the STCA module	R
b1	SY0	SYNFP0 Status Flag	0: No change in the state of the SYNFP0 module 1: A change in the state of the SYNFP0 module	R
b2	SY1	SYNFP1 Status Flag	0: No change in the state of the SYNFP1 module 1: A change in the state of the SYNFP1 module	R
b3	PRC	PRC-TC Status Flag	0: No change in the state of the PRC-TC module 1: A change in the state of the PRC-TC module	R
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	CYC0	Pulse Output Timer 0 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 0 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 0 is detected.	R/W*1
b17	CYC1	Pulse Output Timer 1 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 1 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 1 is detected.	R/W*1
b18	CYC2	Pulse Output Timer 2 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 2 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 2 is detected.	R/W*1
b19	CYC3	Pulse Output Timer 3 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 3 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 3 is detected.	R/W*1
b20	CYC4	Pulse Output Timer 4 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 4 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 4 is detected.	R/W*1
b21	CYC5	Pulse Output Timer 5 Rising Edge Detection Flag	0: A rising edge in the periodic pulse signal from pulse output timer 5 is not detected. 1: A rising edge in the periodic pulse signal from pulse output timer 5 is detected.	R/W*1
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The MIESR register indicates changes in the states of the STCA, SYNFPn, and PRC-TC modules which act as sources of MINT interrupts and the detection of rising edges of pulse output timers m.
For the MINT interrupt, see section 28.4, Interrupts.

28.2.2 MINT Interrupt Request Enable Register (MIEIPR)

Address: EPTPC.MIEIPR E820 5004h

Bit	Symbol	Bit Name	Description	R/W
b0	ST	STCA Status Interrupt Request Enable	0: Disables the generation of MINT interrupt requests by the STCA status flag. 1: Enables the generation of MINT interrupt requests by the STCA status flag.	R/W
b1	SY0	SYNFP0 Status Interrupt Request Enable	0: Disables the generation of MINT interrupt requests by the SYNFP0 status flag. 1: Enables the generation of MINT interrupt requests by the SYNFP0 status flag.	R/W
b2	SY1	SYNFP1 Status Interrupt Request Enable	0: Disables the generation of MINT interrupt requests by the SYNFP1 status flag. 1: Enables the generation of MINT interrupt requests by the SYNFP1 status flag.	R/W
b3	PR	PRC-TC Status Interrupt Request Enable	0: Disables the generation of MINT interrupt requests by the PRC-TC status flag. 1: Enables the generation of MINT interrupt requests by the PRC-TC status flag.	R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	CYC0	Pulse Output Timer 0 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 0. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 0.	R/W
b17	CYC1	Pulse Output Timer 1 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 1. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 1.	R/W
b18	CYC2	Pulse Output Timer 2 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 2. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 2.	R/W
b19	CYC3	Pulse Output Timer 3 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 3. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 3.	R/W
b20	CYC4	Pulse Output Timer 4 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 4. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 4.	R/W
b21	CYC5	Pulse Output Timer 5 Rising Edge Detection Interrupt Request Enable	0: Disables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 5. 1: Enables the generation of MINT interrupt requests in response to detection of a rising edge of pulse output timer 5.	R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R

The MIEIPR register is used to enable or disable the generation of MINT interrupt requests when MINT interrupt source conditions are satisfied.

28.2.3 IPLS Interrupt Request Enable Register (ELIPPR)

Address: EPTPC.ELIPPR E820 5010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	1	1	1	1	1	1	0	0	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are always read as 1 The write value should always be 1.	R
b7, b6	—	Reserved	These bits are always read as 0. The write value should always be 0.	R
b13 to b8	—	Reserved	These bits are always read as 1 The write value should always be 1.	R
b15, b14	—	Reserved	These bits are always read as 0. The write value should always be 0.	R
b16	PLSP	Pulse Output Timer Rising Edge Detection IPLS Interrupt Request Enable	0: Disables IPLS interrupt requests due to rising edges of signals from the selected pulse output timer. 1: Enables IPLS interrupt requests due to rising edges of signals from the selected pulse output timer.	R/W
b23 to b17	—	Reserved	These bits are always read as 0. The write value should always be 0.	R
b24	PLSN	Pulse Output Timer Falling Edge Detection IPLS Interrupt Request Enable	0: Disables IPLS interrupt requests due to falling edges of signals from the selected pulse output timer. 1: Enables IPLS interrupt requests due to falling edges of signals from the selected pulse output timer.	R/W
b31 to b25	—	Reserved	These bits are always read as 0. The write value should always be 0.	R

The register also enables and disables IPLS interrupts due to rising or falling edges of signals from the pulse output timer selected in the IPTSELR register.

The ELIPACR register can be used to set up the one-time-only output of IPLS interrupt requests.

For the IPLS interrupt, see section 28.4, Interrupts.

28.2.4 IPLS Interrupt Enable Automatic Clearing Register (ELIPACR)

Address: EPTPC.ELIPACR E820 5014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	PLSN	—	—	—	—	—	—	—	PLSP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are always read as 0. The write value should always be 0.	R
b16	PLSP	ELIPPR.PLSP Bit Automatic Clearing	0: Disables automatic clearing of the enable bit for IPLS interrupt requests in response to detection of rising edges of the pulse output timer. 1: Enables automatic clearing of the enable bit for IPLS interrupt requests in response to detection of rising edges of the pulse output timer.	R/W
b23 to b17	—	Reserved	These bits are always read as 0. The write value should always be 0.	R
b24	PLSN	ELIPPR.PLSN Bit Automatic Clearing	0: Disables automatic clearing of the enable bit for IPLS interrupt requests in response to detection of falling edges of the pulse output timer. 1: Enables automatic clearing of the enable bit for IPLS interrupt requests in response to detection of falling edges of the pulse output timer.	R/W
b31 to b25	—	Reserved	These bits are always read as 0. The write value should always be 0.	R

The ELIPACR register is used to enable one-time output of an IPLS interrupt request triggered by detecting edges of the periodic pulses of pulse output timer m.
Normally, an IPLS interrupt request is generated at each edge of the periodic pulses of pulse output timer m while the corresponding bit in the ELIPPR register is 1 (enabled).
When a bit in the ELIPPR register is 1 while the corresponding bit in the ELIPACR register is also 1, the bit in the ELIPPR register automatically becomes 0 when an IPLS interrupt request is generated.
For the IPLS interrupt, see section 28.4, Interrupts.

28.2.5 STCA Status Register (STSR)

Address: EPTPC.STSR E820 5040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	W10D	SYNTOUT	—	SYNCOUT	SYNC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYNC	Synchronized State Detection Flag	0: Synchronization is not detected. 1: Synchronization is detected.	R/W*1
b1	SYNCOUT	Synchronization Loss Detection Flag	0: A loss of synchronization is not detected. 1: A loss of synchronization is detected.	R/W*1
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R
b3	SYNTOUT	Sync Message Reception Timeout Detection Flag	0: A Sync message reception timeout is not detected. 1: A Sync message reception timeout is detected.	R/W*1
b4	W10D	Worst 10 Acquisition Completion Flag	0: The worst 10 values have not been acquired yet. 1: The worst 10 values have been acquired.	R/W*1
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: When the SYNSTARTR.STR bit is 0, the value of the corresponding flag remains.
Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The STSR register indicates the state of the STCA module.

SYNC Flag (Synchronized State Detection Flag)

This flag indicates that synchronization has occurred at least the same as the number of times specified by the STMR.SYTH[3:0] bits in succession when the STMR.ALEN0 bit is 1. When the STMR.ALEN0 bit is 0, the SYNC flag is not set to 1 even if synchronization has occurred more than the specified number of times in succession.

SYNCOUT Flag (Synchronization Loss Detection Flag)

This flag indicates that loss of synchronization has occurred at least the same as the number of times specified by the STMR.DVTH[3:0] bits in succession when the STMR.ALEN0 bit is 1.
Since the time is not synchronized immediately after time synchronization is started (SYNSTARTR.STR bit is set to 1), the SYNCOUT becomes 1 regardless of the STMR.ALEN0 bit setting. When using the SYNTOUT flag, set the SYNTOUT flag to 0 immediately after starting time synchronization.
When the STMR.ALEN0 bit is 0, the SYNCOUT flag does not become 1 even if loss of synchronization has occurred at least the same as the specified number of times in succession after time synchronization is started and the SYNTOUT flag is immediately set to 0.

SYNTOUT Flag (Sync Message Reception Timeout Detection Flag)

This flag indicates that a Sync message has not been received during the period specified by the SYNTOR register when the STMR.ALEN1 bit is 1. The SYNTOUT flag becomes 1 immediately if time synchronization is started (SYNSTARTR.STR bit is set to 1) when no Sync message has been received after the EPTPC starts. When using the SYNTOUT flag, set the SYNTOUT flag to 0 immediately after starting time synchronization.

W10D Flag (Worst 10 Acquisition Completion Flag)

This flag indicates that acquisition of the worst 10 has been completed.

28.2.6 STCA Status Notification Enable Register (STIPR)

Address: EPTPC.STIPR E820 5044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	W10D	SYNTOUT	—	SYNCOUT	SYNC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYNC	SYNC Status Notification Enable	0: Disables notification of the state of STSR.SYNC. 1: Enables notification of the state of STSR.SYNC.	R/W
b1	SYNCOUT	SYNCOUT Status Notification Enable	0: Disables notification of the state of STSR.SYNCOUT. 1: Enables notification of the state of STSR.SYNCOUT.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R
b3	SYNTOUT	SYNTOUT Status Notification Enable	0: Disables notification of the state of STSR.SYNTOUT. 1: Enables notification of the state of STSR.SYNTOUT.	R/W
b4	W10D	W10D Status Notification Enable	0: Disables notification of the state of STSR.W10D. 1: Enables notification of the state of STSR.W10D.	R/W
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R

The STIPR register specifies whether the MIESR.ST flag does or does not reflect changes in the state of the STCA module.

28.2.7 STCA Clock Frequency Setting Register (STCFR)

Address: EPTPC.STCFR E820 5050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCF[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	STCF[1:0]	STCA Clock Frequency	b1 b0 0 0: 20 MHz 0 1: 25 MHz 1 0: 50 MHz 1 1: Setting prohibited	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: Set a value in this register before starting the EDMAC, ETHERC, and PTPEDMAC. Do not change the settings during operations.

The STCFR register is used to select the frequency of the clock source for the STCA module (STCA clock).
The setting in the STCFR register must be for the same frequency as that selected by the setting of the STCSELR register.

STCF[1:0] Bits (STCA Clock Frequency)

These bits select the frequency of the STCA clock.
To enable synchronous control in compliance with IEEE 1588, the STCA clock frequency must be selected from 20 MHz, 25 MHz, or 50 MHz. If the frequency selected by these bits differs from the clock frequency actually input to the STCA module, operation is not guaranteed.

28.2.8 STCA Operating Mode Register (STMR)

Address(es): EPTPC.STMR E820 5054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	ALEN1	ALEN1	—	—	—	—	DVTH[3:0]				SYTH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	W10S	—	CMOD	—	—	—	—	—	WINT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	WINT[7:0]	Worst 10 Acquisition Time	00h: The worst 10 values are not acquired. 01h: Sync message reception: 1 time : FFh: Sync message reception: 255 times	R/W
b12 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b13	CMOD	Time Synchronization Correction Mode	0: Mode 1 1: Mode 2	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R
b15	W10S	Worst 10 Acquisition Control Select	0: Measurement is started by hardware and the value acquired in the PW10VR or MW10R register is used as the limit for filtering. 1: Measurement is started by the GETW10R.GW10 bit. Also, the value set in the PLIMITR or MLIMITR register is used as the limit for filtering.	R/W
b19 to b16	SYTH[3:0]	Synchronized State Detection Threshold Setting	0h: None*1 1h: 1 time : Fh: 15 times	R/W
b23 to b20	DVTH[3:0]	Synchronization Loss Detection Threshold Setting	0h: None*2	
b27 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28	ALEN0	Alarm Detection Enable 0	0: The STSR.SYNC or SYNCOUT flag is not set to 1 on detection of synchronization or loss of synchronization. 1: The STSR.SYNC or SYNCOUT flag is set to 1 on detection of synchronization or loss of synchronization.	R/W
b29	ALEN1	Alarm Detection Enable 1	0: The STSR.SYNTOUT flag is not set to 1 on detection of the Sync message reception timeout interrupt. 1: The STSR.SYNTOUT flag is not set to 1 on detection of the Sync message reception timeout interrupt.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. The STSR.SYNC flag does not become 1 regardless of the ALEN0 bit setting.
Note 2. The STSR.SYNCOUT flag does not become 1 regardless of the ALEN0 bit setting.

The STMR register is used to set the operating mode of the STCA module.

WINT[7:0] Bits (Worst 10 Acquisition Time)

These bits set the time for acquiring the worst 10 gradients (the number of times Sync messages are received). Usually, it is recommended to set the number of times of Sync message receptions to 32 or more.

CMOD Bit (Time Synchronization Correction Mode)

Mode 1 or mode 2 can be selected to correct the local time information when the EPTPC operates as a slave clock. Select the appropriate mode in consideration of system configuration, etc.
Table 28.8 is a summary of the two individual correction modes.

Table 28.8 Types and Features of Correction Mode

Correction Mode	Function	Features	Notes
Mode 1	Mode for correcting the counter every Sync message reception by using the current offsetFromMaster (operation is in mode 1 after the start of correction, and then shifts to the specified mode).	The time information of the master clock is set as the local time information at a time.	(e.g. packets are temporarily being discarded due to a failure of communications).
Mode 2	Mode where the gradient value calculated from offsetFromMaster (worst-10 control) is retained and used in correcting the local time information so that it approximates the time information of the master clock.	Even if calculating offsetFromMaster is not possible, a certain level of synchronization can be guaranteed in this mode (the counter is still corrected from the gradient information).	Establishing synchronization takes longer.

W10S Bit (Worst 10 Acquisition Control Select)

This bit selects the value used for measurement and filtering of worst 10 gradients. When this bit is set to 0, the values acquired in registers PW10VRU, PW10VRM, and PW10VRL and registers MW10RU, MW10RM, and MW10RL are used as the limit for the filter. When the bit is set to 1, the values set in registers PLIMITRU, PLIMITRM, and PLIMITRL and registers MLIMITRU, MLIMITRM, and MLIMITRL are used as the limit for the filter.

SYTH[3:0] Bits (Synchronized State Detection Threshold Setting)

These bits specify a value for the number of consecutive times being below the thresholds will be judged as synchronization. Specifically, the value falling within the thresholds set in registers SYNTDBRU and SYNTDBRL as many times as the value of these bits indicates the synchronized state. When the ALEN0 bit is 1, the STSR.SYNCOUT flag becomes 1.

DVTH[3:0] Bits (Synchronization Loss Detection Threshold Setting)

These bits specify a value for the number of consecutive times exceeding a threshold will be judged as a loss of synchronization. Specifically, synchronization is judged to have been lost when the value in registers SYNTDARU and SYNTDARL is consecutively exceeded as many times as the value of these bits. When the ALEN0 bit is 1, the STSR.SYNCOUT flag becomes 1.

ALEN0 Bit (Alarm Detection Enable 0)

When this bit is 1, the STSR.SYNC or SYNCOUT flag is set to 1 on detection of synchronization or loss of synchronization. When this bit is 0, the SYNC or SYNCOUT flag is not set to 1 even if synchronization or loss of synchronization is detected.

ALEN1 Bit (Alarm Detection Enable 1)

When this bit is 1, the STSR.SYNTOUT flag is set to 1 if a Sync message is not received within the time specified by the SYNTOR register. When this bit is 0, the SYNTOUT flag is not set to 1 even if the reception timeout has occurred.

28.2.9 Sync Message Reception Timeout Register (SYNTOR)

Address(es): EPTPC.SYNTOR E820 5058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	A Sync message not being received within 1024 × n (ns), where n is the setting, leads to a timeout for reception of Sync messages, leading to the STSR.SYNTOUT flag being set to 1.	R/W

The SYNTOR register is used to specify the timeout period for reception of Sync messages. The timeout period is 1024 times the setting of these bits, in units of nanoseconds.

A Sync message not being received within the period specified by these bits is judged to represent a timeout.

When the SYNTOR register is 0, the STSR.SYNTOUT flag does not become 1.

28.2.10 IPLS Interrupt Request Timer Select Register (IPTSELR)

Address(es): EPTPC.IPTSELR E820 5060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	IPTSEL5	IPTSEL4	IPTSEL3	IPTSEL2	IPTSEL1	IPTSEL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	IPTSEL0	Pulse Output Timer 0 Select	0: Pulse output timer 0 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 0 is selected as a source of IPLS interrupt requests.	R/W
b1	IPTSEL1	Pulse Output Timer 1 Select	0: Pulse output timer 1 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 1 is selected as a source of IPLS interrupt requests.	R/W
b2	IPTSEL2	Pulse Output Timer 2 Select	0: Pulse output timer 2 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 2 is selected as a source of IPLS interrupt requests.	R/W
b3	IPTSEL3	Pulse Output Timer 3 Select	0: Pulse output timer 3 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 3 is selected as a source of IPLS interrupt requests.	R/W
b4	IPTSEL4	Pulse Output Timer 4 Select	0: Pulse output timer 4 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 4 is selected as a source of IPLS interrupt requests.	R/W
b5	IPTSEL5	Pulse Output Timer 5 Select	0: Pulse output timer 5 is not selected as a source of IPLS interrupt requests. 1: Pulse output timer 5 is selected as a source of IPLS interrupt requests.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

The IPTSELR register is used to select the pulse output timer that generates IPLS interrupt requests.
Each pulse output timer m takes the clock signal from the STCA as its clock source and produces pulses with a specified period and duty cycle. An IPLS interrupt is requested on rising edges if the ELIPPR.PLSP bit is set to 1 and on falling edges if the PLSN bit in the same register is set to 1. The interrupt request signal becomes the logical OR of the interrupt requests from the given channels when bits for multiple channels in register IPTSELR are set to 1. For the IPLS interrupt, see section 28.4, Interrupts.

28.2.11 MINT Interrupt Request Timer Select Register (MITSELR)

Address(es): EPTPC.MITSELR E820 5064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MINTEN0	Pulse Output Timer 0 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 0 is not reflected by the MIESR.CYC0 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 0 is reflected by the MIESR.CYC0 flag as a MINT interrupt source.	R/W
b1	MINTEN1	Pulse Output Timer 1 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 1 is not reflected by the MIESR.CYC1 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 1 is reflected by the MIESR.CYC1 flag as a MINT interrupt source.	R/W
b2	MINTEN2	Pulse Output Timer 2 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 2 is not reflected by the MIESR.CYC2 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 2 is reflected by the MIESR.CYC2 flag as a MINT interrupt source.	R/W
b3	MINTEN3	Pulse Output Timer 3 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 3 is not reflected by the MIESR.CYC3 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 3 is reflected by the MIESR.CYC3 flag as a MINT interrupt source.	R/W
b4	MINTEN4	Pulse Output Timer 4 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 4 is not reflected by the MIESR.CYC4 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 4 is reflected by the MIESR.CYC4 flag as a MINT interrupt source.	R/W
b5	MINTEN5	Pulse Output Timer 5 MINT Interrupt Output Enable	0: Output of rising edges by pulse output timer 5 is not reflected by the MIESR.CYC5 flag as a MINT interrupt source. 1: Output of rising edges by pulse output timer 5 is reflected by the MIESR.CYC5 flag as a MINT interrupt source.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

The MITSELR register is used to select pulse output timer m that generates MINT interrupt requests.
Each pulse output timer m takes the clock signal from the STCA as its clock source and produces pulses with a specified period and duty cycle. A MINT interrupt is requested on rising edges of the pulse signal from the corresponding pulse output timer m if the setting of the MIEIPR.CYCm bit is 1.
For the MINT interrupt, see section 28.4, Interrupts.

28.2.12 Time Synchronization Channel Select Register (STCHSELR)

Address(es): EPTPC.STCHSELR E820 506Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SYSEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYSEL	Timer Information Input Select	0: Time information from the SYNFP0 module is used. 1: Time information from the SYNFP1 module is used.	R/W*1
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Do not change the value of this bit while the SYNSTARTR.STR bit is 1.

The STCHSELR register selects the time information input to the STCA module.

28.2.13 Slave Time Synchronization Start Register (SYNSTARTR)

Address(es): EPTPC.SYNSTARTR E820 5080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LOAD	Local Clock Counter Initial Value Load Directive	0: The initial value is not loaded into the local clock counter. 1: The initial value is loaded into the local clock counter.	W*1
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Do not change the value of this bit while the SYNSTARTR.STR bit is 1.

The LCIVLDR register is used to set the value of registers LCIVRU, LCIVRM, and LCIVRL as the initial value of the local clock counter.

28.2.15 Synchronization Loss Detection Threshold Registers (SYNTDARU, SYNTDARL)

Address(es): EPTPC.SYNTDARU E820 5090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the threshold for detection of loss of synchronization.	R/W

Address(es): EPTPC.SYNTDARL E820 5094h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the threshold for detection of loss of synchronization.	R/W

The settings of the SYNTDARU and SYNTDARL registers specify the threshold value for offsetFromMaster to be used in judging loss of synchronization. When setting a threshold value, write the higher-order 32 bits to SYNTDARU and the lower-order 32 bits to SYNTDARL, in that order and in consecutive operations.
If the offsetFromMaster value becomes at least the same as the value specified in SYNTDARU and SYNTDARL, a loss of synchronization is detected. Set a value in SYNTDARU and SYNTDARL in units of nanoseconds.
SYNTDARU and SYNTDARL are not used when the device is operating as a master clock.

28.2.16 Synchronization Detection Threshold Registers (SYNTDBRU, SYNTDBRL)

Address(es): EPTPC.SYNTDBRU E820 5098h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the threshold for detection of synchronization.	R/W

Address(es): EPTPC.SYNTDBRL E820 509Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the threshold for detection of synchronization.	R/W

The settings of the SYNTDBRU and SYNTDBRL registers specify the threshold value for offsetFromMaster to be used in judging synchronization. When setting a threshold value, write the higher-order 32 bits to SYNTDBRU and the lower-order 32 bits to SYNTDBRL, in that order and in consecutive operations.
If the offsetFromMaster value is less than the value specified in SYNTDBRU and SYNTDBRL, synchronization is detected. Set a value in SYNTDBRU and SYNTDBRL in units of nanoseconds.
SYNTDBRU and SYNTDBRL are not used when the device is operating as a master clock.
If the offsetFromMaster value is less than the value specified in SYNTDBRU and SYNTDBRL, synchronization is detected. Set a value in SYNTDBRU and SYNTDBRL in units of nanoseconds.
SYNTDBRU and SYNTDBRL are not used when the device is operating as a master clock.

28.2.17 Local Clock Counter Initial Value Registers (LCIVRU, LCIVRM, LCIVRL)

Address(es): EPTPC.LCIVRU E820 50B0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 16 bits of the integer portion of the initial value for the local clock counter.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC.LCIVRM E820 50B4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the integer portion of the initial value for the clock counter.	R/W

Address(es): EPTPC.LCIVRL E820 50B8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the fractional portion of the initial value of the clock counter in nanoseconds.	R/W

Registers LCIVRU, LCIVRM, and LCIVRL specify the initial value in seconds of the clock counter. When setting an initial value, write the higher-order 16 bits of the integer portion to LCIVRU, the lower-order 32 bits of the integer portion to LCIVRM, and the fractional portion in nanoseconds to LCIVRL, in that order and in consecutive operations. The value of registers LCIVRU, LCIVRM, and LCIVRL can be used as the initial value of the local clock counter. When setting the value of registers LCIVRU, LCIVRM, and LCIVRL in the local clock counter, set the LCIVLDR.LOAD bit to 1.

Example) When 2.000000025s is to be set as the initial value, write the following values to each of the registers.
LCIVRU: 0000 0000h
LCIVRM: 0000 0002h
LCIVRL: 0000 0019h

28.2.18 Worst 10 Acquisition Directive Register (GETW10R)

Address(es): EPTPC.GETW10R E820 5124h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GW10
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	GW10	Worst 10 Acquisition Directive	0: The worst-10 values are not acquired. 1: Starts acquisition of the worst-10 values.	R/W*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not set this bit to 1 while the STMR.W10S bit is 0.

The GETW10R register is used in software control to start calculation of gradient values for use in selecting the worst-10 values.

A gradient value is the amount by which the timer counter of a slave is incremented when a given interval elapses. Setting the GW10 bit to 1 while the value of the STMR.W10S bit is 1 selects calculation of a gradient value by the EPTPC each time it receives a Sync message. Gradient values are calculated the number of times specified by the STMR.WINT[7:0] bits. The GW10 bit is cleared to 0 on completion of this number of calculations. The GETW10R register is not used in operation as a master clock.

28.2.19 Positive Gradient Limit Registers (PLIMITRU, PLIMITRM, PLIMITRL)

Address(es): EPTPC.PLIMITRU E820 5128h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the middle-order 32 bits of the limit for the positive gradient.	R/W

Address(es): EPTPC.PLIMITRL E820 5130h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

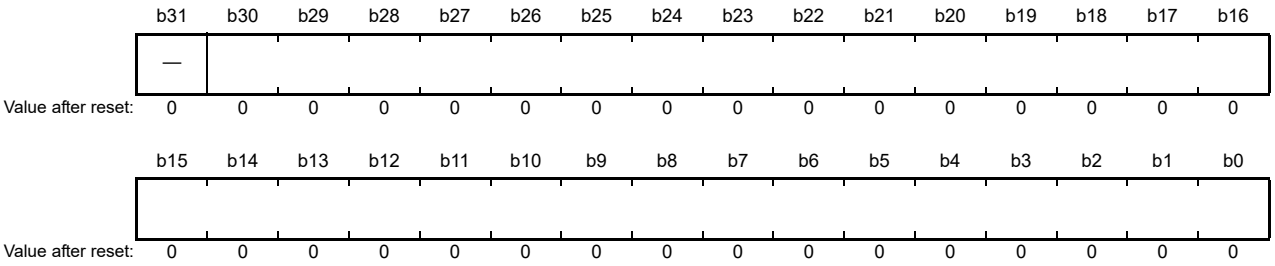
Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the limit for the positive gradient.	R/W

Registers PLIMITRU, PLIMITRM, and PLIMITRL are used to specify an upper limit on gradient (= positive gradient) for use in time synchronization. When setting an upper limit, write values consecutively to PLIMITRU, PLIMITRM, and PLIMITRL in that order.
The gradients that is at least the same as the value specified in registers PLIMITRU, PLIMITRM, and PLIMITRL are not used in time synchronization. Registers PLIMITRU, PLIMITRM, PLIMITRL are not used when the device is operating as a master clock. Registers PLIMITRU, PLIMITRM, and PLIMITRL are effective while the STMR.CMOD and W10S bits are 1.
The gradient value to be set in the register is calculated by using the following expression.
PLIMITRU, PLIMITRM, and PLIMITRL register values = A (s)/T (s) × 232
A: The time (s) by which the slave local clock counter advances during the interval between received Sync messages
T: The actual time (s) between received Sync messages

For example, if the interval between Sync messages is 0.5 seconds and the local clock counter advances by 0.7 seconds during that time, and this is to be set as the limit, then the setting for PLIMITR = 0.7/0.5 × 232 = 6 012 954 214 = 1 6666 6666h, and the settings for the individual registers are as follows: PLIMITRU = 0000 0000h, PLIMITRM = 0000 0001h, and PLIMITRL = 6666 6666h.
The minimum setting depends on the STCA clock frequency as the clock source for counting by the local clock counter. For example, if the STCA clock frequency is 50 MHz, then the minimum allowable setting for registers PLIMITRU, PLIMITRM, and PLIMITRL = (1/50 (MHz)) (s)/0.5 (s) × 232 = 172 = ACh, and the settings for the individual registers are as follows: PLIMITRU = 0000 0000h, PLIMITRM = 0000 0000h, and PLIMITRL = 0000 00ACh.
The gradient limit values to be set are valid when time synchronization correction mode is mode 2 (the STMR.CMOD bit is 1) and the gradient is controlled by software (the STMR.W10S bit is 1).

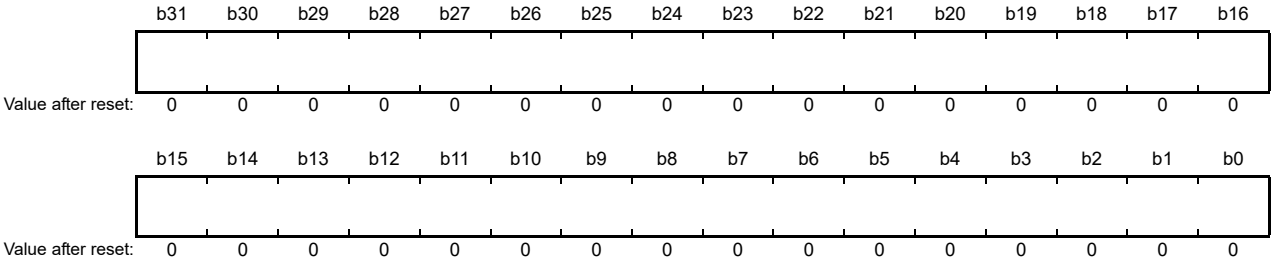
28.2.20 Negative Gradient Limit Registers (MLIMITRU, MLIMITRM, MLIMITRL)

Address(es): EPTPC.MLIMITRU E820 5134h



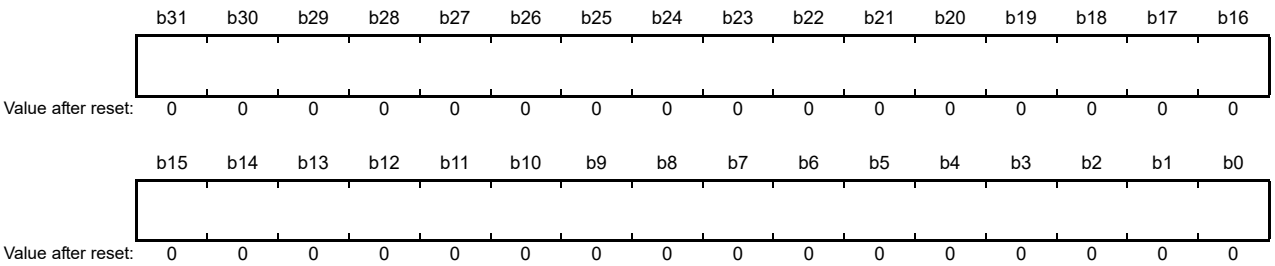
Bit	Symbol	Bit Name	Description	R/W
b30 to b0	—	—	These bits hold the setting for the higher-order 31 bits of the limit for the negative gradient.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

Address(es): EPTPC.MLIMITRM E820 5138h



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the middle-order 32 bits of the limit for the negative gradient.	R/W

Address(es): EPTPC.MLIMITRL E820 513Ch



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the limit for the negative gradient.	R/W

Registers MLIMITRU, MLIMITRM, and MLIMITRL are used to specify a lower limit for the gradient (= negative gradient) for use in time synchronization. Use two's complement to set a lower limit. When setting a lower limit, write values consecutively to MLIMITRU, MLIMITRM, and MLIMITRL in that order.
The gradients that are less than the value specified in registers MLIMITRU, MLIMITRM, and MLIMITRL are not used in time synchronization. Registers MLIMITRU, MLIMITRM, and MLIMITRL are not used when the device is operating as a master clock. Registers MLIMITRU, MLIMITRM, and MLIMITRL are effective while the STMR.CMOD and W10S bits are 1.
The procedure for setting a value and the minimum value that can be set are the same as for registers PLIMITRU, PLIMITRM, and PLIMITRL.

28.2.21 Statistical Information Retention Control Register (GETINFOR)

Address(es): EPTPC.GETINFOR E820 5140h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INFO
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	INFO	Information Retention Control	[When written] 0: Has no effects. 1: Information is retained. [When read] 0: Information retention is completed. 1: Processing for information retention is in progress. Once information fetching is directed, values of various statistical information read before completion of information fetching are not guaranteed.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

The GETINFOR register controls retention of the following statistical information.

- Registers LCCVRU, LCCVRM, and LCCVRL
- Registers PW10VRU, PW10VRM, and PW10VRL
- Registers MW10RU, MW10RM, and MW10RL

The only value that is writable to the INFO bit is 1. When setting a value in registers PW10VRU, PW10VRM, and PW10VRL, or registers MW10RU, MW10RM, and MW10RL, set the INFO bit to 1 only while the STMR.W10S bit is 1. If the INFO bit is set to 1 before acquisition of the worst-10 values is completed, whether the information retained in registers PW10VRU, PW10VRM, and PW10VRL and registers MW10RU, MW10RM, MW10RL is correct or not is not guaranteed. Use the GETW10R.GW10 bit to confirm that acquisition has been completed before setting the INFO bit to 1. The INFO bit is automatically returned to 0 on completion of information fetching.

28.2.22 Local Clock Counters (LCCVRU, LCCVRM, LCCVRL)

Address(es): EPTPC.LCCVRU E820 5170h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits are for reading the lower-order 32 bits of the integer portion of the local clock counter's value.	R

Address(es): EPTPC.LCCVRL E820 5178h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits are for reading the fractional portion of the local clock counter's value (in nanoseconds).	R

Registers LCCVRU, LCCVRM, and LCCVRL indicate the local clock counter's value.
When the GETINFOR.INFO bit is set to 1, the value of the local clock counter at that time is stored in registers LCCVRU, LCCVRM, and LCCVRL. The higher-order 16 bits of the integer portion in seconds are saved in LCCVRU, the lower-order 32 bits of the integer portion in seconds are saved in LCCVRM, and the fractional portion in nanoseconds is saved in LCCVRL.
For example, if the local time information is 14:25, 44 seconds, 10 milliseconds, 23 microseconds, and 39 nanoseconds, registers LCCVRU, LCCVRM, and LCCVRL have 14 × 3600 + 25 × 60 + 44 = 51944 (s) = 0000 0000 CAE8h as the setting of the higher-order 48 bits and 10 × 106 + 23 × 103 + 39 = 10023039 (ns) = 0098 F07Fh as the setting of the lower-order 32 bits.

28.2.23 Positive Gradient Worst 10 Value Registers (PW10VRU, PW10VRM, PW10VRL)

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the start time of the pulse output timer in nanoseconds.	R/W

Registers TMSTTRUm and TMSTTRLm are used to set the start time of pulse output timer m.
Set the start time of pulse output timer m (64 bits) in units of nanoseconds. Though the setting is in units of nanoseconds, the start time of pulse output timer m depends on the resolution of the STCA clock.
For example, if the STCA clock is running at 50 MHz, one cycle takes 20 ns, so the time at which the timer starts may differ from the time set in registers TMSTTRUm and TMSTTRLm by up to 20 ns.
When writing to registers TMSTTRUm and TMSTTRLm, write values consecutively in order of TMSTTRUm and then TMSTTRLm while the TMSTARTR.ENm bit is 0.
Note, however, that the format for setting times in registers TMSTTRUm and TMSTTRLm differs from that described in section 28.2.22, Local Clock Counters (LCCVRU, LCCVRM, LCCVRL).

28.2.26 Timer Cycle Setting Registers m (TMCYCRm) (m = 0 to 5)

Address(es): EPTPC.TMCYCR0 E820 5308h, EPTPC.TMCYCR1 E820 5318h, EPTPC.TMCYCR2 E820 5328h, EPTPC.TMCYCR3 E820 5338h, EPTPC.TMCYCR4 E820 5348h, EPTPC.TMCYCR5 E820 5358h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b29 to b0	—	—	These bits set the cycle of the pulse output timer in nanoseconds. Set a value that is equivalent to at least four cycles of the STCA clock.	R/W
b31 to b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

A TMCYCRm register specifies the period of the output signal generated by the corresponding pulse output timer m. Set a value in nanoseconds that is equivalent to at least four cycles of the STCA clock while the value of the TMSTARTR.ENm bit is 0.

Though the settings of TMCYCRm registers are in units of nanoseconds, the period of the output signal generated by pulse output timer m and the time at which the timer starts depend on the period of the STCA clock. For example, one cycle of the STCA clock running at 50 MHz takes 20 ns, so the clock source for counting by pulse output timer m may differ from the period set in the TMCYCRm registers by up to 19 ns. The SYNFP module handles calculations to correct this difference.

For example, if the setting for the timer period is 81 ns and the STCA clock is running at 50 MHz, the only available settings close to the actual timer period are for 80 ns or 100 ns. By setting the timer period in the SYNFP module to 80 ns for 19 and to 100 ns for 1 of every 20 cycles, we are able to adjust the average period to 81 ns.

$(80\ (\text{ns}) \times 19 + 100\ (\text{ns}) \times 1)/20 = 81\ (\text{ns})$

The minimum value that can be set in a TMCYCRm register is four cycles of the STCA clock. For example, if the STCA clock is running at 50 MHz, the minimum setting corresponds to 80 ns. Timer operation is not guaranteed if a value set in one of these registers is less than this value.

28.2.27 Timer Pulse Width Setting Register m (TMPLSRm) (m = 0 to 5)

Address(es): EPTPC.TMPLSR0 E820 530Ch, EPTPC.TMPLSR1 E820 531Ch, EPTPC.TMPLSR2 E820 532Ch, EPTPC.TMPLSR3 E820 533Ch, EPTPC.TMPLSR4 E820 534Ch, EPTPC.TMPLSR5 E820 535Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b28 to b0	—	—	These bits set the width at high level of the pulse signal from the timer in nanoseconds. Set a value that is equivalent to at least two cycles of the STCA clock.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R

A TMPLSRm register specifies the width at high level of the output signal generated by the corresponding pulse output timer m.

When the TMSTARTR.ENm bit is 0, set a value corresponding to a time no shorter than two cycles of the STCA clock in units of nanoseconds.

The higher-order 3 bits of the TMPLSRm register are reserved. These bits are read as 000b. When writing, write 000b to these bits.

Though the settings of the TMPLSRm register are in units of nanoseconds, the width at high level of the signal from the timer depends on the period of the STCA clock. The method for correcting the width at high level of the signal from the timer is the same as that for correcting the timer periods set by the TMCYCRm register.

28.2.28 Timer Start Register (TMSTARTR)

b2	OVRE2	Relay Packet Overflow Detection Flag 2	0: No overflow in transfer of data from SYNFP1 to SYNFP0 1: An overflow has been detected in transfer of data from SYNFP1 to SYNFP0.	R/W*1
b3	OVRE3	Relay Packet Overflow Detection Flag 3	0: No overflow in transfer of data from SYNFP0 to SYNFP1 1: An overflow has been detected in transfer of data from SYNFP0 to SYNFP1.	R/W*1
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	MACE	Source MAC Address Mismatch Detection Flag	0: A MAC address mismatch has not been detected. 1: A MAC address mismatch has been detected.	R/W*1
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b27 to b16	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b28	URE0	Relay Packet Underflow Detection Flag 0	0: No underflow in transfer of data from SYNFP1 to SYNFP0 1: An underflow has been detected in transfer of data from SYNFP1 to SYNFP0.	R/W*1
b29	URE1	Relay Packet Underflow Detection Flag 1	0: No underflow in transfer of data from SYNFP0 to SYNFP1 1: An underflow has been detected in transfer of data from SYNFP0 to SYNFP1.	R/W*1
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The PRSR register indicates the state of the PRC-TC module.
The PRC-TC module transmits and receives Ethernet packets through Ethernet port 0, Ethernet port 1, and the PTPEDMAC.
The PRSR register indicates the states as overflows, underflows, and non-matching MAC addresses in the transmission and reception of Ethernet packets.

OVRE0 Flag (Relay Packet Overflow Detection Flag 0)

This flag indicates that the FIFO buffer has overflowed while packets were being transferred from the SYNFP1 module to the PTPEDMAC. The data received in the PTPEDMAC may be incorrect if the setting of the OVRE0 flag is 1.

OVRE1 Flag (Relay Packet Overflow Detection Flag 1)

This flag indicates that the FIFO buffer has overflowed while packets were being transferred from the SYNFP0 module to the PTPEDMAC. The data received in the PTPEDMAC may be incorrect if the setting of the OVRE1 flag is 1.

OVRE2 Flag (Relay Packet Overflow Detection Flag 2)

This flag indicates that the FIFO buffer has overflowed while packets were being transferred from the SYNFP1 module to the SYNFP0 module.

OVRE3 Flag (Relay Packet Overflow Detection Flag 3)

This flag indicates that the FIFO buffer has overflowed while packets were being transferred from the SYNFP0 module to the SYNFP1 module.

MACE Flag (Source MAC Address Mismatch Detection Flag)

This flag becomes 1 if the source MAC address of a packet for transmission from the PTPEDMAC matches none of registers PRMACRU0, PRMACRL0, PRMACRU1, and PRMACRL1.

URE0 Flag (Relay Packet Underflow Detection Flag 0)

This flag indicates that the FIFO buffer has underflowed while packets were being transferred from the SYNFP1 module to the SYNFP0 module.

URE1 Flag (Relay Packet Underflow Detection Flag 1)

This flag indicates that the FIFO buffer has underflowed while packets were being transferred from the SYNFP0 module to the SYNFP1 module.

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the local MAC address for Ethernet port 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Registers PRMACRU0 and PRMACRL0 are used to set the local MAC address for Ethernet port 0. Set the higher-order 24 bits and the lower-order 24 bits of the MAC address in PRMACRU0 and PRMACRL0, respectively.
These registers are used in transmission from the PTPEDMAC to send frames from transmission sources with MAC addresses matching the value of this register to Ethernet port 0. Set registers PRMACRU0 and PRMACRL0 to the same value as registers SYMACRU and SYMACRL for the EPTPC0 module.
Rewrite registers PRMACRU0 and PRMACRL0 before starting the EDMAC, ETHERC, and PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.32 Channel 1 Local MAC Address Registers (PRMACRU1, PRMACRL1)

Address(es): EPTPC.PRMACRU1 E820 5418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the higher-order 24 bits of the local MAC address for Ethernet port 1.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Address(es): EPTPC.PRMACRL1 E820 541Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the local MAC address for Ethernet port 1.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Registers PRMACRU1 and PRMACRL1 are used to set the local MAC address for Ethernet port 1. Set the higher-order 24 bits and the lower-order 24 bits of the MAC address in registers PRMACRU1 and PRMACRL1, respectively.
These registers are used in transmission from the PTPEDMAC to send frames from transmission sources with MAC addresses matching the value of this register to Ethernet port 1. Set registers PRMACRU1 and PRMACRL1 to the same value as registers SYMACRU and SYMACRL for the EPTPC1 module.
Rewrite registers PRMACRU1 and PRMACRL1 before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.33 Packet Transmission Control Register (TRNDISR)

Address(es): EPTPC.TRNDISR E820 5420h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDIS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TDIS[1:0]	Packet Transmission Control	b1 b0 0 0: PTP packets are transmitted through both Ethernet port 0 and Ethernet port 1. 0 1: PTP packets are only transmitted through Ethernet port 0. 1 0: PTP packets are only transmitted through Ethernet port 1. 1 1: Setting prohibited	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The TRNDISR register controls transmission of PTP packets when Ethernet port 0 and Ethernet port 1 have the same local MAC address.

When registers PRMACRU0 and PRMACRL0 and registers PRMACRU1 and PRMACRL1 have the same local MAC address setting, the EPTPC can selects whether PTP packets with the matching address are transmitted through both ports or are only transmitted through one port or the other.

If Ethernet port 0 and Ethernet port 1 have different local MAC address settings, set the TDIS[1:0] bits to 00b. If the setting is other than 00b, the transmission of frames with an source MAC address matching that of the Ethernet port may be blocked.

Rewrite the TRNDISR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.34 Relay Mode Register (TRNMR)

Address(es): EPTPC.TRNMR E820 5430h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	FWD1	FWD0	—	—	—	—	—	—	—	MOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MOD	Cut-Through Mode	0: Store-and-forward 1: Cut-through	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	FWD0	Channel 0 Relay Enable	0: Unicast, multicast (other than PTP packets), and broadcast messages from the other node are not relayed from port 0 to port 1. 1: Unicast, multicast (other than PTP packets), and broadcast messages from the other node are relayed from port 0 to port 1.	R/W
b9	FWD1	Channel 1 Relay Enable	0: Unicast, multicast (other than PTP packets), and broadcast messages from the other node are not relayed from port 1 to port 0. 1: Unicast, multicast (other than PTP packets), and broadcast messages from the other node are relayed from port 1 to port 0.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

The TRNMR register is used to control relaying of packets between Ethernet port 0 and Ethernet port 1 by the PRC-TC module. For example, as Figure 28.3 shows, if the network is in a daisy-chain configuration, packets can be transferred through all three devices by enabling relaying of packets between Ethernet port 0 and Ethernet port 1 in the center of the figure.

For recalculating the CRC value in packet transfer, in the case of cut-through mode, a packet that had an abnormal CRC value may be transferred with a normal CRC value. Use store-and-forward mode when abnormal packets need to be discarded. There is no difference in the latency of transfer in cut-through mode and store-and-forward mode when the length of the packets is shorter than 96 bytes.

Rewrite the TRNMR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

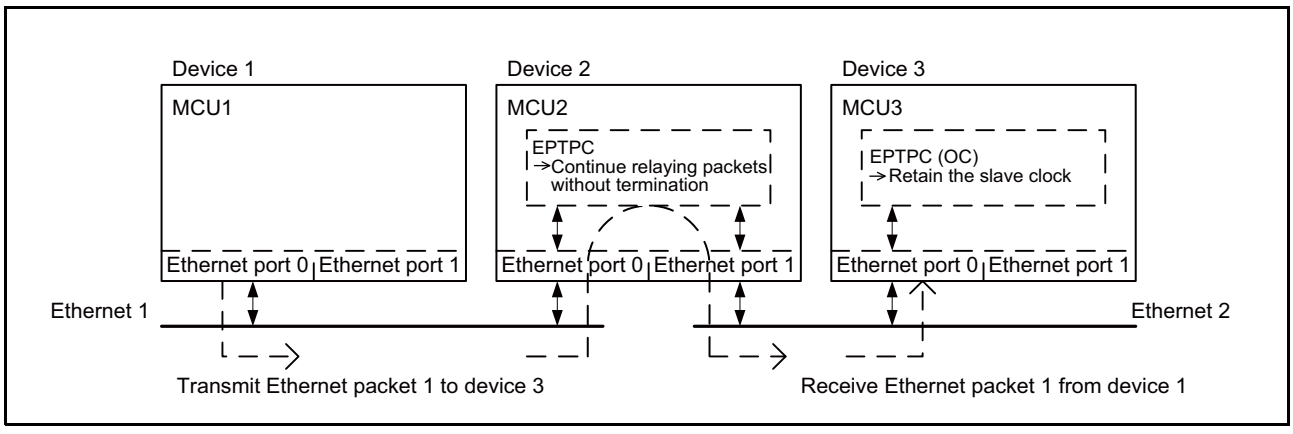

Figure 28.3 Network Configuration Example

28.2.35 Cut-Through Transfer Start Threshold Register (TRNCTTDR)

Address(es): EPTPC.TRNCTTDR E820 5434h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	THVAL[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	THVAL [10:0]	FIFO Read Start Threshold	Threshold for starting to read data from the relay FIFO in cut-through mode (specified as the number of bytes)*1	R
b10 to b2				R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	

Note 1. A value cannot be set in the lower-order 2 bits. These bits are fixed to 0.
A value of less than 96 bytes cannot be set.

The TRNCTTDR register is used to set the threshold for the transmitting port starting to read data from the relay FIFO when the cut-through method is selected for relaying between the Ethernet ports.
When the TRNMR.MOD bit is 1, data transfer can start without waiting for all frame data to be stored in the relay FIFO. The setting of the THVAL[10:0] bits is the amount of data, in bytes, that must be stored in the relay FIFO before transmission starts. Set a multiple of four as the threshold value.
Reading from the relay FIFO starts when either of the following conditions is met.

- The relay FIFO holds at least as much data as the number of bytes specified by the THVAL[10:0] bits.
- The relay FIFO holds at least one frame.

Rewrite the TRNCTTDR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.36 SYNFP Status Register (SYSR)

Address(es): EPTPC0.SYSR E820 5800h, EPTPC1.SYSR E820 5C00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GENDN	RESDN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	INFABT	—	RECLP	—	—	—	—	—	DRQOVR	INTDEV	DRPTO	—	MPDUD	INTCHG	OFMUD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OFMUD	offsetFromMaster Value Update Flag	0: The offsetFromMaster value has not been updated. 1: The offsetFromMaster value has been updated.	R/W*1
b1	INTCHG	Receive logMessageInterval Value Change Detection Flag	0: No change in the received logMessageInterval value. 1: A change in the received logMessageInterval value.	R/W*1
b2	MPDUD	meanPathDelay Value Update Flag	0: The meanPathDelay value has not been updated. 1: The meanPathDelay value has been updated.	R/W*1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R
b4	DRPTO	Delay_Resp/ Pdelay_Resp Reception Timeout Detection Flag	0: A Delay_Resp/Pdelay_Resp timeout has not occurred. 1: A Delay_Resp/Pdelay_Resp timeout has occurred.	R/W*1
b5	INTDEV	Receive logMessageInterval Value Out-of-Range Flag	0: The received logMessageInterval value is within the range. 1: The received logMessageInterval value is out of the range.	R/W*1
b6	DRQOVR	Delay_Req Reception FIFO Overflow Detection Flag	0: The received Delay_Req has not caused the reception FIFO to overflow. 1: The received Delay_Req has caused the reception FIFO to overflow.	R/W*1
b11 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	RECLP	Loop Reception Detection Flag	0: A received message has not returned through a loop. 1: A received message has returned through a loop.	R/W*1
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	INFABT	Control Information Abnormality Detection Flag	0: No abnormality in control information 1: Abnormality in control information	R/W*1
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	RESDN	Response Stop Completion Detection Flag	0: Stopping responses has not been completed. 1: Stopping responses has been completed.	R/W*1
b17	GENDN	Generation Stop Completion Detection Flag	0: Stopping generation has not been completed. 1: Stopping generation has been completed.	R/W*1
b23 to b18	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The SYSR register indicates the state of the SYNFP module.

OFMUD Flag (offsetFromMaster Value Update Flag)

This flag indicates that the value of offsetFromMaster has been updated.

INTCHG Flag (Receive logMessageInterval Value Change Detection Flag)

This flag indicates that the logMessageInterval value of the Delay_Resp, Sync or Announce message differs from the previously received value.

MPDUD Flag (meanPathDelay Value Update Flag)

This flag indicates that the value of meanPathDelay has been updated.

INTDEV Flag (Receive logMessageInterval Value Out-of-Range Flag)

This flag indicates the reception of a Delay_Resp message with a logMessageInterval value outside the range -7 to 6.

DRQOVR Flag (Delay_Req Reception FIFO Overflow Detection Flag)

This flag indicates that the FIFO buffer for storing information from received Delay_Req messages holds 32 or more entries.

RECLP Flag (Loop Reception Detection Flag)

This flag indicates that the value of the sourcePortIdentity field in a received PTP message matches the local PortIdentity (as set by registers SYCIDRU, SYCIDRL, and SYPNUMR).

INFABT Flag (Control Information Abnormality Detection Flag)

This flag indicates that the control information included a mismatch.
When this bit is set to 1, reset the EPTPC, PTPEDMAC, and respective channel of the ETHERC and EDMAC. Follow the procedure below to reset these functional blocks.

(1) Write “0000 0001h” to the PTRSTR register of the EPTPC.
(2) Write “0000 0001h” to the EDMR register of the PTPEDMAC.
(3) Write “0000 0001h” to the EDMR register of the respective channel of the EDMAC.
(4) Wait until the initialization is completed (for 64 cycles of Bφ).
(5) Write “0000 0000h” to the PTRSTR register of the EPTPC.

For details on resetting these functional blocks, see section 28.2.83, PTP Reset Register (PTRSTR) and section 29.2.1, EDMAC Mode Register (EDMR).

RESDN Flag (Response Stop Completion Detection Flag)

This flag indicates the end of processing for transmission of a Delay_Resp or Pdelay_Resp as response messages when the handling of a received Delay_Req or Pdelay_Req by the SYNFP module has been disabled by the setting of the SYRFL1R or SYRVLDR register.

GENDN Flag (Generation Stop Completion Detection Flag)

This flag indicates the end of processing for transmission of messages of a type disabled in the SYTRENR or SYRVLDR register.

28.2.37 SYNFP Status Notification Enable Register (SYIPR)

Address(es): EPTPC0.SYIPR E820 5804h, EPTPC1.SYIPR E820 5C04h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the local MAC address.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Registers SYMACRU and SYMACRL are used to specify the local MAC address for Ethernet ports 0 and 1.
Rewrite registers SYMACRU and SYMACRL before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.39 SYNFP LLC-CTL Value Register (SYLLCCTLR)

Address(es): EPTPC0.SYLLCCTLR E820 5818h, EPTPC1.SYLLCCTLR E820 5C18h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	CTL[7:0]	LLC-CTL Field	Set a value used for the control field in the LLC sublayer when generating IEEE802.3 frames.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYLLCCTLR register is used to set the control field (LLC-CTL) value of LCC frames generated by the SYNFP module.
Rewrite the SYLLCCTLR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.40 SYNFP Local IP Address Register (SYIPADDRR)

Address(es): EPTPC0.SYIPADDRR E820 581Ch, EPTPC1.SYIPADDRR E820 5C1Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the local IP address.	R/W

The SYIPADDRR register is used to specify the local IP address for Ethernet ports 0 and 1.
Rewrite the SYIPADDRR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.41 SYNFP Specification Version Setting Register (SYSPVRR)

Address(es): EPTPC0.SYSPVRR E820 5840h, EPTPC1.SYSPVRR E820 5C40h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TRSP[3:0]				VER[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	VER[3:0]	versionPTP Field Value	These bits are used to set the versionPTP field value of the PTP v2 header. When a message is received, this value is compared with the versionPTP field of the received frame. In generating messages, the value is used for the versionPTP field of the frame for transmission. Set these bits to 0010b (PTP v2).	R/W
b7 to b4	TRSP[3:0]	transportSpecific Field Value	These bits are used to set the transportSpecific field value of the PTP v2 header. When a message is received, this value is compared with the transportSpecific field of the received frame. In generating messages, the value is used for the transportSpecific field of the frame for transmission. Set these bits to 0000b (IEEE 1588).	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYSPVRR register is used to set the transportSpecific and versionPTP field values of the PTP v2 message header. The value should not be modified while reception or transmission of PTP messages is enabled.

28.2.42 SYNFP Domain Number Setting Register (SYDOMR)

Address(es): EPTPC0.SYDOMR E820 5844h, EPTPC1.SYDOMR E820 5C44h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	DNUM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DNUM[7:0]	domainNumber Field Value Setting	These bits are used to set the domainNumber field value of the PTP v2 header. When a message is received, this value is compared with the domainNumber field of the received frame as a condition for PTP reception processing. In generating messages, the value is used for the domainNumber field of the frame for transmission.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYDOMR register is used to set the domainNumber field value of the PTP v2 message header. The value should not be modified while reception or transmission of PTP messages is enabled.

28.2.43 Announce Message Flag Field Setting Register (ANFR)

Address(es): EPTPC0.ANFR E820 5850h, EPTPC1.ANFR E820 5C50h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	—	FLAG8	—	—	FLAG5	FLAG4	FLAG3	FLAG2	FLAG1	FLAG0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FLAG0	leap61	This bit is used to set the logical value of the leap61 member of timePropertiesDS. 0: leap61 is set to FALSE. 1: leap61 is set to TRUE.	R/W
b1	FLAG1	leap59	This bit is used to set the logical value of the leap59 member of timePropertiesDS. 0: leap59 is set to FALSE. 1: leap59 is set to TRUE.	R/W
b2	FLAG2	currentUtcOffsetValid	This bit is used to set the logical value of the currentUtcOffsetValid member of timePropertiesDS. 0: currentUtcOffsetValid is set to FALSE. 1: currentUtcOffsetValid is set to TRUE.	R/W
b3	FLAG3	ptpTimescale	This bit is used to set the logical value of the ptpTimescale member of timePropertiesDS. 0: ptpTimescale is set to FALSE. 1: ptpTimescale is set to TRUE.	R/W
b4	FLAG4	timeTraceable	This bit is used to set the logical value of the timeTraceable member of timePropertiesDS. 0: timeTraceable is set to FALSE. 1: timeTraceable is set to TRUE.	R/W
b5	FLAG5	frequencyTraceable	This bit is used to set the logical value of the frequencyTraceable member of timePropertiesDS. 0: frequencyTraceable is set to FALSE. 1: frequencyTraceable is set to TRUE.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag	0: alternateMasterFlag is set to FALSE. 1: alternateMasterFlag is set to TRUE.	R/W
b9	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10	FLAG10	unicastFlag	0: unicastFlag is set to FALSE. 1: unicastFlag is set to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: PTP profile Specific 1 is set to FALSE. 1: PTP profile Specific 1 is set to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: PTP profile Specific 2 is set to FALSE. 1: PTP profile Specific 2 is set to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ANFR register is used to set the flagField section of the header when the SYNFP module is to generate an Announce message.

The value specified by the ANFR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

28.2.44 Sync Message Flag Field Setting Register (SYNFR)

Address(es): EPTPC0.SYNFR E820 5854h, EPTPC1.SYNFR E820 5C54h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG 14	FLAG 13	—	—	FLAG 10	FLAG9	FLAG8	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag	0: alternateMasterFlag is set to FALSE. 1: alternateMasterFlag is set to TRUE.	R/W
b9	FLAG9	twoStepFlag	Set this bit to 0 (FALSE).	R/W
b10	FLAG10	unicastFlag	0: unicastFlag is set to FALSE. 1: unicastFlag is set to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: PTP profile Specific 1 is set to FALSE. 1: PTP profile Specific 1 is set to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: PTP profile Specific 2 is set to FALSE. 1: PTP profile Specific 2 is set to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYNFR register is used to set the flagField section of the header when the SYNFP module is to generate a Sync message.
The value specified by the SYNFR register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.45 Delay_Req Message Flag Field Setting Register (DYRQFR)

Address(es): EPTPC0.DYRQFR E820 5858h, EPTPC1.DYRQFR E820 5C58h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10	FLAG10	unicastFlag	0: unicastFlag is set to FALSE. 1: unicastFlag is set to TRULE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: PTP profile Specific 1 is set to FALSE. 1: PTP profile Specific 1 is set to TRULE.	R/W
b14	FLAG14	PTP profile Specific 2	0: PTP profile Specific 2 is set to FALSE. 1: PTP profile Specific 2 is set to TRULE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Register DYRQFR is used to set the flagField section of the header when the SYNFP module is to generate a Delay_Req or Pdelay_Req message.
The value specified by DYRQFR is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.46 Delay_Resp Message Flag Field Setting Register (DYRPFR)

Address(es): EPTPC0.DYRPFR E820 585Ch, EPTPC1.DYRPFR E820 5C5Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	FLAG9	FLAG8	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag*1	0: alternateMasterFlag is set to FALSE. 1: alternateMasterFlag is set to TRUE.	R/W
b9	FLAG9	twoStepFlag*2	Set this bit to 0 (FALSE).	R/W
b10	FLAG10	unicastFlag	0: unicastFlag is set to FALSE. 1: unicastFlag is set to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: PTP profile Specific 1 is set to FALSE. 1: PTP profile Specific 1 is set to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: PTP profile Specific 2 is set to FALSE. 1: PTP profile Specific 2 is set to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is reserved for Pdelay_Resp messages. Set the bit to 0.
Note 2. This bit is reserved for Delay_Resp messages.

The DYRPFR register is used to set the flagField section of the header when the SYNFP module is to generate a Delay_Resp or PDelay_Resp message.
The value specified by the DYRPFR register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.
Do not change the value of the DYRPFR register while processing for the transmission of Delay_Resp or Pdelay_Resp messages is enabled. Furthermore, after disabling this processing for transmission, do not change the value of the DYRPFR register until the SYSR.RESDN flag becomes 1.

28.2.47 SYNFP Local Clock ID Registers (SYCIDRU, SYCIDRL)

Address(es): EPTPC0.SYCIDRU E820 5860h, EPTPC1.SYCIDRU E820 5C60h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the clock-ID of the local port.	R/W

Address(es): EPTPC0.SYCIDRL E820 5864h, EPTPC0.SYCIDRL E820 5C64h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the clock-ID of the local port.	R/W

The SYCIDR registers are used to set the clock-ID of the local port.
The registers are used for the clockIdentity section in the sourcePortIdentity field of the header when the SYNFP module is to generate a PTP message.
When a PTP message is received, the value of these registers is compared with the clockIdentity section in the sourcePortIdentity field of the PTP message to determine whether the message is one that was transmitted by you.
Usually, the setting should be the same as the value of portDS.portIdentity.clockIdentity.
Do not change the value of these registers while processing for the reception or transmission of PTP messages is enabled.

28.2.48 SYNFP Local Port Number Register (SYPNUMR)

Address(es): EPTPC0.SYPNUMR E820 5868h, EPTPC1.SYPNUMR E820 5C68h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PNUM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PNUM[15:0]	Local Port Number Setting	These bits hold the setting for the port number of the local port.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYPNUMR register is used to set the port number of the local port.
This register is used for the portNumber section in the sourcePortIdentity field of the header when the SYNFP module is to generate a PTP message.
When a PTP message is received, the value of this register is compared with the portNumber section in the sourcePortIdentity field of the PTP message to determine whether the message is one that was transmitted by the local device.
Usually, the setting should be the same as the value of portDS.portIdentity.portNumber.
Do not change the value of this register while processing for the reception or transmission of PTP messages is enabled.

28.2.49 SYNFP Register Value Load Directive Register (SYRVLDR)

Address(es): EPTPC0.SYRVLDR E820 5880h, EPTPC1.SYRVLDR E820 5C80h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ANUP	STUP	BMUP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BMUP	BMC Update	When this bit is set to 1, the SYNFP module simultaneously reflects values of registers storing the MasterClock identifying information.	W
b1	STUP	State Update	When this bit is set to 1, the SYNFP module simultaneously reflects register values for PTP message reception and transmission.	W
b2	ANUP	Announce Message Generation Information Update	When this bit is set to 1, the Announce message generation block simultaneously reflects register values required for generating Announce messages.	W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYRVLDR register is used for simultaneously updating multiple register values in the SYNFP module.

BMUP Bit (BMC Update)

When the BMUP bit is set to 1, the SYNFP module simultaneously reflects the values of registers storing the MasterClock identifying information listed below.

- Registers MTCIDU and MTCIDL
- MTPID register

STUP Bit (State Update)

When the STUP bit is set to 1, the SYNFP module simultaneously reflects the values of registers and bits for PTP message reception and transmission listed below.

- SYNFR register
- DYRQFR register
- SYTLIR.DREQ[7:0] bits
- RSTOUTR register
- SYRFL1R register
- SYRFL2R register
- SYTRENR register

ANUP Bit (Announce Message Generation Information Update)

When the ANUP bit is set to 1, the Announce message generation block simultaneously reflects the values of registers and bits required for generating Announce messages listed below.

- ANFR register
- SYTLIR.ANCE[7:0] bits
- GMPR register
- GMCQR register
- Registers GMIDRU and GMIDRL
- CUOTSR register
- SRR register

28.2.50 SYNFP Reception Filter Register 1 (SYRFL1R)

Address(es): EPTPC0.SYRFL1R E820 5890h, EPTPC1.SYRFL1R E820 5C90h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b21			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b22			0: The SYNFP does not process messages. 1: The SYNFP processes messages.	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b24	PDRP[2:0]	Pdelay_Resp Message Processing	0: Messages are not transferred to the PTPEDMAC. 1: Messages are transferred to the PTPEDMAC.	R/W
b25			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b26			0: The SYNFP does not process messages. 1: The SYNFP processes messages.	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R
b28	PDFUP [2:0]	Pdelay_Resp_Follow_Up Message Processing	0: Messages are not transferred to the PTPEDMAC. 1: Messages are transferred to the PTPEDMAC.	R/W
b29			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b30			0: The SYNFP does not process messages. 1: The SYNFP processes messages.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

The SYRFL1R register is used to set up filtering for the reception of PTP messages.
Multiple bits corresponding to different types of messages can be set to 1. Setting all bits for a type of message to 0 leads to all messages of the given type being discarded.
The value specified by the SYRFL1R register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.51 SYNFP Reception Filter Register 2 (SYRFL2R)

Address(es): EPTPC0.SYRFL2R E820 5894h, EPTPC0.SYRFL2R E820 5C94h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	ILL[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	SIG[1:0]		—	—	MAN[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MAN[1:0]	Management Message Processing Setting	0: Messages are not transferred to the PTPEDMAC. 1: Messages are transferred to the PTPEDMAC.	R/W
b1			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b4	SIG[1:0]	Signaling Message Processing Setting	0: Messages are not transferred to the PTPEDMAC. 1: Messages are transferred to the PTPEDMAC.	R/W
b5			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b27 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28	ILL[1:0]	Illegal Message Processing Setting*1	0: Messages are not transferred to the PTPEDMAC. 1: Messages are transferred to the PTPEDMAC.	R/W
b29			0: The PRC-TC does not relay messages between ports 0 and 1. 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. PTP messages other than PTP v2 messages and messages of undefined type are handled as illegal messages.

The SYRFL2R register is used to set up filtering for the reception of PTP messages.
Multiple bits corresponding to different types of messages can be set to 1. Setting all bits for a type of message to 0 leads to all messages of the given type being discarded.
The value specified by the SYRFL2R register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.52 SYNFP Transmission Enable Register (SYTRENR)

Address(es): EPTPC0.SYTRENR E820 5898h, EPTPC1.SYTRENR E820 5C98h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PDRQ	—	—	—	DRQ	—	—	—	SYNC	—	—	—	ANCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ANCE	Announce Message Transmission Enable	0: Announce messages are not transmitted. 1: Announce messages are transmitted.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b4	SYNC	Sync Message Transmission Enable	0: Sync messages are not transmitted. 1: Sync messages are transmitted.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	DRQ	Delay_Req Message Transmission Enable	0: Delay_Req messages are not transmitted. 1: Delay_Req messages are transmitted.	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	PDRQ	Pdelay_Req Message Transmission Enable	0: Pdelay_Req messages are not transmitted. 1: Pdelay_Req messages are transmitted.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYTRENR register is used to enable or disable transmission of PTP messages.
The PDRQ and DRQ bits should not be set to 1 at the same time. Operation is not guaranteed when both bits are set to 1.
The value specified by the SYTRENR register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.53 Master Clock ID Registers (MTCIDU, MTCIDL)

Address(es): EPTPC0.MTCIDU E820 58A0h, EPTPC1.MTCIDU E820 5CA0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the clock-ID of the master clock.	R/W

Address(es): EPTPC0.MTCIDL E820 58A4h, EPTPC1.MTCIDL E820 5CA4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the clock-ID of the master clock.	R/W

Registers MTCIDU and MTCIDL are used to set the clock-ID of the master for synchronization.
The value specified by registers MTCIDU and MTCIDL is only reflected in the SYNFP module after the SYRVLDR.BMUP bit is set to 1.

28.2.54 Master Clock Port Number Register (MTPID)

Address(es): EPTPC0.MTPID E820 58A8h, EPTPC1.MTPID E820 5CA8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PNUM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PNUM [15:0]	Master Clock Port Number Setting	These bits hold the setting for the port number of the master clock.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The MTPID register is used to set the port number of the master for synchronization.
The value specified by the MTPID register is only reflected in the SYNFP module after the SYRVLDR.BMUP bit is set to 1.
In normal usage, set the value of parentDS.parentPortIdentity.portNumber in this register.

28.2.55 SYNFP Transmission Interval Setting Register (SYTLIR)

Address(es): EPTPC0.SYTLIR E820 58C0h, EPTPC1.SYTLIR E820 5CC0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DREQ[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC[7:0]								ANCE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	ANCE[7:0]	Announce Message Transmission Interval Setting	These bits set the interval for the transmission of Announce messages.	R/W
b15 to b8	SYNC[7:0]	Sync Message Transmission Interval Setting	These bits set the interval for the transmission of Sync messages. The setting is also placed in the logMessageInterval field of transmitted Sync messages.	R/W
b23 to b16	DREQ[7:0]	Delay_Req Transmission Interval Average Value/ Pdelay_Req Transmission Interval Setting	The bits set the average interval for the transmission of Delay_Req messages and the interval for the transmission of Pdelay_Req messages. The setting is also placed in the logMessageInterval field of Delay_Resp messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYTLIR register is used to set the interval for the transmission of messages generated by the SYNFP module. The setting is an integer logarithm in base 2 (log2(x)) and determines a value x in seconds.
In other words, the interval for transmission is 2n (s), where n is the setting. The available settings are from -7 (F9h) to +6 (06h).

Example:
If the setting is 06h, then the interval for transmission is $2^6 = 64$ (s).
If the setting is 00h, then the interval for transmission is $2^0 = 1$ (s).
If the setting is FFh, then the interval for transmission is $2^{-1} = 0.5$ (s) = 500 (ms).
If the setting is F9h, then the interval for transmission is $2^{-7} = 0.0078125$ (s) = 7.8125 (ms).

The value set in the ANCE[7:0] bits is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.
The value set in the DREQ[7:0] and SYNC[7:0] bits is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.56 SYNFP Received logMessageInterval Value Indication Register (SYRLIR)

Address(es): EPTPC0.SYRLIR E820 58C4h, EPTPC1.SYRLIR E820 5CC4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DRESP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC[7:0]								ANCE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	ANCE[7:0]	Announce Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Announce message.	R
b15 to b8	SYNC[7:0]	Sync Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Sync message.	R
b23 to b16	DRESP[7:0]	Delay_Resp Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Delay_Resp message.	R
b31 to b24	—	Reserved	These bits are read as 0.	R

The SYRLIR register indicates the logMessageInterval field values of received PTP messages.

28.2.57 offsetFromMaster Value Registers (OFMRU, OFMRL)

Address(es): EPTPC0.OFMRU E820 58C8h, EPTPC1.OFMRU E820 5CC8h zzz

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits indicate the higher-order 32 bits of the calculated offsetFromMaster value.	R

Address(es): EPTPC0.OFMRL E820 58CCh, EPTPC1.OFMRL E820 5CCCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits indicate the lower-order 32 bits of the calculated offsetFromMaster value.	R

Registers OFMRU and OFMRL indicate the calculated offsetFromMaster value.
The value is expressed as two's complements in units of nanoseconds. Note that the numeric representation*1 differs from that of the offsetFromMaster member of the current data set (currentDS).
When read, access to the registers should be in order of OFMRU and then OFMRL.

Note 1. The value of currentDS.offsetFromMaster is multiplied by 2^{16}.
Example: 2.5 (ns) = 00000000_00028000h

28.2.58 meanPathDelay Value Registers (MPDRU, MPDRL)

Address(es): EPTPC0.MPDRU E820 58D0h, EPTPC1.MPDRU E820 5CD0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits indicate the higher-order 32 bits of the calculated meanPathDelay value.	R

Address(es): EPTPC0.MPDRL E820 58D4h, EPTPC1.MPDRL E820 5CD4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits indicate the lower-order 32 bits of the calculated meanPathDelay value.	R

Registers MPDRU and MPDRL indicate the calculated meanPathDelay value.
The value is expressed as two's complements in units of nanoseconds. Note that the numeric representation*1 differs from that of the meanPathDelay member of the current data set (currentDS).
When read, access to the registers should be in order of MPDRU and then MPDRL.

Note 1. The value of currentDS.meanPathDelay is multiplied by 2^{16}.
Example: 2.5 (ns) = 00000000_00028000h

28.2.59 grandmasterPriority Field Setting Register (GMPR)

Address(es): EPTPC0.GMPR E820 58E0h, EPTPC1.GMPR E820 5CE0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	GMPR1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	GMPR2[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	GMPR2 [7:0]	grandmasterPriority2 Field Value Setting	These bits are used to set the value of the grandmasterPriority2 fields of Announce messages.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b23 to b16	GMPR1 [7:0]	grandmasterPriority1 Field Value Setting	These bits are used to set the value of the grandmasterPriority1 fields of Announce messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The GMPR register is used to specify the grandmasterPriority1 and grandmasterPriority2 field values of Announce messages generated by the SYNFP module.
The value specified by the GMPR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

28.2.60 grandmasterClockQuality Field Setting Register (GMCQR)

Address(es): EPTPC0.GMCQR E820 58E4h, EPTPC0.GMCQR E820 5CE4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

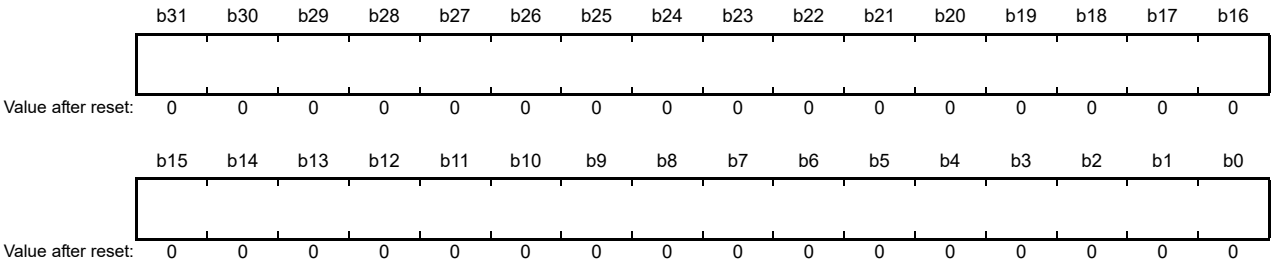
Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits are used to set the value of the grandmasterClockQuality fields of Announce messages. The correspondence between bits and the grandmasterClockQuality fields is as listed below. b31 to b24: clockClass b23 to b16: clockAccuracy b15 to b0: offsetScaledLogVariance	R/W

The GMCQR register is used to specify the grandmasterClockQuality field value of Announce messages generated by the SYNFP module.

The value specified by the GMCQR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

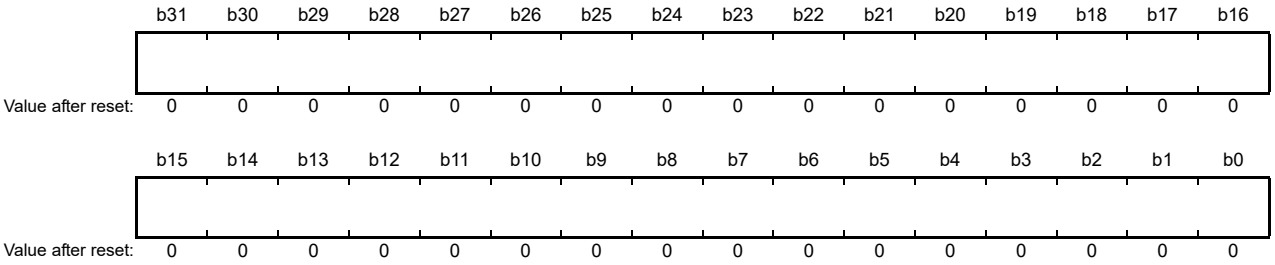
28.2.61 grandmasterIdentity Field Setting Registers (GMIDRU, GMIDRL)

Address(es): EPTPC0.GMIDRU E820 58E8h, EPTPC1.GMIDRU E820 5CE8h



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the higher-order 32 bits of the value of the grandmasterIdentity fields of Announce messages.	R/W

Address(es): EPTPC0.GMIDRL E820 58ECh, EPTPC1.GMIDRL E820 5CECh

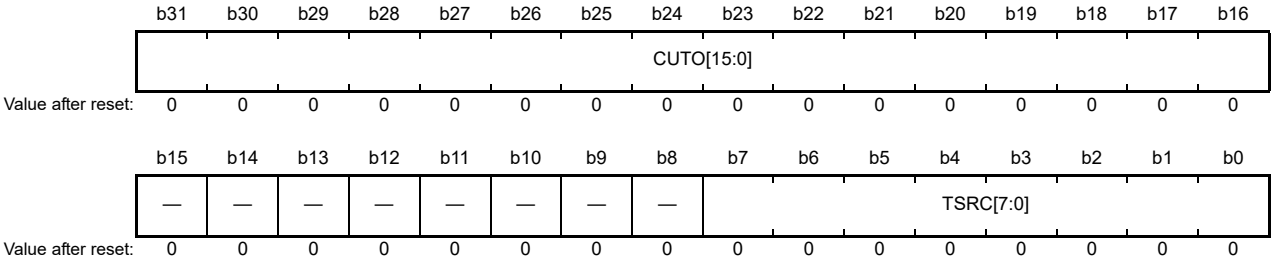


Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the value of the grandmasterIdentity fields of Announce messages.	R/W

Registers GMIDRU and GMIDRL are used to specify the grandmasterIdentity field value of Announce messages generated by the SYNFP module.
The value specified by registers GMIDRU and GMIDRL is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

28.2.62 currentUtcOffset/timeSource Field Setting Register (CUOTSR)

Address(es): EPTPC0.CUOTSR E820 58F0h, EPTPC1.CUOTSR E820 5CF0h

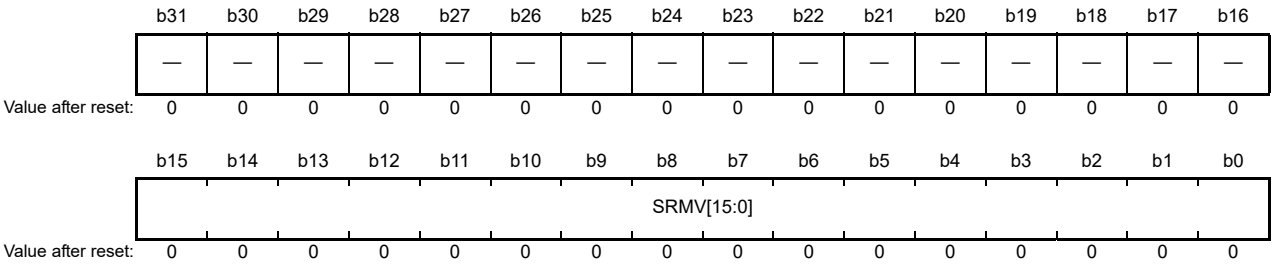


Bit	Symbol	Bit Name	Description	R/W
b7 to b0	TSRC[7:0]	timeSource Field Setting	These bits set the value of the timeSource fields of Announce messages.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b31 to b16	CUTO[15:0]	currentUtcOffset Field Setting	These bits set the value of the currentUtcOffset fields of Announce messages.	R/W

The CUOTSR register is used to specify the currentUtcOffset and timeSource field values of Announce messages generated by the SYNFP module.
The value specified by the CUOTSR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

28.2.63 stepsRemoved Field Setting Register (SRR)

Address(es): EPTPC0.SRR E820 58F4h, EPTPC1.SRR E820 5CF4h



Bit	Symbol	Bit Name	Description	R/W
b15 to b0	SRMV [15:0]	stepsRemoved Field Value Setting	These bits set the value of the stepsRemoved fields of Announce messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SRR register is used to specify the stepsRemoved field value of Announce messages generated by the SYNFP module.
The value specified by the SRR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

28.2.64 PTP-primary Message Destination MAC Address Setting Registers (PPMACRU, PPMACRL)

Address(es): EPTPC0.PPMACRU E820 5900h, EPTPC1.PPMACRU E820 5D00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	1	1	0	1	1	0	0	0	1	1	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the destination MAC address for PTP-primary messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PPMACR registers are used to specify the destination MAC address for PTP-primary messages. In normal usage, set 01:1B:19:00:00:00 in these registers.

The value is used in the destination MAC address field when generating an Ethernet frame for a PTP-primary message. It is also used as a determining condition for received frames carrying PTP messages.

Set a value in these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.65 PTP-pdelay Message MAC Address Setting Registers (PDMACRU, PDMACRL)

Address(es): EPTPC0.PDMACRU E820 5908h, EPTPC1.PDMACRU E820 5D08h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	0	0	0	0	0	0	0	1	1	0	0	0	0	1	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the higher-order 24 bits of the destination MAC address for PTP-pdelay messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Address(es): EPTPC0.PDMACRL E820 590Ch, EPTPC1.PDMACRL E820 5D0Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the destination MAC address for PTP-pdelay messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PDMACR registers are used to specify the destination MAC address for PTP-pdelay messages. In normal usage, set 01:80:C2:00:00:0E in these registers.

The value is used in the destination MAC address field when generating frames carrying PTP-pdelay messages in the Ethernet format. It is also used as a determining condition for received frames carrying PTP messages.

Set a value in these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.66 PTP Message Ethertype Setting Register (PETYPER)

Address(es): EPTPC0.PETYPER E820 5910h, EPTPC1.PETYPER E820 5D10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TYPE[15:0]															
Value after reset:	1	0	0	0	1	0	0	0	1	1	1	1	0	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TYPE [15:0]	PTP Message Ethertype Value Setting	These bits hold the setting for the Ethertype field value for frames in the Ethernet II format.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PETYPER register is used to specify the Ethertype field for frames carrying the PTP messages. In normal usage, set 0000 88F7h in this register.
The value is used in the Ethertype field when generating frames carrying PTP messages in the Ethernet II format. It is also used as a determining condition for received frames carrying PTP messages.
Set a value in these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.67 PTP-primary Message Destination IP Address Setting Register (PPIPR)

Address(es): EPTPC0.PPIPR E820 5920h, EPTPC1.PPIPR E820 5D20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the destination IP address for PTP-primary messages.	R/W

The PPIPR register is used to specify the destination IP address for PTP messages. In normal usage, set E000 0181h (224.0.1.129) in this register.

The value is used in the destination IP address field when generating frames carrying PTP-primary messages in the IPv4 format. The lower-order 23 bits are also used in the destination MAC address field for Ethernet frames. The value is also used as a determining condition for received frames carrying PTP messages.

Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.68 PTP-pdelay Message Destination IP Address Setting Register (PDIPR)

Address(es): EPTPC0.PDIPR E820 5924h, EPTPC1.PDIPR E820 5D24h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	0	1	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the destination IP address for PTP-pdelay messages.	R/W

The PDIPR register is used to specify the destination IP address for PTP-pdelay messages. In normal usage, set E000 006Bh (224.0.0.107) in this register.

The value is used in the destination IP address field when generating frames carrying PTP-pdelay messages in the IPv4 format. The lower-order 23 bits are also used in the destination MAC address field for Ethernet frames. The value is also used as a determining condition for received frames carrying PTP messages.

Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.69 PTP Event Message TOS Setting Register (PETOSR)

Address(es): EPTPC0.PETOSR E820 5928h, EPTPC1.PETOSR E820 5D28h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	EVTO[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	EVTO[7:0]	PTP Event Message TOS Field Value Setting	These bits hold the setting for the value of the TOS field within the IPv4 headers of PTP event messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PETOSR register is used to set the TOS (type of service) field value within the IPv4 headers of PTP event messages. Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.70 PTP general Message TOS Setting Register (PGTOSR)

Address(es): EPTPC0.PGTOSR E820 592Ch, EPTPC1.PGTOSR E820 5D2Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	GETO[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	GETO[7:0]	PTP general Message TOS Field Value Setting	These bits hold the setting for the value of the TOS field within the IPv4 headers of PTP general messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PGTOSR register is used to set the TOS (type of service) field value within the IPv4 headers of PTP general messages.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.71 PTP-primary Message TTL Setting Register (PPTTLR)

Address(es): EPTPC0.PPTTLR E820 5930h, EPTPC1.PPTTLR E820 5D30h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PRTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	PRTL[7:0]	PTP-primary Message TTL Field Value Setting	These bits hold the setting for the value of the TTL field within the IPv4 headers of PTP-primary messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PPTTLR register is used to set the TTL (time to live) field value within the IPv4 headers of PTP-primary messages. Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.72 PTP-pdelay Message TTL Setting Register (PDTTLR)

Address(es): EPTPC0.PDTTLR E820 5934h, EPTPC1.PDTTLR E820 5D34h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PDTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	PDTL[7:0]	PTP-pdelay Message TTL Field Value	These bits hold the setting for the value of the TTL field within the IPv4 headers of PTP-pdelay messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PDTTLR register is used to set the TTL field value within the IPv4 headers of PTP-pdelay messages.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.73 PTP Event Message UDP Destination Port Number Setting Register (PEUDPR)

Address(es): EPTPC0.PEUDPR E820 5938h, EPTPC1.PEUDPR E820 5D38h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EVUPT [15:0]	PTP Event Message Destination Port Number Setting	These bits hold the setting for the value of the destination port number field within the UDP headers of PTP event messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PEUDPR register is used to set the destination port number field value within the UDP headers of PTP event messages. In normal usage, set 013Fh (319) in this register.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.74 PTP general Message UDP Destination Port Number Setting Register (PGUDPR)

Address(es): EPTPC0.PGUDPR E820 593Ch, EPTPC1.PGUDPR E820 5D3Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GEUPT[15:0]															
Value after reset:	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	GEUPT [15:0]	PTP general Message Destination Port Number	These bits hold the setting for the value of the destination port number field within the UDP headers of PTP general messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

The PGUDPR register is used to set the destination port number field value within the UDP headers of PTP general messages. In normal usage, set 0140h (320) in this register.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.75 Frame Reception Filter Setting Register (FFLTR)

Address(es): EPTPC0.FFLTR E820 5940h, EPTPC1.FFLTR E820 5D40h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXTPRM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ENB	PRT	SEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEL	Receive MAC Address Select*1	This bit selects how filtering is handled when multicast frames other than PTP messages are received. b2 b0 0 0 0: Filtering is disabled (all multicast frames are received). 0 0 1: Filtering is disabled (all multicast frames are received). 0 1 0: Filtering is disabled (all multicast frames are received). 0 1 1: Filtering is disabled (all multicast frames are received). 1 0 0: Do not receive multicast frames. 1 0 1: Do not receive multicast frames. 1 1 0: Only receive multicast frames matching the MAC address setting in registers FMAC0RU and FMAC0RL. 1 1 1: Only receive multicast frames matching the MAC address setting in registers FMAC1RU and FMAC1RL).	R/W
b1	PRT	Frame Reception Enable*1		R/W
b2	ENB	Reception Filter Enable*1		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	EXTPRM	Extended Promiscuous Mode Setting	0: Normal operation (unicast frames addressed to the EPTPC are received, filtering of PTP frames is applied, multicast filtering is applied, and all broadcast frames are received). 1: Extended promiscuous mode (all frames are received)	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. The setting of these bits is only effective when the EXTPRM bit is 0.

The FFLTR register is used to switch extended promiscuous mode on or off and to select how filtering is handled when multicast frames other than PTP messages are received.
The filter for the reception of multicast frames other than PTP messages is enabled by setting the ENB, PRT, and SEL bits to 110b or 111b. Frames passed by the filter are then transferred by EDMACn.
Relaying of multicast frames other than PTP messages is in accord with the TRNMR register and relaying and reception of PTP messages is in accord with the setting of registers SYRFL1R and SYRFL2R.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.76 Frame Reception Filter MAC Address 0 Setting Registers (FMAC0RU, FMAC0RL)

Address(es): EPTPC0.FMAC0RU E820 5960h, EPTPC1.FMAC0RU E820 5D60h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the higher-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Address(es): EPTPC0.FMAC0RL E820 5964h, EPTPC1.FMAC0RL E820 5D64h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Registers FMAC0RU and FMAC0RL are used to specify the MAC address for filtering in the reception of multicast frames other than PTP messages.

Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.77 Frame Reception Filter MAC Address 1 Setting Registers (FMAC1RU, FMAC1RL)

Address(es): EPTPC0.FMAC1RU E820 5968h, EPTPC1.FMAC1RU E820 5D68h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the higher-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Address(es): EPTPC0.FMAC1RL E820 596Ch, EPTPC1.FMAC1RL E820 5D6Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	—	—	These bits hold the setting for the lower-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Registers FMAC1RU and FMAC1RL are used to specify the MAC address for filtering in the reception of multicast frames other than PTP messages.

Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.78 Asymmetric Delay Setting Registers (DASYMRU, DASYMRL)

Address(es): EPTPC0.DASYMRU E820 59C0h, EPTPC1.DASYMRU E820 5DC0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	—	These bits hold the setting for the higher-order 16 bits of the asymmetric delay value. Set them to 0000h in this MCU.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

Address(es): EPTPC0.DASYMRL E820 59C4h, EPTPC1.DASYMRL E820 5DC4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	These bits hold the setting for the lower-order 32 bits of the asymmetric delay value. Set them to 0000 0000h in this MCU.	R/W

Registers DASYMRU and DASYMRL are used to set the asymmetric delay value (delayAsymmetry).

Set the registers DASYMRU and DASYMRL to 0000 0000h in this MCU.

28.2.79 Timestamp Latency Setting Register (TSLATR)

Address(es): EPTPC0.TSLATR E820 59C8h, EPTPC1.TSLATR E820 5DC8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	INGP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EGP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EGP [15:0]	Output Port Timestamp Latency Setting	These bits hold the setting for the time stamp latency (ns) for the output ports.	R/W
b31 to b16	INGP [15:0]	Input Port Timestamp Latency Setting	These bits hold the setting for the time stamp latency (ns) for the input ports.	R/W

The TSLATR register is used to set the amount of latency in timestamp acquisition in nanoseconds.
The value should not be modified while reception or transmission of PTP messages is enabled.

EGP[15:0] Bits (Output Port Timestamp Latency Setting)

Set the corresponding fixed value in Table 28.9. The timestamp latency differs with the link transfer rate (100 Mbps or 10 Mbps) and the frequency of the STCA clock (25 or 50 MHz).

Table 28.9 Settings of the EGP[15:0] Bits (ns)

		STCA Clock Frequency		
Link Transfer Rate		20 MHz	25 MHz	50 MHz
MII	100 Mbps	590	625	695
	10 Mbps	7430	7465	7535
RMII	100 Mbps	770	805	875
	10 Mbps	9230	9265	9335

INGP[15:0] Bits (Input Port Timestamp Latency Setting)

Set the corresponding fixed value in Table 28.10. The timestamp latency differs with the link transfer rate (100 Mbps or 10 Mbps) and the frequency of the STCA clock (25 or 50 MHz).

Table 28.10 Settings of the INGP[15:0] Bits (ns)

		STCA Clock Frequency		
Link Transfer Rate		20 MHz	25 MHz	50 MHz
MII	100 Mbps	980	945	875
	10 Mbps	8180	8145	8075
RMII	100 Mbps	1060	1025	955
	10 Mbps	8980	8945	8875

28.2.80 SYNFP Operation Setting Register (SYCONFR)

Address(es): EPTPC0.SYCONFR E820 59CCh, EPTPC1.SYCONFR E820 5DCCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	TCMOD	—	—	—	FILDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SBDIS	—	—	—	—	TCYC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	TCYC[7:0]	PTP Message Transmission Interval Setting	These bits are used to set the time from the completion of one transmission to the start of the next in cycles of the transmission clock. A value n in these bits means that a transmission interval of n cycles will be secured. No interval is secured if the setting is 00h. The recommended value is 28h (40 cycles).	R/W
b11 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	SBDIS	Sync Message Transmission Bandwidth Securing Disable	0: Securing of the bandwidth for the transmission of SYNC messages is enabled (transfer by the EDMAC is given lower priority). 1: Securing of the bandwidth for the transmission of SYNC messages is disabled (transfer by the EDMAC is given higher priority).	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	FILDIS	Receive Message domainNumber Filter Disable	0: Filtering conditions for the reception of PTP messages include comparison with the domainNumber field. 1: Filtering conditions for the reception of PTP messages do not include comparison with the domainNumber field.	R/W
b19 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b20	TCMOD	TC Mode Setting	0: E2E TC 1: P2P TC	R/W
b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYCONFR register controls operation of the SYNFP module.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

TCYC[7:0] Bits (PTP Message Transmission Interval Setting)

The TCYC[7:0] bits are used to secure the waiting time between packets to keep a fixed transmission delay time.
The setting defines the interval from input of the transmission completed signal from the ETHERC to output of the next transmission request as a number of cycles of the transmission clock (which runs at 2.5 MHz if the link transfer rate is 10 Mbps and at 25 MHz if the rate is 100 Mbps).

SBDIS Bit (Sync Message Transmission Bandwidth Securing Disable)

This bit disables securing of bandwidth to increase accuracy of the interval for the transmission of SYNC messages.

TCMOD Bit (TC Mode Setting)

This bit sets the delay mechanism for operation as a transparent clock (TC). The bit setting changes the method of calculating the values used in the correctionField field during operation as a TC.

28.2.81 SYNFP Frame Format Setting Register (SYFORMR)

Address(es): EPTPC0.SYFORMR E820 59D0h, EPTPC1.SYFORMR E820 5DD0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FORM1	FORM0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FORM0	Ethernet Frame Format Setting	Set this bit to 0 (Ethernet II frame format). 0: Ethernet II frame format	R/W
b1	FORM1	Ethernet/UDP Encapsulation	0: PTP directly over Ethernet 1: PTP over UDP/IPv4	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

The SYFORMR register is used to set the format for frame generation by the SYNFP module.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

28.2.82 Response Message Reception Timeout Register (RSTOUTR)

Address(es): EPTPC0.RSTOUTR E820 59D4h, EPTPC1.RSTOUTR E820 5DD4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
31 to b0	—	Response Message Reception Timeout Time Setting	A response message not being received within n × 1024 (ns), where n is the setting, is judged to represent a timeout.	R/W

The RSTOUTR register is used to set the time for detection of a timeout in the reception of PTP response messages (Delay_Resp and Pdelay_Resp).
If a Delay_Resp or Pdelay_Resp message is not received within the time specified by this register after transmission of a Delay_Req or Pdelay_Req message, the SYSR.DRPTO flag becomes 1.
The value specified by this register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

28.2.83 PTP Reset Register (PTRSTR)

Address(es): EPTPC.PTRSTR E820 4500h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RESET
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RESET	EPTPC Software Reset	0: The EPTPC is not reset. 1: The EPTPC is reset.*1	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Do not access the EPTPC-related registers other than this register while a software reset is being issued.

The PTRSTR register is used to reset the EPTPC.
It takes 64 cycles of the peripheral module clock (Bφ) until initialization of the EPTPC is completed. After the RESET bit is set to 1, wait for 64 cycles of the Bφ before setting its value back to 0.

28.2.84 STCA Clock Select Register (STCSELR)

Address(es): EPTPC.STCSELR E820 4504h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCLKSEL[2:0]			—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2, b1	—	Reserved	These bits are read as 1. The write value should be1.	R
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b10 to b8	SCLKSEL [2:0]	STCA Clock Select	b10 b8 0 1 0: Input clock from the REF50CK0 pin 0 1 1: Input clock from the REF50CK1 pin 1 0 0: Input clock from the ET0_RX_CLK pin / Input clock from the ET0_SCLKIN pin 1 0 1: Input clock from the ET1_RX_CLK pin / Input clock from the ET1_SCLKIN pin Settings other than above are prohibited.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

The STCSELR register selects the STCA clock signal for use in the EPTPC.
Set a value in this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

SCLKSEL[2:0] Bits (STCA Clock Select)

These bits select the STCA clock signal for use in the EPTPC.
Switching of ETn_RX_CLK/ETn_SCLKIN is selected with an Etn_EXOUT_SEL bit of section 51.3.36, Peripheral Pin Function Control Register (PMODEPFS). For details, refer to section 51, GPIO.

28.2.85 1588 Module Bypass Register (BYPASS)

Address(es): EPTPC.BYPASS E820 4508h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BYPASS1
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BYPASS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BYPASS0	Ether 0ch 1588 module bypass setting	0: Use the 1588 module of Ethernet channel 0. 1: Bypass the 1588 module of Ethernet channel 0.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	
b16	BYPASS1	Ether 1ch 1588 module bypass setting	0: Use the 1588 module of Ethernet channel 1. 1: Bypass the 1588 module of Ethernet channel 1.	
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: Do not access the bypass register while the Ethernet is operating. The 1588 module can be bypassed by setting the bypass register if EPTPC is not used.

28.3 Operation

The EPTPC is set not to receive (analyze) and transmit (generate) PTP messages after release from the reset state. Accordingly, the EPTPC has no effect on the transmission and reception of frames by the ETHERC and EDMAC at that time.

Settings of the EPTPC registers are required for the ETHERC and EDMAC to be able to use packet filtering by MAC address in the SYNFP modules and for relaying between Ethernet ports by the PRC-TC module. That is, the transmission and reception of PTP messages requires setting of the EPTPC.

Figure 28.4 is a block diagram of the modules involved in transferring and relaying frames.

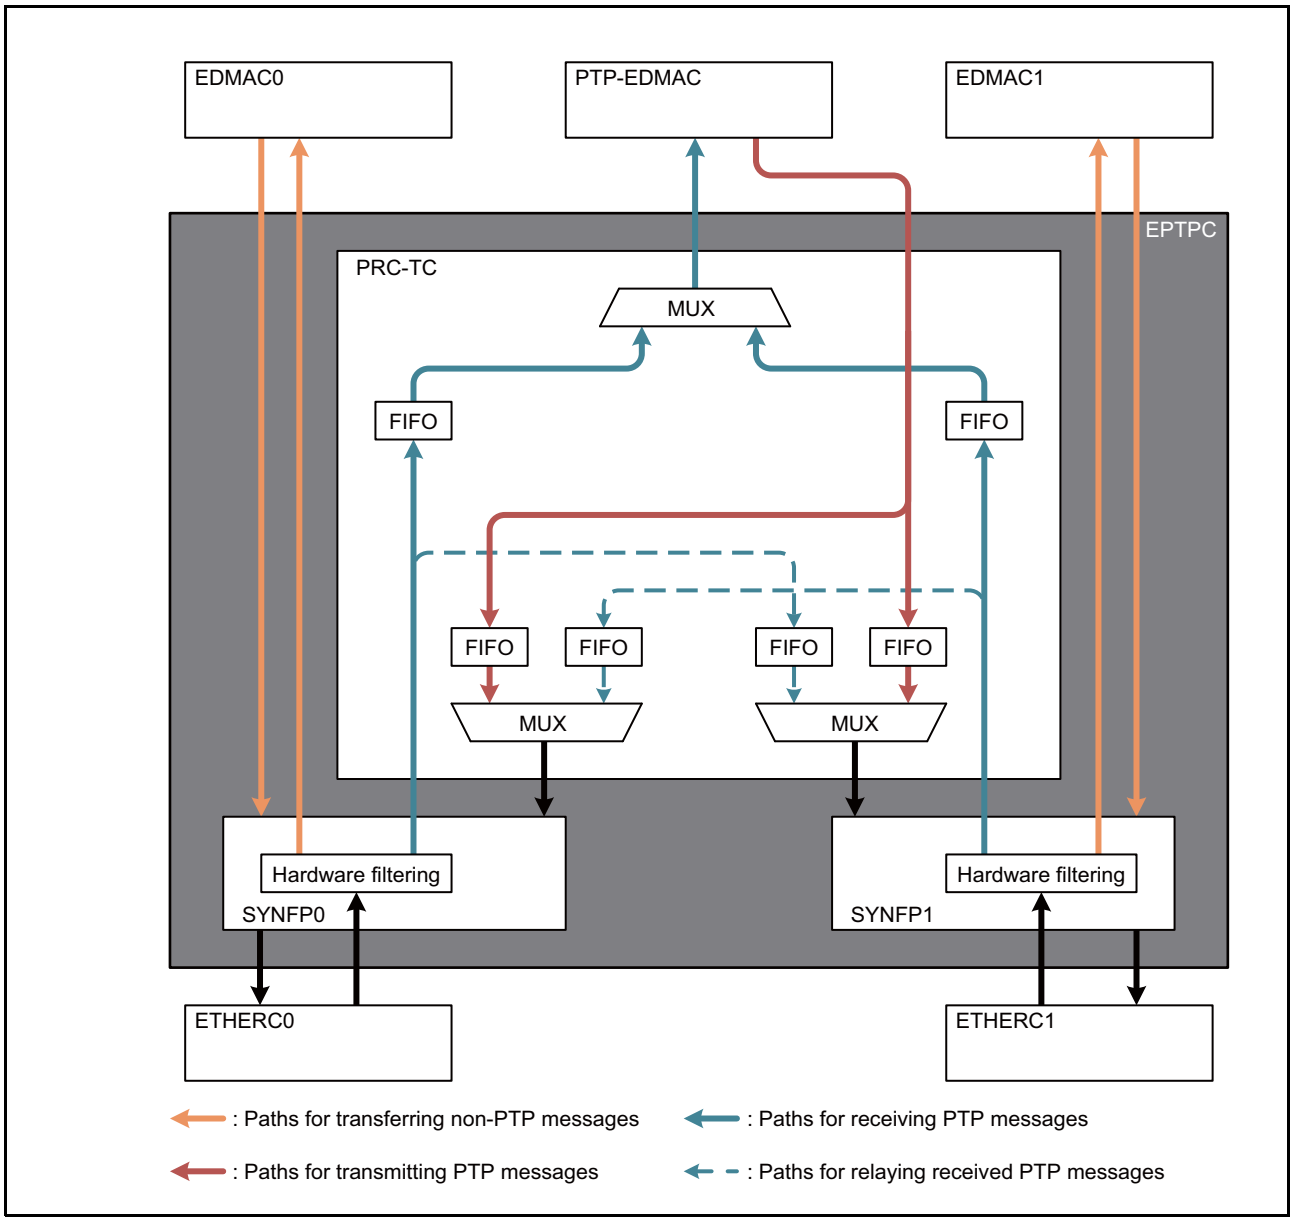

Figure 28.4 Block Diagram of the Modules Involved in Transferring and Relaying Frames

28.3.1 Transmission and Reception and Relaying of Non-PTP Messages

The EPTPC operates in extended promiscuous mode if the setting of the FFLTR.EXTPRM bit is 1 (extended promiscuous mode). In this mode, all frames received by the Ethernet ports are transferred to the EDMAC without filtering.

The EPTPC operates in normal mode if the setting of the FFLTR.EXTPRM bit is 0 (normal operation). In this mode, the SYNFP module applies its hardware filtering function to filter frames received by the Ethernet ports.

Frames for the other node can also be relayed to the Ethernet port on the other side in accord with the settings of the TRNMR.FWD0 and FWD1 bits.

The EPTPC and EDMAC transfer received unicast frames if they are for the given node. When a received frame is for the other node, the EPTPC is able to relay received frames to the other port if relaying between Ethernet ports is enabled.

Operation when multicast frames are received can be selected from the following: frames are transferred to the EDMAC, frames are not transferred to the EDMAC, or frames are transferred to the EDMAC only when the address matches the specified MAC address. The EPTPC also relays multicast frames to the other Ethernet port if relaying between Ethernet ports is enabled.

The EPTPC transfers received broadcast frames to the EDMAC for the receiving Ethernet port. The EPTPC also relays broadcast frames to the other Ethernet port if relaying between Ethernet ports is enabled.

The PRC-TC module, which handles the relaying of frames received by one Ethernet port to the other Ethernet port, has a relaying FIFO buffer for use in this process. Either of two methods for reading out from the relaying FIFO is selectable: store and forward or cut-through. With the cut-through method, reading out from the relaying FIFO starts when it holds more than one frame or more data than a specified threshold value, or when both of these conditions are satisfied. The TRNCTTDR.THVAL[10:0] bits specify the threshold value for reading out from the relaying FIFO.

With the cut-through method, when a frame is handled as an error frame due to a fault (such as malformed data being read) after a read operation starts, there is no procedure for notifying the ETHERC module of the error. Accordingly, the ETHERC may send such error frames over the line as if they were normal frames. Avoid situations of this kind by using the store-and-forward method with the relaying FIFO. With the store-and-forward method, the PRC-TC module internally discards error frames.

28.3.2 Paths for the Transfer of Non-PTP Messages

Messages received through the Ethernet port are transferred to the EDMAC. The PRC-TC module is capable of relaying messages between the Ethernet ports.

Figure 28.5 is a diagram of paths for the transmission and reception and relaying of non-PTP messages.

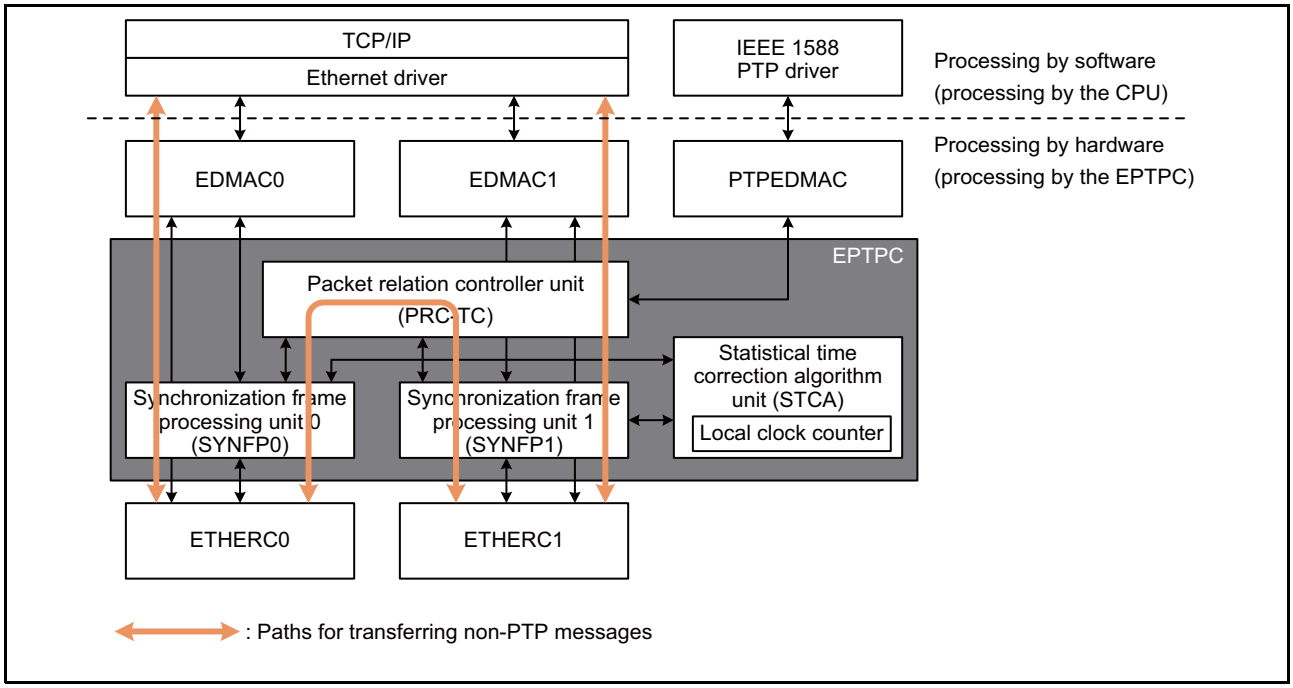

Figure 28.5 Paths for the Transmission and Reception and Relaying of Non-PTP Messages

28.3.3 Transmission and Reception and Relaying of PTP Messages

Hardware of the EPTPC automatically handles analysis of and the extraction of fields from received PTP messages, and generation and transmission of PTP messages. However, software must still handle the transmission of certain PTP messages. Table 28.11 shows the specifications for control over the transmission and reception of the various PTP messages.

Table 28.11 Control over the Transmission and Reception of PTP Messages

Message Type	Message	OC (Ordinary Clock)/BC (Boundary Clock)		TC (Transparent Clock)
		Master	Slave	
Event	Sync	Generation (automatic)	Reception (automatic)	Relaying (automatic)
	Delay_Req	Generation (automatic)	Reception (automatic)	Relaying (automatic)
	Pdelay_Req	Generation and reception (automatic)	Generation and reception (automatic)	Generation and reception (automatic)
	Pdelay_Resp	Generation and reception (automatic)	Generation and reception (automatic)	Generation and reception (automatic)
General	Announce	Generation (automatic)	Reception (software)	Reception (software)
	Follow_Up	—*1	Reception (automatic)	Relaying (automatic)
	Delay_Resp	Packet generation	Reception (automatic)	Relaying (automatic)
	Pdelay_Resp_Follow_Up	—*1	Reception (automatic)	Relaying (automatic)
	Management	Transmission and reception (software)	Transmission and reception (software)	Relaying (automatic)
	Signaling	Transmission and reception (software)	Transmission and reception (software)	Relaying (automatic)

Note 1. Control is not required as the clock in this case is a one-step clock.

28.3.4 Paths for the Transfer of PTP Messages

Paths for the transfer of PTP messages differ according to whether transfer requires processing by software or is automatically processed by hardware.

28.3.4.1 Paths for the Transfer of PTP Messages Requiring Processing by Software

Paths for the transfer of PTP messages where transfer requires processing by software are shown in Figure 28.6. The figure shows paths for message, clock-type, and process combinations for which "(software)" is indicated inTable 28.11.

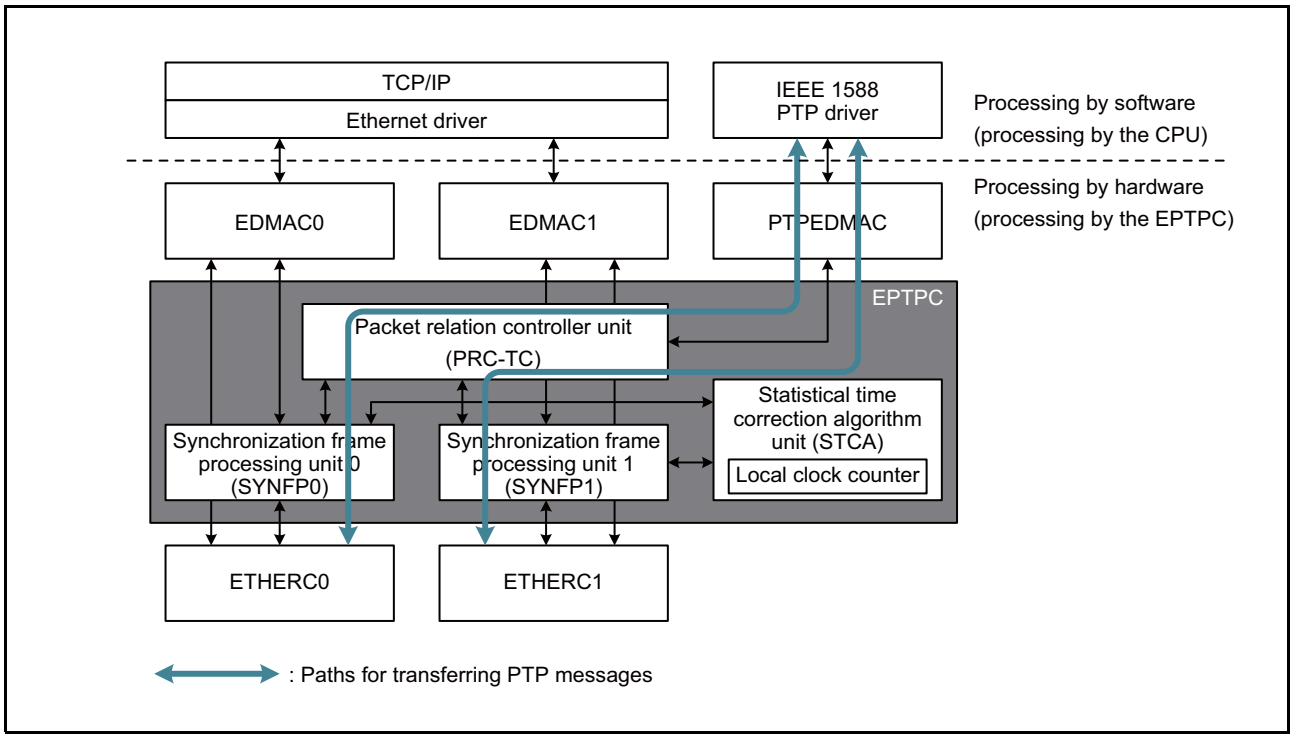

Figure 28.6 Paths for the Transfer of PTP Messages Requiring Processing by Software

28.3.4.2 Paths for the Transfer of PTP Messages Automatically Handled by Hardware

In the case of PTP messages for which hardware automatically handles the processing, the SYNFP modules handle transmission and reception, and the PRC-TC module handles relaying.

(1) Generation of and Response to PTP Messages by Hardware

Paths for transfer in the automatic generation of and response to PTP messages by the SYNFP modules are shown in Figure 28.7. The paths in the figure are used for operations “Generation (automatic)”, “Reception (automatic)”, and “Generation and reception (automatic)” indicated in Table 28.11.

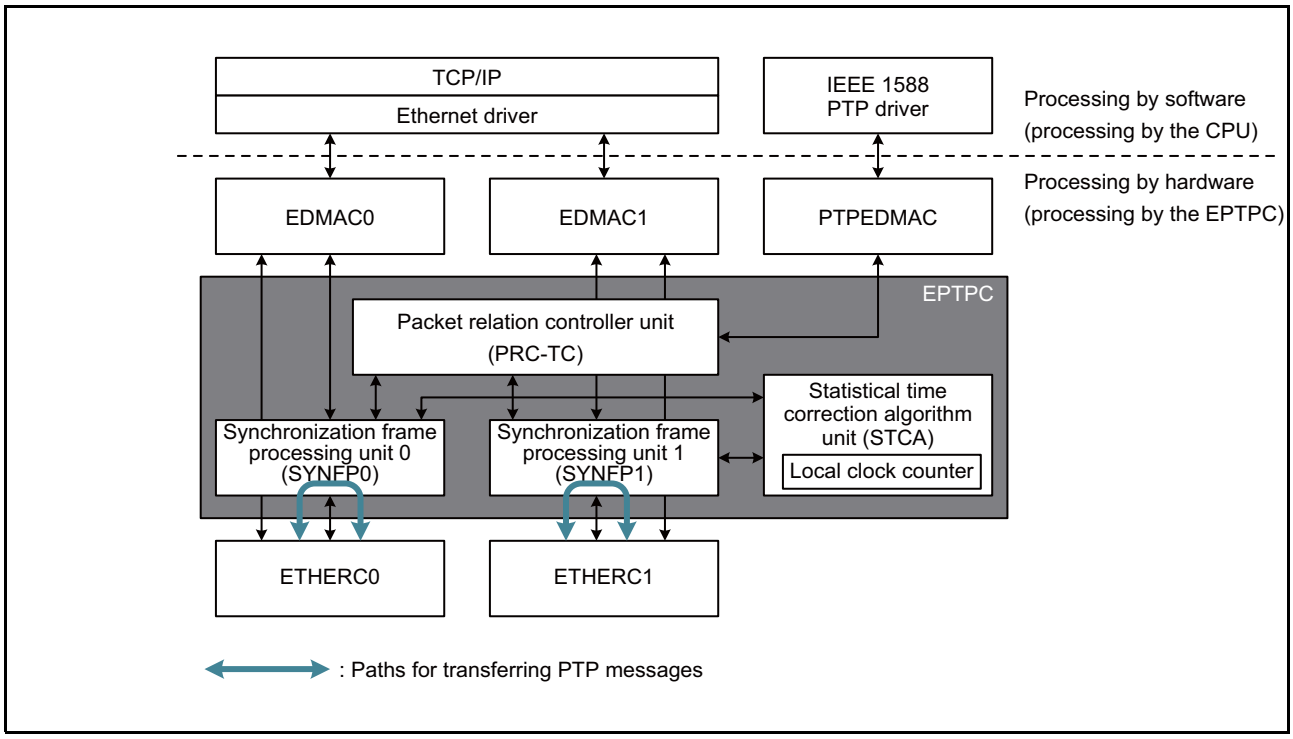

Figure 28.7 Paths for the Generation of and Response to PTP Messages by Hardware

(2) Relaying of PTP Messages by Hardware

Figure 28.8 shows paths for the relaying of PTP messages by the PRC-TC module. The paths in the figure are used for the “Relaying” operation indicated in Table 28.11.

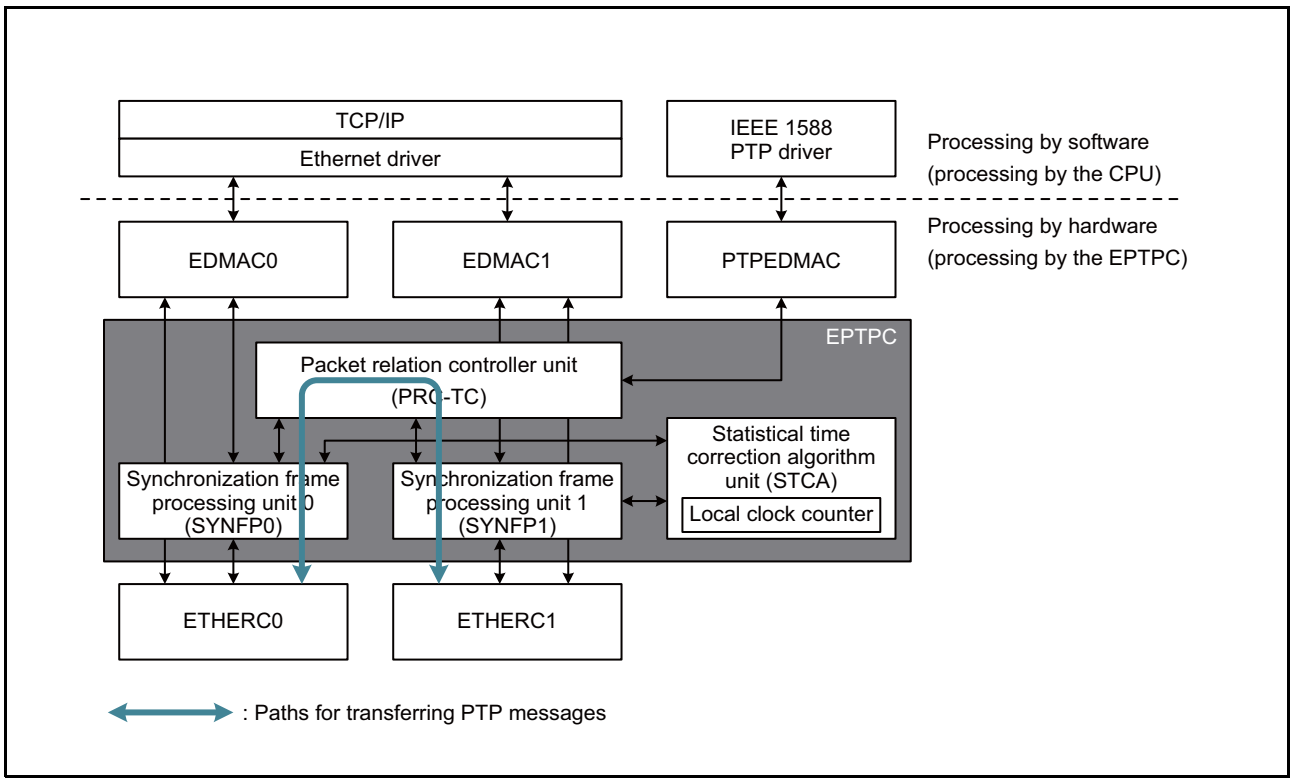

Figure 28.8 Paths for the Relaying of PTP Messages by Hardware

28.3.5 Clock Devices

The EPTPC can operate as the clock device defined in IEEE 1588.

28.3.5.1 End-to-End (E2E)

(1) Master

PTP messages are transmitted and received as listed below in operation as an end-to-end (E2E) master.

Table 28.12 List of PTP Message Processing (by an E2E Master)

Message Type	Message	Details of Processing
Event	Sync	Sync messages are transmitted at the fixed interval specified by the SYTLIR.SYNC[7:0] bits.
	Delay_Req	When this message is received, a Delay_Resp message is transmitted in response.
	Pdelay_Req	—
	Pdelay_Resp	—
General	Announce	Announce messages are transmitted at the fixed interval specified by the SYTLIR.ANCE[7:0] bits.
	Follow_Up	—
	Delay_Resp	This is transmitted as the response to a received Delay_Req messages.
	Pdelay_Resp_Follow_Up	—
	Management	Management messages are transmitted and received by software via the PTPEDMAC.
	Signaling	Signaling messages are transmitted and received by software via the PTPEDMAC.

(2) Slave

PTP messages are transmitted and received as listed below in operation as an E2E slave, and the calculated offsetFromMaster is used to correct the local time information.

Table 28.13 List of PTP Message Processing (by an E2E Slave)

Message Type	Message	Details of Processing
Event	Sync	The offsetFromMaster value is calculated when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
	Delay_Req	Delay_Req messages are transmitted at random intervals from 0 to the time specified by the SYTLIR.DREQ[7:0] bits × 2.
	Pdelay_Req	—
	Pdelay_Resp	—
General	Announce	Announce messages are transmitted by software via the PTPEDMAC.
	Follow_Up	The offsetFromMaster value is calculated when this message is received if twoStepFlag in flagField of the most recently received Sync message was TRUE (two-step clock).
	Delay_Resp	The meanPathDelay value is calculated when this message is received.
	Pdelay_Resp_Follow_Up	—
	Management	Management messages are transmitted and received by software via the PTPEDMAC.
	Signaling	Signaling messages are transmitted and received by software via the PTPEDMAC.

28.3.5.2 Peer-to-Peer (P2P)

(1) Master

PTP messages are transmitted and received as listed below in operation as a peer-to-peer (P2P) master.

Table 28.14 List of PTP Message Processing (by a P2P Master)

Message Type	Message	Details of Processing
Event	Sync	Timestamps for transmission are transmitted at the fixed interval specified by the SYTLIR.SYNC[7:0] bits. When this message is received, a Pdelay_Resp message is transmitted in response.
	Delay_Req	—
	Pdelay_Req	Pdelay_Req messages are transmitted at the fixed interval specified by the SYTLIR.DREQ[7:0] bits.
	Pdelay_Resp	This is transmitted as the response to a received Pdelay_Req messages. The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
General	Announce	Announce messages are transmitted at the fixed interval specified by the SYTLIR.ANCE[7:0] bits.
	Follow_Up	—
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE (two-step clock).
	Management	Management messages are transmitted by software via the PTPEDMAC.
	Signaling	Signaling messages are transmitted by software via the PTPEDMAC.

(2) Slave

PTP messages are transmitted and received as listed below in operation as a P2P slave, and the calculated offsetFromMaster is used to correct the local time information.

Table 28.15 List of PTP Message Processing (by a P2P Slave)

Message Type	Message	Details of Processing
Event	Sync	The offsetFromMaster value is calculated when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
	Delay_Req	—
	Pdelay_Req	Pdelay_Req messages are transmitted at the fixed interval specified by the SYTLIR.DREQ[7:0] bits. When this message is received, a Pdelay_Resp message is transmitted in response.
	Pdelay_Resp	This is transmitted as the response to a received Pdelay_Req messages. The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
General	Announce	Announce messages are transmitted by software via the PTPEDMAC.
	Follow_Up	The offsetFromMaster value is calculated when this message is received if twoStepFlag in flagField of the most recently received Sync message was TRUE (two-step clock).
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE (two-step clock).
	Management	Management messages are transmitted and received by software via the PTPEDMAC.
	Signaling	Signaling messages are transmitted and received by software via the PTPEDMAC.

28.3.5.3 Ordinary Clock (OC)

PTP messages are transmitted and received through one Ethernet port in operation as an ordinary clock.
An ordinary clock operates as the grand master clock or as a slave clock in the master-slave hierarchy.
For operation as an E2E master, E2E slave, P2P master, or P2P slave, see section 28.3.7, Operation as an E2E Master, section 28.3.8, Operation as an E2E Slave, section 28.3.10, Operation as a P2P Master, and section 28.3.11, Operation as a P2P Slave.

28.3.5.4 Boundary Clock (BC)

PTP messages are transmitted and received through both ports in operation as a boundary clock.
One port operates as a slave in synchronization with the root master clock and the other operates as the master that delivers time information synchronized with the master clock.
Both ports can also operate as masters.
For operation as an E2E master, E2E slave, P2P master, or P2P slave, see section 28.3.7, Operation as an E2E Master, section 28.3.8, Operation as an E2E Slave, section 28.3.10, Operation as a P2P Master, and section 28.3.11, Operation as a P2P Slave.

28.3.5.5 Transparent Clock (TC)

(1) E2E TC

In operation as an E2E transparent clock, received PTP-primary and PTP-pdelay messages are relayed.

Table 28.16 List of Packet Processing (by an E2E TC)

Message Type	Message	Details of Processing
Event	Sync	The packet residence time in the clock device is added when these messages are relayed.
	Delay_Req	
	Pdelay_Req	
	Pdelay_Resp	
General	Announce	These messages are relayed.
	Follow_Up	
	Delay_Resp	
	Pdelay_Resp_Follow_Up	
	Management	These messages are relayed. Messages are also transmitted and received by software via the PTPEDMAC.
	Signaling	

(2) P2P TC

In operation as a P2P transparent clock, PTP-primary messages other than Delay_Req and Delay_Resp are relayed.

Table 28.17 List of Packet Processing (by a P2P TC)

Message Type	Message	Details of Processing
Event	Sync	The packet residence time in the clock device is added when this message is relayed.
	Delay_Req	—
	Pdelay_Req	Pdelay_Req messages are transmitted at the fixed interval specified by the SYTLIR.DREQ[7:0] bits. When this message is received, a Pdelay_Resp message is transmitted in response.
	Pdelay_Resp	This is transmitted as the response to a received Pdelay_Req messages. The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
General	Announce	These messages are relayed.
	Follow_Up	
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	The meanPathDelay value is calculated when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE (two-step clock).
	Management	These messages are relayed. Messages are also transmitted and received by software via the PTPEDMAC.
	Signaling	

28.3.6 EPTPC Initialization

Transmitting and receiving PTP messages requires settings in various registers of the EPTPC.
Table 28.18 is a list of the registers for which settings are required. Set the registers corresponding to the Ethernet port used. Also set the registers listed in Table 28.19 if the UDP and IPv4 are used for the frame format of the PTP messages.

Table 28.18 List of the Registers for which Settings are Required

Register Name	Settings	Description
STCFR	Example: 0000 0002h	The value for 50 MHz is given as an example. Three other settings are also available.
STCSELR	Example: 0000 0206h	The value for the input clock from the REF50CK0 pin is given as an example.
PRMACRU0, PRMACRL0	As desired	This setting is not required if Ethernet port 0 is not used.
PRMACRU1, PRMACRL1	As desired	This setting is not required if Ethernet port 1 is not used.
SYCONFR	Example: 0000 0028h	The setting differs with the type of PTP clock operation.
SYMACRU, SYMACRL	As desired	
SYSPVRR	0000 0002h	transportSpecific and version fields
SYDOMR	As desired	
SYCIDRU, SYCIDRL	As desired	Set the same value for Ethernet ports 0 and 1.
SYPNUMR	0000 0001h or 0000 0002h	If the PTP clock operates as an OC, the setting is 0000 0001h. If it operates as a BC or TC, set 0000 0001h for one port and 0000 0002h for the other.
PPMACRU, PPMACRL	01:1B:19:00:00:00	MAC address for PTP-primary messages
PDMACRU, PDMACRL	01:80:C2:00:00:0E	MAC address for PTP-pdelay messages
DASYMRU, DASYMRL	0000 0000h	-
TSLATR	As desired	Depends on the link transfer rate and STCA clock frequency.
SYFORMR	As desired	Four settings are available.
SYLLCCTLR	0000 0003h	LLC-CTL field value for Ethernet frames
PETYPER	0000 88F7h	Ethertype for PTP messages

Table 28.19 List of the Registers for which Settings are Required (Additional Settings Required when UDP or IPv4 is to be Used)

Register Name	Settings	Description
SYIPADDRR	As desired	Local IP address
PRIPR	E000 0181h	IP address for PTP-primary messages
PETOSR	As desired	Set the highest allowable traffic class selector codepoint as the value for the differentiated service (DS) field.
PGTOSR	As desired	
PPTTLR	As desired	TTL field value for PTP-primary messages
PEUDPR	0000 013Fh	UDP port number for event messages
PGUDPR	0000 0140h	UDP port number for general messages
PDIPR	E000 006Bh	IP address for PTP-pdelay messages
PDTTLR	0000 0001h	TTL field value for PTP-pdelay messages

In operation as an OC or BC, set registers as shown below in order to transfer received Announce, Management, and Signaling messages to the PTPEDMAC.

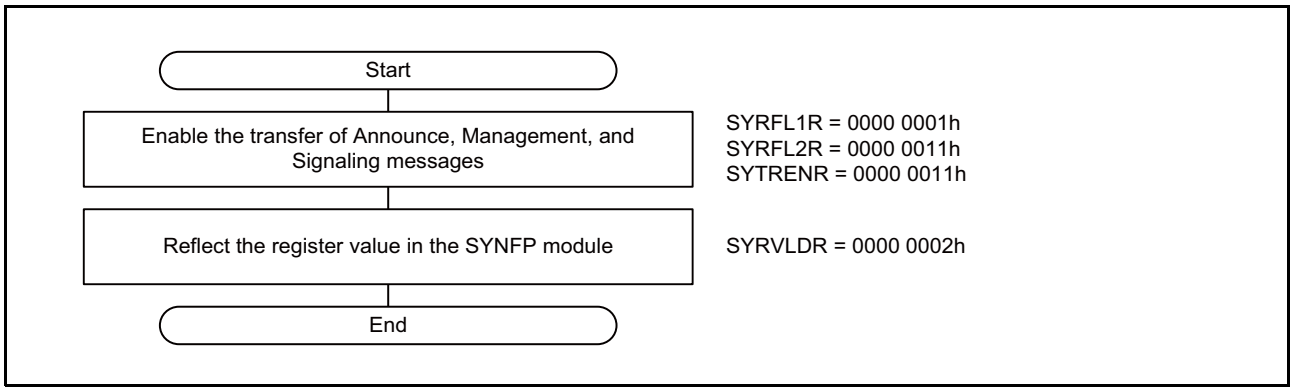

Figure 28.9 Common Settings for PTP Devices

28.3.7 Operation as an E2E Master

28.3.7.1 Preparatory Setting

Table 28.20 lists the registers for use in operation as an E2E master.
If the EPTPC operates as an OC or as a BC with both ports serving as masters, set the initial value of the time information in advance. Refer to section 28.2.17, Local Clock Counter Initial Value Registers (LCIVRU, LCIVRM, LCIVRL) for the initial value of the time information. Reflecting the values set in the registers requires setting the SYRVLDR.STUP or ANUP bit to 1.

Table 28.20 Registers for Use in Operation as an E2E Master

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
SYNFR	STUP	0000 0000h	flagField for Sync messages
SYTLIR	STUP ANUP	Example: 0000 0001h	Delay_Resp: 1s Sync: 1s Announce: 2s
ANFR	ANUP	0000 0000h	flagField for Announce messages
GMPR	ANUP	As desired	
GMCQR	ANUP	As desired	
GMIDR	ANUP	As desired	
CUOTSR	ANUP	As desired	timeSource: Internal Oscillator
SRR	ANUP	As desired	If the EPTPC operates as an OC or as a BC with both ports serving as masters, set this register to 0000 0000h. If the EPTPC operates as a BC in the combination of a slave and master, set this register to the StepsRemoved field value of Announce messages received by the slave plus one.
SYRFL1R	STUP	0000 4001h	This enables the processing of Delay_Req messages by the SYNFP module.
SYRFL2R	STUP	0000 0011h	This enables the transfer of Signaling and Management messages to the PTPEDMAC.
SYTRENR	STUP	0000 0011h	This enables the transmission of Sync and Announce messages.

28.3.7.2 Procedure for Starting Operations

Figure 28.10 shows the procedure for settings to start operation as an E2E master.

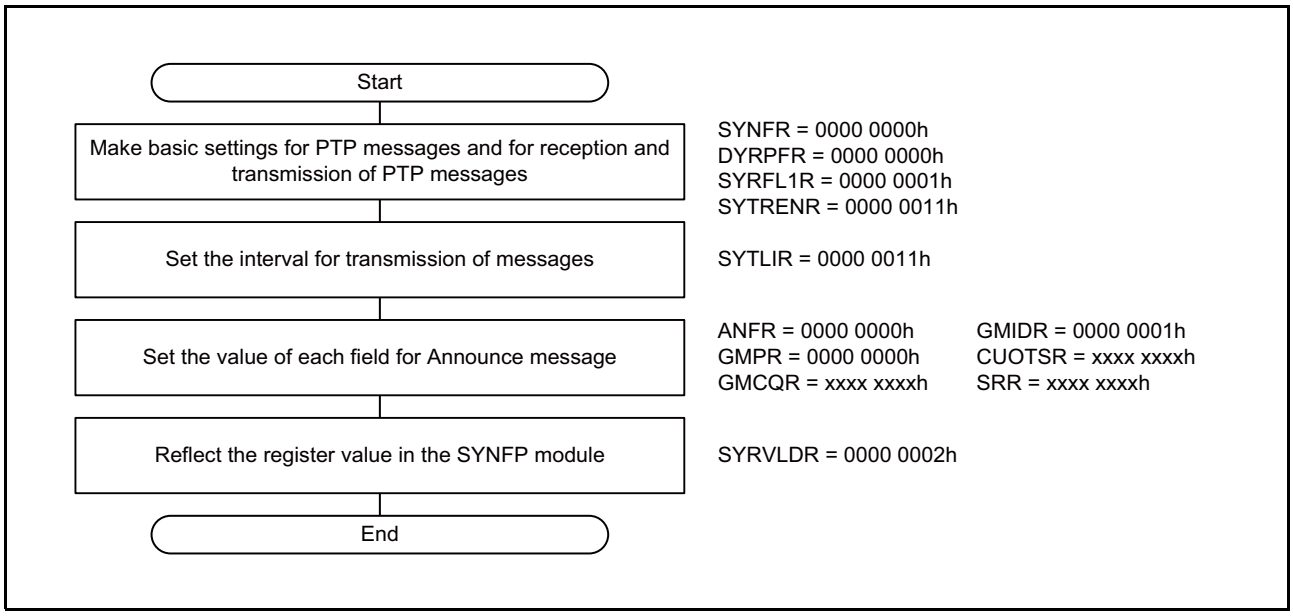

Figure 28.10 Procedure for Starting Operation as an E2E Master

28.3.7.3 Procedure for Changing the Settings

Increases in the frequency of receiving Delay_Req messages due to network conditions may lead to an overflow of the FIFO buffer which is receiving the Delay_Req messages. In such cases, change the value of the logMessageInterval field of Delay_Resp messages so that the slave sending the Delay_Req messages lengthens the interval between the messages. Figure 28.11 shows the procedure for changing the value of the logMessageInterval field.

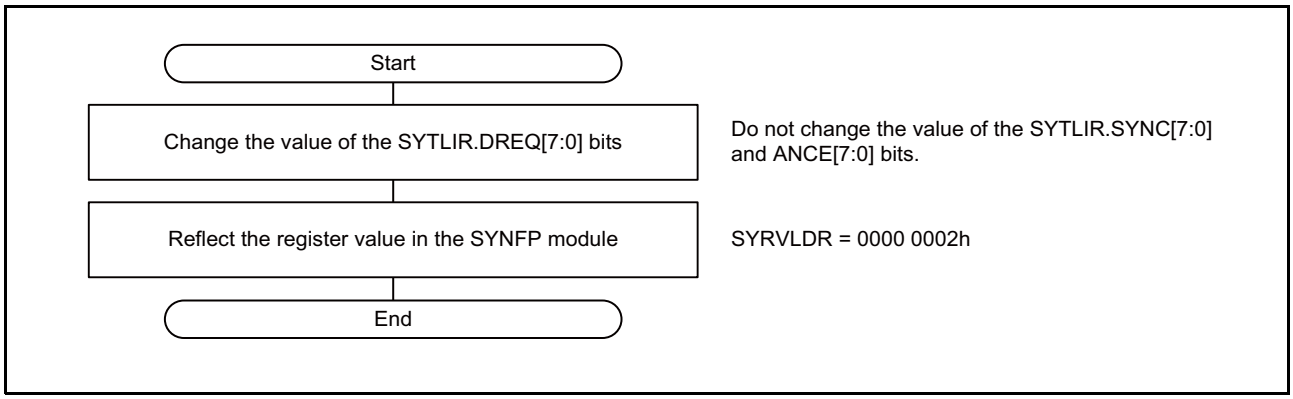

Figure 28.11 Procedure for Changing the Value of the logMessageInterval Field for Delay_Resp Messages

28.3.7.4 Procedure for Stopping Operations

Figure 28.12 shows the procedure for stopping operation as an E2E master. To confirm that the operation as the E2E master is completely stopped, read the SYSR.GENDN flag and RESDN flag to check that generating messages and sending responses are completely stopped.

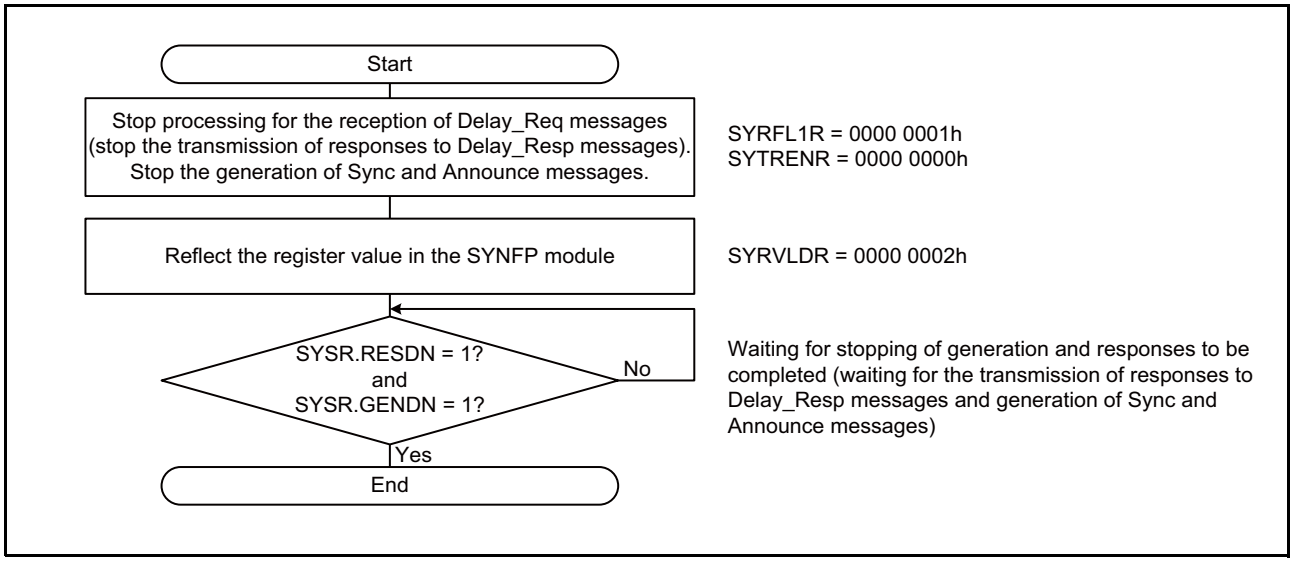

Figure 28.12 Procedure for Stopping Operation as an E2E Master

28.3.8 Operation as an E2E Slave

28.3.8.1 Preparatory Setting

Table 28.21 lists the registers for use in operation as an E2E slave.
Reflecting the value set in the register in SYNFP operations requires setting the SYRVLDR.STUP, ANUP, or BMUP bit to 1.

Table 28.21 Registers for Use in Operation as an E2E Slave

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
MTCID	BMUP	As desired	This is the clockIdentity value of the master clock that provides synchronization.
MTPID	BMUP	As desired	This is the portNumber value of the master clock that provides synchronization.
SYTLIR	ANUP BMUP	Example: 0000 0000h	Delay_Resp: 1 s*1
RSTOUTR	STUP	As desired	
SYNTOR	—	As desired	
SYRFL1R	STUP	0004 0441h	This enables the reception of Delay_Resp, Follow_Up, and Sync messages and the transfer of Announce messages to the PTPEDMAC.
SYRFL2R	STUP	0000 0011h	This enables the transfer of Signaling and Management messages to the PTPEDMAC.
SYTRENR	STUP	0000 0100h	This enables the generation of Delay_Req messages.

Note 1. In the reception of Delay_Resp messages by an E2E slave, the SYTLIR.DREQ[7:0] bits must be adjusted if the value of the SYRLIR.DRESP[7:0] flags is to be altered. The SYTLIR.DREQ[7:0] bits specify a value in the range from -7 to 6. Set the SYTLIR.DREQ[7:0] bits to -7 if the value indicated by the SYRLIR.DRESP[7:0] flags is less than or equal to -8 and to 6 if the value indicated by the SYRLIR.DRESP[7:0] flags is greater than or equal to 7.

28.3.8.2 Procedure for Starting Operations

Figure 28.13 shows the procedure for settings to start operation as an E2E slave.

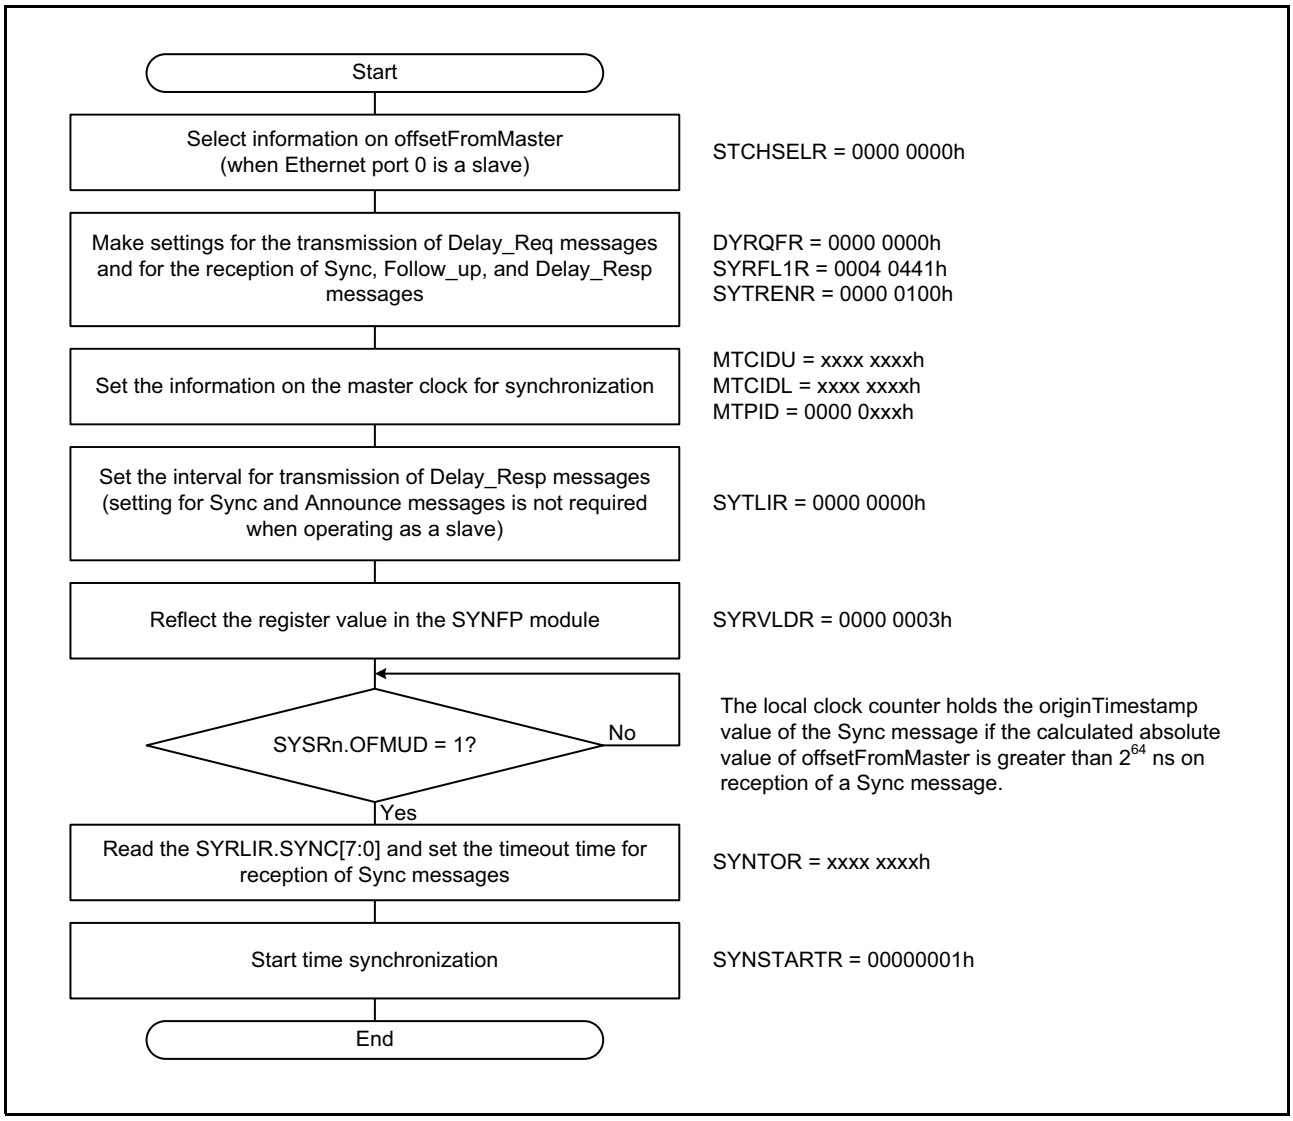

Figure 28.13 Procedure for Starting Operation as an E2E Slave

28.3.8.3 Procedure for Changing the Settings

IEEE 1588 stipulates that the average interval for the transmission of Delay_Req messages must be adjusted in response to changes in the value of the logMessageInterval field of received Delay_Resp messages. The EPTPC sets the SYSR.INTCHG flag to 1 if the logMessageInterval value of a received message differs from that of the previous message.

When this happens, set the SYTLIR.DREQ[7:0] bits to the value of the SYRLIR.DRESP[7:0] bits.

The SYTLIR.DREQ[7:0] bits specify a value in the range from -7 to 6. Set the SYTLIR.DREQ[7:0] bits to -7 if the value indicated by the SYRLIR.DRESP[7:0] flags is less than or equal to -8 and to 6 if the value indicated by the SYRLIR.DRESP[7:0] bits is greater than or equal to 7.

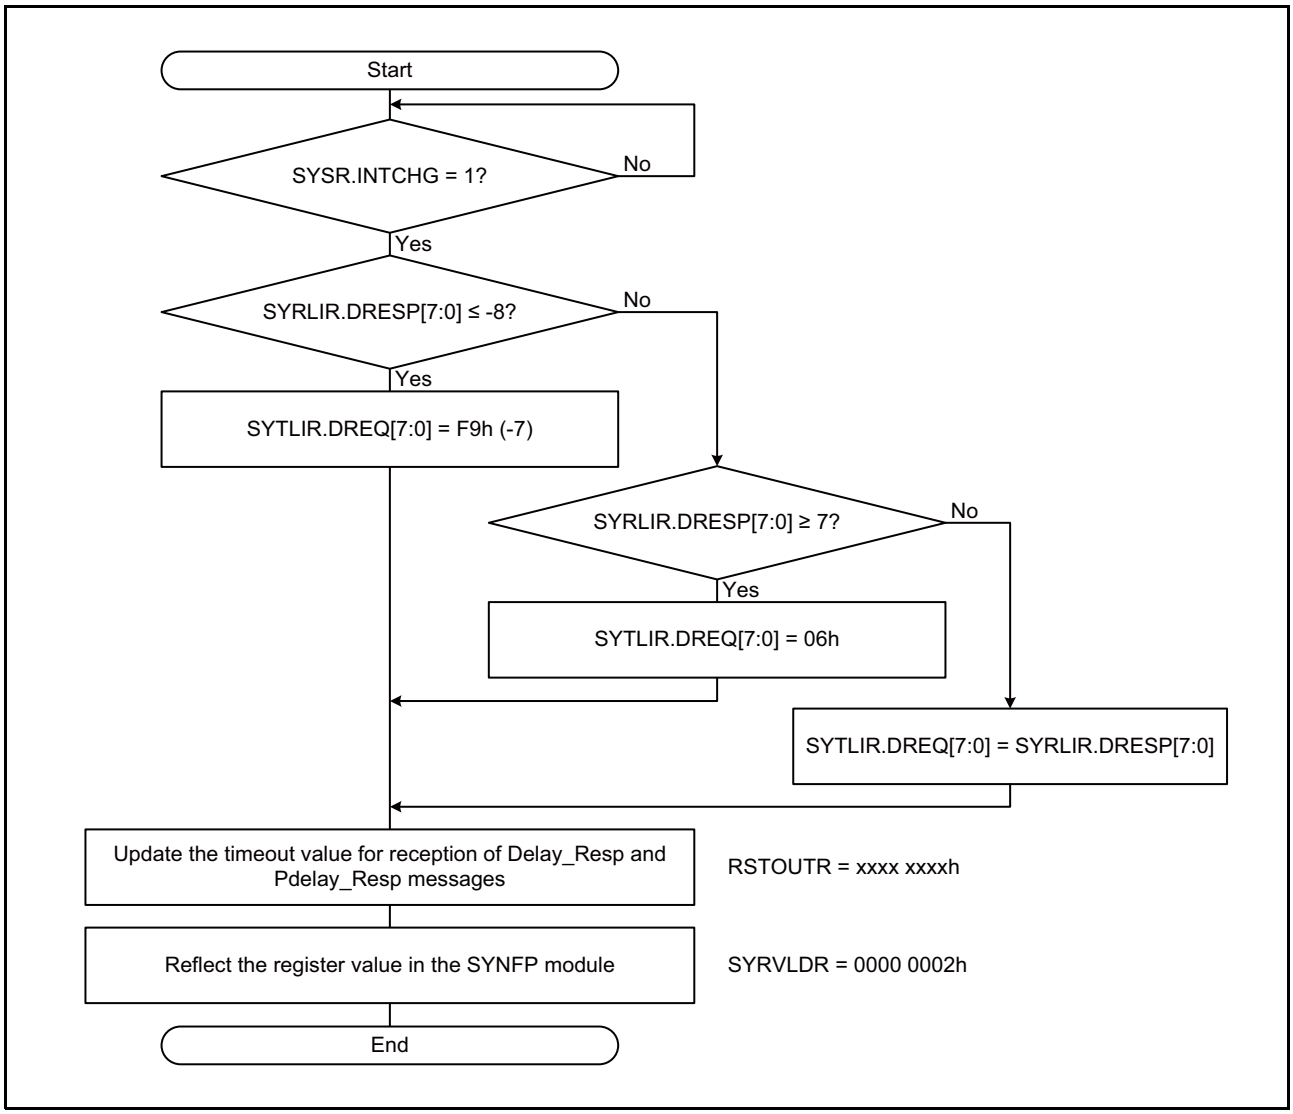

Figure 28.14 Procedure for Changing the Interval for Transmission of Delay_Req Messages

28.3.8.4 Procedure for Stopping Operations

Figure 28.15 shows the procedure for stopping operation as an E2E slave. To confirm that operation as an E2E slave is completely stopped, read the SYSR.GENDN flag to check that generation is completely stopped.

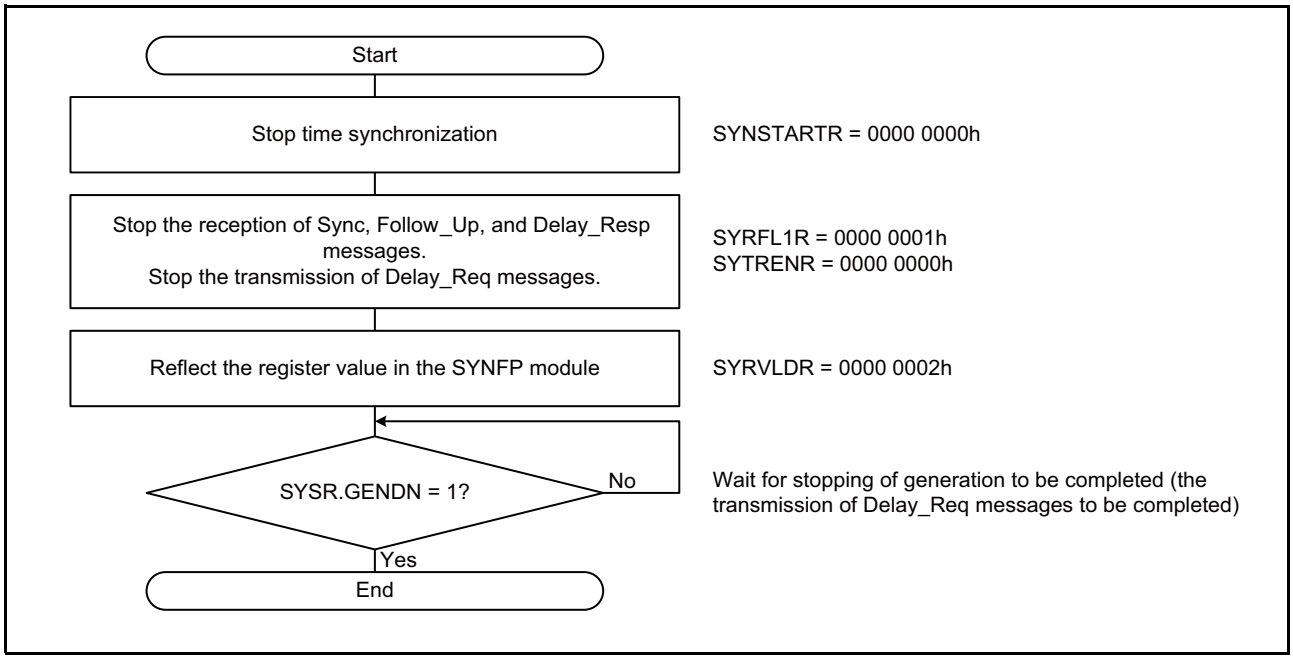

Figure 28.15 Procedure for Stopping Operation as an E2E Slave

28.3.9 P2P Operation (Common to Master and Slave)

If the EPTPC is to be operated as a P2P, the SYNFP module handles the processing of PTP-pdelay messages regardless of whether operation is to be as a master or slave. The interval for Pdelay_Req transmission and the parameters for monitoring of Pdelay_Resp messages must be set at the same time. Registers for use in operation as a P2P are listed in Table 28.22.

Table 28.22 Registers for Use in Operation as a P2P

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
MTCID	BMUP	As desired	This is the clockIdentity value of the synchronized master clock.
MTPID	BMUP	As desired	This is the portNumber value of the synchronized master clock.
SYTLIR	ANUP STUP	0000 0000h	Announce: — Sync: — Pdelay_Req: 1 s
RSTOUTR	STUP	As desired	
SYRFL1R	STUP	4440 0001h	This enables the reception of Pdelay_Req, Pdelay_Resp, and Pdelay_Resp_Follow_Up messages and the transfer of Announce messages to the PTPEDMAC.
SYRFL2R	STUP	0000 0011h	This enables the transfer of Signaling and Management messages to the PTPEDMAC.
SYTRENR	STUP	0000 1000h	This enables the generation of Pdelay_Req messages.

28.3.9.1 Procedure for Starting Operations

Figure 28.16 shows the procedure for starting operation as a P2P (sending and receiving PTP-pdelay messages).

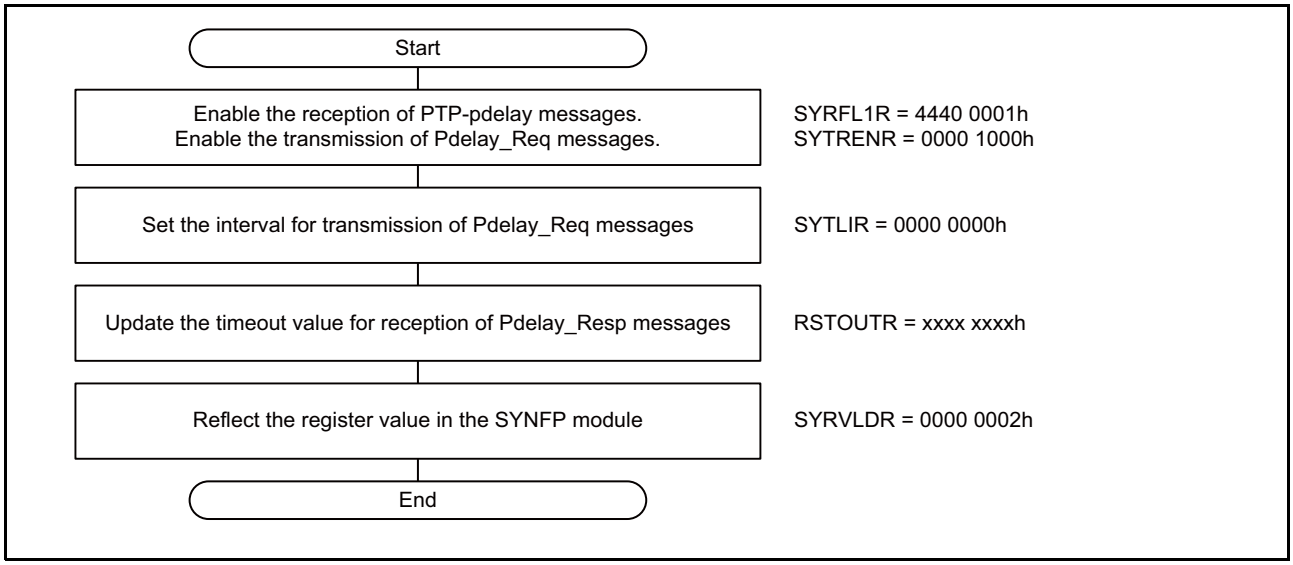

Figure 28.16 Procedure for Starting Operation as a P2P

28.3.9.2 Procedure for Stopping Operations

Figure 28.17 shows the procedure for stopping operation as a P2P (sending and receiving PTP-pdelay messages).

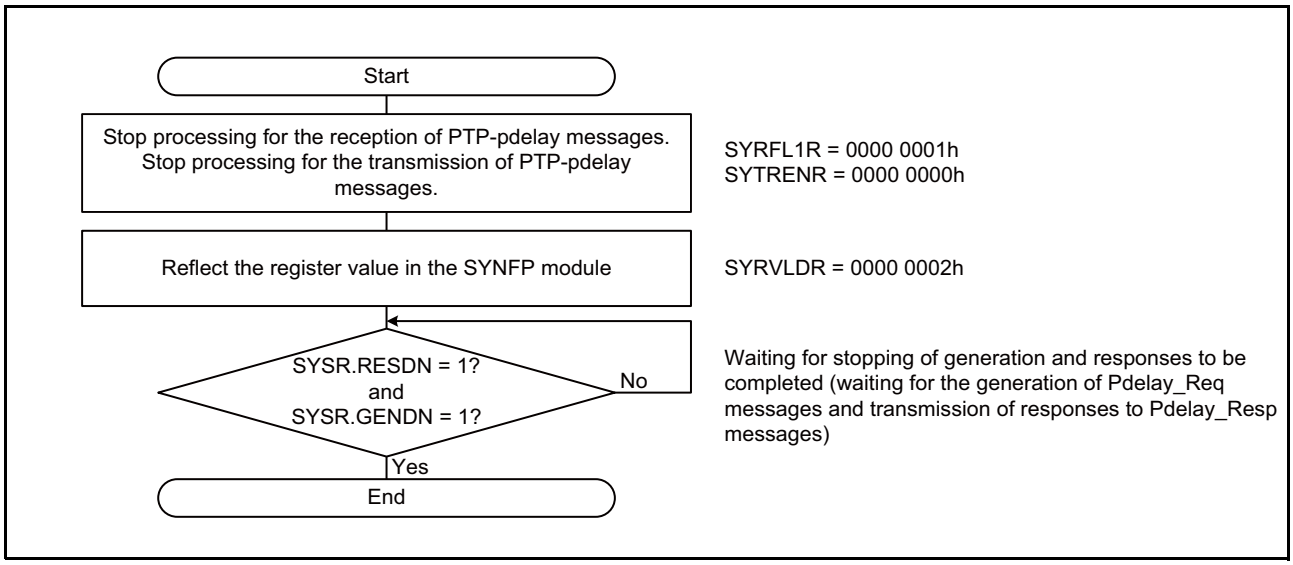

Figure 28.17 Procedure for Stopping Operation as a P2P

28.3.10 Operation as a P2P Master

When the EPTPC operates as OC or BC that uses both ports as the master, set the initial value of time information in advance as required. Refer to section 28.2.17, Local Clock Counter Initial Value Registers (LCIVRU, LCIVRM, LCIVRL) for the initial value of time information. Registers for use in operation as a P2P master are listed in Table 28.23.

Table 28.23 Registers for Use in Operation as a P2P Master

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
SYCONFR	—	0000 0028h	
ANFR	ANUP	0000 0000h	flagField for Announce messages
SYNFR	STUP	0000 0000h	flagField for Sync messages
SYTLIR	ANUP STUP	Example: 0000 0001h	Announce: 2 s Sync: 1 s Pdelay_Req: 1 s
GMPR	ANUP	As desired	Grandmaster Priority1 and Priority2
GMCQR	ANUP	As desired	Grandmaster Quality
GMIDR	ANUP	As desired	Grandmaster Identity
CUOTSR	ANUP	As desired	currentUtcOffset, timeSource
SRR	ANUP	As desired	StepsRemoved
RSTOUTR	STUP	As desired	
SYRFL1R	STUP	4440 0000h	This enables the reception of Pdelay_Req, Pdelay_Resp, and Pdelay_Resp_Follow_Up messages.
SYRFL2R	STUP	0000 0011h	This enables the transfer of Signaling and Management messages to the PTPEDMAC.
SYTRENR	STUP	0000 1011h	This enables the transmission of Pdelay_Req, Sync, and Announce messages.

28.3.10.1 Procedure for Starting Operations

When transmission of Sync and Announce messages is started during operation as a P2P (sending and receiving PTP-pdelay messages), the EPTPC operates as a P2P master. Figure 28.18 shows the procedure for starting operation as a P2P mas-ter.

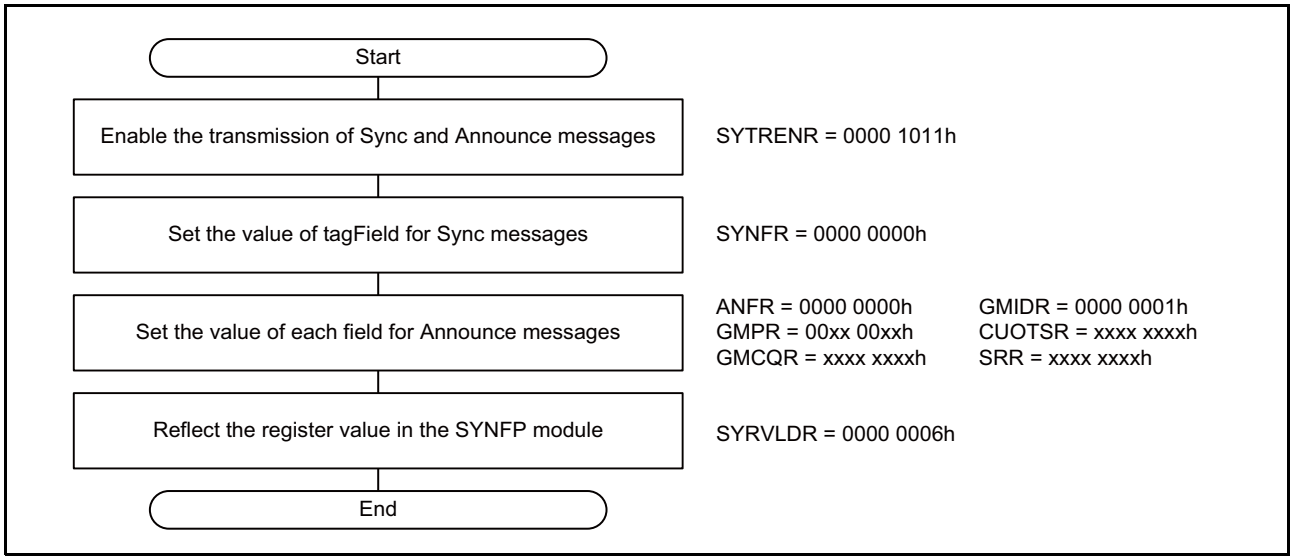

Figure 28.18 Procedure for Starting Operation as a P2P Master

28.3.10.2 Procedure for Stopping Operations

Figure 28.19 shows the procedure for stopping the transmission of Sync and Announce messages to stop operation as a P2P master.

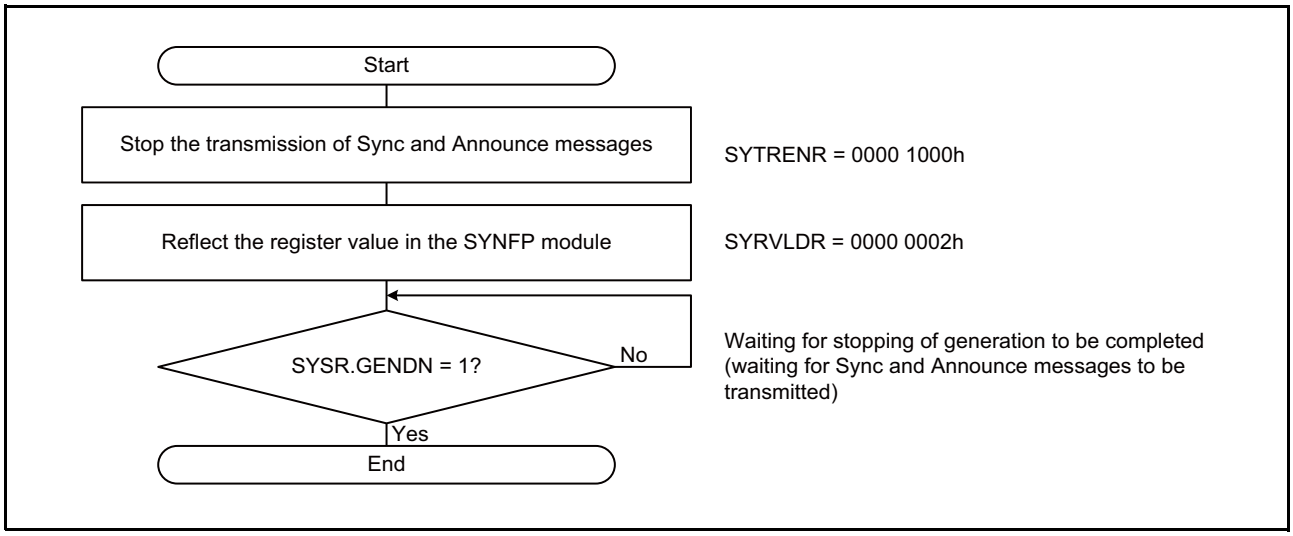

Figure 28.19 Procedure for Stopping Operation as a P2P Master

28.3.11 Operation as a P2P Slave

Setting a SYNFP module to receive Sync messages and Follow_Up messages during P2P operation obtains operation as a P2P slave. Information on the master clock for synchronization must be specified.
Table 28.24 lists the registers for use in operation as a P2P slave.

Table 28.24 Registers for Use in Operation as a P2P Slave

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
MTCID	BMUP	As desired	This is the clockIdentity value of the synchronized master clock.
MTPID	BMUP	As desired	This is the portNumber value of the synchronized master clock.
RSTOUTR	STUP	As desired	
SYRFL1R	STUP	4440 0441h	This enables the reception of Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up, Follow_Up, and Sync messages and the transfer of Announce messages to the PTPEDMAC.

28.3.11.1 Procedure for Starting Operations

Figure 28.20 shows the procedure for making the additional settings for shifting to operation as a slave during operation as a P2P (sending and receiving PTP-pdelay messages).

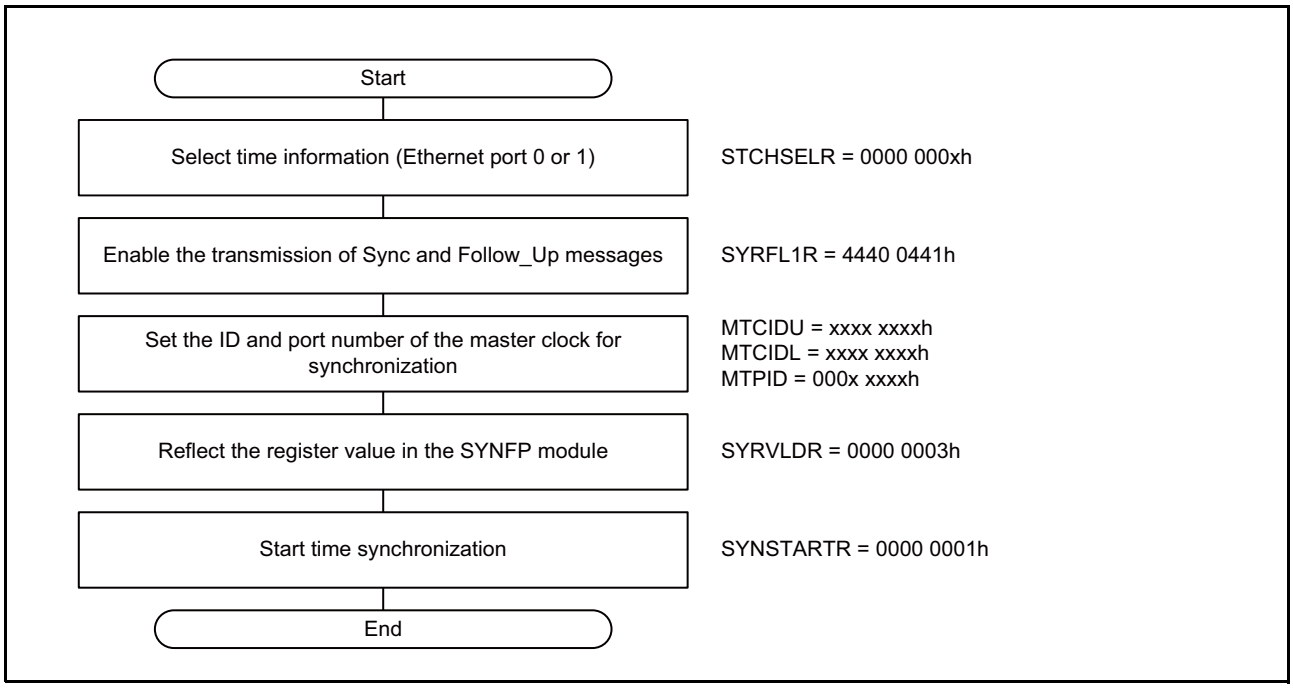

Figure 28.20 Procedure for Starting Operation as a P2P Slave

28.3.11.2 Procedure for Stopping Operations

Figure 28.21 shows the procedure for stopping the reception of Sync and Follow_Up messages to stop operation as a P2P slave.

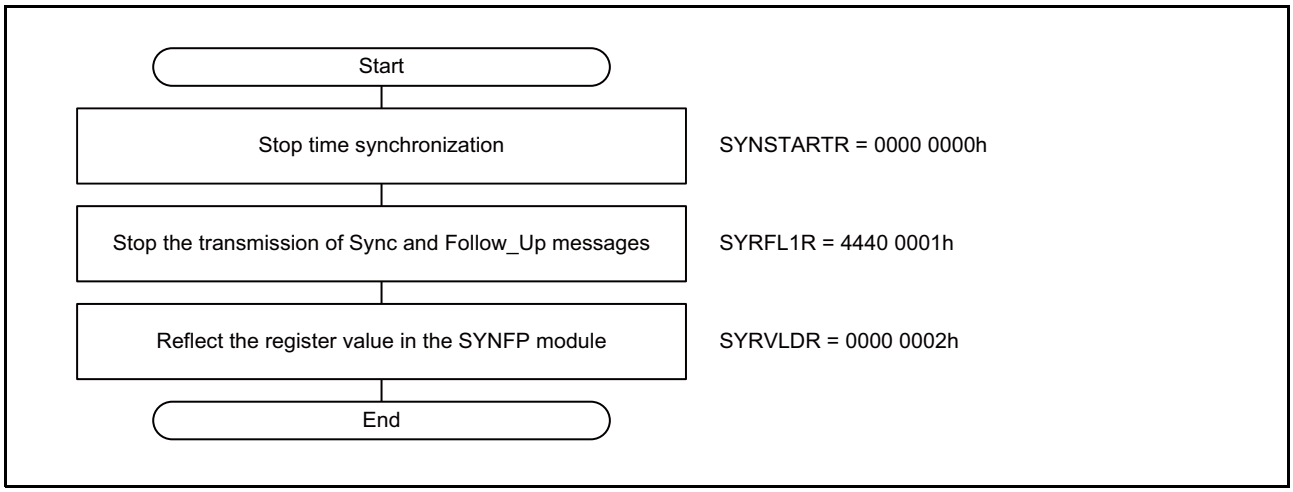

Figure 28.21 Procedure for Stopping Operation as a P2P Slave

28.3.12 Operation as an E2E TC

28.3.12.1 Preparatory Setting

Table 28.25 lists the registers for use in operation as an E2E TC.
Make the settings for both the SYNFP0 and SYNFP1 modules.

Table 28.25 Registers for Use in Operation as an E2E TC

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
SYCONFR	—	Example: 0000 0028h	Set the TCMOD bit to 0 as a preparatory setting for the PTP device.
SYRFL1R	STUP	2222 2222h	This enables the relaying of messages by the PRC-TC.
SYRFL2R	STUP	2000 0033h	This enables the transfer of Signaling and Management messages to the PTPEDMAC and the relaying of these messages by the PRC-TC.
SYTRENR	STUP	0000 0000h	No generation of messages

28.3.12.2 Procedure for Starting Operations

Figure 28.22 shows the procedure for starting operation as an E2E TC.

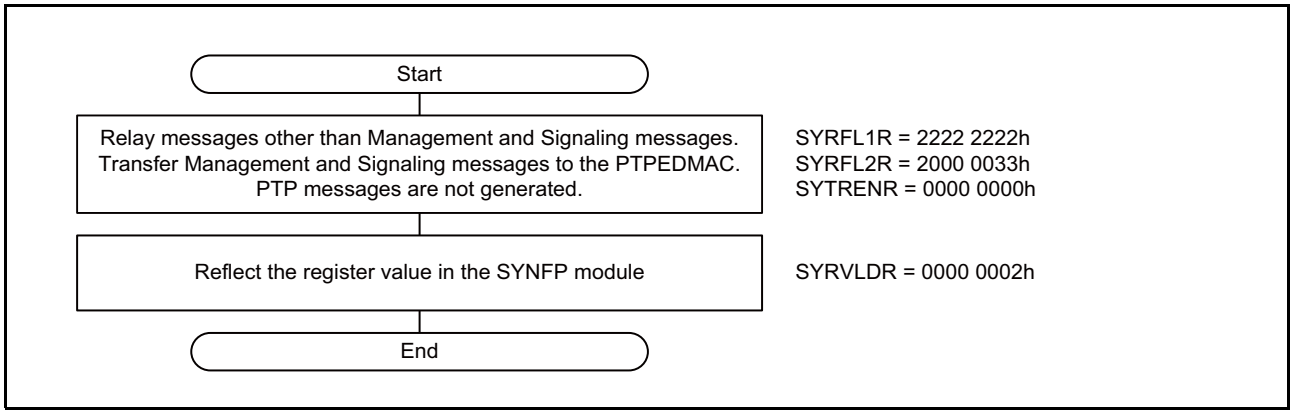

Figure 28.22 Procedure for Starting Operation as an E2E TC

28.3.13 Operation as a P2P TC

Table 28.26 lists the registers for use in operation a P2P TC.
Make the settings for both the SYNFP0 and SYNFP1 modules.

Table 28.26 Registers for Use in Operation as a P2P TC

Register Name	SYRVLDR Register Bits Used for Loading Direction	Settings	Description
SYCONFR	—	Example: 0010 0028h	Set the TCMOD bit to 1 as a preparatory setting for the PTP device.
RSTOUTR	STUP	As desired	
SYTLIR	STUP	Example: 0000 0000h	Pdelay_Req: 1 s
SYRFL1R	STUP	4440 0222h	This enables the discarding of Delay_Req and Delay_Resp messages and the relaying of Sync, Follow_Up, and Announce messages by the PRC-TC.
SYRFL2R	STUP	2000 0033h	This enables the transfer of Signaling and Management messages to the PTPEDMAC and the relaying of these messages by the PRC-TC
SYTRENR	STUP	0000 1000h	This enables the generation of Pdelay_Req messages.

28.3.13.1 Procedure for Starting Operations

Figure 28.23 shows the procedure for starting operation as a P2P TC.

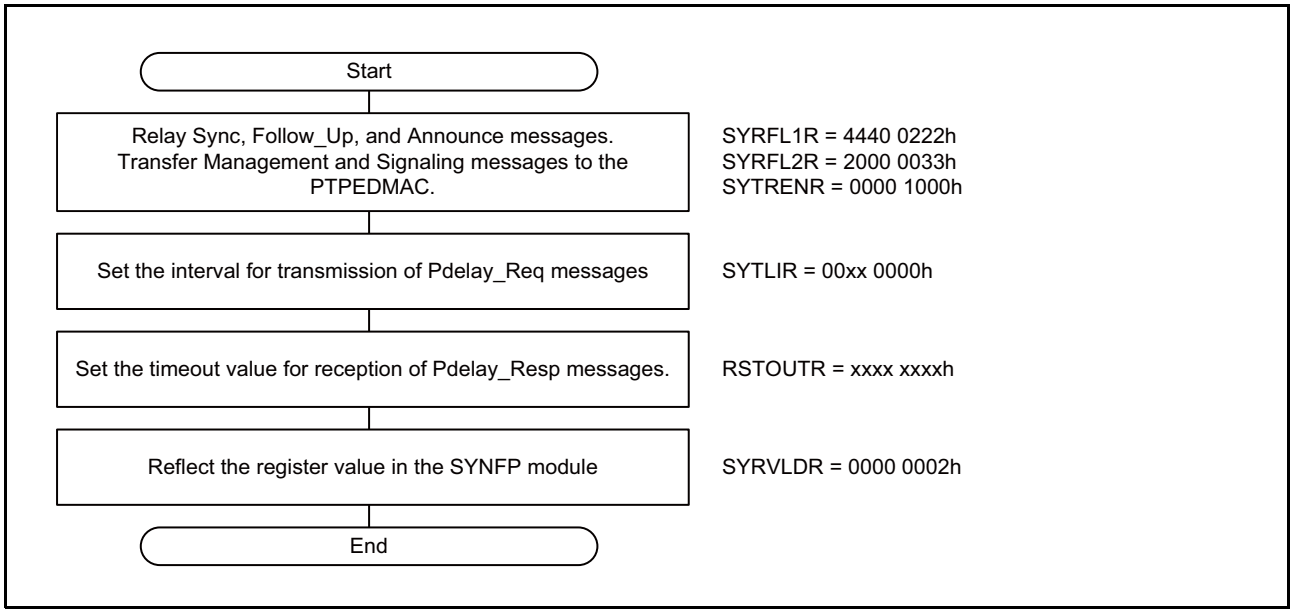

Figure 28.23 Procedure for Starting Operation as a P2P TC

28.3.14 Monitoring of Received Messages

28.3.14.1 Reception of Announce Messages

The EPTPC does not detect timeouts in the reception of Announce messages. To detect timeouts in the reception of these messages, monitor the reception of Announce messages by software.

28.3.14.2 Reception of Sync Messages

The STSR.SYNTOUT flag becomes 1 when a timeout in the reception of a Sync message occurs during the correction of time synchronization.
The SYSR.OFMUD flag becomes 1 when a Sync message is received, regardless of whether time synchronization is being corrected. Accordingly, the reception of Sync messages is detectable by reference to the SYSR.OFMUD flag even if the correction of time synchronization stops due to a timeout in the reception of a Sync message.

28.3.14.3 Reception of Delay_Resp and Pdelay_Resp Messages

The SYSR.DRPTO flag becomes 1 when a timeout in the reception of a Delay_Resp message occurs after the transmission of a Delay_Req message during operation as an E2E slave, or when a timeout in the reception of a Pdelay_Resp message occurs after the transmission of a Pdelay_Req message during operation as a P2P.
The SYSR.MPDUD flag becomes 1 when a Delay_Resp or Pdelay_Resp message is received, so the reception of these messages is still detectable in the case of a timeout in reception.

28.3.15 Correcting Time Synchronization

A slave detects differences in the clock gradient relative to the master clock. The offsetFromMaster values calculated by using the standard IEEE 1588 algorithm are used to calculate the clock gradient, so the result includes elements of network fluctuation besides frequency differences. The EPTPC has a “worst 10” function to eliminate fluctuations due to network load, etc. With these functions, the time is corrected from the calculated gradient difference values and results of correction are obtained as shown in Figure 28.25.

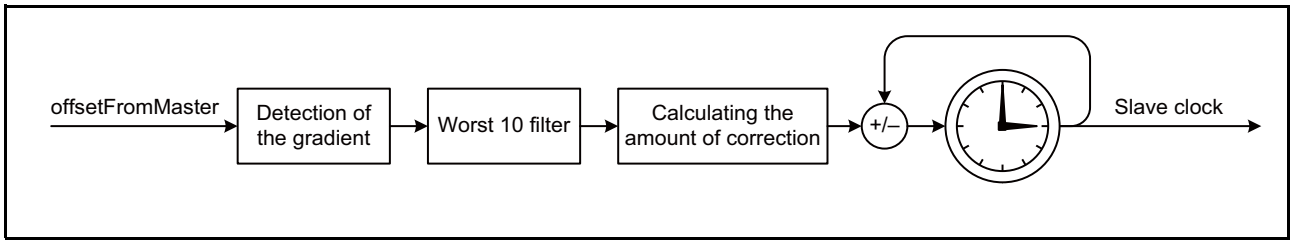

Figure 28.24 Configuration of the Time Correction Circuit

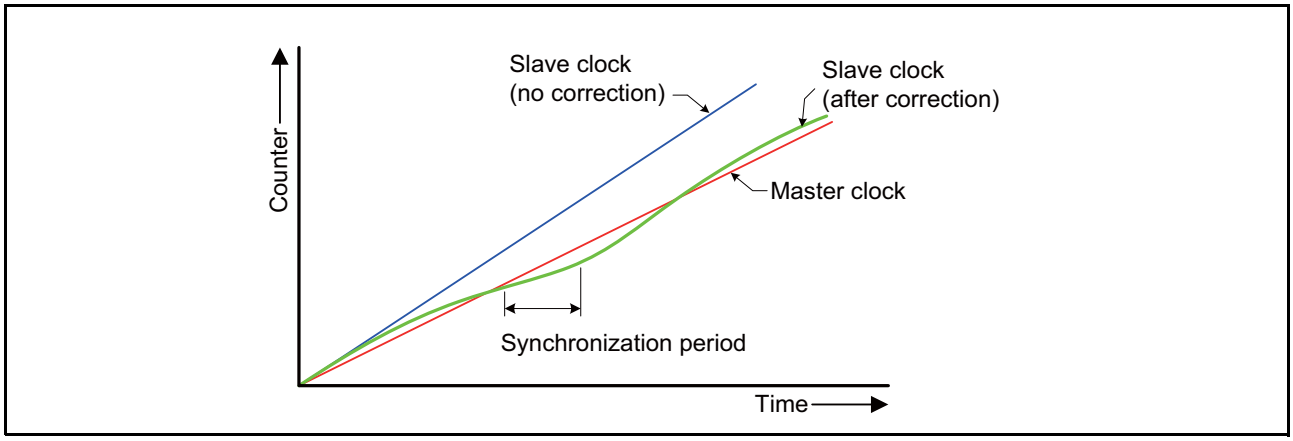

Figure 28.25 Overview of Time Correction

28.3.15.1 Judging Synchronization and Loss of Synchronization

The absolute value of offsetFromMaster reaching or exceeding the value specified in the SYNTDARU or SYNTDARL register is considered a loss of synchronization. The absolute value of offsetFromMaster being less than the absolute values of the synchronization detection threshold registers (SYNTDBRU and SYNTDBRL) is considered synchronization.

The values of the STSR.SYNCOUT and SYNC flags become 1 when synchronization is lost and obtained, respectively. Hysteresis can be obtained by setting the respective threshold registers to appropriate different values. Furthermore, the STMR.DVTH[3:0] and SYTH[3:0] bits can be used to set the consecutive number of times detection must occur for the judgment of loss of synchronization and of synchronization.

Set registers SYNTDARU and SYNTDARL to low values and the number of times detection is required to judge loss of synchronization to one in systems where control must be aborted if synchronization is lost due to fluctuations in network conditions. Set registers SYNTDARU and SYNTDARL and the number of times detection is required to large values in systems where the above condition does not apply.

Figure 28.26 shows an example of a situation where synchronization is being lost and regained. In this example, the number of consecutive times detection is required is three for both synchronization and loss of synchronization.

Note: The setting of the STSR.SYNCOUT flag is 1 when time synchronization starts, even though the condition for judging loss of synchronization has not been satisfied at this stage. For this reason, detection of loss of synchronization must be ignored immediately after time synchronization starts.

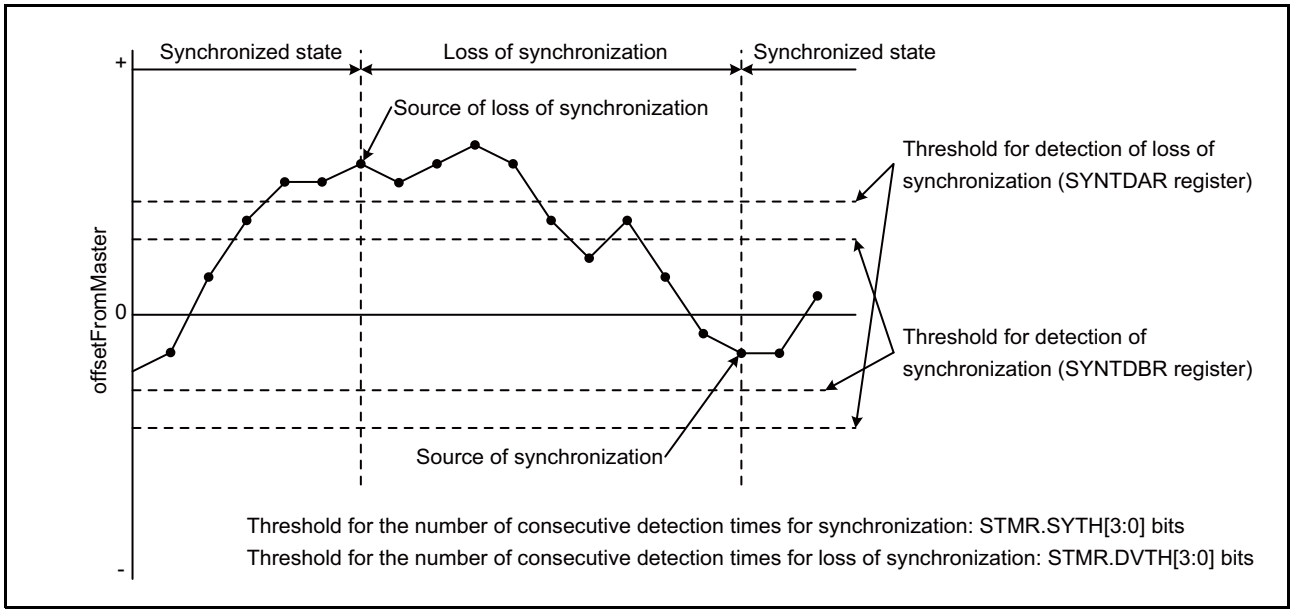

Figure 28.26 Example of a Situation where Synchronization is being Lost and Regained (the number of consecutive detection times is specified as three by the STMR.DVTH[3:0] and SYTH[3:0] bits)

28.3.15.2 Worst 10 Function

The worst 10 function is for imposing limits with regard to exceedingly large and small values among the calculated values for differences in clock gradient.

Values for difference in clock gradient are collected by observing the state of transfer over a specified interval and threshold values to impose limits are extracted from the observed values. With regard to differences in gradient, not only errors in the clock but also fluctuations in network conditions must be considered, and differences in both the positive and negative directions as shown in Figure 28.27 are collected

From among the collected values for positive and negative gradient difference, the largest values for gradient, from the first to the tenth place (worst to tenth worst), are acquired and the tenth worst is used as a threshold value. Fluctuations in the time kept by a slave clock can be suppressed by continually overwriting the tenth worst value for gradient difference with new values large enough to exceed the threshold. Furthermore, periodic collections of gradient values can also be made for updating the threshold values during operations or for the method of setting threshold values from previously measured results

However, note that while fluctuations in the time kept by a slave clock can be suppressed by the effective filtering of values for gradient difference (collecting the worst 10 values and using the tenth worst), following of the time kept by a master clock also becomes slower.

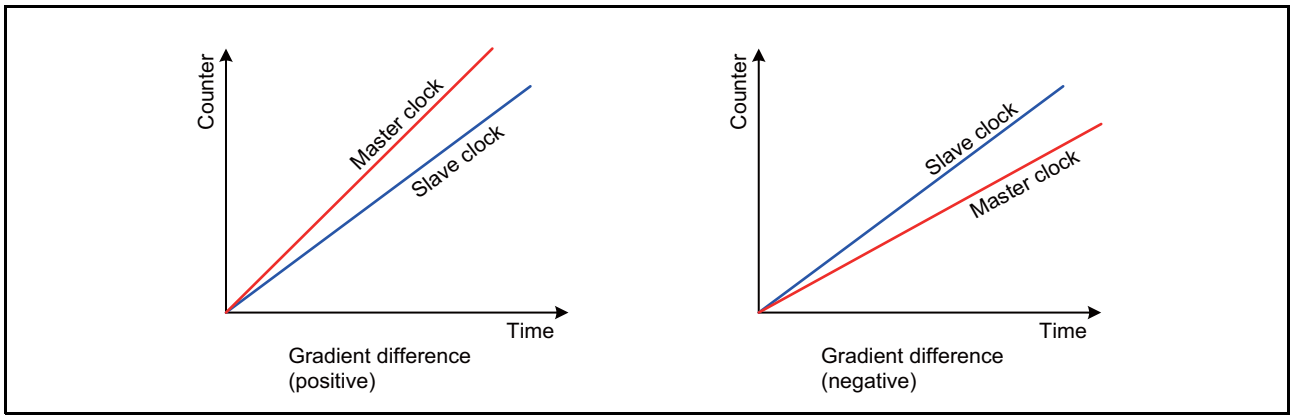

Figure 28.27 Overview of Gradient Differences

28.3.15.3 Collecting Differences in Clock Gradient and Extracting the Worst Ten Values

During slave operation, the EPTPC is capable of calculating the offsetFromMaster values from received messages and then calculating gradient differences between the local clock (acting as a slave clock) and master clock from those values. Specifically, the worst ten values are extracted from the sets of collected values for gradient difference. Either automatic filtering by the hardware or software-triggered filtering can be designated for acquisition of the sets of worst-10 values.

Figure 28.28 gives an overview of the collection of values for gradient difference.

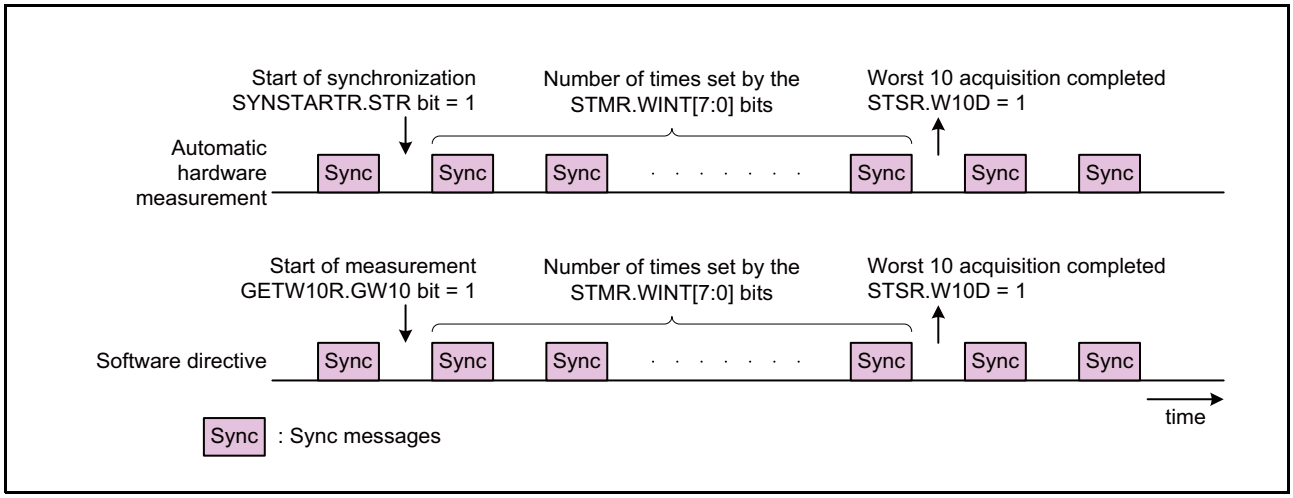

Figure 28.28 Overview of the Collection of Values for Gradient Differences

(1) Collecting Gradient Differences and Extracting the Worst Ten Values by Hardware

The EPTPC automatically collects the values of gradient difference by hardware if the STMR.W10S bit is 0.

When the SYNSTARTR.STR bit is set to 1 (starting slave time synchronization), the EPTPC collects gradient difference values for the number of times set by the STMR.WINT[7:0] bits. When the collection of gradient difference values is finished, the tenth largest values on the positive and negative gradient difference sides are stored as the tenth worst values in registers PW10VRU, PW10VRM, and PW10VRL and registers MW10RU, MW10RM, and MW10RL. When acquisition of the worst 10 values is complete, the STSR.W10D flag becomes 1.

Filtering of gradient difference values by using the stored tenth worst values then proceeds automatically.

Note that if the number of times set by STMR.WINT[7:0] bits are fewer than ten times, the double of the best of the collected values on the positive side is stored in registers PW10VRU, PW10VRM, and PW10VRL, and the half of the best of the collected values on the negative side is stored in registers MW10RU, MW10RM, and MW10RL.

(2) Collecting Gradient Differences and Extracting the Worst Ten Values by Software

The EPTPC collects values of gradient differences by software if the STMR.W10S bit is 1.
When the GETW10R.GW10 bit is set to 1 after time synchronization has started, the EPTPC collects gradient difference values for the number of times set by the STMR.WINT[7:0] bits. When the collection of gradient difference values is finished, the tenth largest values on the positive and negative gradient difference sides are stored as the tenth worst values in registers PW10VRU, PW10VRM, and PW10VRL and registers MW10RU, MW10RM, and MW10RL. When acquisition of the worst 10 values is complete, the STSR.W10D flag becomes 1.
Since filtering of gradient difference values proceeds with the values set in registers PLIMITRU, PLIMITRM, and PLIMITRL and registers MLIMITRU, MLIMITRM, and MLIMITRL as the upper and lower limits for filtering, the values stored in registers PW10VRU, PW10VRM, and PW10VRL and registers MW10RU, MW10RM, and MW10RL must be written to the PLIMITRU, PLIMITRM, and PLIMITRL and registers MLIMITRU, MLIMITRM, and MLIMITRL, respectively.
Note that if the number of times set by the STMR.WINT[7:0] bits is fewer than ten or times, the double of the best of the collected values on the positive is stored in registers PW10VRU, PW10VRM, and PW10VRL, and the half of the best of the collected values on the negative side is stored in registers MW10RU, MW10RM, and MW10RL.
The flowchart in Figure 28.29 shows an example of the procedure for software-triggered acquisition of the worst 10 values.

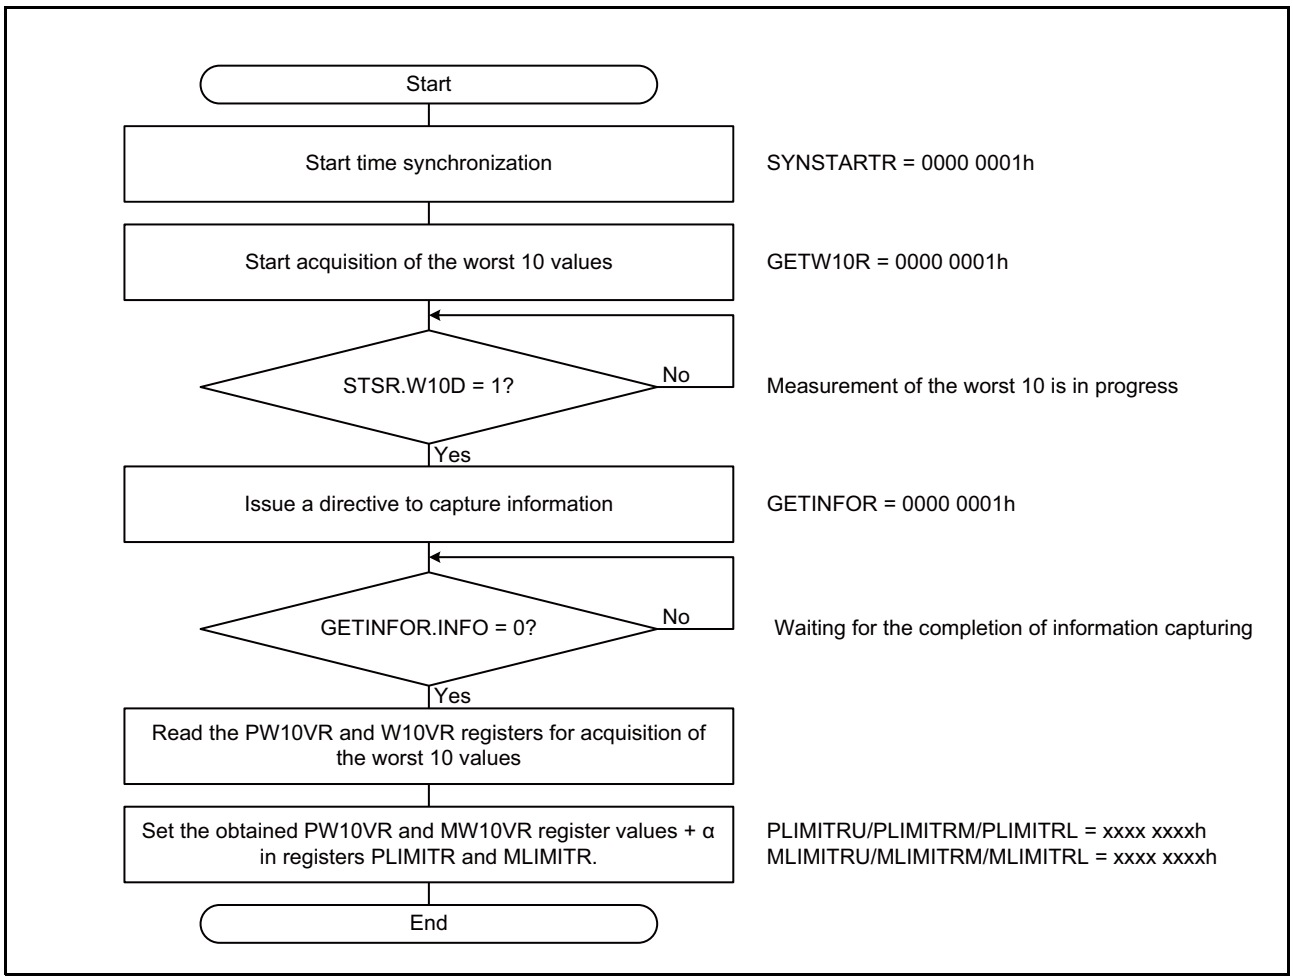

Figure 28.29 Example of the Procedure for Software-Triggered Acquisition of the Worst 10 Values

28.3.16 Local Clock Counter

The local clock counter retains the synchronized time information. The counter starts counting from 0 after the ETHERC is released from the module stop state or the EPTPC is released from the software reset state. The local clock counter can then be set to any desired value. The procedure for setting the initial value in the local clock counter is shown in Figure 28.30.

The time information kept by the local clock counter is also readable. Figure 28.31 shows the procedure for reading the time information kept by the local clock counter.

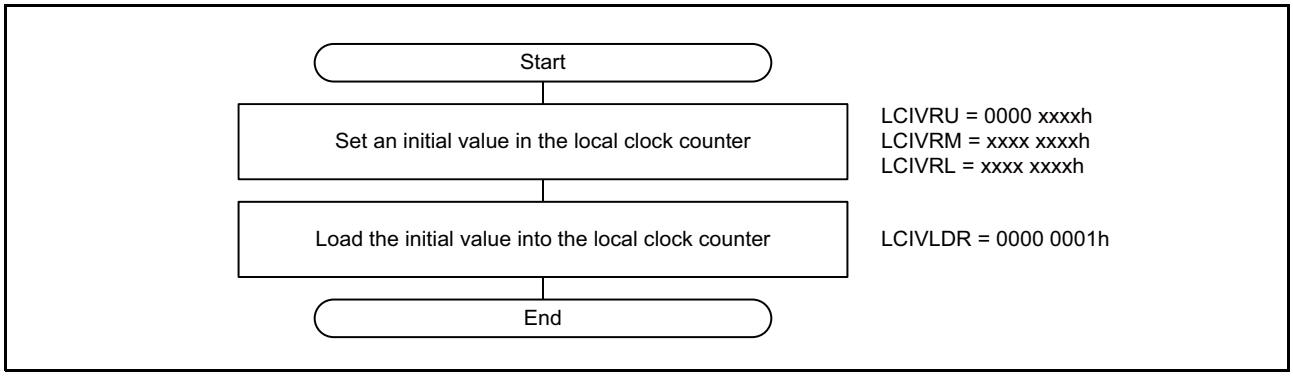

Figure 28.30 Procedure for Setting a New Initial Value in the Local Clock Counter

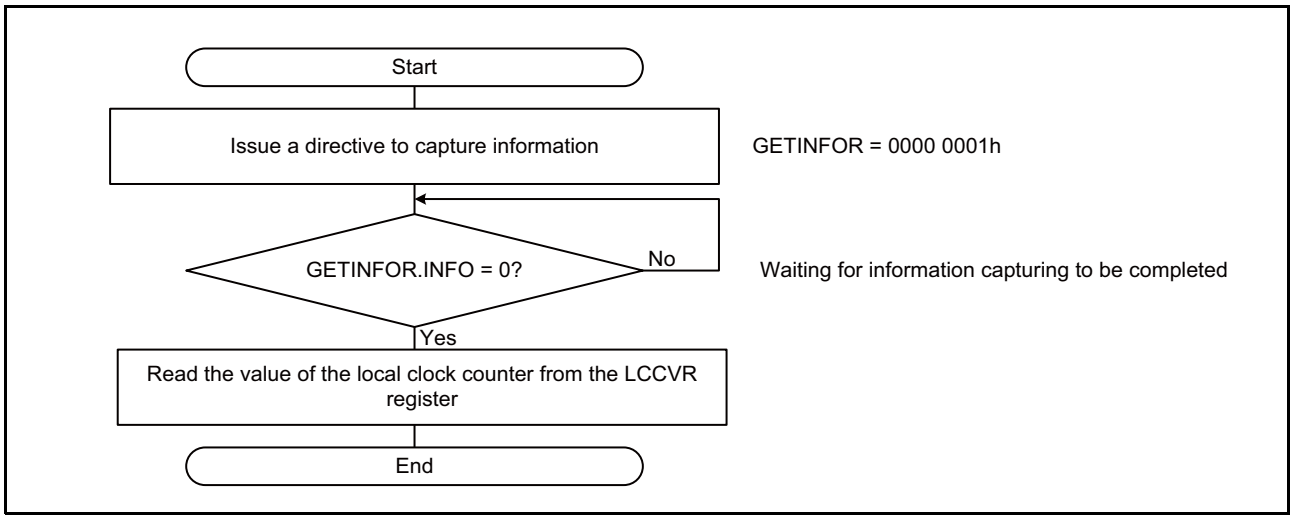

Figure 28.31 Procedure for Reading the Time Kept by the Local Clock Counter

28.3.17 Pulse Output Timer

The STCA module of the EPTPC incorporates six timers (pulse output timers 0 to 5) which operate independently of each other.

The pulse output timers produce periodic pulses, and the rising or falling edges of these pulses can be used as interrupt requests or output to the ELC as event signals. The time at which a pulse output timer starts operating (tstart), and the period (tc) and pulse width (tw) of the output pulses, can be specified.

The timing of pulse output timer operation is shown in Figure 28.32, and limits on the settings are listed in Table 28.27.

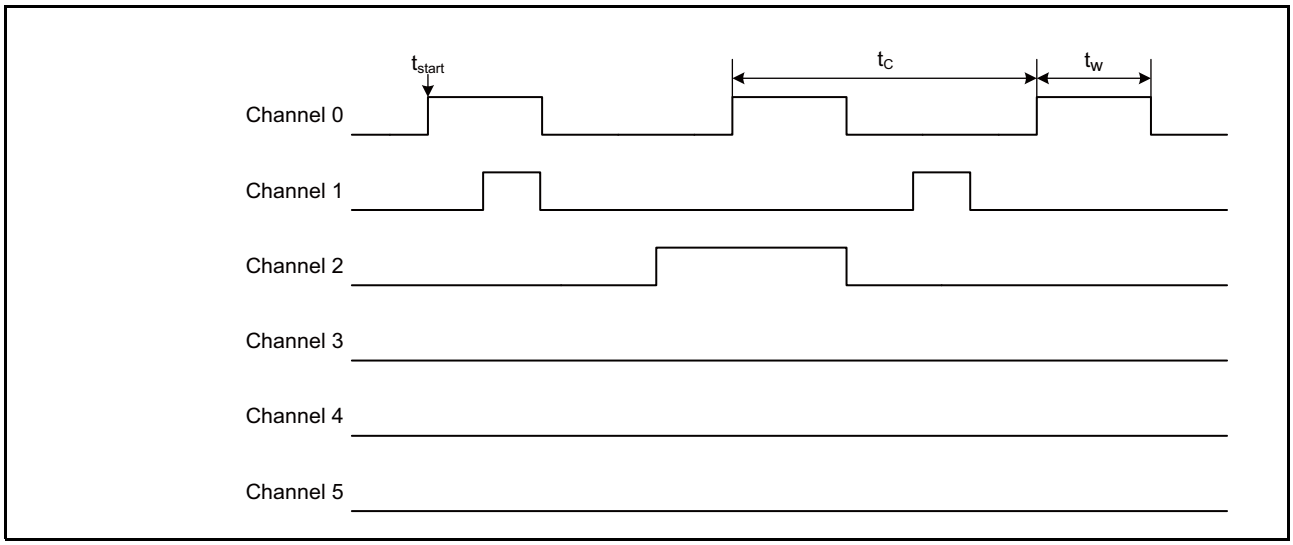

Figure 28.32 Time at which a Pulse Output Timer Starts Operating

Table 28.27 Limits on the Values that can be Specified for a Pulse Output Timer

Item	Description
Cycle (tC)	At least four cycles of the STCA clock and no greater than 1 s
Resolution of the cycle	Set in units of nanoseconds. However, the timing of rising edges is rounded by the period of the system clock (50 ns, 40 ns, or 20 ns).
Pulse width (tw)	At least two cycles of the STCA clock and no greater than 500 ms
Resolution of the pulse width	Set in units of nanoseconds. However, the timing of falling edges is rounded by the period of the system clock (50 ns, 40 ns, or 20 ns).

28.3.17.1 Procedure for Setting a Pulse Output Timer

Figure 28.33 shows the procedure for setting a pulse output timer.
Note that a timer does not produce periodic pulses if the time set in registers TMSTTRUm and TMSTTRLm (m = 0 to 5) has already passed. Set the time for a pulse output timer to start to a later time than the time when the timer is being set.

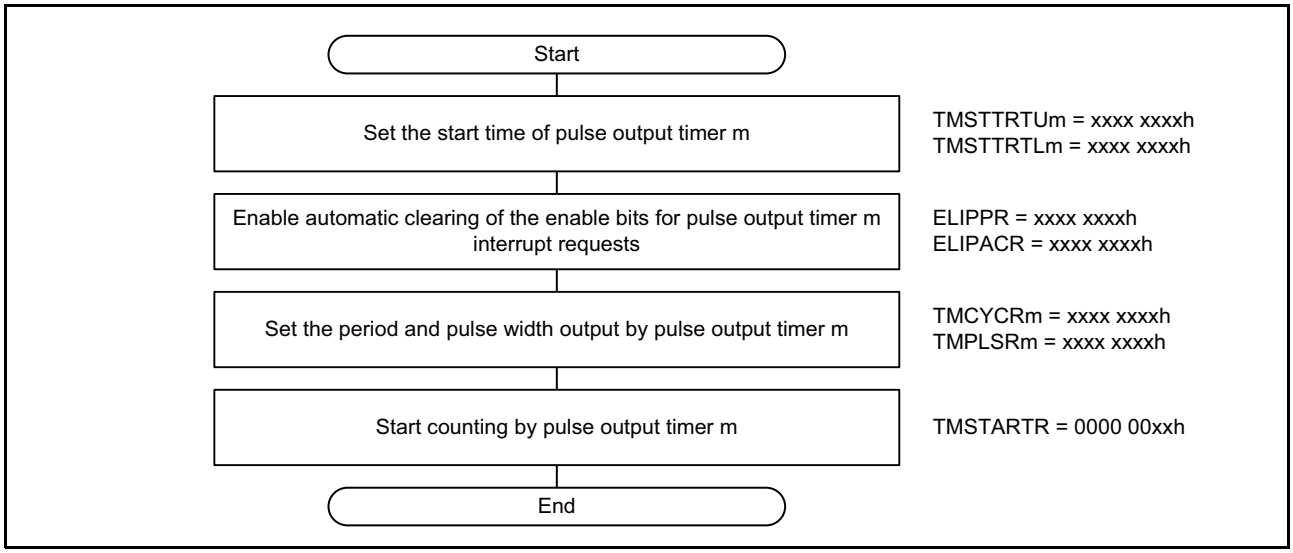

Figure 28.33 Procedure for Setting a Pulse Output Timer

28.3.17.2 Output of periodic pulses as interrupt requests or event signals

MINT interrupt requests, IPLS interrupt requests, or event output signals for the ELC can be generated by detecting rising or falling edges of the periodic pulses from the pulse output timer. The edge for detection and pulse output timer to use can be selected, and automatic clearing of enable bits for the IPLS interrupt or event output can be set. Make the required settings before setting the TMSTARTR.ENm bit to 1 (starting pulse output timer m).

(1) MINT Interrupt Request

Rising edges of the periodic pulses from the pulse output timers can be detected to generate MINT interrupt requests. Falling edges cannot be used in this way. The pulse output timers for use in generating MINT interrupt requests are selected by the MITSELR.MINTENm bits.
Automatic clearing of the enable bits for MINT interrupt requests is not available.

(2) IPLS Interrupt Request

Rising or falling edges of the periodic pulses from the pulse output timers can be detected to generate IPLS interrupt requests. The pulse output timers for use in generating IPLS interrupt requests are selected by the IPTSELR.IPTSELm bits.
Setting the ELIPACR.PLSP or PLSN bit enables automatic clearing of the enable bits for IPLS interrupt requests.

28.3.18 Priority Control in Transmission

28.3.18.1 Arbitration

In cases of contention between a message for transmission from the PTPEDMAC and a request for relaying from another channel, the PRC-TC module gives priority to the request for relaying from the other channel.
Cases of contention between multiple requests for the transmission of messages by the SYNFP module are also arbitrated in the order of priority shown in Table 28.28.

Table 28.28 Priority in Arbitration for Messages for Transmission

Messages for Transmission	Priority Order	Remark
Sync	1 Highest priority	
Delay_Req, Pdelay_Req	2	There is no device type that simultaneously transmits Delay_Req and Pdelay_Req messages.
Delay_Resp, Pdelay_Resp	3	There is no device type that simultaneously transmits Delay_Resp and Pdelay_Resp messages.
Announce	4	
Relay messages from another channel	5	The PRC-TC module determines the order of priority for these two items.
Messages for transmission from the PTPEDMAC	5	
Messages for transmission from the EDMAC	6	

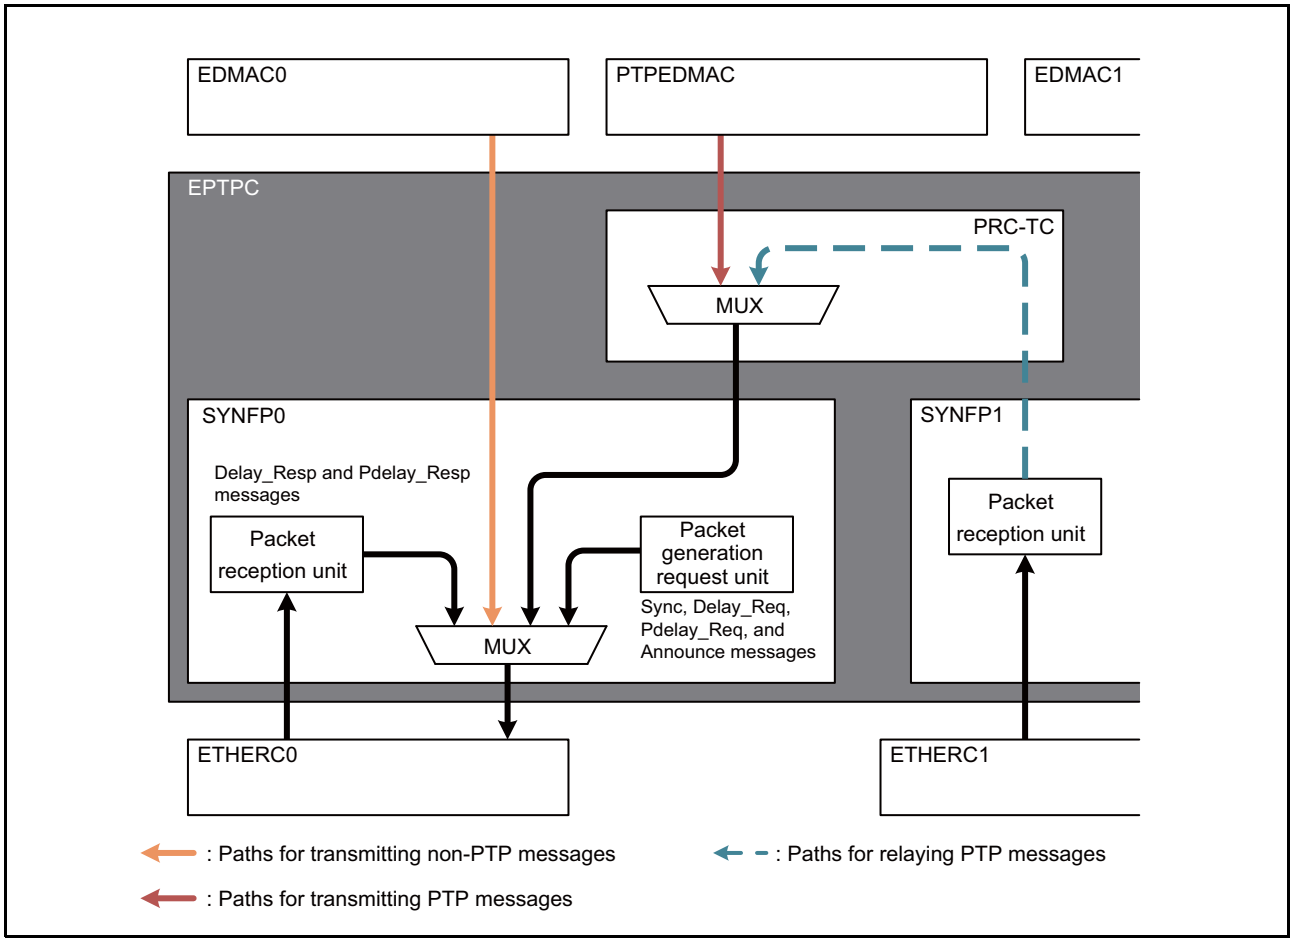

Figure 28.34 Arbitration in Message Transmission

28.3.18.2 Securing of Bandwidth for the Transmission of Sync Messages

The EPTPC secures bandwidth for the transmission of Sync messages, and is capable of handling transmission at very precise intervals.

If the transmission of a Sync message at a fixed interval proceeds at the same time as transmission by the PTPEDMAC or the relaying of messages by another channel is in progress, because transmission of the Sync message proceeds when the other processing is complete, the interval for transmission will no longer be fixed.

By securing bandwidth for the transmission of Sync messages, the transmission of messages from EDMAC0, EDMAC1, and the PTPEDMAC is limited, and the transmission of Sync messages can be handled without fluctuations. Securing of bandwidth for the transmission of Sync messages can be disabled by setting the SYCONFR.SBDIS bit to 1. Figure 28.35 gives a schematic view of securing bandwidth for the transmission of Sync messages.

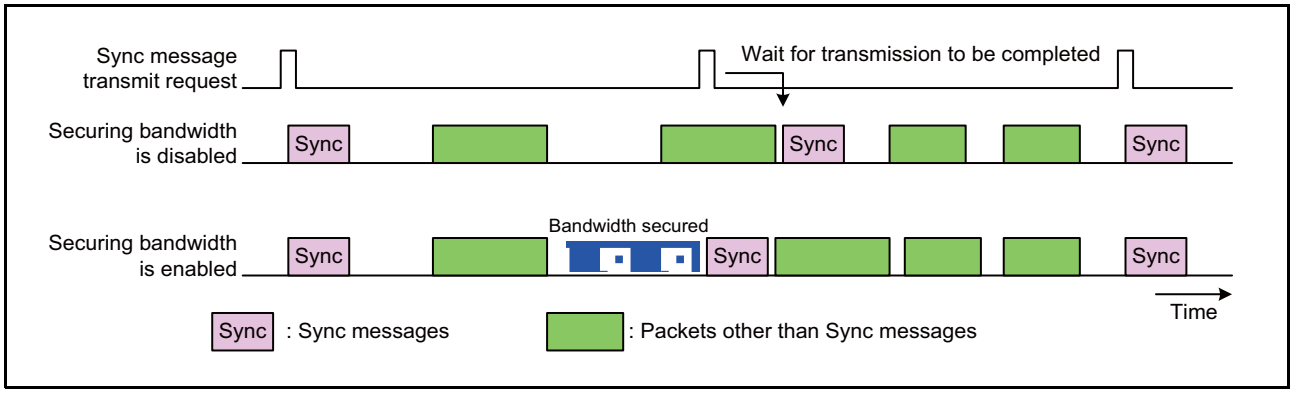

Figure 28.35 Securing of Bandwidth for the Transmission of Sync Messages

28.3.18.3 Securing of Transmission Interval

In the transmission of messages by the ETHERC, if there is a fixed delay from the time of a request for transmission to the time of transmission on the MII of Ethernet port 0 or 1, time stamp values of PTP messages can be used for accurately obtaining the size of the delay during operation as a slave. However, in the case of continuous transfer and so on, in situations where processing of messages to wait for interpacket gap times is required, delay times may fluctuate. Specifying an interval for frame transmission in SYCONFR.TCYC[7:0] bits to control the interval between the completion of transmission and the next request for transmission makes the ETHERC able to secure the reliability of time stamp values, thus avoiding the effects of interpacket gap times and obtaining a fixed delay for transmission.

28.4 Interrupts

The EPTPC has the MINT interrupt request and IPLS interrupt request.
Figure 28.36 shows the relation between the MINT interrupt request and IPLS interrupt request. Figure 28.37 shows the details on interrupt requests of the pulse output timer.

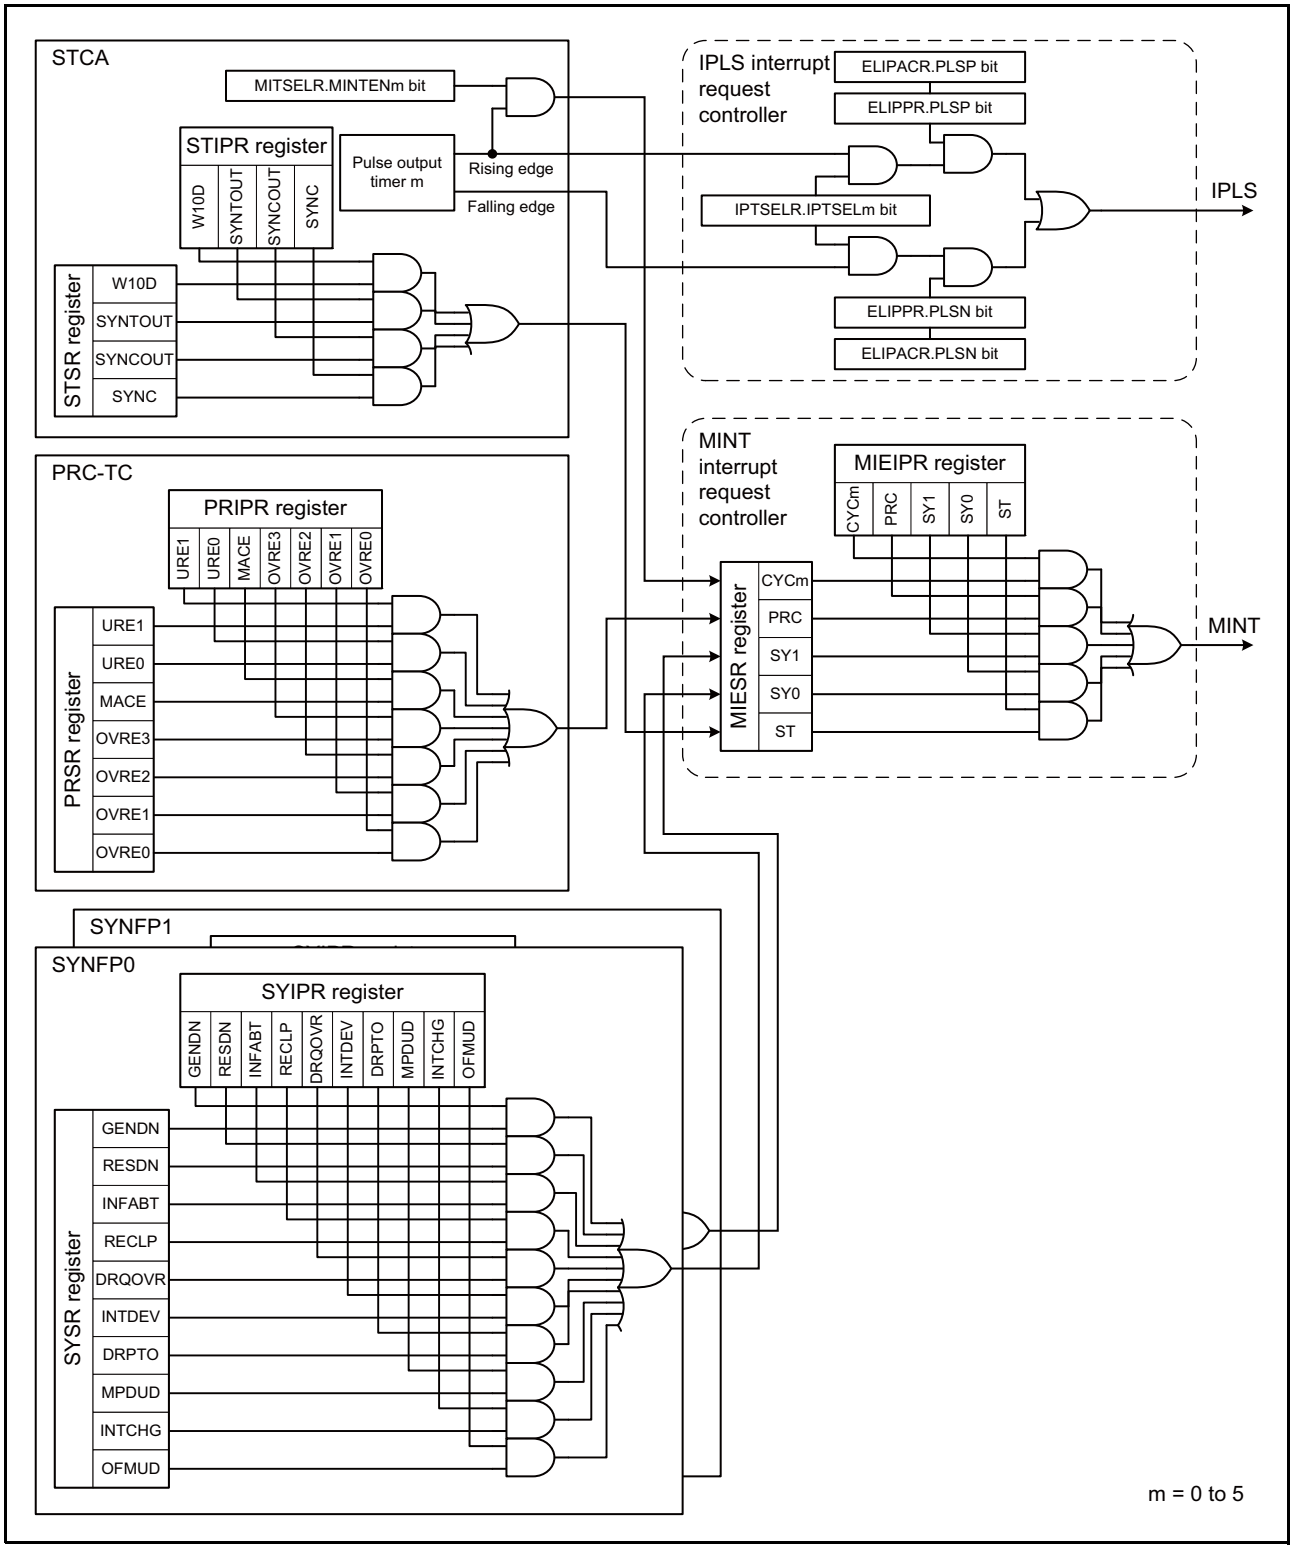

Figure 28.36 MINT Interrupt Request and IPLS Interrupt Request

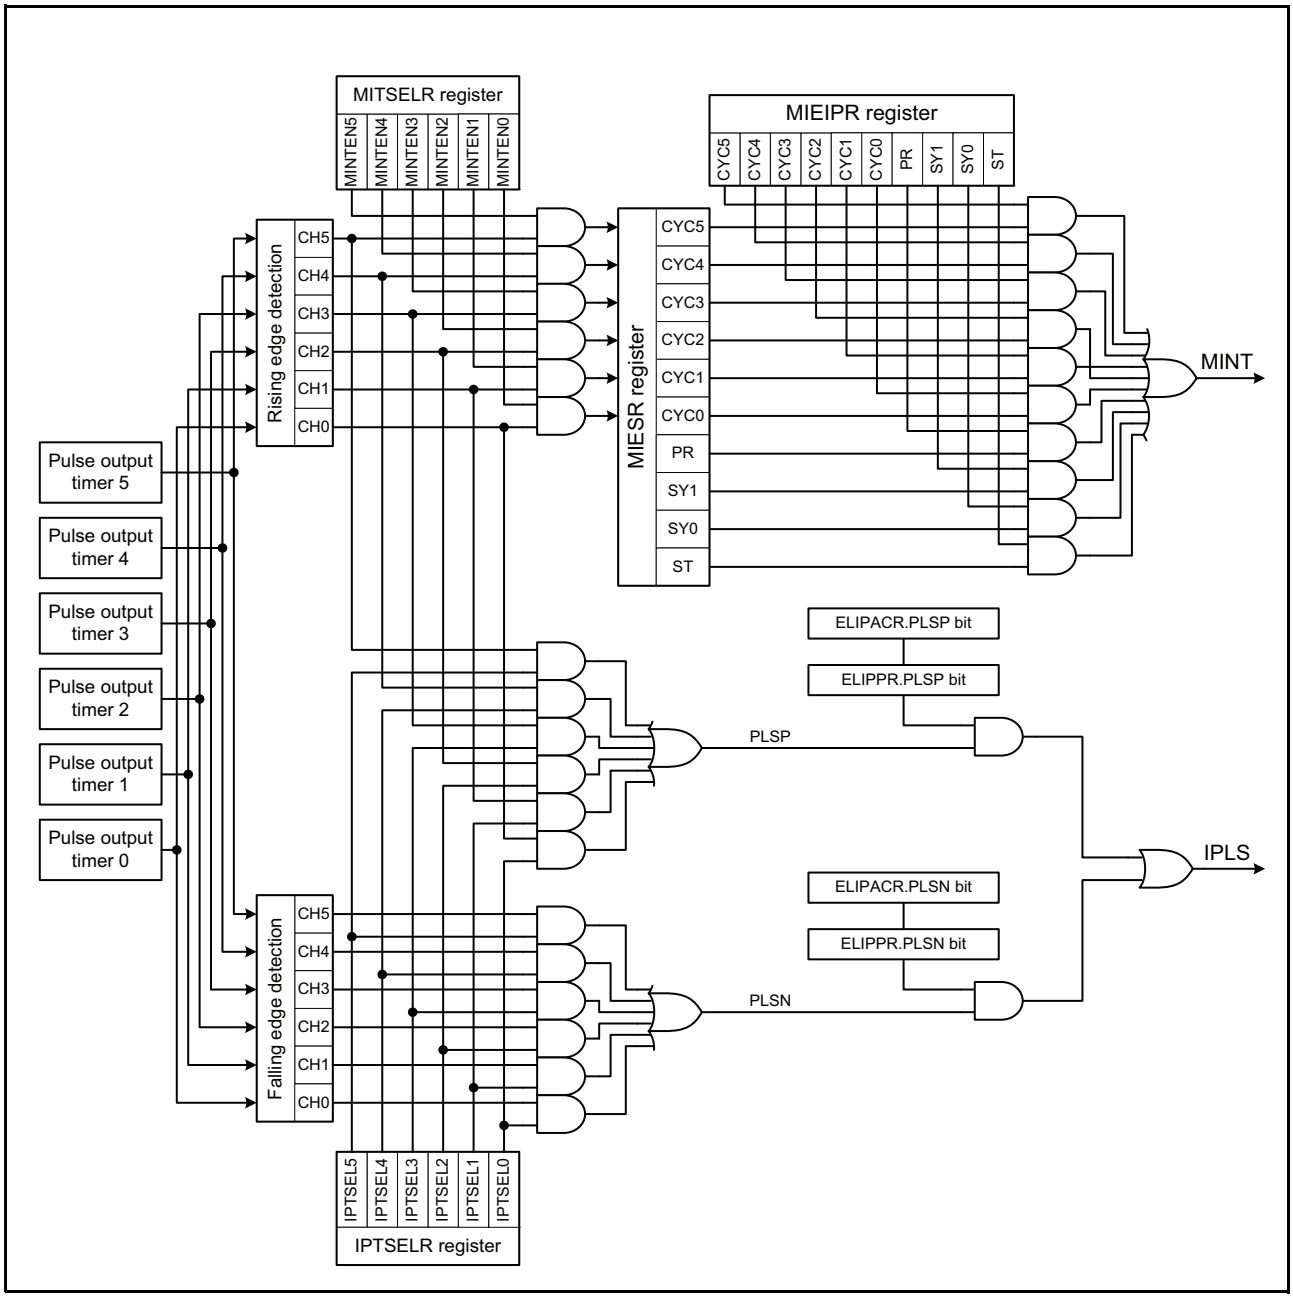

Figure 28.37 Details on Interrupt Requests of the Pulse Output Timer

28.5 Usage Notes

28.5.1 Setting of the Module-Stop Function

Operation of the EPTPC can be disabled or enabled with the standby control register 6 (STBCR6). The value following a reset is for the STBCR6 to stop. The registers of the EPTPC become accessible after 3 µs have elapsed following its release from the module-stop state and clearing of the BYPASS.BYPASSn bit to 0. For details on the module-stop function, see section 52, Power-Down Modes. Table 28.29 shows the relation between the settings of the respective bits and the accessibility of each of the EPTPC registers.
Access to the STCA and SYNFP units must proceed while the STCA and MII clock signals are being supplied to the respective units.

Table 28.29

STBCR6 Register				BYPASS Register		Allocation of Register Addresses for Access					
MSTP65 (ETHERC0, EDMAC0)	MSTP64 (ETHERC1, EDMAC1)	MSTP63 (EPTPC, PTPEDMAC)	MSTP62 (common circuit)	BYPASS0	BYPASS1	E820 4500h to E820 45FFh	E820 5000h to E820 503Fh	E820 5040h to E820 53FFh (STCA)	E820 5400h to E820 57FFh (PRC-TC)	E820 5800h to E820 5BFFh (SYNFP0)	E820 5C00h to E820 5FFFh (SYNFP1)
0	0	0	0	0	0	Accessible	Accessible	Accessible	Accessible	Accessible	Accessible
0	1	0	0	0	1	Accessible	Accessible	Accessible	Accessible	Accessible	Not accessible
1	0	0	0	1	0	Accessible	Accessible	Accessible	Accessible	Not accessible	Accessible
0	0	1	0	1	1	Accessible	Not accessible	Not accessible	Not accessible	Not accessible	Not accessible
0	1	1	0	1	1	Accessible	Not accessible	Not accessible	Not accessible	Not accessible	Not accessible
1	0	1	0	1	1	Accessible	Not accessible	Not accessible	Not accessible	Not accessible	Not accessible
1	1	1	1	1	1	Not accessible	Not accessible	Not accessible	Not accessible	Not accessible	Not accessible

Note: Settings other than those listed above are prohibited.

Writing does not proceed if you attempt access to the non-accessible registers or access while the MII and STCA clock signals are not being supplied. If you attempt reading, 0h is returned.

28.5.1.1 Release from the Module-Stop State

Before using the EPTPC, follow the steps below to release the EPTPC from the module-stop state. Do not proceed with other processing while this procedure is in progress.

(1) Clear the MSTP62, MSTP63, MSTP64, and MSTP65 bits in the STBCR6 register to 0.
(2) Clear the BYPASS0 and BYPASS1 bits in the BYPASS register to 0.
(3) Wait for 3µs.

Note: The procedure above is for cases where all functions are to be enabled. Set the respective bits as required.

28.5.1.2 Transition to the Module-Stop State

Follow the steps below to place the ETHERC, EPTPC, and EDMAC in the module-stop state. Do not proceed with other processing while this procedure is in progress.

(1) Reset the ETHERC, EPTPC, and EDMAC.*1
(2) Set the BYPASS0 and BYPASS1 bits in the BYPASS register to 1.
(3) Clear the MSTP62, MSTP63, MSTP64, and MSTP65 bits in the STBCR6 register to 1.
(4) Wait for 3 µs.

Note 1. See section 27.5.4, Points to Note when the EPTPC Is not in Use.

28.5.2 Notes on Placing the CPU on Software Standby

When you intend to place the CPU on software standby, start by placing the ETHERC, EPTPC, and EDMAC in the module stop state before executing the WFI instruction.

28.5.3 Wait Cycles for Register Access

Access to registers in the EPTPC involves the arbitration of different clock signals, specifically the peripheral module clock signal (Bφ), the STCA clock signal, and the MII clock signals such as TX_CLK. Accordingly, numbers of wait cycles for register access differ with the combination of the frequency settings of the peripheral module clock signal, of the STCA clock signal, and of the MII clock signals.
Table 28.30 gives examples of numbers of wait cycles for different combinations of clock frequency. Add 1 to 2 cycles to these values to obtain the number of access cycles.

Table 28.30 Wait Cycles for Register Access (when the frequency of the STCA clock is 50 MHz)

Address Range	STCA Clock = 50MHz							
	Peripheral Module Clock Bφ = 132 MHz				Peripheral Module Clock Bφ = 33 MHz			
	MII Clock 25 MHz (100 Mbps)		MII Clock 2.5 MHz (10 Mbps)		MII Clock 25 MHz (100 Mbps)		MII Clock 2.5 MHz (10 Mbps)	
	Read	Write	Read	Write	Read	Write	Read	Write
E820 4500h to E820 45FFh	2	2	2	2	2	2	2	2
E820 5000h to E820 503Fh	4	4	4	4	4	4	4	4
E820 5040h to E820 53FFh (STCA)	7	19 to 25*1	7	19 to 25*1	7	15 to 17*1	7	15 to 17*1
E820 5400h to E820 57FFh (PRC-TC)	8	8	8	8	8	8	8	8
E820 5800h to E820 5BFFh (SYNFP0)	8	25 to 37*2	8	119 to 225*2	8	17 to 21*2	8	41 to 69*2
E820 5C00h to E820 5FFFh (SYNFP1)	8	23 to 33*2	8	111 to 225*2	8	17 to 21*2	8	41 to 69*2

Note 1. The number of wait cycles in access to the STCA-related registers (Wstca) can be calculated to be in the following range from the periods of the peripheral module clock (tc(Bφ)) and STCA clock (tc(STCA)).
The minimum value of Wstca = Int (tc(STCA)/tc(Bφ)) × 2 + 15 (tc(Bφ) ≤ tc(STCA))
= 15 (tc(Bφ) > tc(STCA))
The maximum value of Wstca = Int (tc(STCA)/tc(Bφ)) × 4 + 17 (tc(Bφ) ≤ tc(STCA))
= 17 (tc(Bφ) > tc(STCA))
• Int(A) is the calculation of the largest integer not greater than A.
• This calculation presumes that the CPU clock and peripheral module clock have the same periods.

For example, if the frequency of the peripheral module clock is 132 MHz and that of the STCA clock is 50 MHz,
the minimum value of Wstca = Int (50 [ns]/7.58 [ns]) × 2 + 15 = 19, and
the maximum value of Wstca = Int (50 [ns]/7.58 [ns]) × 4 + 17 = 25.

Note 2. The number of wait cycles in access to the SYNFP-related registers (Wsynf) can be calculated to be in the following range from the periods of the peripheral module clock (tc(Bφ)) and MII clock (tc(MII)).
The minimum value of Wsynf = Int (tc(MII)/tc(Bφ)) × 2 + 15 (tc(Bφ) ≤ tc(MII))
= 15 (tc(Bφ) > tc(MII))
The maximum value of Wsynf = Int (tc(MII)/tc(Bφ)) × 4 + 17 (tc(Bφ) ≤ tc(MII))
= 17 (tc(Bφ) > tc(MII))
• Int(A) is the calculation of the largest integer not greater than A.
• This calculation presumes that the CPU clock and peripheral module clock have the same periods.

For example, if the frequency of the peripheral module clock is 132 MHz and the transmission rate is 10 Mbps (so the MII clock is running at 2.5 MHz),
the minimum value of Wsynf= Int (400 [ns]/7.58 [ns]) × 2 + 15 = 119, and
the maximum value of Wsynf= Int (400 [ns]/7.58 [ns]) × 4 + 17 = 225.

28.5.4 Restriction on the EPTPCa Operation when the MII Interface is in Use

The ETn_RX_CLK signal of the MII can be used for the STCA clock, however, it must be fixed to 25 MHz (100 Mbps) when in use. Use the ETn_SCLKIN signal instead if you may use the ETHERC at 10 Mbps when the MII is in use.

28.5.5 Transfer by PTPEDMAC when the Transparent Clock (TC) is in Use

When the setting of any of the following bits is 1, indicating the processing of a PTP event message, do not use PTPEDMAC to transfer data for transmission. Instead, use EDMACn of a corresponding channel for transfer (n = 0, 1).

- SYRFL1R.PDRP[1], SYRFL1R.PDRQ[1], SYRFL1R.DRP[1],or SYRFL1R.SYNC[1]

29. DMA Controller for the Ethernet Controller (EDMACa)

29.1 Overview

This MCU has three channels for the ethernet controller direct memory access controller (EDMAC): two channels for the ethernet controller (ETHERC) and one channel for the PTP controller (EPTPC). EDMAC0 and EDMAC1 control data transmission and reception for ETHERC0 and ETHERC1, respectively. The PTPEDMAC controls data transmission and reception for ETHERC0 and ETHERC1 according to the EPTPC settings. In this section, channel numbers are indicated as n (n = 0, 1).

The EDMAC controls most of the transmit/receive buffer management for communications. This reduces the load on the CPU and allows efficient data transmission and reception. The data transfers are controlled according to the information (referred to as descriptors) on the memory.

Table 29.1 lists the EDMAC specifications. Figure 29.1 shows the EDMAC configuration, and Figure 29.2 shows the configuration of descriptors and transmit/receive buffers on the memory.

Table 29.1 EDMAC Specifications

Item	Description
Data transmission and reception	• Controls data transmission and reception according to descriptors • Supports single buffer frame transmission and reception (1 buffer per frame), and multi-buffer frame transmission and reception (multiple buffers per frame)
Functions	• Minimizes system bus occupation time using block transfer (32-byte units) • Writes back the transmit/receive frame state to descriptors • Inserts padding in receive data
Low power consumption function	The EDMAC can be set to the module-stop state to reduce power consumption.

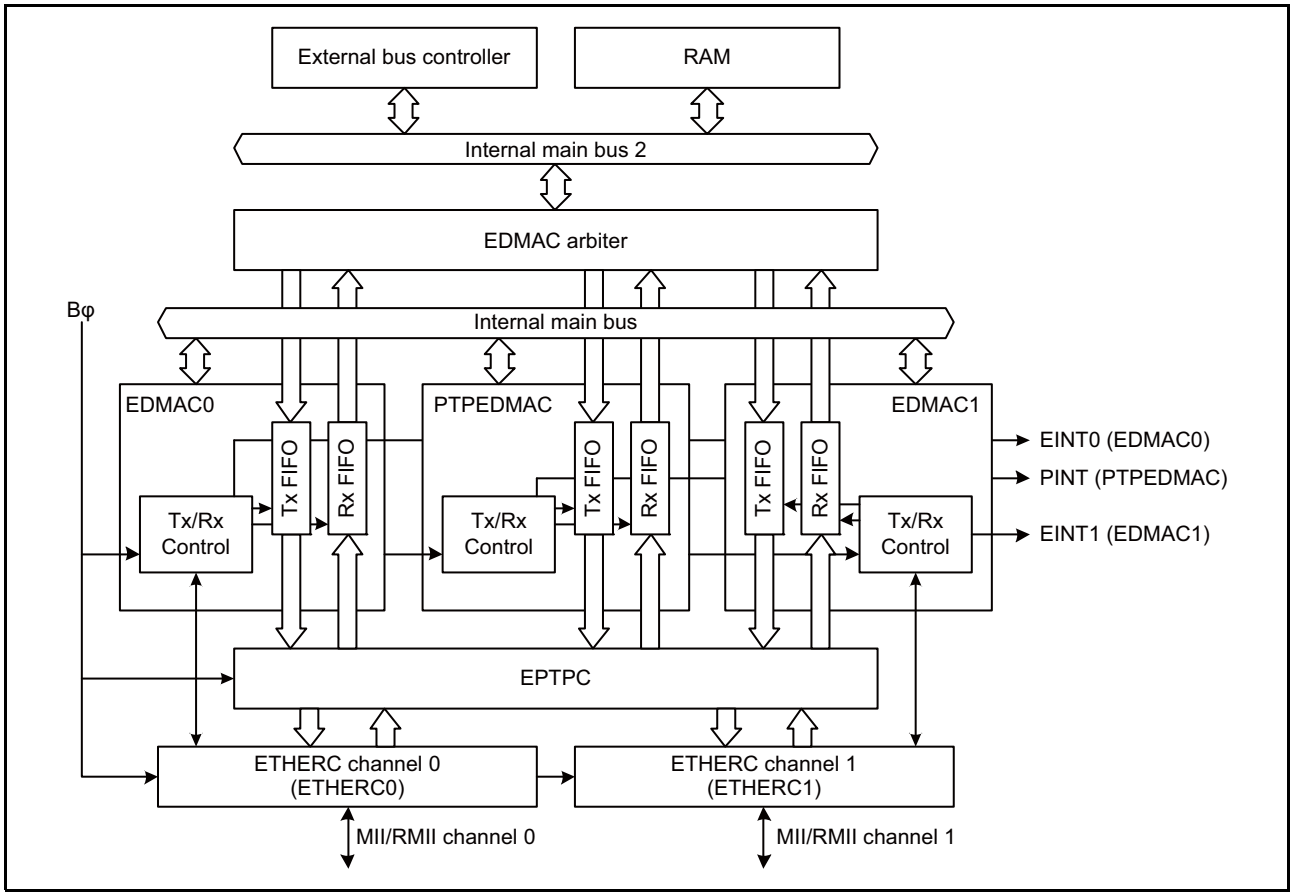

Figure 29.1 EDMAC Configuration

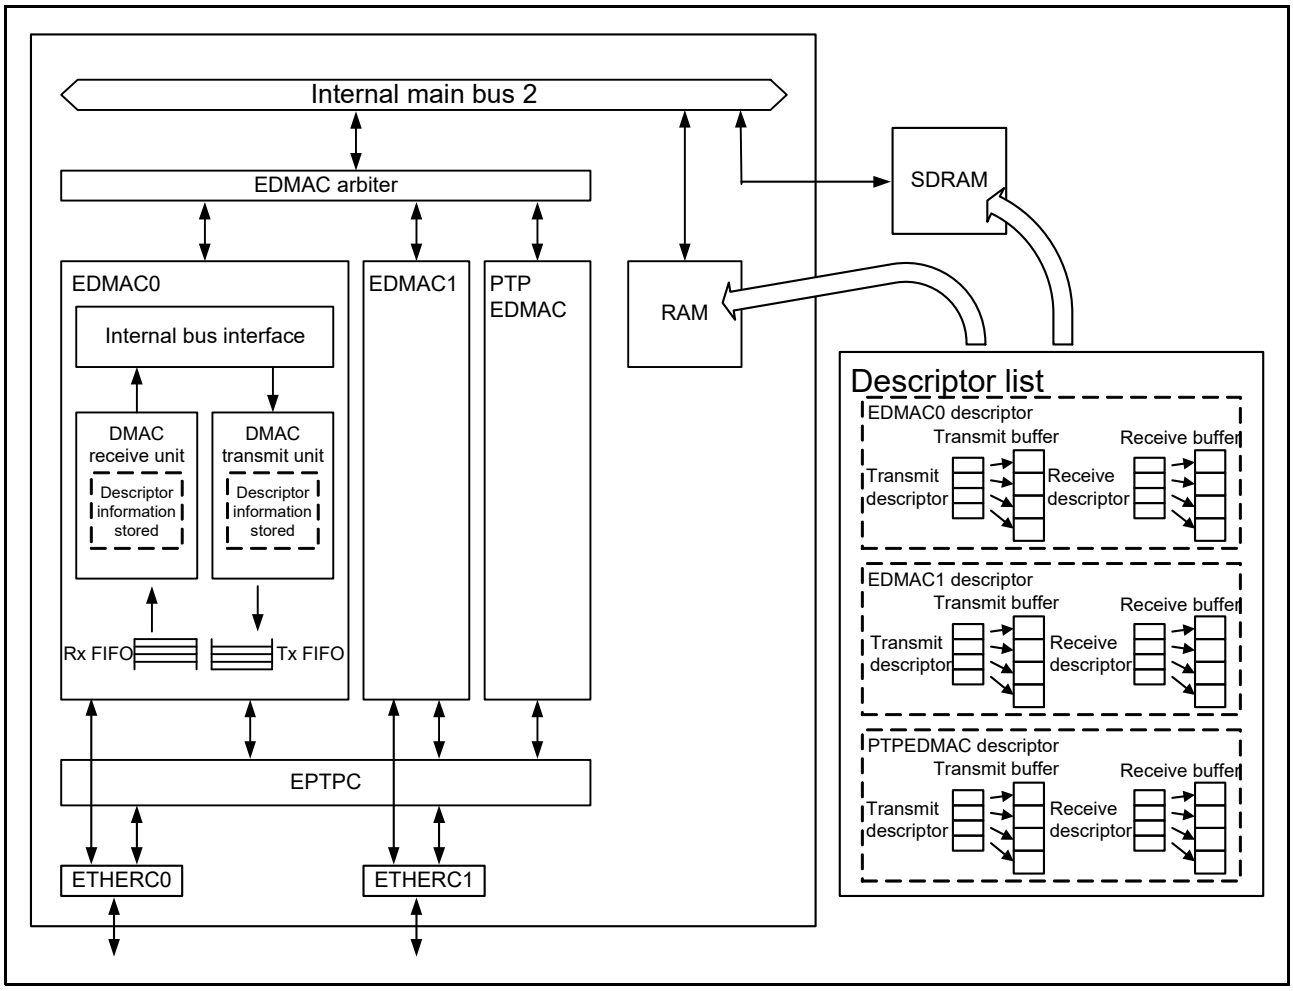

Figure 29.2 Configuration of Descriptors and Transmit/Receive Buffers on the Memory

29.2 Register Descriptions

Table 29.2 shows the register configuration.

Table 29.2 Register Configuration

Module	Register Name	Abbreviation	Address	Access size
EDMAC0	EDMAC mode register	EDMR	E820 4000h	32
	EDMAC transmit request register	EDTRR	E820 4008h	32

29.2.1 EDMAC Mode Register (EDMR)

Address: EDMAC0.EDMR E820 4000h, EDMAC1.EDMR E820 4200h, PTPEDMAC.EDMR E820 4400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DE	DL[1:0]		—	—	—	SWR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SWR	Software Reset	When 1 is written, the corresponding channels of the EDMAC and ETHERC are reset. Note that for the PTPEDMAC, the ETHERC are not reset. Registers TDLAR, RDLAR, RMFCR, TFUCR, and RFOCR are not reset with this bit. The read value is 0.	R/W
b3 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W
b5, b4	DL[1:0]	Transmit/Receive Descriptor Length	b5 b4 0 0: 16 bytes 0 1: 32 bytes 1 0: 64 bytes 1 1: 16 bytes	R/W
b6	DE	Big Endian Mode/Little Endian Mode *1	0: Big endian mode 1: Little endian mode	R/W
b31 to b7	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. This setting applies to data for the transmit/receive buffer. It does not apply to transmit/receive descriptors and registers.

The EDMR register controls EDMAC operation.
Set the EDMR register during the initialization process after a reset. When rewriting this register outside of the initialization process, set the SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again. If the ETHERC and EDMAC are reset during data transmission or reception, abnormal data may be sent on the line. Do not rewrite this register while the ETHERC transmit or receive function is enabled. It takes 64 cycles of the peripheral module clock (Bφ) to initialize the ETHERC and EDMAC. Complete the initialization process before accessing registers in the ETHERC and EDMAC.

29.2.2 EDMAC Transmit Request Register (EDTRR)

Address: EDMAC0.EDTRR E820 4008h, EDMAC1.EDTRR E820 4208h, PTPEDMAC.EDTRR E820 4408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TR	Transmit Request	When 1 is written, the EDMAC reads the corresponding descriptor and transmits frames where the TD0.TACT bit is 1. The TR bit becomes 0 after all the valid frames are transmitted. Writing 0 to this bit has no effect.	R/W
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W

The EDTRR register controls EDMAC transmission.

After the EDMAC has transmitted one frame, it reads the next descriptor. When the TD0.TACT bit in the descriptor is 1, the EDMAC continues transmission. When the TD0.TACT bit is 0, the EDMAC sets the TR bit to 0 and stops transmission.

29.2.3 EDMAC Receive Request Register (EDRRR)

Address: EDMAC0.EDRRR E820 4010h, EDMAC1.EDRRR E820 4210h, PTPEDMAC.EDRRR E820 4410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RR	Receive Request	0: Receive function is disabled.*1 1: Receive descriptor is read, and the receive function is enabled.	R/W
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. If the receive function is disabled during frame reception, write-back to the receive descriptor is not performed successfully. Subsequent pointers for reading a receive descriptor become abnormal and the EDMAC cannot operate normally. In this case, to enable the EDMAC receive function again, execute a software reset by setting the EDMR.SWR bit to 1.
To disable the EDMAC receive function without resetting the EDMAC, set the ETHERCn.ECMR.RE bit to 0. Next, after the EDMAC has completed reception and write-back to the receive descriptor has been confirmed, set the RR bit to 0.

The EDRRR register controls EDMAC reception.

When the RR bit becomes 1, the EDMAC reads the receive descriptor. When the RD0.RACT bit is 1, the EDMAC waits for a receive request from the ETHERC.

When the EDMAC has received data for the receive buffer size, it reads the next descriptor and waits to receive a frame. If the RD0.RACT bit is 0, the EDMAC sets the RR bit to 0 and stops reception.

29.2.4 Transmit Descriptor List Start Address Register (TDLAR)

Address: EDMAC0.TDLAR E820 4018h, EDMAC1.TDLAR E820 4218h, PTPEDMAC.TDLAR E820 4418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	The start address of the receive descriptor list is set. Set the start address according to the descriptor length selected by the EDMR.DL[1:0] bits. 16-byte boundary: Lower 4 bits = 0000b 32-byte boundary: Lower 5 bits = 00000b 64-byte boundary: Lower 6 bits = 000000b	R/W

The TDLAR register sets the start address of the transmit descriptor list.
Align each descriptor on the corresponding boundary to the descriptor length selected by the EDMR.DL[1:0] bits.
Do not rewrite the TDLAR register during transmission. Rewrite the TDLAR register while the EDTRR.TR bit is 0.

29.2.5 Receive Descriptor List Start Address Register (RDLAR)

Address: EDMAC0.RDLAR E820 4020h, EDMAC1.RDLAR E820 4220h, PTPEDMAC.RDLAR E820 4420h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	—	—	The start address of the receive descriptor list is set. Set the start address according to the descriptor length selected by the EDMR.DL[1:0] bits. 16-byte boundary: Lower 4 bits = 0000b 32-byte boundary: Lower 5 bits = 00000b 64-byte boundary: Lower 6 bits = 000000b	R/W

The RDLAR register sets the start address of the receive descriptor list.
Allocate each descriptor on the corresponding boundary to the descriptor length selected by the EDMR.DL[1:0] bits.
Do not rewrite the RDLAR register during reception. Rewrite the RDLAR register while the EDRRR.RR bit is 0.

29.2.6 ETHERC/EDMAC Status Register (EDMACn.EESR)

Address: EDMAC0.EESR E820 4028h, EDMAC1.EESR E820 4228h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	TWB	—	—	—	TABT	RABT	RFCOF	—	ECI	TC	TDE	TFUF	FR	RDE	RFOF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CND	DLC	CD	TRO	RMAF	—	—	RRF	RTLF	RTSF	PRE	CERF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CERF	CRC Error Flag	0: CRC error has not been detected. 1: CRC error has been detected.	R/W
b1	PRE	PHY-LSI Receive Error Flag	0: PHY-LSI receive error has not been detected. 1: PHY-LSI receive error has been detected.	R/W
b2	RTSF	Frame-Too-Short Error Flag	0: Frame-too-short error has not been received. 1: Frame-too-short error has been received.	R/W
b3	RTLF	Frame-Too-Long Error Flag	0: Frame-too-long error has not been received. 1: Frame-too-long error has been received.	R/W
b4	RRF	Alignment Error Flag	0: Alignment error has not been received. 1: Alignment error has been received.	R/W
b6, b5	—	Reserved	The read value is 0. The write value should be 0.	R/W
b7	RMAF	Multicast Address Frame Receive Flag	0: Multicast address frame has not been received. 1: Multicast address frame has been received.	R/W
b8	TRO	Transmit Retry Over Flag	0: Transmit retry-over condition has not been detected. 1: Transmit retry-over condition has been detected.	R/W
b9	CD	Late Collision Detect Flag	0: Late collision has not been detected. 1: Late collision has been detected during frame transmission.	R/W
b10	DLC	Loss of Carrier Detect Flag	0: Loss of carrier has not been detected. 1: Loss of carrier has been detected during frame transmission.	R/W
b11	CND	Carrier Not Detect Flag	0: A carrier has been detected when transmission starts. 1: A carrier has not been detected during preamble transmission.	R/W
b15 to b12	—	Reserved	The read value is 0. The write value should be 0.	R/W
b16	RFOF	Receive FIFO Overflow Flag	0: Overflow has not occurred. 1: Overflow has occurred.	R/W
b17	RDE	Receive Descriptor Empty Flag	0: The EDMAC detects that the receive descriptor valid bit (RD0.RACT) is 1. 1: The EDMAC detects that the receive descriptor valid bit (RD0.RACT) is 0.	R/W
b18	FR	Frame Receive Flag	0: Frame has not been received. 1: Frame has been received. Update of the receive descriptor is complete.	R/W
b19	TFUF	Transmit FIFO Underflow Flag	0: Underflow has not occurred. 1: Underflow has occurred.	R/W
b20	TDE	Transmit Descriptor Empty Flag	0: The EDMAC detects that the transmit descriptor valid bit (TD0.TACT) is 1. 1: The EDMAC detects that the transmit descriptor valid bit (TD0.TACT) is 0.	R/W
b21	TC	Frame Transfer Complete Flag	0: Transfer have not been completed, or no transfer has been requested. 1: All frames indicated by the transmit descriptor have been completely transferred to the transmit FIFO.	R/W

Bit	Symbol	Bit Name	Description	R/W
b22	ECI	ETHERC Status Register Source Flag	0: ETHERC status interrupt source has not been detected. 1: ETHERC status interrupt source has been detected.	R *1
b23	—	Reserved	The read value is 0. The write value should be 0.	R
b24	RFCOF	Receive Frame Counter Overflow Flag	0: Receive frame counter has not overflowed. 1: Receive frame counter has overflowed.	R/W
b25	RABT	Receive Abort Detect Flag	0: Frame reception has not been aborted or no reception has been requested. 1: Frame reception has been aborted.	R/W
b26	TABT	Transmit Abort Detect Flag	0: Frame transmission has not been aborted or no transmission has been requested. 1: Frame transmission has been aborted.	R/W
b29 to b27	—	Reserved	The read value is 0. The write value should be 0.	R/W
b30	TWB	Write-Back Complete Flag	0: Write-back has not been completed, or no transmission has been requested. 1: Write-back to the transmit descriptor has been completed.	R/W
b31	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. The ECI flag is read-only. When the source in the ETHERCn.ECSR register is cleared, the ECI flag is also cleared.

The EDMACn.EESR register indicates the ETHERC and EDMAC communication status.
Each flag in the EESR register can be output as an interrupt request signal (EINTn) from the EDMAC. Each flag, excluding the ECI flag, becomes 0 by writing 1. The value of each flag is not changed by writing 0. Each interrupt source can be enabled by the corresponding bit in the EDMACn.EESIPR register.

CERF Flag (CRC Error Flag)

The CERF flag becomes 1 when an error is detected in checking the frame check sequence (FCS) field of the receive frame.

PRE Flag (PHY-LSI Receive Error Flag)

The PRE flag indicates the RX_ER signal output from the PHY-LSI is high.

RTSF Flag (Frame-Too-Short Error Flag)

The RTSF flag indicates that a received frame was less than 64 bytes.

RTLF Flag (Frame-Too-Long Error Flag)

The RTLF flag indicates that a received frame is greater than the upper limit of the receive frame length set in the ETHERCn.RFLR register. The excess data is discarded.

RRF Flag (Alignment Error Flag)

The RRF flag indicates that a frame is not an integral number of octets. The last word that is not an integral number of octets is not transferred.

RMAF Flag (Multicast Address Frame Receive Flag)

The RMAF flag indicates that a multicast frame has been received.

TRO Flag (Transmit Retry Over Flag)

This flag indicates that a collision occurred again during the 15th retry of frame transmission.

CD Flag (Late Collision Detect Flag)

The CD flag indicates that a late collision has been detected during frame transmission.

DLC Flag (Loss of Carrier Detect Flag)

The DLC flag indicates that a loss of carrier has been detected during frame transmission.

CND Flag (Carrier Not Detect Flag)

The CND flag becomes 1 when a carrier has not been detected during preamble transmission.

RFOF Flag (Receive FIFO Overflow Flag)

The RFOF flag indicates that the receive FIFO has overflowed during frame reception.

RDE Flag (Receive Descriptor Empty Flag)

The RDE flag indicates that the read receive descriptor is invalid.
When this flag becomes 1, set the RD0.RACT bit in the receive descriptor to 1 and set the EDRRR.RR bit to 1 to resume reception.

FR Flag (Frame Receive Flag)

The FR flag indicates that a frame has been received and the receive descriptor has been updated. The FR flag becomes 1 every time a frame is received.

TFUF Flag (Transmit FIFO Underflow Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data is sent on the line.

TDE Flag (Transmit Descriptor Empty Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor indicates that the frame is not complete (TD0.TFP[1:0] bits are 10b or 00b) in multi-buffer frame trans-mission. As a result, an incomplete frame may be sent.
When this flag becomes 1, perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission. Transmission starts from the address stored in the TDLAR register.

TC Flag (Frame Transfer Complete Flag)

The TC flag indicates that all the data specified by the transmit descriptor has been transmitted from the ETHERC. This flag becomes 1 when one frame has been transmitted in single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0.TACT bit in the next transmit descriptor is 0. After frame transmission is completed, the EDMAC writes the transfer status back to the descriptor.

ECI Flag (ETHERC Status Register Source Flag)

The ECI flag becomes 1 when an interrupt request is generated by the ETHERC.ECSR register.

ADE Flag (Address Error Flag)

The ADE flag indicates that the memory address that the EDMAC tried to transfer is invalid.

RFCOF Flag (Receive Frame Counter Overflow Flag)

The RFCOF flag indicates that the next frame reception starts while the number of frames stored in the receive FIFO reaches the maximum number of frames (16 frames). Note that the received frame is discarded while the RFCOF flag is 1.

RABT Flag (Receive Abort Detect Flag)

The RABT flag indicates that the ETHERC has aborted frame reception due to a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or other error.

TABT Flag (Transmit Abort Detect Flag)

The TABT flag indicates that the ETHERC has aborted frame transmission due to transmit retry over, loss of carrier, no carrier detection, or other error.

TWB Flag (Write-Back Complete Flag)

The TWB flag indicates the EDMAC has completed writing back to the descriptor after frame transmission. Note that this flag becomes 1 after each frame transmission when the TRIMD.TIM bit is 0. This flag becomes 1 only when the TRIMD.TIS bit is 1.

29.2.7 PTP/EDMAC Status Register (PTPEDMAC.EESR)

Address: PTPEDMAC.EESR E820 4428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b26	TABT	Transmit Abort Detect Flag	0: Frame transmission has not been aborted or transmission has not been requested. 1: Frame transmission has been aborted.	R/W
b29 to b27	—	Reserved	The read value is 0. The write value should be 0.	R/W
b30	TWB	Write-Back Complete Flag	0: Write-back has not been completed, or transmission has not been requested. 1: Write-back to the transmit descriptor has been completed.	R/W
b31	—	Reserved	The read value is 0. The write value should be 0.	R/W

The PTPEDMAC.EESR register indicates the PTPEDMAC communication status.
Each flag in the EESR register can be output as an interrupt request signal (PINT) from the PTPEDMAC. Each flag becomes 0 by writing 1. The value of each flag is not changed by writing 0. Each interrupt source, excluding the TYPE[3:0] flag, can be enabled by setting the corresponding bit in the PTPEDMAC.EESIPR register.

TYPE[3:0] Flags (PTP v2 Message Type Flag)

The TYPE[3:0] flags indicate the type of received PTP message.

PVER Flag (PTP v2 Packet Flag)

The PVER flag indicates whether the received packet is a PTP v2 packet.

RPORT Flag (Receive Port Flag)

The RPORT flag indicates which Ethernet port has been used for receiving PTP messages.

MACE Flag (MAC Address Mismatch Flag)

The MACE flag indicates the source MAC address is different from the set value.

RFOF Flag (Receive FIFO Overflow Flag)

The RFOF flag indicates that the receive FIFO has overflowed during frame reception.

RDE Flag (Receive Descriptor Empty Flag)

The RDE flag indicates that the read receive descriptor is invalid.
When this flag becomes 1, set the RD0.RACT bit in the receive descriptor to 1 and set the EDRRR.RR bit to 1 to resume reception.

FR Flag (Frame Receive Flag)

The FR flag indicates that a frame has been received and the receive descriptor has been updated. The FR flag becomes 1 every time a frame is received.

TFUF Flag (Transmit FIFO Underflow Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data is sent on the line.

TDE Flag (Transmit Descriptor Empty Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor indicates that the frame is not complete (TD0.TFP[1:0] bits are 10b or 00b) in multi-buffer frame transmission. As a result, an incomplete frame may be sent.
When this flag becomes 1, perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission. Transmission starts from the address stored in the TDLAR register.

TC Flag (Frame Transfer Complete Flag)

The TC flag indicates that all the data specified by the transmit descriptor has been transmitted from the ETHERC. This flag becomes 1 when one frame has been transmitted in single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0.TACT bit in the next transmit descriptor is 0. After frame transmission is completed, the PTPEDMAC writes the transfer status back to the descriptor.

ADE Flag (Address Error Flag)

The ADE flag indicates that the memory address that the PTPEDMAC tried to transfer is invalid.
RFCOF Flag (Receive Frame Counter Overflow Flag)
The RFCOF flag indicates that the next frame reception starts while the number of frames stored in the receive FIFO reaches the maximum number of frames (16 frames). Note that the received frame is discarded while the RFCOF flag is 1.

TABT Flag (Transmit Abort Detect Flag)

The TABT flag indicates that the ETHERC has aborted frame transmission due to transmit retry over, loss of carrier, no carrier detection, or other error.

TWB Flag (Write-Back Complete Flag)

The TWB flag indicates the PTPEDMAC has completed writing back to the descriptor after frame transmission. Note that this flag becomes 1 after each frame transmission when the TRIMD.TIM bit is 0. This flag becomes 1 only when the TRIMD.TIS bit is 1.

29.2.8 ETHERC/EDMAC Status Interrupt Enable Register (EDMACn.EESIPR)

b23	—	Reserved	The read value is 0. The write value should be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b24	RFCOFIP	Receive Frame Counter Overflow Interrupt Request Enable	0: Receive frame counter overflow interrupt request is disabled. 1: Receive frame counter overflow interrupt request is enabled	R/W
b25	RABTIP	Receive Abort Detect Interrupt Request Enable	0: Receive abort detect interrupt request is disabled. 1: Receive abort detect interrupt request is enabled.	R/W
b26	TABTIP	Transmit Abort Detect Interrupt Request Enable	0: Transmit abort detect interrupt request is disabled. 1: Transmit abort detect interrupt request is enabled.	R/W
b29 to b27	—	Reserved	The read value is 0. The write value should be 0.	R/W
b30	TWBIP	Write-Back Complete Interrupt Request Enable	0: Write-back complete interrupt request is disabled. 1: Write-back complete interrupt request is enabled.	R/W
b31	—	Reserved	The read value is 0. The write value should be 0.	R/W

The EDMACn.EESIPR register enables interrupt requests corresponding to bits in the EDMACn.EESR register. When a bit in this register is 1, the corresponding interrupt request is enabled.

29.2.9 PTP/EDMAC Status Interrupt Enable Register (PTPEDMAC.EESIPR)

Address: PTPEDMAC.EESIPR E820 4430h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b20	TDEIP	Transmit Descriptor Empty Interrupt Request Enable	0: Transmit descriptor empty interrupt request is disabled. 1: Transmit descriptor empty interrupt request is enabled.	R/W
b21	TCIP	Frame Transfer Complete Interrupt Request Enable	0: Frame transmission complete interrupt request is disabled. 1: Frame transmission complete interrupt request is enabled.	R/W
b23, b22	—	Reserved	The read value is 0. The write value should be 0.	R/W
b24	RFCOFIP	Receive Frame Counter Overflow Interrupt Request Enable	0: Receive frame counter overflow interrupt request is disabled. 1: Receive frame counter overflow interrupt request is enabled.	R/W
b25	—	Reserved	The read value is 0. The write value should be 0.	R/W
b26	TABTIP	Transmit Abort Detect Interrupt Request Enable	0: Transmit abort detect interrupt request is disabled. 1: Transmit abort detect interrupt request is enabled.	R/W
b29 to b27	—	Reserved	The read value is 0. The write value should be 0.	R/W
b30	TWBIP	Write-Back Complete Interrupt Request Enable	0: Write-back complete interrupt request is disabled. 1: Write-back complete interrupt request is enabled.	R/W
b31	—	Reserved	The read value is 0. The write value should be 0.	R/W

The PTPEDMAC.EESIPR register enables interrupt requests corresponding to bits in the PTPEDMAC.EESR register. When a bit in this register is 1, the corresponding interrupt request is enabled.

29.2.10 ETHERC/EDMAC Transmit/Receive Status Copy Enable Register (EDMACn.TRSCER)

Address: EDMAC0.TRSCER E820 4038h, EDMAC1.TRSCER E820 4238h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RMAFCE	—	—	RRFCE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	RRFCE	RRF Flag Copy Enable	0: The EESR.RRF flag status is reflected in the RD0.RFE bit of the receive descriptor. 1: The EESR.RRF flag status is not reflected in the RD0.RFE bit of the receive descriptor.	R/W
b6, b5	—	Reserved	The read value is 0. The write value should be 0.	R/W
b7	RMAFCE	RMAF Flag Copy Enable	0: The EESR.RMAF flag status is reflected in the RD0.RFE bit of the receive descriptor. 1: The EESR.RMAF flag status is not reflected in the RD0.RFE bit of the receive descriptor.	R/W
b31 to b8	—	Reserved	The read value is 0. The write value should be 0.	R/W

The EDMACn.TRSCER register selects whether the receive status indicated by flags EDMACn.EESR.RMAF and RRF is reflected in the RFE bit of the receive descriptor as a summary. The bits in the TRSCER register correspond to bits in the EESR register that have the same number. When setting the RMAFCE or RRFCE bit to 0, the corresponding receive status (EESR.RMAF or RRF flag) is reflected in the RFE bit of the receive descriptor. When setting the RMAFCE or RRFCE bit to 1, the corresponding receive status is not reflected in the RFE bit.

29.2.11 Missed-Frame Counter Register (RMFCR)

Address: EDMAC0.RMFCR E820 4040h, EDMAC1.RMFCR E820 4240h, PTPEDMAC.RMFCR E820 4440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MFC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MFC[15:0]	Missed-Frame Counter	These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RMFCR register indicates that the number of frames that could not be stored in the receive FIFO and were therefore discarded during reception. When the receive FIFO overflows, it stops receiving data, and the remain-ing frames are discarded. At the same time, the RMFCR register value is incremented. When the RMFCR register value reaches FFFFh, incrementing is halted. When any value is written to the RMFCR register, the counter value becomes 0.
For the frame that has not been completely received, after data in the receive FIFO is transferred to the receive buffer, the RACT bit in the receive descriptor 0 (RD0) becomes 0 (descriptor disabled), the RFS9 bit becomes 1 (receive FIFO overflow), and the EDMACn.EESR.RFOF or PTPEDMAC.EESR.RFOF flag becomes 1 (overflow has occurred).

29.2.12 Transmit FIFO Threshold Register (TFTR)

Address: EDMAC0.TFTR E820 4048h, EDMAC1.TFTR E820 4248h, PTPEDMAC.TFTR E820 4448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TFT[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b10 to b0	TFT[10:0]	Transmit FIFO Threshold	b10 b0 000h: Store and forward mode 001h to 00Ch: Setting prohibited 00Dh to 200h: The threshold is the set value multiplied by 4. Example: 00Dh: 52 bytes 040h: 256 bytes 100h: 1024 bytes 200h: 2048 bytes 201h to 7FFh: Setting prohibited	R/W
b31 to b11	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. When starting transmission before one frame data has been completely written, take care to prevent an underflow.
Note 2. To prevent a transmit underflow, using the initial value (store and forward mode) is recommended.

The TFTR register sets the transmit FIFO threshold at which the first transmission starts. The actual threshold is the set value multiplied by 4.

The ETHERC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes set in the TFTR register, when the transmit FIFO is full, or when one frame data has been completely written. Set the TFTR register while the EDTRR.TR bit is 0.

29.2.13 FIFO Depth Register (FDR)

Address: EDMAC0.FDR E820 4050h, EDMAC1.FDR E820 4250h, PTPEDMAC.FDR E820 4450h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TFD[4:0]					—	—	—	RFD[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	RFD[4:0]	Receive FIFO Depth	b4 b0 01111: 4096 bytes Settings other than above are prohibited.	R/W
b7 to b5	—	Reserved	The read value is 0. The write value should be 0.	R/W
b12 to b8	TFD[4:0]	Transmit FIFO Depth	b12 b8 00111: 2048 bytes Settings other than above are prohibited.	R/W
b31 to b13	—	Reserved	The read value is 0. The write value should be 0.	R/W

The FDR register sets the transmit and receive FIFO depths.
Set this register to 0000 070Fh before starting transmission and reception.

29.2.14 Receive Method Control Register (RMCR)

Address: EDMAC0.RMCR E820 4058h, EDMAC1.RMCR E820 4258h, PTPEDMAC.RMCR E820 4458h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RNR	Receive Request Reset	0: EDRRR.RR bit (receive request bit) is set to 0 when one frame has been received. 1: EDRRR.RR bit (receive request bit) is not set to 0 when one frame has been received.	R/W
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RMCR register sets how to control the EDRRR.RR bit when receiving a frame.
Since the EDRRR.RR bit becomes 0 when one frame has been received while the RNR bit is 0, the RR bit needs to be set to 1 by software to receive the subsequent frame.
Since the EDRRR.RR bit does not become 0 when one frame has been received while the RNR bit is 1, the EDMAC reads the next receive descriptor and continues receiving frames. It is recommended to set the RNR bit to 1 when receiving data continuously.
Set the RMCR register while the EDRRR.RR bit is 0.

29.2.15 Transmit FIFO Underflow Counter (TFUCR)

Address: EDMAC0.TFUCR E820 4064h, EDMAC1.TFUCR E820 4264h, PTPEDMAC.TFUCR E820 4464h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	UNDER[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	UNDER[15:0]	Transmit FIFO Underflow Count	These bits indicate how many times the transmit FIFO has underflowed. The counter stops when the counter value reaches FFFFh.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The TFUCR register indicates how many times the transmit FIFO has underflowed.
When writing any value to the TFUCR register, the counter value becomes 0.

29.2.16 Receive FIFO Overflow Counter (RFOCR)

Address: EDMAC0.RFOCR E820 4068h, EDMAC1.RFOCR E820 4268h, PTPEDMAC.RFOCR E820 4468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVER[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	OVER[15:0]	Receive FIFO Overflow Count	These bits indicate how many times the receive FIFO has overflowed. The counter stops when the counter value reaches FFFFh.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RFOCR register indicates how many times the receive FIFO has overflowed.
When writing any value to the RFOCR register, the counter value becomes 0.

29.2.17 Independent Output Signal Setting Register (IOSR)

Address: EDMAC0.IOSR E820 406Ch, EDMAC1.IOSR E820 426Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ELB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ELB	External Loopback Mode	0: The ETn_EXOUT pin outputs low. 1: The ETn_EXOUT pin outputs high.	R/W
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W

The IOSR register selects the output level of the ETHERC external output pin (ETn_EXOUT) in external loopback mode.

The ELB bit value is output to the ETn_EXOUT pin of the MCU as is, which can be used to set loopback mode for the PHY-LSI. To use the loopback function of the PHY-LSI through this register, the PHY-LSI needs to be provided with the pin to be connected to the ETn_EXOUT pin.

29.2.18 Flow Control Start FIFO Threshold Setting Register (FCFTR)

Address: EDMAC0.FCFTR E820 4070h, EDMAC1.FCFTR E820 4270h, PTPEDMAC.FCFTR E820 4470h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFFO[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFDO[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	RFDO[2:0]	Receive FIFO Data PAUSE Output Threshold	b2 b0 0 0 0: When 224 (256 - 32) bytes of data is stored in the receive FIFO. 0 0 1: When 480 (512 - 32) bytes of data is stored in the receive FIFO. : 1 1 0: When 1760 (1792 - 32) bytes of data is stored in the receive FIFO. 1 1 1: When 2016 (2048 - 32) bytes of data is stored in the receive FIFO.	R/W
b15 to b3	—	Reserved	The read value is 0. The write value should be 0.	R/W
b18 to b16	RFFO[2:0]	Receive FIFO Frame PAUSE Output Threshold	b18 b16 0 0 0: When 2 receive frames have been stored in the receive FIFO. 0 0 1: When 4 receive frames have been stored in the receive FIFO. 0 1 0: When 6 receive frames have been stored in the receive FIFO. : 1 1 0: When 14 receive frames have been stored in the receive FIFO. 1 1 1: When 16 receive frames have been stored in the receive FIFO.	R/W
b31 to b19	—	Reserved	The read value is 0. The write value should be 0.	R/W

The FCFTR register sets the ETHERC flow control (sets the threshold for automatically transmitting a PAUSE frame). The threshold can be set using the data size (RFDO[2:0] bits) and the number of frames (RFFO[2:0] bits) stored in the receive FIFO. The flow control starts when the stored data size or number of stored frames reaches its threshold.

29.2.19 Receive Data Padding Insert Register (RPADIR)

Address: EDMAC0.RPADIR E820 4078h, EDMAC1.RPADIR E820 4278h, PTPEDMAC.RPADIR E820 4478h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PADS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	PADR[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PADR[5:0]	Padding Slot	b5 b0 00h: Padding is inserted at the head of received data. 01h: Padding is inserted between the 1st byte and 2nd byte of received data. : 3Eh: Padding is inserted between the 62nd byte and 63rd byte of received data. 3Fh: Padding is inserted between the 63rd byte and 64th byte of received data	R/W
b15 to b6	—	Reserved	The read value is 0. The write value should be 0.	R/W
b17, b16	PADS[1:0]	Padding Size	b17 b16 0 0: No padding is inserted. 0 1: 1 byte is inserted. 1 0: 2 bytes are inserted. 1 1: 3 bytes are inserted.	R/W
b31 to b18	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RPADIR register sets insertion of padding for received data. The padding value is 00h.
Set the EDMR.SWR bit to 1 to reset before rewriting the RPADIR register.

29.2.20 Transmit Interrupt Setting Register (TRIMD)

Address: EDMAC0.TRIMD E820 407Ch, EDMAC1.TRIMD E820 427Ch, PTPEDMAC.TRIMD E820 447Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	TIM	—	—	—	TIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TIS	Transmit Interrupt Enable	0: Transmit Interrupt is disabled. 1: Transmit Interrupt is enabled. Set the EESR.TWB flag to 1 in the mode selected by the TIM bit to notify an interrupt.	R/W
b3 to b1	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	TIM	Transmit Interrupt Mode	0: Transmission complete interrupt mode An interrupt occurs when a frame has been transmitted. 1: Write-back complete interrupt mode An interrupt occurs when write-back to the transmit descriptor has been completed while the TWBI bit is 1.	R/W
b31 to b5	—	Reserved	The read value is 0. The write value should be 0.	R/W

The TRIMD register sets transmit interrupt mode and enables/disables the transmit interrupt.
When the condition set in this register is satisfied, the EESR.TWB flag becomes 1, and an interrupt request is output when the EESIPR.TWBIP bit is 1.

29.2.21 Receive Buffer Write Address Register (RBWAR)

Address: EDMAC0.RBWAR E820 40C8h, EDMAC1.RBWAR E820 42C8h, PTPEDMAC.RBWAR E820 44C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The RBWAR register indicates the last address that the EDMAC has written data to when writing to the receive buffer. Refer to the address indicated by the RBWAR register to recognize which address in the receive buffer the EDMAC is writing data to. Note that the address that the EDMAC is outputting to the receive buffer may not match the read value of the RBWAR register during data reception.
The RBWAR register is read only. Do not write to this register.

29.2.22 Receive Descriptor Fetch Address Register (RDFAR)

Address: EDMAC0.RDFAR E820 40CCh, EDMAC1.RDFAR E820 42CCh, PTPEDMAC.RDFAR E820 44CCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The RDFAR register indicates the start address of the last fetched receive descriptor when the EDMAC fetches descriptor information from the receive descriptor.
Refer to the address indicated by the RDFAR register to recognize which receive descriptor information the EDMAC is using for the current processing. Note that the address of the receive descriptor that the EDMAC fetches may not match the read value of the RDFAR register during data reception.
The RDFAR is read only. Do not write to this register.

29.2.23 Transmit Buffer Read Address Register (TBRAR)

Address: EDMAC0.TBRAR E820 40D4h, EDMAC1.TBRAR E820 42D4h, PTPEDMAC.TBRAR E820 44D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TBRAR register indicates the last address that the EDMAC has read data from when reading data from the transmit buffer.
Refer to the address indicated by the TBRAR register to recognize which address in the transmit buffer the EDMAC is reading from. Note that the address that the EDMAC is outputting to the transmit buffer may not match the read value of the TBRAR register.
The TBRAR register is read only. Do not write to this register.

29.2.24 Transmit Descriptor Fetch Address Register (TDFAR)

Address: EDMAC0.TDFAR E820 40D8h, EDMAC1.TDFAR E820 42D8h, PTPEDMAC.TDFAR E820 44D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TDFAR register indicates the start address of the last fetched transmit descriptor when the EDMAC fetches descriptor information from the transmit descriptor.
Refer to the address indicated by the TDFAR register to recognize which transmit descriptor information the EDMAC is using for the current processing. Note that the address of the transmit descriptor that the EDMAC fetches may not match the read value of the TDFAR register.
The TDFAR is read only. Do not write to this register.

29.3 Operation

The EDMAC transfers data according to the information written in the descriptor. Two types of descriptors are provided: transmit descriptor and receive descriptor. A descriptor includes the buffer size, address, and transmit/receive status. The EDMAC transmits or receives data continuously using sequentially arranged descriptors (descriptor list).

29.3.1 Descriptor Lists and Data Buffers

To transfer data using the EDMAC, create the transmit and receive descriptor lists on the memory, set the start address of the transmit descriptor list to the TDLAR register, and set the start address of the receive descriptor list to the RDLAR register. Also, transmit and receive buffers corresponding to the each descriptor are required.
Align the descriptor list on the appropriate address boundary according to the descriptor length set by the EDMR.DL[1:0] bits. The transmit buffer can be aligned on a long word boundary, word boundary, or byte boundary. When the valid transmit buffer size is 16 bytes or less, align it on a 32-byte boundary. Align the receive buffer on a 32-byte boundary. Set different addresses for the transmit and receive descriptors and buffers for EDMAC0, EDMAC1, and the PTPEDMAC.

29.3.1.1 Transmit Descriptor

Figure 29.3 shows the relation between a transmit descriptor and transmit buffer. A transmit descriptor consists of TD0 to TD2. The transmit frame and transmit buffer configuration can be selected from one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the transmit descriptor.

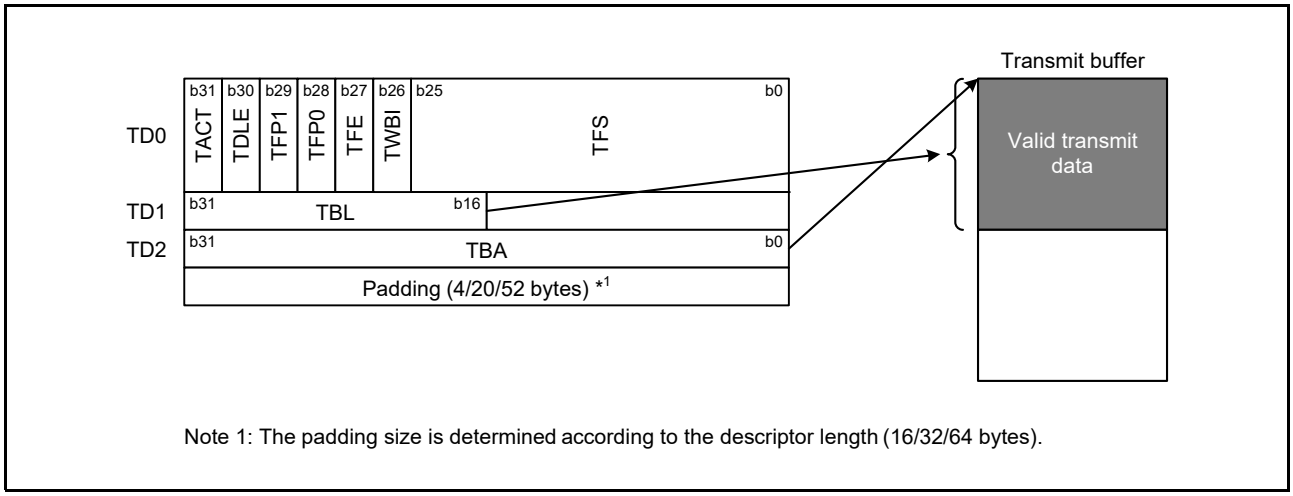

Figure 29.3 Relation between a Transmit Descriptor and Transmit Buffer

(1) Transmit Descriptor 0 (TD0)

Bit	Symbol	Bit Name	Description	R/W
b25 to b0	TFS	Transmit Frame Status	Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: [for EDMACn] TFS25 to TFS9: Reserved TFS8: Transmit abort is detected (the value is equivalent to the EESR.TABT flag). TFS7 to TFS4: Reserved TFS3: No carrier is detected (the value is equivalent to the EESR.CND flag). TFS2: Loss of carrier is detected (the value is equivalent to the EESR.DLC flag). TFS1: Late collision during transmission is detected (the value is equivalent to the EESR.CD flag). TFS0: Transmit retry over (the value is equivalent to the EESR.TRO flag) When each bit becomes 1, it indicates that the corresponding error has occurred during frame transmission. When any of the TFS bits becomes 1, the TFE bit also becomes 1. When any bit from TFS3 to TFS0 becomes 1, the TFS8 bit also becomes 1. [for the PTPEDMAC] TFS25 to TFS9: Reserved TFS8: Transmit abort is detected (the value is equivalent to the EESR.TABT flag). TFS7 to TFS1: Reserved TFS0: The transmission source MAC address of the transmit frame data does not match the set value (the value is equivalent to the EESR.MACE flag). When each bit becomes 1, it indicates that the corresponding error has occurred during frame transmission. When any of the TFS bits becomes 1, the TFE bit also becomes 1. When TFS0 becomes 1, TFS8 also becomes 1.	R/W
b26	TWBI	Write-Back Complete Interrupt Enable	0: Interrupt does not occur when write-back to this descriptor has been completed. 1: Interrupt occurs when write-back to this descriptor has been completed.	R/W
b27	TFE	Transmit Frame Error	0: Frame transmission is successfully completed. 1: An error occurs during frame transmission (transmission aborted).	R/W
b29, b28	TFP[1:0]	Transmit Frame Position	b29 b28 0 0: Transmit buffer indicated by this descriptor is the middle of a transmit frame (frame information is incomplete). 0 1: Transmit buffer indicated by this descriptor is the end of a transmit frame (frame information is complete). 1 0: Transmit buffer indicated by this descriptor is the head of a transmit frame (frame information is incomplete.) 1 1: Transmit buffer indicated by this descriptor is all of a transmit frame (one buffer per frame).	R/W
b30	TDLE	Transmit Descriptor List End	When this bit is 1, it indicates that this descriptor is the last descriptor of the descriptor list.	R/W
b31	TACT	Transmit Descriptor Valid	This bit indicates that this descriptor is valid.	R/W

Note: Bits for write-back are underlined.

TD0 indicates the transmit frame settings, and the status after transmission.

TWBI Bit (Write-Back Complete Interrupt Enable)

This bit setting is valid, when the TRIMD.TIM bit is 1.

To generate an interrupt request, the TRIMD.TIS and EESIPR.TWBIP bits must be set to 1.

TFE Bit (Transmit Frame Error)

When the TFE bit is 1, it indicates that one or more of the TFS bits is 1.

TFP[1:0] Bits (Transmit Frame Position)

The TFP[1:0] bits indicate which part of a transmit frame corresponds to the transmit buffer indicated by this descriptor. The TFP[1:0] and TD1.TBL bit settings must be logically consistent in the previous and next descriptors.

TACT Bit (Transmit Descriptor Valid)

The TACT bit indicates that this descriptor is valid. The TACT bit is set to 1 by software. This bit becomes 0 when the transmit frame has been transferred or when the transmission is aborted.

(2) Transmit Descriptor 1 (TD1)

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	The read value is 0. The write value should be 0.	R/W
b31 to b16	TBL	Transmit Buffer Length	Set a valid byte length of the corresponding transmit buffer. Set a value equal to or greater than 1.	R/W

TD1 is used to set a valid byte length of the transmit buffer.

(3) Transmit Descriptor 2 (TD2)

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TBA	Transmit Buffer Address	Set the start address of the transmit buffer. When the TD1.TBL bit value is 1 to 16 bytes, align it on a 32-byte boundary.	R/W

TD2 is used to set the start address of the transmit buffer.

29.3.1.2 Receive Descriptor

Figure 29.4 shows the relation between a receive descriptor and receive buffer. The receive frame and receive buffer configuration can be selected from one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the receive descriptor. If the receive buffer length (RBL) is set to 0, operation indicated by the descriptor is not guaranteed.

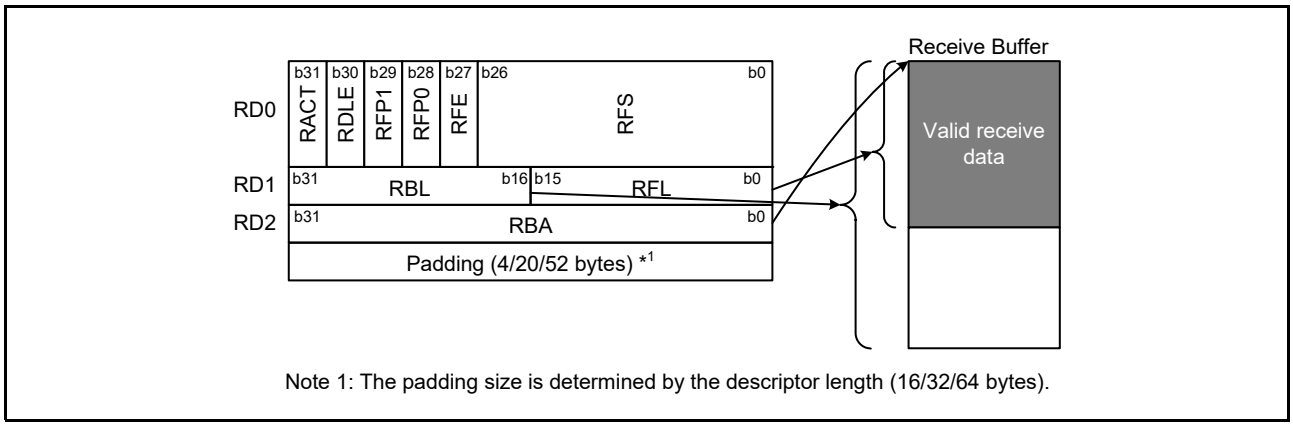

Figure 29.4 Relation between Receive Descriptor and Receive Buffer

(1) Receive Descriptor 0 (RD0)

Bit	Symbol	Bit Name	Description	R/W
b26 to b0	RFS	Receive Frame Status	Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: [for EDMACn] RFS26 to RFS10: Reserved RFS9: Receive FIFO overflow (the value is equivalent to the EESR.RFOF flag) RFS8: Receive abort is detected (the value is equivalent to the EESR.RABT flag). RFS7: Multicast address frame is received (the value is equivalent to the EESR.RMAF flag). RFS6 and RFS5: Reserved RFS4: Alignment error is detected (the value is equivalent to the EESR.RRF flag). RFS3: Frame-too-long error (the value is equivalent to the EESR.RTLF flag) RFS2: Frame-too-short error (the value is equivalent to the EESR.RTSF flag) RFS1: PHY-LSI receive error (the value is equivalent to the EESR.PRE flag) RFS0: CRC error (the value is equivalent to the EESR.CERF flag) When each bit becomes 1, it indicates that the corresponding error has occurred during frame reception. When any of the RFS bits becomes 1, the RFE bit also becomes 1 (set the TRSCER register to select whether bits RFS7 and RFS4 are reflected in the RFE bit). When any bit from RFS3 to RFS0 becomes 1, the RFS8 bit also becomes 1. [for the PTPEDMAC] RFS26 to RFS10: Reserved RFS9: Receive FIFO overflow (the value is equivalent to the EESR.RFOF flag) RFS8: Reserved RFS7: Receive port (the value is equivalent to the EESR.RPORT flag) RFS4: PTPV2 packet is received (the value is equivalent to the EESR.PVER flag). The PTPEDMAC can receive only PTP packets. If a non-PTP packet is received, the packet is not transferred to the PTPEDMAC, and it is discarded. RFS3 to RFS0: Type of the received PTP message (the value is equivalent to the EESR.TYPE[3:0] flags) Each bit indicates the status of the received frame.	R/W
b27	RFE	Receive Frame Error	[for EDMACn] 0: No error has occurred in the received frame. 1: An error has occurred in the received frame. [for the PTPEDMAC] Reserved	R/W
b29, b28	RFP[1:0]	Receive Frame Position	b29 b28 0 0: Receive buffer indicated by this descriptor is the middle of a receive frame (frame information is incomplete). 0 1: Receive buffer indicated by this descriptor is the end of a receive frame (frame information is complete). 1 0: Receive buffer indicated by this descriptor is the head of a receive frame (frame information is incomplete). 1 1: Receive buffer indicated by this descriptor is all of a receive frame (one buffer per frame).	R/W
b30	RDLE	Receive Descriptor List End	When this bit is 1, it indicates that this descriptor is the last one of the descriptor list.	R/W
b31	RACT	Receive Descriptor Valid	Indicates that this descriptor is valid.	R/W

Note: Bits for write-back are underlined.

RD0 indicates the receive frame status.

RFE Bit (Receive Frame Error)

When the RFE bit is 1, it indicates that one or more of the RFS bits is 1 (set the TRSCER register to select whether bits RFS7 and RFS4 of EDMACn are reflected in the RFE bit).

RFP[1:0] Bits (Receive Frame Position)

The RFP[1:0] bits indicate which part of a receive frame corresponds to the receive buffer indicated by this descriptor.

RACT Bit (Receive Descriptor Valid)

The RACT bit indicates that this descriptor is valid. The RACT bit is set to 1 by software. This bit becomes 0 when all data has been transferred to the receive buffer indicated by RD2 or when the receive buffer becomes full.

(2) Receive Descriptor 1 (RD1)

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RFL	Receive Frame Length	These bits indicate the length (number of bytes) of the receive frame stored in the buffer. The number of bytes for padding set by the RPADIR register is not included. These bits are written back to the descriptor corresponding to the end of a frame.	R/W
b31 to b16	RBL	Receive Buffer Length	These bits indicate the byte length of the corresponding receive buffer. Set an integral multiple of 32 as the buffer length.	R/W

Note: Bits for write-back are underlined.

RD1 indicates the receive buffer length. When reception is completed, the receive frame length is written back.

(3) Receive Descriptor 2 (RD2)

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBA	Receive Buffer Address	These bits indicate the start address of the receive buffer. Align the buffer address on a 32-byte boundary.	R/W

RD2 indicates the start address of the receive buffer.

29.3.2 Transmission

When setting the EDTRR.TR bit to 1 while the ETHERCn.ECMR.TE bit is 1, the EDMAC reads the descriptor following the previously used descriptor in the transmit descriptor list (or the descriptor indicated by the TDLAR register after a reset). When the TACT bit is 1 in the transmit descriptor (TD0), the EDMAC sequentially reads transmit data from the start address of the transmit buffer indicated by transmit descriptor 2 (TD2) and transfers them to the ETHERC via the transmit FIFO. The ETHERC creates a transmit frame and starts transmission to the MII/RMII. When all data indicated by the TD1.TBL bit is transferred, write-back is performed according to the TD0.TFP[1:0] bits as follows:

•When the TD0.TFP[1:0] bits are 00b or 10b (frame information is incomplete), the TD0.TACT bit is written back.

•When the TD0.TFP[1:0] bits are 01b or 11b (frame information is complete), bits TD0.TACT, TD0.TFS, and TD0.TFE are written back.

When the TD0.TACT bit in the read descriptor is 1, the EDMAC continues reading descriptors and transmit frames. When the TD0.TACT bit in the read descriptor is 0, the EDMAC sets the EDTRR.TR bit to 0 and stops transmission.

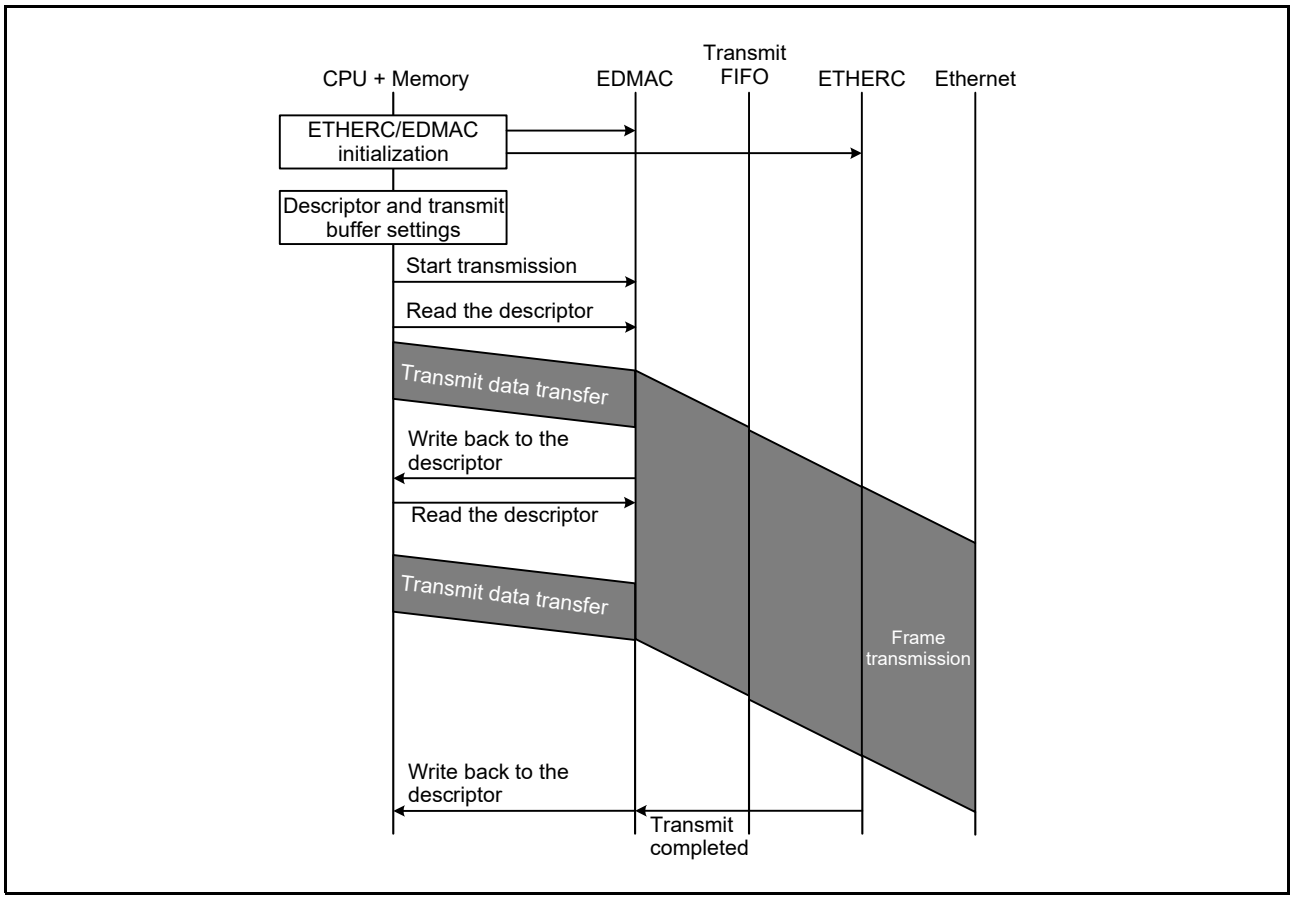

Figure 29.5 Example of Transmission Flow

29.3.3 Reception

When setting the EDRRR.RR bit to 1 while the ETHERCn.ECMR.RE bit is 1, the EDMAC reads the receive descriptor following the previously used descriptor (or descriptor indicated by the RDLAR register after a reset) and then waits for reception. While the RD0.RACT bit is 1, if the data stored to the receive FIFO is 32 bytes or more, or if the end byte of the frame is stored in the receive buffer, the EDMAC transfers data from the receive FIFO to the receive buffer indicated by receive descriptor 2 (RD2). If the data length of the received frame is longer than the buffer length set by the RBL bit in receive descriptor 1 (RD1), the EDMAC writes back 10b or 00b to the RD0.RFP[1:0] bits and 0 to the RD0.RACT bit when the receive buffer becomes full, and then the EDMAC reads the next data. After that, the EDMAC transfers data to another receive buffer. When the frame reception is completed or when the frame reception is aborted by an error, the EDMAC writes back 11b or 01b to the RD0.RFP[1:0] bits, 0 to the RD0.RACT bit, and the receive frame length to the RD1.RFL bit.*1 When the RMCR.RNR bit is 1, the EDMAC reads the next descriptor and waits for reception. When the RNR bit is 0, the EDMAC sets the EDRRR.RR bit to 0 and stops reception.

Note 1. If the reception is interrupted when the data stored in the FIFO is less than 16 times, the data in the FIFO are discarded without being transferred.
At this time, the corresponding error flag does not also set to 1.

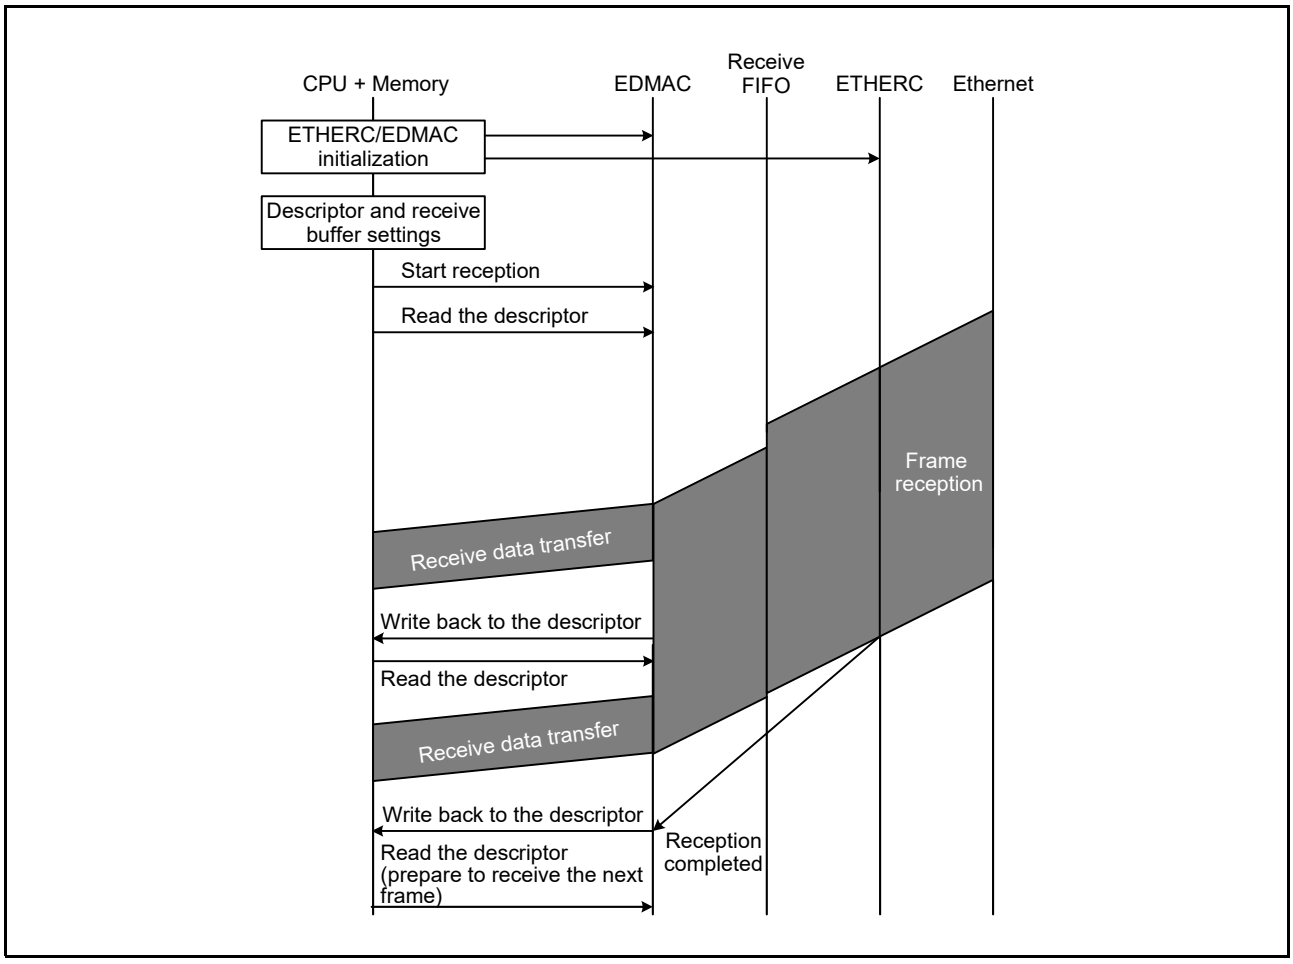

Figure 29.6 Example of Reception Flow

29.3.4 Multi-Buffer Frame Transmission

29.3.4.1 Error Processing While Transmitting a Multi-Buffer Frame

If an error occurs during multi-buffer frame transmission, the EDMAC performs the processing shown in Figure 29.7. In the figure, when the TACT bit of transmit descriptor 0 (TD0) is 0, the descriptor indicates that all data in the buffer has been successfully transmitted. When the TACT bit is 1, the descriptor indicates that data in the buffer has not yet been transmitted. If a frame transmit error *1 occurs in the head or middle of the frame while the TD0.TACT bit is 1, the EDMAC stops data transmission from the transmit FIFO and EDMAC data transfer, and sets the TD0.TACT bit to 0. After that, the EDMAC reads the next descriptor to see if the descriptor indicates the middle of the fame (TD0.TFP[1:0] bits are 00b) or the end of the frame (TD0.TFP[1:0] bits are 01b). When the descriptor indicates the middle of the frame, the EDMAC sets the TD0.TACT bit to 0 and reads the next descriptor. When the descriptor indicates the end of the frame, the EDMAC not only sets the TD0.TACT bit to 0, but also writes back to bits TD0.TFE and TD0.TFS. After an error occurs, data in the buffer is not transmitted until write-back to the descriptor for the end of the frame. When the corresponding transmit error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor for the end of the frame.

Note 1. For EDMACn, a transmit retry-over condition, late collision, or loss of carrier is detected, or a carrier is not detected. For the PTPEDMAC, the MAC address does not match the set value.

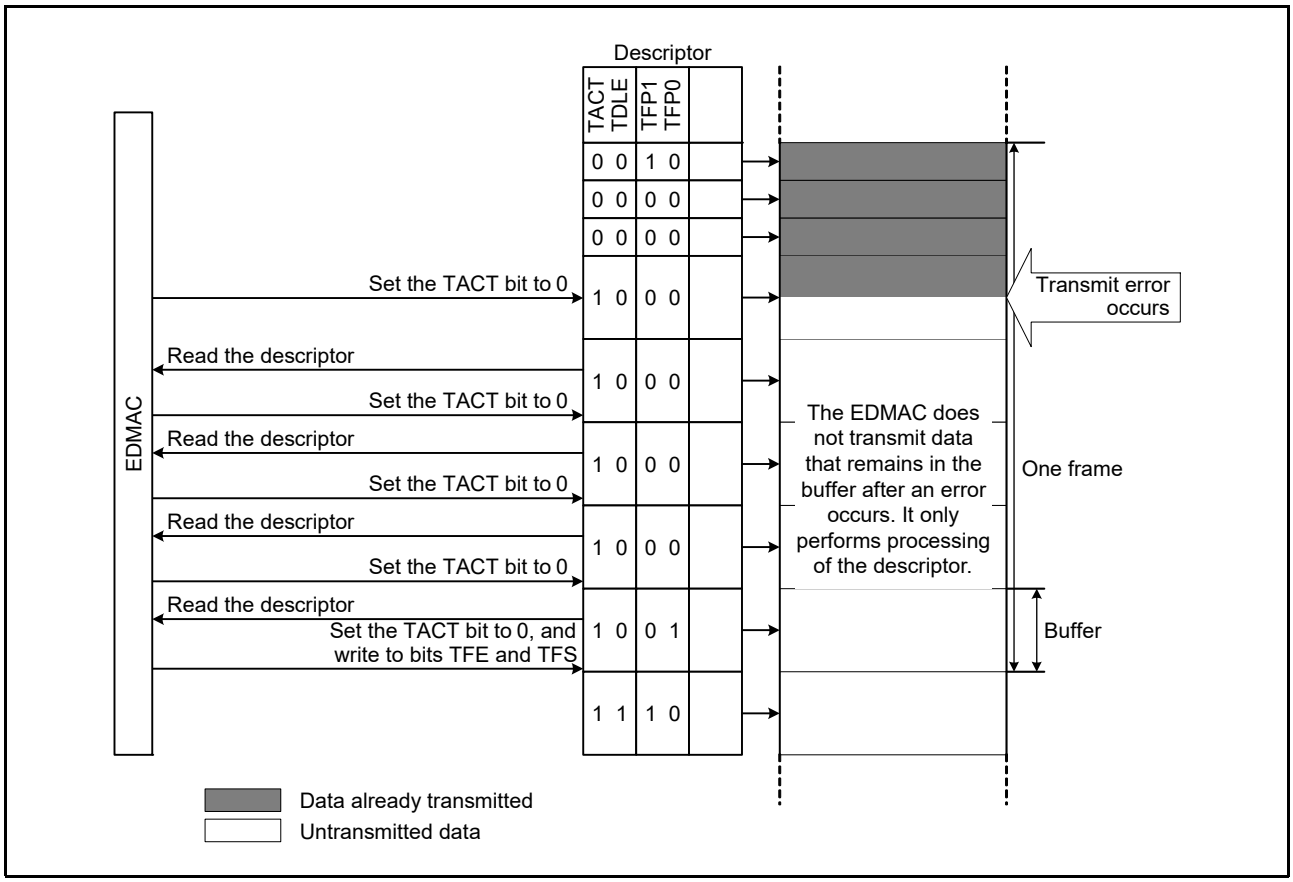

Figure 29.7 EDMAC Operation After a Transmit Error Occurs

29.3.4.2 Error Processing While Receiving a Multi-Buffer Frame

If an error occurs during multi-buffer frame reception, the EDMAC performs the processing shown in Figure 29.8 In the figure, when the RACT bit of receive descriptor 0 (RD0) is 0, the descriptor indicates that data has been successfully received in the buffer. When the RACT bit is 1, the descriptor indicates that data has not yet been received in the buffer. If a frame receive error*1 occurs, the EDMAC stops receiving data of the frame, but it transfers data that has already been stored in the receive FIFO to the receive buffer.

When the receive buffer becomes full during transfer, the EDMAC sets the RACT bit to 0 and the RFP[1:0] bits to 10b or 00b and reads the next descriptor. After all data in the receive FIFO has been transferred, the EDMAC writes back the status to the descriptor.

When the corresponding receive error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor. When there is a request to receive a new frame, the EDMAC continues reception using the descriptor following the descriptor where the error occurred.

Note 1. For EDMACn, a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or alignment error is detected. For the PTPEDMAC, a parity error is detected.

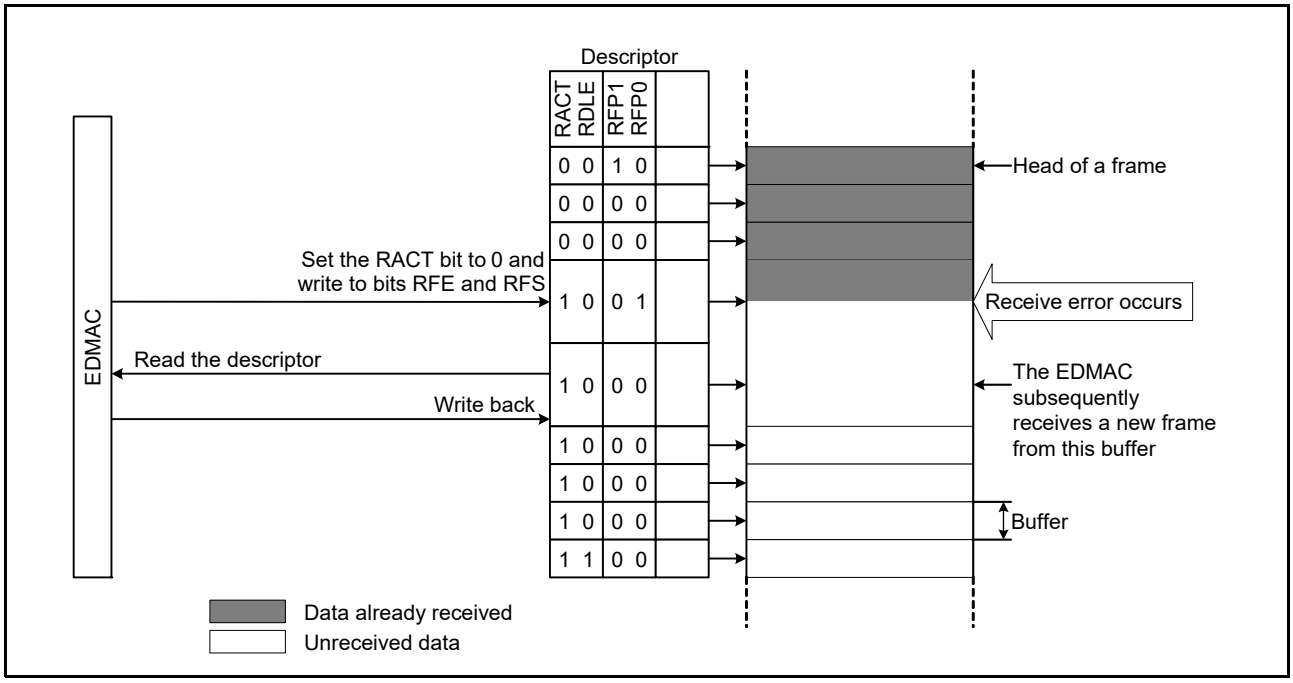

Figure 29.8 EDMAC Operation After a Receive Error Occurs

29.3.5 EDMAC Channel Priority

Priority of the three EDMAC channels (EDMAC0, EDMAC1, PTPEDMAC) is determined in a round-robin fashion. Each time transfer of one channel is completed, the channel becomes the lowest priority. This operation is shown in Figure 29.9. After a reset, the priority is EDMAC0 > EDMAC1 > PTPEDMAC.

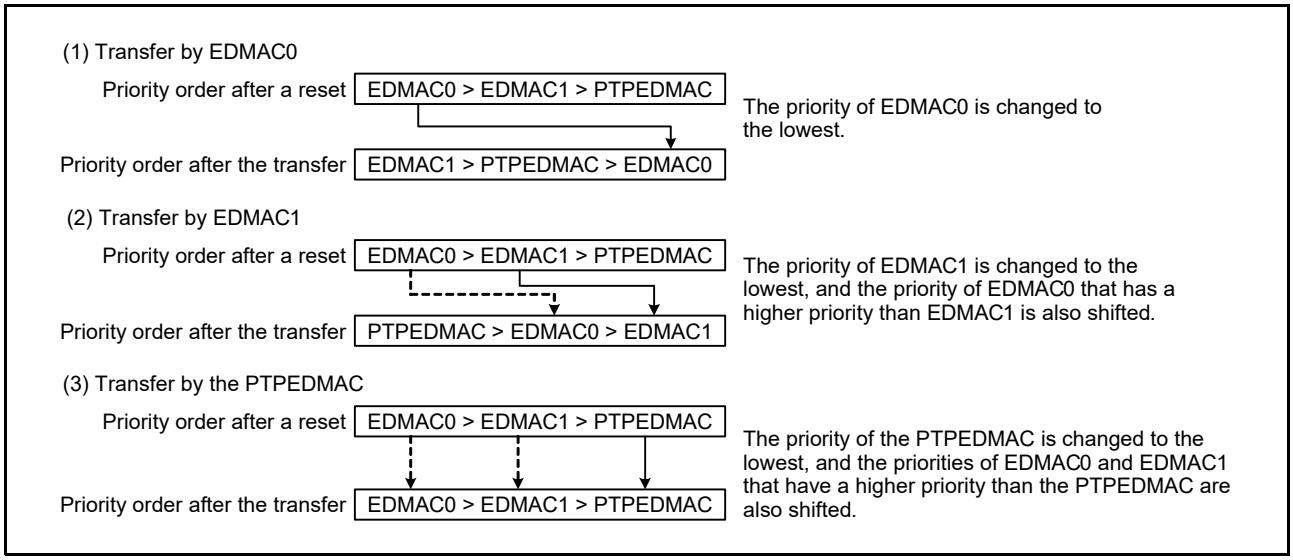

Figure 29.9 Operation in Round-Robin Fashion

Figure 29.10 shows change of the channel priority order when transfer requests are concurrently generated to EDMAC0 and the PTPEDMAC and a transfer request to the EDMAC1 while EDMAC0 is transferring data.

1. Transfer requests are concurrently generated to EDMAC0 and the PTPEDMAC.
2. Since EDMAC0 has a higher priority than the PTPEDMAC, EDMAC0 starts a transfer (PTPEDMAC waits to transfer).
3. A transfer request is generated to EDMAC1 during the transfer by EDMAC0 (EDMAC1 and the PTPEDMAC wait to transfer).
4. After EDMAC0 ends the transfer, the priority of EDMAC0 is changed to the lowest.
5. Since EDMAC1 has higher priority than the PTPEDMAC at this time, EDMAC1 starts a transfer (PTPEDMAC waits to transfer).
6. After EDMAC1 ends the transfer, the priority of EDMAC1 is changed to the lowest.
7. The PTPEDMAC starts a transfer.
8. After the PTPEDMAC ends the transfer, the priority of PTPEDMAC is changed to the lowest.

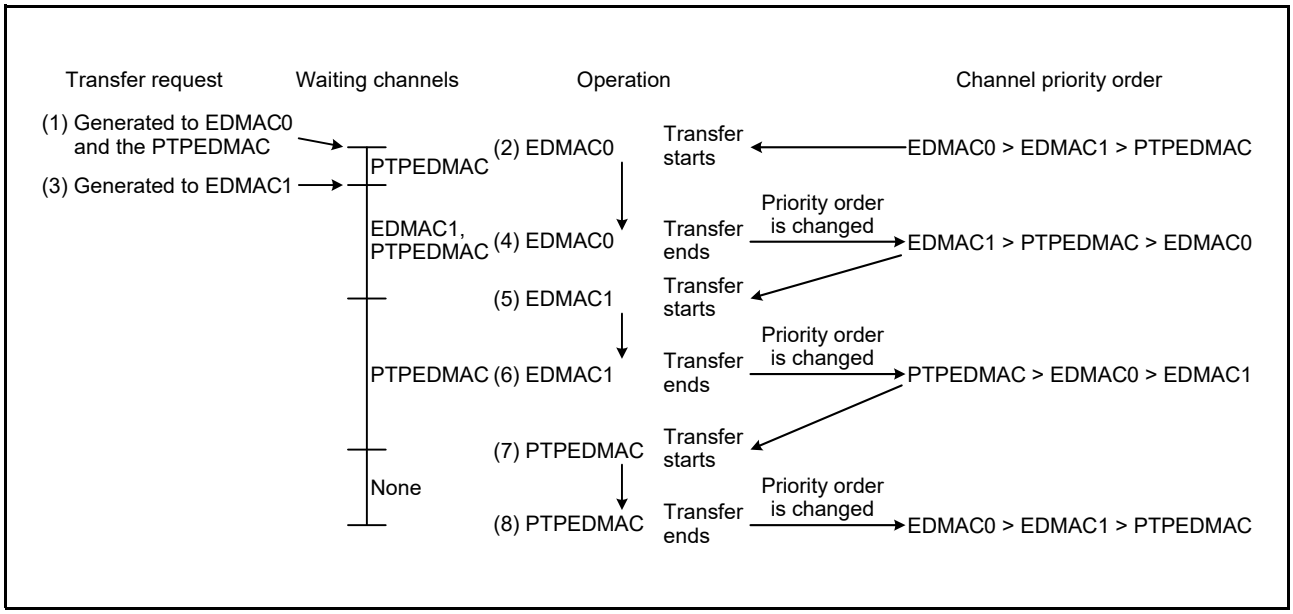

Figure 29.10 Channel Priority in Round-Robin Fashion

29.4 Interrupts

When any of the status flags in the EESR register becomes 1 while the corresponding interrupt request enable bit in the EESIPR register is 1, EDMACn outputs an EINTn interrupt request or the PTPEDMAC outputs a PINT interrupt request to the CPU.

29.5 Usage Notes

29.5.1 Setting the Module-Stop Function

The following bits in Standby Control Register 6 (STBCR6) are used to enable/disable the EDMAC operation.

- MSTP65 bit is used to enable/disable the ETHERC0 and the EDMAC0 operation.
- MSTP64 bit is used to enable/disable the ETHERC1 and the EDMAC1 operation.
- MSTP63 bit is used to enable/disable the EPTPC and the PTPEDMAC operation.

After a reset, the EDMAC is stopped. After exiting the module-stop state, registers can be accessed. Refer to section 52, Power-Down Modes for details.

29.5.2 Stopping the EDMAC during Operations

When stopping EDMAC operation by using a sleep instruction or module-stop function while the EDMAC is running, confirm that bits EDTRR.TR and EDRRR.RR are 0. If the EDMAC is stopped while the EDTRR.TR or EDRRR.RR bit 1, the data for the frame that is being transmitted or received may not be complete, and EDMAC operation after exiting the sleep mode or module-stop state is not guaranteed.

30. A/D Converter

30.1 Overview

This LSI incorporates one unit of a 12-bit successive approximation A/D converter, up to eight analog input channels are selectable.
The A/D conversion accuracy is selectable from 12-bit conversion, and conversion to a digital value can be performed with the relationship between speed and resolution optimized.
The A/D converter has three operating modes: single scan mode in which the analog inputs of up to 8 channels arbitrarily selected are converted for only once in ascending channel order; continuous scan mode in which the analog inputs of up to 8 channels arbitrarily selected are continuously converted in ascending channel order; and group scan mode in which up to 8 channels of the analog inputs are arbitrarily divided into two groups (group A and group B) or three groups (group A, group B, and group C) and converted in ascending channel order in each group.
In group scan mode, either of two groups (group A, B) and three groups (groups A, B, C) must be selected.
The scan start conditions (trigger) for each group (A, B or A, B, C) can be independently selected, and scan for each group (A, B or A, B, C) can be started at different timing.
In group priority control in group scan mode, along with operation as described above, if a request to start scan for a priority group is accepted during scanning for a low priority group, the scanning for the low priority group is discontinued and scan for the priority group is started.
The priority order of group priority control is group A > group B > group C.
In group priority control, if a request to start group B scan is accepted during group C scanning, the group C scanning is interrupted and the group B scan is started. If a request to start group A scan is accepted during group C scanning, the group C scanning is interrupted and group A scan is started. Similarly, if a request to start group A scan is accepted during group B scanning, the group B scanning is interrupted and group A scan is started.
Additionally, scan for the interrupted group can be restarted after the scan for the priority group has completed.
In double trigger mode, one analog input channel arbitrarily selected is converted in single scan mode or group scan mode (group A), and the resulting data of A/D conversion started by the first and second synchronous triggers are stored into different registers (duplication of A/D conversion data).
Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages internally generated in the A/D converter is converted.

The compare function specifies the upper-side reference value for window A and lower-side reference value for window B and outputs an interrupt when the A/D-converted value of the selected channel meets the comparison conditions. Furthermore, the comparator operation to compare the A/D-converted value with the lower-side reference value is also available.

Table 30.1 lists the specifications of the A/D converter and Table 30.2 indicates the functions of the A/D converter.

Table 30.1 Specifications of A/D Converter

Item	Specifications
Input channels	Eight channels
A/D conversion method	Successive approximation method
Resolution	12 bits / 10 bits / 8 bits selectable
Conversion time	1 µs per channel (when A/D conversion clock ADCLK = 33 MHz)
A/D conversion clock	Peripheral module clock PCLK (= P1φ) and A/D conversion clock ADCLK (= P0φ) can be set so that the frequency division ratio should be one of the following. PCLK to ADCLK frequency division ratio = 1:1, 1:2 Each clock is set using the clock pulse generator.
Data registers	• 8 registers for analog input, 1 for A/D-converted data duplication in double trigger mode, 2 for A/D-converted data duplication during extended operation in double trigger mode, and 1 register for self-diagnosis. • The results of A/D conversion are stored in the A/D data registers. • 8-, 10-, and 12-bit accuracy conversion for the results of A/D conversion • The value obtained by adding up A/D-converted results is stored as a value in the number of bit for conversion accuracy + 2 bits*3 in the A/D data registers in A/D-converted value addition mode. • Double trigger mode (selectable in single scan and group scan modes): The first piece of A/D-converted analog-input data on one selected channel is stored in the data register for the channel, and the second piece is stored in the duplication register. • Extended operation in double trigger mode (available for specific triggers): A/D-converted analog-input data on one selected channel is stored in the duplication register that is prepared for each type of trigger.
Operating modes	• Single scan mode: - A/D conversion is performed only once on the analog inputs of up to 8 channels arbitrarily selected. • Continuous scan mode: - A/D conversion is performed repeatedly on the analog inputs of up to 8 channels arbitrarily selected. • Group scan mode: - Two (group A, B) or three (group A, B, C) can be selected for the number of groups to be used. (When the number of groups is two, only the combination of group A and group B can be selected.) - Analog inputs of up to 8 channels arbitrarily selected are divided into group A and group B, or group A, group B, and group C, and A/D conversion of the analog input selected on a group basis is performed only once. - The conditions for scanning start of group A, group B and group C (trigger) can be independently selected, thus allowing A/D conversion of group A, group B, and group C to be started independently. Group scan mode (when group priority is selected) : - If a trigger for a priority group occurs during scanning for a low priority group, the scanning for the low priority group is interrupted and scan for the priority group is started. The priority order is group A (high) > group B > group C (low). - Whether to re-execute (rescan) the scan for the low priority group after the scan for the priority group is completed can be set. Additionally, whether to start rescan from the head of the selected channels or from the channel on which A/D conversion has not finished can be selected.
Conditions for A/D conversion start	• Software trigger • Synchronous trigger Trigger by the multi-function timer pulse unit 3 (MTU3a) and the general-purpose PWM timer (GPT). • Asynchronous trigger A/D conversion can be triggered by the ADTRG# external trigger pin.
Function	• Variable sampling state count (which can be set for each channel) • Self-diagnosis of A/D converter • Selectable A/D-converted value addition mode or average mode • Analog input disconnection detection function (Precharge function/discharge function) • Double trigger mode (duplication of A/D conversion data) • Switching function of 8-, 10-, and 12-bit conversion • Automatic clear function of A/D data registers • Compare Function (Window-A and Window-B)

Item	Specifications
Interrupt source	• In the modes except double trigger mode and group scan mode, A/D scan end interrupt (S12ADI0) request can be generated on completion of single scan. • In double trigger mode, A/D scan end interrupt (S12ADI0) request can be generated on completion of double scan. • In group scan mode: - An A/D scan end interrupt (S12ADI0) request can be generated on completion of group A scan. - An A/D scan end interrupt for group B (S12GBADI0) request can be generated on completion of group B scan. - An A/D scan end interrupt for group C (S12GCADI0) request can be generated on completion of group C scan. • When double trigger mode is selected in group scan mode (including extended operation in double trigger mode), A/D scan end interrupt (S12ADI0) request can be generated on completion of double scan of group A, whereas A/D scan end interrupt especially for group B and group C (S12GBADI0 and S12GCADI0) request can be generated on completion of group B and group C scan, respectively. (pulse output) • When the window A/B comparison conditions are met, S12ADCMPAI0/S12ADCMPBI0 is generated. • The S12ADI0, S12GBADI0 or S12GCADI0 interrupt can activate the DMA controller (DMAC).
Low power consumption function	• Module standby mode, software standby mode, and deep standby mode can be specified.*1,*2

Note 1. See section 52, Power-Down Modes for details.
Note 2. After canceling module standby mode, wait for at least 1 µs before starting A/D conversion.
Note 3. The number of extended bits for addition varies with the A/D conversion accuracy and the addition count.
2-bit extension: 4-time conversion (3-time addition) with the A/D conversion accuracy = 8/10/12 bits.
4-bit extension: 16-time conversion (15-time addition) with the A/D conversion accuracy = 12 bits.

30.2.1 A/D Data Register y (ADDRy: y = 0 to 7), A/D Data Duplication Register (ADDBLDR), A/D Data Duplication Register A (ADDBLDRA), A/D Data Duplication Register B (ADDBLDRB)

The ADDRy registers (y = 0 to 7) are 16-bit read-only registers for storing the result of A/D conversion. Register ADDBLDR is a 16-bit read-only register for storing the result of A/D conversion in response to the second trigger in double trigger mode. Registers ADDBLDRA and ADDBLDRB are 16-bit read-only registers for storing the result of A/D conversion during extended operation in double trigger mode.
The formats for data in the ADDRy, ADDBLDR, ADDBLDRA, and ADDBLDRB registers vary according to the following conditions.

- The setting of the A/D data register format select bit (determining whether the data are flush-left or flush-right in the registers)
- The setting of the A/D conversion-accuracy selection bits (8-, 10-, or 12-bit)
- The setting of the A/D-Converted Value Addition/Average Count Select Register (A/D conversion count, A/D converted value average mode is selected or not selected)

The data formats (section 30.2.23, Data Format, (1) to (9)) for each given condition are shown below.

Table 30.5 Correspondence between the Addition Count and the Setting Condition

A/D conversion accuracy	Format specification	Addition/ Average deselected	Conversion count when addition is selected (addition count)					Conversion count when average is selected	
			1 (0) time	2 (1) times	3 (2) times	4 (3) times	16 (15) times	2 times	4 times
8-bit	Right-aligned	(1)	(3)*1	(3)*1	(3) *1	(3)*1		(1)	(1)
	Left-aligned	(2)	(4)*1	(4)*1	(4)*1	(4)*1		(2)	(2)
10-bit	Right-aligned	(3)	(5)*1	(5)*1	(5)*1	(5)*1		(3)	(3)
	Left-aligned	(4)	(6)*1	(6)*1	(6)*1	(6)*1		(4)	(4)
12-bit	Right-aligned	(5)	(7)*1	(7)*1	(7)*1	(7)*1	(9)*2	(5)	(5)
	Left-aligned	(6)	(8)*1	(8)*1	(8)*1	(8)*1	(9)*2	(6)	(6)

Note 1. Only when 1 (0) to 4 (3) times is specified as the conversion count (addition count) in addition mode, the A/D conversion addition result is 2-bit-extended and stored in the A/D data register.
The explanation about this is also described in "When A/D-converted value addition mode is selected".
Note 2. When addition is selected and 16-time conversion (15-time addition) is specified with 12-bit A/D conversion accuracy, the A/D conversion addition result is 4-bit-extended and stored in the A/D data register.

For details about this register format, see section 30.2.23, Data Format, (1) to (9). In that section, see the description as follows:

- Replace bit symbol "DATA[*:0]" with "AD[*:0]".
- "Function" should be n-bit A/D-converted value. (n = 8, 10, 12, 14 to 16)
- The R/W attribute should be R.

When A/D-converted value average mode is selected

A/D-converted value average mode can be selected only when 2 or 4 times is specified in A/D-converted value addition mode. When A/D-converted value average mode is set, the average of A/D conversion results is retained in the A/D data register. Even if A/D-converted value average mode is selected, the value is stored in the A/D data register according to the settings of the A/D data register format select bit in the same way as normal A/D conversion.

When A/D-converted value addition mode is selected

When the bit accuracy is set to 12-bit accuracy, 1, 2, or 4 times can be specified in A/D-converted value addition mode. Additionally, only when the bit accuracy is set to 12-bit accuracy, 16 times can be specified in A/D-converted value addition mode.
In A/D-converted value addition mode, the value obtained by adding up of A/D conversion results is retained in the A/D data register as a bit-extended value of the conversion accuracy specified.
When 12-bit A/D conversion accuracy is selected and 1 to 4 times is specified in addition mode, 2-bit extension is performed. When 12-bit A/D conversion accuracy is selected and 16 times is specified in addition mode, 4-bit extension is performed.
Even if A/D-converted value addition mode is selected, the value is stored in the A/D data register according to the settings of the A/D data register format select bits.

30.2.2 A/D Self-Diagnosis Data Register (ADRD)

ADRD is a 16-bit read-only register that holds the A/D conversion results based on the A/D converter's self-diagnosis. In addition to the AD bit indicating A/D-converted value, the self-diagnosis status bit (DIAGST) is included in. In the ADRD register, the following different formats are used depending on the conditions below.

- The setting of the A/D data register format select bit (determining whether the data are flush-left or flush-right in the registers)
- The setting of the A/D conversion-accuracy selection bits (ADCER.ADPRC[1:0]) (8-, 10-, or 12-bit)

The A/D-converted value addition mode and A/D-converted value average mode cannot be applied to the A/D self-diagnosis function. For details of self-diagnosis, see section 30.2.9, A/D Control Extended Register (ADCER).

The settings for flush-right data

DIAGST[1:0] is allocated to the upper two bits (b15, b14). The A/D conversion result is allocated to the bit position b13 to b0 depending on the setting of the A/D conversion accuracy specify bits.

A/D Conversion Accuracy Specify Bits = 8-bit accuracy

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DIAGST[1:0]		—	—	—	—	—	—	AD[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

A/D Conversion Accuracy Specify Bits = 10-bit accuracy

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DIAGST[1:0]		—	—	—	—	AD[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

A/D Conversion Accuracy Specify Bits = 12-bit accuracy

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DIAGST[1:0]		—	—	AD[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b13 to b0	AD[11**:0]	—	The data width varies depending on the setting of the A/D conversion accuracy specify bits. 8-bit: AD[7:0] is stored in b7 to b0. 10-bit: AD[9:0] is stored in b9 to b0. 12-bit: AD[11:0] is stored in b11 to b0.	R
	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b15, b14	DIAGST[1:0]	Self-Diagnosis Status	b15 b14 0 0: Self-diagnosis has never been executed since power-on. 0 1: Self-diagnosis using the voltage of 0 V has been executed. 1 0: Self-diagnosis using the voltage of reference power supply × 1/2 has been executed. 1 1: Self-diagnosis using the voltage of reference power supply has been executed.	R

The settings for flush-left data

DIAGST[1:0] is allocated to the lower two bits (b1, b0). The A/D conversion result is allocated to the bit position b15 to b2 depending on the setting of the A/D conversion accuracy specify bits.

A/D Conversion Accuracy Specify Bits = 12-bit accuracy

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[11:0]												—	—	DIAGST[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b1, b0	DIAGST[1:0]	Self-Diagnosis Status	b1 b0 0 0: Self-diagnosis has never been executed since power-on. 0 1: Self-diagnosis using the voltage of 0 V has been executed. 1 0: Self-diagnosis using the voltage of reference power supply × 1/2 has been executed. 1 1: Self-diagnosis using the voltage of reference power supply has been executed.	R
b15 to b2	AD[11** :0]	—	The data width varies depending on the setting of the A/D conversion accuracy specify bits. 8-bit: AD[7:0] is stored in b15 to b8. 10-bit: AD[9:0] is stored in b15 to b6. 12-bit: AD[11:0] is stored in b15 to b4.	R
	—	Reserved	These bits are read as 0. The write value should be 0.	R0

30.2.3 A/D Control Register (ADCSR)

ADCSR sets A/D conversion control, mode/trigger/interrupt.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ADST	ADCS[1:0]		ADIE	—	—	TRGE	EXTRG	DBLE	GBADIE	—	DBLANS[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b4 to b0	DBLANS [4:0]	A/D Conversion Data Duplication Channel Select Double Trigger Channel Select	These bits select one analog input channel for which to duplicate A/D conversion data. The setting is only effective while double trigger mode is selected. These bits select one analog input channel for double triggered operation. The setting is only effective while double trigger mode is selected.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R0
b6	GBADIE	Group B Scan End Interrupt Enable	0: Disables S12GBADI0 interrupt generation upon group B scan completion. 1: Enables S12GBADI0 interrupt generation upon group B scan completion.	R/W
b7	DBLE	Double Trigger Mode Select	0: Deselects double trigger mode. 1: Selects double trigger mode.	R/W
b8	EXTRG	Trigger Select*1	0: A/D conversion is started by a synchronous trigger (MTU, GPT). 1: A/D conversion is started by the asynchronous trigger (ADTRG#).	R/W
b9	TRGE	Trigger Start Enable	0: Disables A/D conversion to be started by the synchronous or asynchronous trigger. 1: Enables A/D conversion to be started by the synchronous or asynchronous trigger.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b12	ADIE	Scan End Interrupt Enable	0: Disables S12ADI0 interrupt generation upon scan completion. 1: Enables S12ADI0 interrupt generation upon scan completion.	R/W
b14, b13	ADCS [1:0]	Scan Mode Select	00: Single scan mode 01: Group scan mode 10: Continuous scan mode 11: Setting prohibited	R/W
b15	ADST	A/D Conversion Start	0: Stops A/D conversion process 1: Starts A/D conversion process	R/W*2

Note 1. Starting A/D conversion using an external pin (asynchronous trigger)
After a high-level signal is input to the external pin (ADTRG#), write 1 to both the TRGE and EXTRG bits in ADCSR and change the signals of ADTRG# to the low level. Thus the falling edge of ADTRG# are detected and the scan conversion process is started. In this case, the pulse width of the low-level input must be at least 1.5 clock cycles of PCLK.
Note 2. See the following description of the ADST bit.

DBLANS[4:0] Bits (Double Trigger Channel Select)

The DBLANS[4:0] bits select one of the channels for A/D conversion data duplication in double trigger mode. The A/D conversion results of the analog input of the channel selected by the DBLANS[4:0] bits are stored into the A/D data register y when conversion is started by the first trigger, and into the A/D data duplication register when started by the second trigger. Table 30.6 shows selection of the channel for double triggered operation.

The A/D-converted value addition/average functions with double trigger mode become available by selecting the channel selected in the DBLANS[4:0] bits using the ADADS0 register. When double trigger mode is selected, the channels selected in the ADANSA0 register are invalid, and the channel selected in the DBLANS[4:0] bits is subject to A/D conversion.

When double trigger mode is selected in group scan mode, double trigger mode only operates on group A and does not operate on groups B and C.

Although in double trigger mode, multiple analog input channels cannot be selected for group A, they can be selected for groups B and C.

The DBLANS[4:0] bits should be set while the ADST bit is 0. (They should not be set simultaneously when 1 is written to the ADST bit.)

Table 30.6 Selection of the Channel on which to Duplicate A/D Conversion Data

DBLANS[4:0]	Duplication channel
5'd0	AN000
5'd1	AN001
5'd2	AN002
5'd3	AN003
5'd4	AN004
5'd5	AN005
5'd6	AN006
5'd7	AN007

GBADIE Bit (Group B Scan End Interrupt Enable)

The GBADIE bit sets whether to enable or disable group B scan end interrupt (S12GBADI0) in group scan mode.

DBLE Bit (Double Trigger Mode Select)

In double trigger mode, the following operations 1 and 2 are performed on condition that the scan is started by the synchronous trigger (MTU, GPT) selected in ADSTRGR.TRSA[5:0].
If the ADIE bit is set to 1, the scan end interrupt is output not upon completion of the first scan but upon completion of the second scan.
The first piece of A/D conversion data of the analog input selected in the DBLANS[4:0] bits is stored in the A/D data register y, and the second piece is stored in the A/D data duplication register.
When the DBLE bit is set to 1, channels selected in the ADANSA0 register are invalid. Double trigger mode is not selected when the DBLE bit is set to 0. If the DBLE bit is set to 1 again, the preceding operations 1 and 2 are performed with the first scan by the first trigger.
In continuous scan mode, double trigger mode should not be selected.
Software trigger should not be used in double trigger mode.
The DBLE bit should be set when the ADST bit set to 0.
(This bit should not be set simultaneously when 1 is written to the ADST bit.)

EXTRG Bit (Trigger Select)

The EXTRG bit selects the synchronous trigger or the asynchronous trigger as the trigger for starting A/D conversion.

TRGE Bit (Trigger Start Enable)

The TRGE bit sets whether to enable or disable starting of A/D conversion by the synchronous trigger and the asynchronous trigger.
This bit should be set to 1 in group scan mode.

ADIE Bit (Scan End Interrupt Enable)

The ADIE bit sets whether to enable or disable generation of the A/D scan end interrupt (S12ADI0) in group scan mode (except for group B, C scan).
With double trigger mode deselected, the S12ADI0 interrupt is generated after the first scan is completed if the ADIE bit is set to 1.
With double trigger mode selected, the S12ADI0 interrupt is generated after the second scan is completed if the ADIE bit is set to 1 as long as the scan is started by the synchronous trigger (MTU, GPT) selected by the ADSTRGR.TRSA[5:0] bits.

ADCS[1:0] Bits (Scan Mode Select)

The ADCS bit select the scan mode.
In single scan mode, A/D conversion is performed for the analog inputs of a maximum of eight channels selected with the ADANSA0 register in the ascending order of the channel number, and when one cycle of A/D conversion is completed for all the selected channels, the scan conversion is stopped.
In continuous scan mode, while the ADST bit in ADCSR is 1, A/D conversion is performed for the analog inputs of a maximum of eight channels selected with the ADANSA0 register in the ascending order of the channel number, and when one cycle of A/D conversion is completed for all the selected channels, A/D conversion is repeated from the first channel. If the ADST bit in ADCSR is set to 0 during continuous scan, A/D conversion is stopped even if scanning is in progress.
In group scan mode, A/D conversion is performed for the analog inputs (group A) of a maximum of eight channels selected with the ADANSA0 register in the ascending order of the channel number after scanning is started by the synchronous trigger (MTU, GPT) selected by the TRSA[5:0] bits in ADSTRGR, and when one cycle of A/D conversion is completed for all the selected channels, A/D conversion is stopped.
A/D conversion is also performed for the analog inputs (group B/group C) of a maximum of eight channels selected with the ADANSB0/ADANSC0 register in the ascending order of the channel number after scanning is started by the synchronous trigger (MTU, GPT) selected by the TRSB[5:0]/TRSC[5:0] bits in ADSTRGR, and when one cycle of A/D conversion is completed for all the selected channels, A/D conversion is stopped.
In group scan mode, different channels and triggers should be selected for group A, group B and group C.

To use two groups when group scan mode is enabled, group A and group B should be used (ADGCTRGR.GRCE = 1’b0). Likewise, to use three groups, group A, group B, and group C should be used (ADGCTRGR.GRCE = 1’b1).

The ADCS[1:0] bits should be set while the ADST bit is 0 (it should not be set simultaneously when 1 is written to the ADST bit.)

ADST Bit (A/D Conversion Start)

The ADST bit starts or stops A/D conversion process.
Before the ADST bit is set to 1, set the A/D conversion clock, the conversion mode, and conversion target analog input.

[Setting conditions]

The ADST bit is set to 1 if one of the following conditions is satisfied:

- 1 is written by software.
- The synchronous trigger (MTU, GPT) selected by the ADSTRGR.TRSA[5:0] bits is detected with ADCSR.EXTRG and ADCSR.TRGE bits being set to 0 and 1, respectively.
- The synchronous trigger (MTU, GPT) selected by the ADSTRGR.TRSB[5:0] bits is detected with the ADCSR.TRGE bit being set to 1 in group scan mode.
- The asynchronous trigger is detected with the ADCSR.TRGE and ADCSR.EXTRG bits being set to 1 and the ADSTRGR.TRSA[5:0] bits being set to 00000b.
- When group priority control operation mode is enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), the ADGSPCR.GBRP bit is set to 1, and A/D conversion for the lowest-priority group starts.

[Clearing conditions]

The ADST bit is cleared to 0 if one of the following conditions is satisfied:

- 0 is written by software.
- The A/D conversion of all the selected channels is completed in single scan mode.
- Group A scan is completed in group scan mode.
- Group B scan is completed in group scan mode.
- Group C scan is completed in group scan mode.
- When group priority control operation mode is enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), the ADGSPCR.GBRSCN bit is set to 1, and scan for the lowest-priority group started by trigger completes.

Note 1. When group priority control operation mode has been enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), do not set the ADST bit to 1.

Note 2. When group priority control operation mode has been enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), do not set the ADST bit to 0. When forcibly terminating A/D conversion, follow the procedure for clearing the ADST bit.

Note 3. When the single scan succession function is used (ADGSPCR.GBRP = 1) with group priority control operation mode enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), the ADST bit retains 1.

30.2.4 A/D Channel Select Register A0 (ADANSA0)

ADANSA0 selects analog input channels for A/D conversion among AN000 to AN007. In group scan mode, this register selects group A channels.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSA0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	ANSA0[7:0]	A/D Conversion Channels Select	0: AN000 to AN007 are not subjected to conversion. 1: AN000 to AN007 are subjected to conversion.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

ANSA0[7:0] Bits (A/D Conversion Channel Select)

The ANSA0[7:0] bits select analog input channels for A/D conversion among AN000 to AN007. The channels to be selected and the number of channels can be arbitrarily set. The ANSA0[0] bit corresponds to AN000 and the ANSA0[7] bit corresponds to AN007. When double trigger mode is selected, the channel selected by the ANSA0[7:0] bits is invalid, and the channel selected by the ADCSR.DBLANS[4:0] bits is selected in group A instead. The ANSA0[7:0] bits should be set while the ADCSR.ADST bit is 0.

30.2.5 A/D Channel Select Register B0 (ADANSB0)

ADANSB0 selects analog input channels for A/D conversion among AN000 to AN007 in group B when group scan mode is selected. The ADANSB0 register is not used in any scan mode other than group scan mode.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSB0[7:0]

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	ANSB0[7:0]	A/D Conversion Channels Select	0: AN000 to AN007 are not subjected to conversion. 1: AN000 to AN007 are subjected to conversion.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

ANSB0[7:0] Bits (A/D Conversion Channel Select)

The ANSB0[7:0] bits select analog input channels for A/D conversion among AN000 to AN07 in group B when group scan mode is selected. The ANSB0[0] bit corresponds to AN000 and the ANSB0[7] bit corresponds to AN007. The ANSB0[7:0] bits should be set while the ADCSR.ADST bit is 0.

30.2.6 A/D Channel Select Register C0 (ADANSC0)

ADANSC0 selects analog input channels for A/D conversion among AN000 to AN007 in group C when group scan mode is selected. The ADANSC0 register is not used in any scan mode other than group scan mode.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSC0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	ANSC0[7:0]	A/D Conversion Channels Select	0: AN000 to AN007 are not subjected to conversion. 1: AN000 to AN007 are subjected to conversion.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

ANSC0[7:0] Bits (A/D Conversion Channel Select)

The ANSC0[7:0] bits select analog input channels for A/D conversion among AN000 to AN007 in group C when group scan mode is selected. The ANSC0[0] bit corresponds to AN000 and the ANSB0[7] bit corresponds to AN007. The ANSC0[7:0] bits should be set while the ADCSR.ADST bit is 0.

30.2.7 A/D-Converted Value Addition/Average Mode Select Register 0 (ADADS0)

ADADS0 selects the channels AN000 to AN007 on which A/D conversion is performed successively for the specified number of times (The possible addition count depends on the conversion accuracy to be used. See Table 30.5 in section 30.2.1.) and then converted values are added (integrated) or averaged.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ADS0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	ADS0[7:0]	A/D-Converted Value Addition/ Average Channel Select	0: A/D-converted value addition/average mode for AN000 to AN007 is not selected. 1: A/D-converted value addition/average mode for AN000 to AN007 is selected.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

ADS0[7:0] Bits (A/D-Converted Value Addition/Average Channel Select)

When the ADS0[n] bit of the number that is the same as that of A/D-converted channel selected by the ANSA0[n] bits (n = 0 to 7) in ADANSA0 register or DBLANS[4:0] bits in ADCSR register, ANSB0[n] bits (n = 0 to 7) in ADANSB0 register, and ANSC0[n] bits (n = 0 to 7) in ADANSC0 register is set to 1, A/D conversion of analog input of the selected channels is performed successively (The possible addition count depends on the conversion accuracy to be used. See Table 30.5 in section 30.2.1.) that is set with the ADC[2:0] bits in ADADC register.
When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition (integration) is stored in the A/D data register. As for the channel on which the A/D conversion is performed and addition/average mode is not selected, a normal one-time conversion is executed and the conversion result is stored to the A/D data register.
The ADS0[7:0] bits should be set while the ADCSR.ADST bit is 0.

Figure 30.1 shows the scan sequence when ADS0[2] and ADS0[6] are set to 1.
It is assumed that the scan is operated in continuous scan mode (ADCS = 10b in ADCSR), addition mode is selected (ADADC.AVEE = 0), the number of additions is set to 3 (conversion is performed four times) (ADADC.ADC[2:0] = 011b), and AN000 to AN007 is selected (ADANSA0.ANSA0[7:0] = 00FFh). Conversion is started from AN000. Conversion for AN002 is performed four times, and the value obtained by addition (integration) is stored in the A/D data register 2. Then, conversion for AN003 is started. Conversion for AN006 is performed four times successively, and the value obtained by addition (integration) is stored in the A/D data register 6. After conversion of AN007 is completed, the same sequence repeats from AN000.

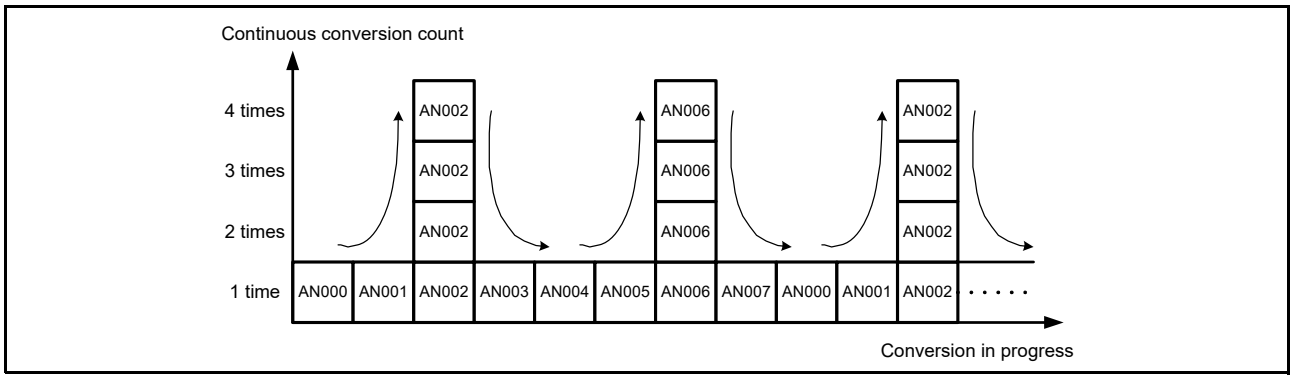

Figure 30.1 Scan Conversion Sequence with ADADC.ADC[2:0] = 011b, ADADC.AVEE = 0, ADS[2] = 1, and ADS[6] = 1

30.2.8 A/D-Converted Value Addition/Average Count Select Register (ADADC)

ADADC sets the addition count and average count for A/D conversion of the channel for which A/D-converted value addition/average mode is selected, and selects either addition or average mode.

	b7	b6	b5	b4	b3	b2	b1	b0
	AVEE	—	—	—	—	ADC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b2 to b0	ADC[2:0]	Addition Count Select	b2 b1 b0 0 0 0: 1-time conversion (no addition; same as normal conversion) 0 0 1: 2-time conversion (addition once) 0 1 0: 3-time conversion (addition twice)*1 0 1 1: 4-time conversion (addition three times) 1 0 1: 16-time conversion (addition 15 times) Other settings are prohibited.	R/W
b6 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b7	AVEE	Average Mode Enable	0: Addition mode is selected.*1 1: Average mode is selected.*1	R/W

Note 1. The AVEE bit is only effective for 2-time and 4-time conversion. When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the addition count to three times. (ADADC.ADC[2:0] = 010b)

ADC[2:0] Bits (Addition Count Select)

The ADC[1:0] bits set the addition count common to the channels for which A/D conversion and A/D-converted value addition/average mode is selected, including the channels selected in double trigger mode (by ADCSR.DBLANS[4:0] bits).

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the addition count to three times (ADADC.ADC[2:0] = 010b).

Additionally, as described in Table 30.5 in section 30.2.1, the combination of a condition in which the addition count is 16 (ADADC.ADC[2:0] = 101b) and a condition in which the A/D conversion accuracy is 8 or 10 bits (ADCER.ADPRC[1:0] = 10b or 01b) is a prohibited setting.

The ADC[2:0] bits should be set while the ADCSR.ADST bit is 0.

AVEE Bit (Average Mode Enable)

The AVEE bit selects addition or average mode for A/D conversion of the channel for which A/D conversion and A/D-converted value addition/average mode is selected, including the channels selected in double trigger mode (by ADCSR.DBLANS[4:0] bits).

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the addition count to three times (ADADC.ADC[2:0] = 010b). The average of 3-time conversion cannot be calculated.

The AVEE bits should be set while the ADCSR.ADST bit is 0.

30.2.9 A/D Control Extended Register (ADCER)

The ADCER register sets the A/D data register, A/D conversion accuracy, and self-diagnosis conversion.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b9, b8	DIAGVAL[1:0]	Self-Diagnosis Conversion Voltage Select	b9 b8 0 0: Setting prohibited when self-diagnosis is enabled 0 1: Uses the voltage of 0 V for self-diagnosis. 1 0: Uses the voltage of reference power supply × 1/2 for self-diagnosis. 1 1: Uses the voltage of reference power supply for self-diagnosis.	R/W
b10	DIAGLD	Self-Diagnosis Mode Select	0: Rotation mode for self-diagnosis voltage 1: Fixed mode for self-diagnosis voltage	R/W
b11	DIAGM	Self-Diagnosis Enable	0: Disables self-diagnosis of A/D converter. 1: Enables self-diagnosis of A/D converter.	R/W
b14 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b15	ADRFMT	A/D Data Register Format Select	0: Right-alignment is selected for the A/D data register format. 1: Left-alignment is selected for the A/D data register format.	R/W

ADPRC[1:0] Bits (A/D Conversion Accuracy Specify)

These bits select the A/D conversion accuracy among 8-, 10-, or 12-bit accuracy. When the A/D conversion accuracy is changed, A/D conversion time is also changed.

See section 30.3.6, Analog Input Sampling and Scan Conversion Time for details.

The ADPCR[1:0] bits should be set while the ADCSR.ADST bit is 0.

ACE Bit (Automatic Clearing Enable)

The ACE bit selects enabling or disabling of automatic clearing (all “0”) of the A/D data register (ADDRy, ADRD, ADDBLDR, ADDBLDRA, or ADDBLDRB) when reading any of these registers by the CPU or DMACA. Automatic clearing of the A/D data register enables a failure which has not been updated in the A/D data register to be detected.

DIAGVAL[1:0] Bits (Conversion Voltage Select Self-Diagnosis)

For details, refer to the descriptions of the ADCER.DIAGLD bit.

Self-diagnosis should not be executed by setting the ADCER.DIAGLD bit to 1 when the ADCER.DIAGVAL[1:0] bits are set to 00b.

DIAGLD Bit (Self-Diagnosis Mode Select)

The DIAGLD bit selects whether the three voltage values are rotated or the fixed voltage is used in self-diagnosis. Setting this bit (ADCER.DIAGLD) to 0 allows conversion of the voltages in rotation mode where 0, the reference power supply × 1/2, and the reference power supply are converted in this order. The fixed voltage specified by the ADCER.DIAGVAL[1:0] bits is converted when self-diagnosis voltage fixed mode is selected. In self-diagnosis voltage rotation mode, the self-diagnosis voltage value does not return to 0 when scan conversion is completed. When scan conversion is restarted, therefore, rotation starts at the voltage value following the previous value. If fixed mode is switched to rotation mode, rotation starts at the fixed voltage value.
The DIAGLD bit should be set while the ADCSR.ADST bit is 0.

DIAGM Bit (Self-Diagnosis Enable)

The DIAGM bit selects execution of self-diagnosis.
Self-diagnosis is used to detect a failure of the A/D converter. It is used to convert the voltage value selected from the internally generated voltage values 0, the reference power supply × 1/2, and the reference power supply. When conversion is completed, information on the converted voltage and the conversion result is stored into the self-diagnosis data register (ADRD). ADRD can then be read out by software to determine whether the conversion result falls within the normal range (normal) or not (abnormal). Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages is converted. To use the double trigger function (ADCSR.DBLE = 1), self-diagnosis should be deselected (set the DIAGM bit to 0).
When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed in group A, B and C.
The DIAGM bit should be set while the ADCSR.ADST bit is 0.

ADRFMT Bit (A/D Data Register Format Select)

The ADRFMT bit specifies right-alignment or left-alignment for the data to be stored in ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADCMPDR0/1, ADWINLLB, or ADWINULB.
The ADRFMT bit should be set while the ADCSR.ADST bit is 0.
see section 30.2.23, Data Format for details.

30.2.10 A/D Start Trigger Select Register (ADSTRGR)

ADSTRGR selects the A/D conversion start trigger.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b5 to b0	TRSB[5:0]	A/D Conversion Start Trigger Select for Group B	Select the A/D conversion start trigger for group B in group scan mode.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b13 to b8	TRSA[5:0]	A/D Conversion Start Trigger Select	Select the A/D conversion start trigger in single scan mode and continuous mode. In group scan mode, the A/D conversion start trigger for group A is selected.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R0

TRSB[5:0] Bits (A/D Conversion Start Trigger Select for Group B)

The TRSB[5:0] bits select the trigger to start scanning of the analog input selected in group B. The TRSB[5:0] bits require to be set only in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for group B, setting a software trigger or an asynchronous trigger is prohibited. Therefore, the TRSB[5:0] bits should be set to the value other than 000000b and the ADCSR.TRGE bit should be set to 1 in group scan mode.
When group is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows group B to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSB[5:0] bits to 3Fh.
Note that the issuance period of trigger for A/D conversion must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by the trigger may have no effect.
Because an A/D conversion start trigger requires synchronization processing, a delay of the period for synchronization processing occurs. See section 30.3.6, Analog Input Sampling and Scan Conversion Time for details.
Table 30.7 lists the A/D conversion startup sources selected by the TRSB[5:0] bits.

TRSA[5:0] Bits (A/D Conversion Start Trigger Select)

The TRSA[5:0] bits select the trigger to start A/D conversion in single scan mode and continuous scan mode. In group scan mode, the trigger to start scanning of the analog input selected in group A is selected. When scanning is executed in group scan mode or double trigger mode, a software trigger and an asynchronous trigger cannot be used at the same time.

- When using the A/D conversion startup source of a synchronous trigger (MTU, GPT), set the TRGE bit in ADCSR to 1 and set the EXTRG bit in ADCSR to 0.
- When using the asynchronous trigger (ADTRG#), set the TRGE bit in ADCSR to 1 and set the EXTRG bit in ADCSR to 1.
- Software trigger (ADCSR.ADST) is enabled regardless of the settings of the ADCSR.TRGE bit, the ADCSR.EXTRG bit, and the TRSA[5:0] bits.

Note that the issuance period of trigger for A/D conversion must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by a trigger may have no effect.
Because an A/D conversion start trigger requires synchronization processing, a delay of the period for synchronization processing occurs.
See section 30.3.6, Analog Input Sampling and Scan Conversion Time for details.
Table 30.8 lists the selection of A/D activation sources selected by the TRSA[5:0] bits.

Table 30.7 Selection of A/D Activation Sources by the TRSB[5:0] Bits (for Group B only)

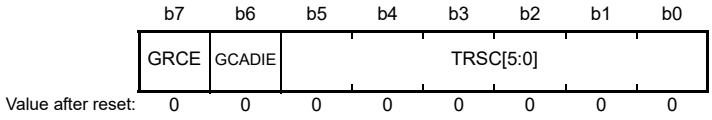
30.2.11 A/D Group C Trigger Select Register (ADGCTRGR)

The ADGCTRGR register enables the operation of group C and selects the A/D conversion start trigger. For details about the setting of group priority control, see section 30.3.4.3, Group Priority Control.



Bit	Symbol	Bit Name	Function	R/W
b5 to b0	TRSC[5:0]	A/D Conversion Start Trigger Select for Group C	Select the A/D conversion start trigger for group C in group scan mode.	R/W
b6	GCADIE	Group C Scan End Interrupt Enable	0: Disables S12GCADI0 interrupt generation upon group C scan completion. 1: Enables S12GCADI0 interrupt generation upon group C scan completion.	R/W
b7	GRCE	Group C Dedicated A/D Conversion Operation Enable	Sets whether to enable A/D conversion operation of group C. 0: Do not use group C. 1: Use group C.	R/W

TRSC[5:0] Bits (A/D Conversion Start Trigger Select for Group C)

The TRSC[5:0] bits select the trigger to start scanning of the analog input selected in group C. The TRSC[5:0] bits require to be set only in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for group C, setting a software trigger or an asynchronous trigger is prohibited. Therefore, the TRSC[5:0] bits should be set to the value other than 000000b and the ADCSR.TRGE bit and ADCSR.GRCE bit should be set to 1 in group scan mode.

When group is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows group C to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSC[5:0] bits to 3Fh.

Note that the issuance period of trigger for A/D conversion must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by the trigger may have no effect.

Because an A/D conversion start trigger requires synchronization processing, a delay of the period for synchronization processing occurs. See section 30.3.6, Analog Input Sampling and Scan Conversion Time for details.

Table 30.9 lists the A/D conversion startup sources selected by the TRSB[5:0] bits.

GCADIE Bit (Group C Scan End Interrupt Enable)

The GCADIE bit enables or disables generation of the group C scan end interrupt (S12GCADI0) in group scan mode.

GRCE Bit (Group C Dedicated A/D Conversion Operation Enable)

The GRCE bit should be set to 1 to use group C in group scan mode.

When the GRCE bit is set to 0, input of a trigger for group C is invalid. When ADGSPCR.GBRP is set to 1 under group priority control with group C (ADGSPCR.PGS bit = 1), single scan operation is performed continuously on group C. (When the GRCE bit is set to 1, single scan operation is not performed continuously on group B.)

The ADCSR.ADST bit must be 0 when the GRCE bit is set.

Table 30.9 Selection of A/D Activation Sources by the TRSC[5:0] Bits (for Group C only)

Module	Source	Remarks	TRSC[5]	TRSC[4]	TRSC[3]	TRSC[2]	TRSC[1]	TRSC[0]

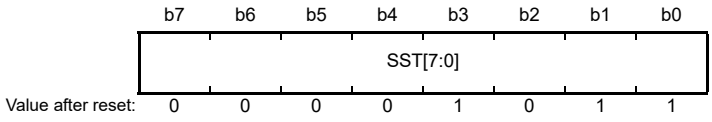
	ADTRGA3 or ADTRGB3	Compare match with GPT3.GTADTRA or with GPT3.GTADTRB	0	1	1	1	0	0

30.2.12 A/D Sampling State Register n (ADSSTRn) (n = 0 to 7)

The ADSSTRn register sets the sampling time for analog input.



Bit	Symbol	Bit Name	Function	R/W
b7 to b0	SST[7:0]	Sampling Time Setting	These bits set the sampling time in the range from 5 to 255 states.	R/W

If one state is one ADCLK (A/D conversion clock) cycle and the ADCLK clock is 33 MHz, one state is 30.3 ns. The initial value is 11 states. If the impedance of analog input signal source is too high to secure sufficient sampling time or if the ADCLK clock is slow, the sampling time can be adjusted.
These bits should be set while the ADCSR.ADST bit is 0.

The lower limit of the sampling time setting depends on the frequency ratio:
If the frequency ratio of PCLK to ADCLK = 1:1 or 1:2, the sampling time must be set to 5 states or longer.

Table 30.10 shows the relationship between the A/D sampling state register and the relevant channels.
For details, refer to section 30.3.6, Analog Input Sampling and Scan Conversion Time.

Table 30.10 Relationship between A/D Sampling State Register and Relevant Channels

Bit Name	Corresponding Channel
ADSSTR0.SST[7:0] bits	AN000, Self-diagnosis
ADSSTR1.SST[7:0] bits	AN001
ADSSTR2.SST[7:0] bits	AN002
ADSSTR3.SST[7:0] bits	AN003
ADSSTR4.SST[7:0] bits	AN004
ADSSTR5.SST[7:0] bits	AN005
ADSSTR6.SST[7:0] bits	AN006
ADSSTR7.SST[7:0] bits	AN007

30.2.13 A/D Disconnection Detection Control Register (ADDISCR)

ADDISCR sets the disconnection detection assist function.

Bit	Symbol	Bit Name	Function	R/W
b4 to b0	ADNDIS[4:0]	Disconnection Detection Assist Setting	Disconnection detection assist function is set. b4 ADNDIS[4]: Setting precharge or discharge 0: discharge 1: precharge b3 to b0 ADNDIS[3:0]: Setting the period of precharge or discharge.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R0

ADNDIS[4:0] Bits (Disconnection Detection Assist Setting)

These bits selects either precharge or discharge and the period of precharge/discharge for the A/D disconnection detection assist function. Setting the ADNDIS[4] = 1 allows to select precharge and setting the ADNDIS[4] = 0 allows to select discharge. The period of precharge/discharge can be set with the ADNDIS[3:0] bits. When the ADNDIS[3:0] = 0000b, the disconnection detection assist function is not effective. Setting of the ADNDIS[3:0] bits to 0001b is prohibited. Except for the case of ADNDIS[3:0] = 0000b or 0001b, the specified value indicates the number of states for the period of precharge/discharge.

ADNDIS[4:0] bits should be set while the ADCSR.ADST bit is 0.

30.2.14 A/D Group Scan Priority Control Register (ADGSPCR)

The ADGSPCR register sets priority control to interrupt scanning for a low priority group in group scan mode and execute scan for a priority group.

For details about the setting of group priority control, see section 30.3.4.3, Group Priority Control.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GBRP	LGRRS	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	PGS	Group Priority Control Setting*1	0: Operation is without group A priority control 1: Operation is with group A priority control	R/W
b1	GBRSCN	Low Priority Group Restart Setting	(Enabled only when PGS = 1. Reserved when PGS = 0.) 0: Scanning for group is not restarted after having been discontinued due to group priority control. 1: Scanning for group is restarted after having been discontinued due to group priority control.	R/W
b8 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b14	LGRRS	Restart Channel Select	(Enabled only when PGS = 1 and GBRSCN = 1. Reserved when PGS = 0 or GBRSCN = 0.) 0: Rescan is performed from the first channel of the scan. 1: Rescan is performed from the channel on which A/D conversion has not completed.	R/W
b15	GBRP	Single Scan Continuous Start*2	(Enabled only when PGS = 1. Reserved when PGS = 0.) 0: Single scan is not continuously activated. 1: Single scan for the lowest priority group is continuously activated.	R/W

Note 1. When the PGS bit is to be set to 1, the ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode). If the bits are set to any other values, proper operation cannot be guaranteed.

Note 2. When the GBRP bit is set to 1, single scan is performed continuously on the lowest priority group regardless of the setting of the GBRSCN bit.

PGS Bit (Group A Priority Control Setting)

This bit controls priority operation in group scan mode. Set the PGS bit to 1 to enable group priority control. When the PGS bit is to be set to 1, the ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode). If the bits are set to any other values, proper operation cannot be guaranteed.

In group priority control, if a request to start scan for a priority group is accepted during scanning for a low priority group, the scanning for the low priority group is interrupted and scan for the priority group is started.

The priority order is group A > group B > group C. If a request to start group B scan is accepted during group C scanning, the group C scanning is interrupted and group B scan is started.

If a request to start group A scan is accepted during group C scanning, the group C scanning is interrupted and group A scan is started. Likewise, if a request to start group A scan is accepted during group B scanning, the group B scanning is interrupted and group A scan is started.

When the PGS bit has been set to 0, A/D conversion must be cleared by software according to section 30.5.2, Notes on Stopping A/D Conversion.

When the PGS bit has been set to 1, make register settings according to section 30.3.4.3, Group Priority Control.

GBRSCN Bit (Low priority group Restart Setting)

This bit controls the restarting of scan operation when group priority control is enabled. The setting of the GBRSCN bit has an effect when the PGS bit is set to 1.

If a scan operation on a low priority group has been stopped by a priority group trigger input with the GBRSCN bit set to 1, the scan operation is restarted on completion of the A/D conversion on a priority group. Also, if a low priority group

trigger is input during A/D conversion on a priority group, the scan operation on a low priority group is restarted on completion of the A/D conversion on a priority group. If the GBRSCN bit has been set to 0, triggers that are input during A/D conversion are ignored.
GBRSCN bit should be set while the ADCSR.ADST bit is 0.

LGRRS Bit (Restart Channel Select)

This bit sets the rescan start channel when group priority control is enabled. The setting of the LGRRS bit is valid when the PGS and GBRSCN bits are 1.
When the LGRRS bit is 0, scan to be performed after scan for the priority group is re-executed from the first channel for the low priority group whose scan was interrupted due to group priority control.
When the LGRRS bit is 1, scan to be performed after scan for the priority group is re-executed*1 from the channel on which A/D conversion has not completed for the low priority group whose scan was interrupted due to group priority control.
The LGRRS bits should be set while the ADCSR.ADST bit is 0.

Note: If A/D conversion for an addition setting channel has not completed for the specified number of times at the time of interruption, A/D conversion for the addition setting channel is performed again for the specified number of times at the time of re-execution.

GBRP Bit (Single Scan Continuous Start Setting)

Set the GBRP bit to perform single scan operation continuously on the lowest priority group under group priority control. This bit is set when a single scan operation is to be performed continuously on group B.

The setting of the GBRP bit is valid when the PGS bit is 1.
The lowest priority group is group C when groups A, B, C are used, and group B when only groups A and B are used.
Setting the GBRP bit to 1 starts a single scan for the lowest priority group. On completion of a scan, a single scan for the lowest priority group is automatically restarted. If scan has been interrupted due to group priority control, a single scan for the lowest priority group is automatically restarted on completion of the A/D conversion on the priority group.
Disable trigger input for the lowest priority group before setting the GBRP bit to 1. Setting the GBRP bit to 1 performs a rescan only for the lowest priority group even if the GBRSCN bit is 0.
GBRP bit should be set while the ADCSR.ADST bit is 0.

30.2.15 A/D Compare Control Register (ADCMPCR)

ADCMPCR is used to set compare window A/B operation.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMPAIE	WCMPE	CMPBIE	—	CMPAE	—	CMPBE	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b8 to b0	—	Reserved	These bits are read as 0. The write value should be 0	R0
b9	CMPBE	Compare Window B Operation Enable	0: Compare Window B disabled 1: Compare Window B enabled	R/W
b10	—	Reserved	This bit is read as 0. The write value should be 0	R0
b11	CMPAE	Compare Window A Operation Enable	0: Compare Window A disabled 1: Compare Window A enabled	R/W
b12	—	Reserved	This bit is read as 0. The write value should be 0	R0
b13	CMPBIE	Compare B Interrupt Enable	0: Generation of an S12ADCMPBI0 interrupt in response to matches with a condition for comparison (Window B) is disabled. 1: Generation of an S12ADCMPBI0 interrupt in response to matches with a condition for comparison (Window B) is enabled.	R/W
b14	WCMPE	Window Function Setting	0: Window function disabled Window A and B operate as a comparator to compare the single value on the lower side with the A/D conversion result. 1: Window function enabled Window A and B operate as a window comparator to compare the two values on the upper and lower sides with the A/D conversion result.	R/W
b15	CMPAIE	Compare A Interrupt Enable	0: Generation of an S12ADCMPAI0 interrupt in response to matches with a condition for comparison (Window A) is disabled. 1: Generation of an S12ADCMPAI0 interrupt in response to matches with a condition for comparison (Window A) is enabled.	R/W

CMPBE Bit (Compare Window B Operation Enable)

This bit selects enabling or disabling of Window B operation. This bit should be set while the ADCSR.ADST bit is 0. Set this bit to 0 when setting the following registers. This bit sets to “0” when

- A/D Channel Select Register A0/B0 (ADANSA0, ADANSB0)
- The CMPCHB[5:0] bits in the A/D Compare Function Window-B Channel Selection Register (ADCMPBNSR) (ADCMPBNSR.CMPCHB[5:0])

CMPAE Bit (Compare Window A Operation Enable)

Enabling or disabling of Window A operation. This bit should be set while the ADCSR.ADST bit is 0.
Set this bit to 0 when setting the following registers.

- A/D Channel Select RegisterA0/B0 (ADANSA0, ADANSB0)
- Window-A Channel Selection Register 0 (ADCMPANSR0)

CMPBIE Bit (Compare B Interrupt Enable)

This bit selects enables or disables generation of a compare interrupt (S12ADCMPBI0) in response to matches with a condition for comparison (Window B).

WCMPE Bit (Window Function Setting)

This bit selects enabling or disabling of Window function. This bit should be set while the ADCSR.ADST bit is 0.

CMPAIE Bit (Compare A Interrupt Enable)

This bit selects enables or disables generation of a compare interrupt (S12ADCMPAI0) in response to matches with a condition for comparison (Window A).

30.2.16 A/D Compare Function Window-A Channel Selection Register 0 (ADCMPANSR0)

ADCMPANSR0 selects analog input channels for comparison from among AN000 to AN007 in the compare window A condition.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CMPCHA0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	CMPCHA0[7:0]	Compare Window A Channel Select	0: The corresponding channel from among AN000 to AN007 is not a target for the compare Window A. 1: The corresponding channel from among AN000 to AN007 is a target for the compare Window A.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0	R0

CMPCHA0[7:0] Bits (Compare Channel Select)

Setting the CMPCHA0[n] bit which has the same number as the A/D channel selected by the ADANSA.ANSA[n] (n = 0 to 7), ADANSB.ANSB[n] (n = 0 to 7) or ADANSC.ANSC[n] (n = 0 to 7) bits to 1 enables comparison with that channel. Set the CMPCHA0[7:0] bits while ADCSR.ADST bit is 0.

30.2.17 A/D Compare Function Window-A Comparison Condition Setting Register 0 (ADCMPLR0)

The ADCMPLR0 register sets the condition for use in comparing the values of the ADCMPDR0 and ADCMPDR1 registers with results of A/D conversion.
Set the ADCMPLR0 register while ADCSR.ADST is 0.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CMPLCHA0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	CMPLCHA0 [7:0]	Compare window A Compare Level Select	Set the condition for comparison with the selected channels from among AN000 to AN007 under the compare window A condition. Compare conditions are shown in Table 30.11. When Window function is disabled (ADCMPCR.WCMPE = 0): 0: ADCMPDR0 register value > A/D-converted value 1: ADCMPDR0 register value < A/D-converted value When Window function is enabled (ADCMPCR.WCMPE = 1): 0: AD-converted value < ADCMPDR0 register value or A/D-converted value > ADCMPDR1 register value 1: ADCMPDR0 register value < A/D-converted value < ADCMPDR1 register value	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0	R0

CMPLCHA0[7:0] Bits (Compare Condition Select)

The CMPLCHA0[7:0] bits set the condition for use in comparison with the selected channel from among AN000 to AN007 under the compare window A condition. A condition can be set for individual comparison of each analog input. The CMPLCHA0[0] bit is used for AN000, and the CMPLCHA0[7] bit is used for AN007.
When the result of comparison matches the set condition, ADCMPSR0.CMPSTCHA0n is set to 1 and a compare interrupt (S12ADCMPAI0) is generated.

Table 30.11 Compare function description of compare function window A

Compare condition when Window function is disabled

CMPLCHA0[*] = 1'b0		CMPLCHA0[*] = 1'b1	
ADCMPDR0 register value ≤ A/D-converted value	Not matched	ADCMPDR0 register value < A/D-converted value	Matched
ADCMPDR0 register value > A/D-converted value	Matched	ADCMPDR0 register value ≥ A/D-converted value	Not matched

Compare condition when Window function is enabled

CMPLCHA0[*] = 1'b0	
ADCMPDR1 register value < A/D-converted value	Matched
ADCMPDR0 register value ≤ A/D-converted value ≤ ADCMPDR1 register value	Not matched
A/D-converted value < ADCMPDR0 register value	Matched

CMPLCHA0[*] = 1'b1	
ADCMPDR1 register value ≤ A/D-converted value	Not matched
ADCMPDR0 register value < A/D-converted value < ADCMPDR1 register value	Matched
A/D-converted value ≤ ADCMPDR0 register value	Not matched

30.2.18 A/D Compare Function Window-A Lower Level Setting Register (ADCMPDR0), A/D Compare Function Window-A Upper Level Setting Register (ADCMPDR1), A/D Compare Function Window-B Lower Level Setting Register (ADWINLLB), A/D Compare Function Window-B Upper Level Setting Register (ADWINULB)

The ADCMPDR0 register is a readable/writable register to set the reference data when the compare window A function is used. ADCMPDR0 sets the reference data for comparison with the selected channels.

ADCMPDR0 sets the lower-side reference value (CMPLLA[15:0]) for window A, and ADCMPDR1 sets the upper-side reference value (CMPULA[15:0]) for window A.

The ADWINULB and ADWINLLB registers are readable/writable registers to set the reference data when the compare window B function is used.

ADWINLLB sets the lower-side reference value (CMPLLB[15:0]) for window B, and ADWINULB sets the upper-side reference value (CMPULB[15:0]) for window B.

- The ADCMPDRy, ADWINULB, and ADWINLLB registers are writable even during A/D conversion. The reference value can be dynamically*1 changed by rewriting register values during A/D conversion.
- Specify the settings so that upper-side reference value ≥ lower-side reference value (CMPULA ≥ CMPLLA, CMPULB ≥ CMPLLB).
- The ADCMPDR1 and ADWINULB registers are not used when Window function is disabled.

Note 1. Each of the upper-side and lower-side reference values are changed when the corresponding register is written. For example, a comparison is made between the upper-side reference value (after rewriting) and the lower-side reference value (before rewriting) as shown below in the time between rewriting of the upper-side reference value and rewriting of the lower-side reference value.

If the comparison during the rewriting of these two reference values is problematic, rewrite these reference values when the ADCSR.ADST bit and the associated window operation enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) are 0.

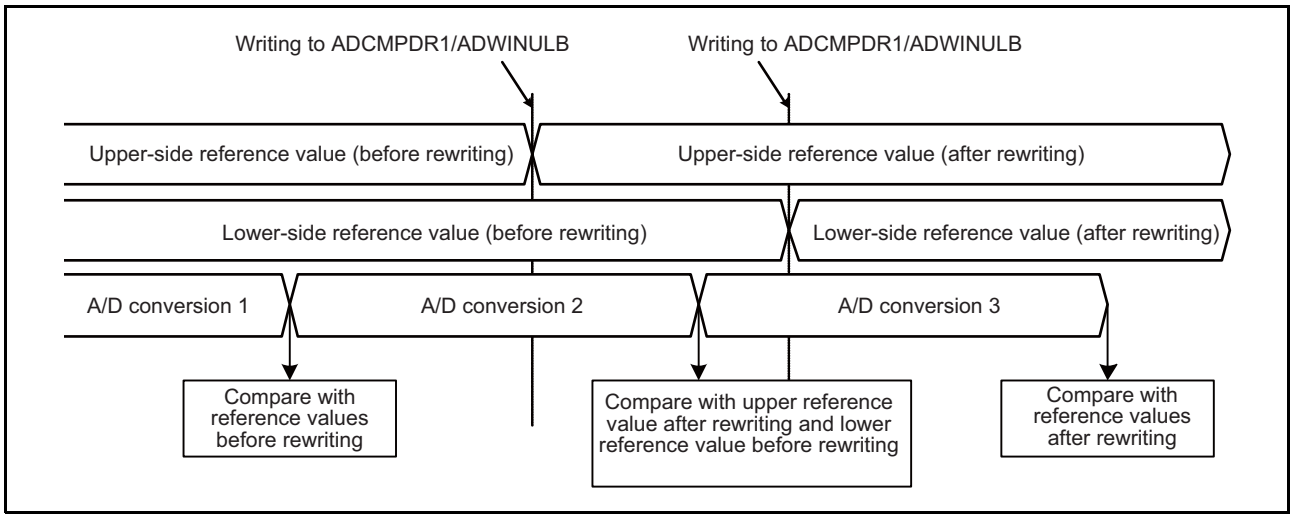


Figure 30.2 Reflection Timing of Reference Values

Note the following settings so that the ADCMPDRy, ADWINULB, and ADWINLLB registers are set according to the A/D data register format shown in section 30.2.1, A/D Data Register y (ADDRy: y = 0 to 7), A/D Data Duplication Register (ADDBLDR), A/D Data Duplication Register A (ADDBLDRA), A/D Data Duplication Register B (ADDBLDRB)*2.

For the correspondence between each condition and data format, see section 30.2.1, Table 30.5.

- The value of the A/D data register format select bit (flush-right or flush-left)
- The value of A/D conversion accuracy specify bits (12 bits, 10 bits, 8 bits)
- The value of A/D-converted value addition/average mode select register (A/D conversion value average mode is selected or not selected)

Note 2. If a compare value is set in a format different from the A/D data register format, the correct comparison result cannot be obtained.

For details about this register format, see section 30.2.23, (1) to (9). In that section, see the description as follows:

- For ADCMPDR0, replace bit symbol "DATA[*:0]" with "CMPLLA[*:0]".
  "Function" should be n-bit compare level (lower-side reference value for window A) (n = 8, 10, 12, 14, 16).
  The R/W attribute of CMPLLA[*:0] should be R/W.
- For ADCMPDR1, replace bit symbol "DATA[*:0]" with "CMPULA[*:0]".
  "Function" should be n-bit compare level (upper-side reference value for window A) (n = 8, 10, 12, 14, 16).
  The R/W attribute of CMPULA[*:0] should be R/W.
- For ADWINLLB, replace bit symbol "DATA[*:0]" with "CMPLLB[*:0]".
  "Function" should be n-bit compare level (lower-side reference value for window B) (n = 8, 10, 12, 14, 16).
  The R/W attribute of CMPLLB[*:0] should be R/W.
- For ADWINULB, replace bit symbol "DATA[*:0]" with "CMPULB[*:0]".
  "Function" should be n-bit compare level (upper-side reference value for window B) (n = 8, 10, 12, 14, 16).
  The R/W attribute of CMPULB[*:0] should be R/W.

30.2.19 A/D Compare Function Window-A Channel Status Register 0 (ADCMPSR0)

The ADCMPSR0 register sets the compare window A function.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CMPSTCHA0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	CMPSTCHA0 [7:0]	Compare Window-A Flag	Indicates compare results of CH(AN000 to AN007) when window A is active (ADCMPCR.CMPAE = 1b). 0: Condition for comparison was not met. 1: Condition for comparison was met.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

CMPSTCHA0[7:0] Bits (Compare Window-A Flag)

These bits are status flags that indicate the comparison result of channels (AN000 to AN007) that are subject to the window A comparison condition.

When the result of comparison on completion of A/D conversion matches the condition set in ADCMPLR0.CMPLCHAn, the corresponding flags are set to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt (S12ADCMPAI0) request is generated when the setting of the flag becomes 1. The CMPSTCHA0[0] bit is used for AN000, and the CMPSTCHA0[7] bit is used for AN007. The value 1 cannot be written to the CMPSTCHA0n bit.

[Setting “1” condition]

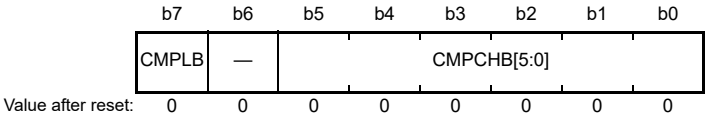
When ADCMPCR.CMPAE = 1b, The condition set in ADCMPLR0.CMPLCHAn is met.

[Clearing “0” condition]

0 is written after reading 1.

30.2.20 A/D Compare Function Window-B Channel Selection Register (ADCMPBNSR)

The ADCMPBNSR register sets the compare window B function.



Bit	Symbol	Bit Name	Function	R/W
b5 to b0	CMPCHB [5:0]	Compare Window B Channel Select	Selects a channel to be compared with the compare window B conditions. 6'b000000: AN000 6'b000001: AN001 6'b000010: AN002 to 6'b111111: Not selected Note: Setting any value from 6'b001000 to 6'b111110 is prohibited.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R0
b7	CMPLB	Compare Window B Compare Condition Setting	Sets comparison conditions for channels for window B. Table 30.12 shows the compare conditions. When Window function is disabled (ADCMPCR.WCMPE bit = 0): 0: CMPLLB register value > A/D-converted value 1: CMPLLB register value < A/D-converted value When Window function is enabled (ADCMPCR.WCMPE bit = 1): 0: A/D-converted value < CMPLLB register value or CMPULB register value < A/D-converted value 1: CMPLLB register value < A/D-converted value < CMPULB register value	R/W

CMPCHB[5:0] Bits (Compare Window B Channel Select)

These bits select a channel to be compared with the compare window B conditions from AN000 to AN007.
Specifying the number (hexadecimal) of the A/D conversion channel selected in the ADANSA0.ANSA0[n] (n = 0 to 7) bits and ADANSB0.ANSB0[n] (n = 0 to 7) bits enables the compare window B function.
Set the CMPCHB[5:0] bits while the ADCSR.ADST bit is 0.

CMPLB Bit (Compare Window B Compare Condition Setting)

This bit sets comparison conditions for channels for window B. When the result of comparison of analog input matches the set condition, ADCMPBSR0.CMPSTB is set to 1 and a compare interrupt (S12ADCMPBI0) is generated.

Table 30.12 Explanation of Compare Conditions for Compare Function Window B

Compare condition when Window function is disabled

CMPLB = 1'b0

ADWINLLB register value ≤ A/D-converted value	Not matched
ADWINLLB register value	Matched

CMPLB = 1'b1

ADWINLLB register value < A/D-converted value	Matched
ADWINLLB register value ≥ A/D-converted value	Not matched

Compare condition when Window function is enabled

CMPLB = 1'b0

A/D-converted value > ADWINULB register value	Matched
ADWINLLB register value ≤ A/D-converted value ≤ ADWINULB register value	Not matched
A/D-converted value < ADWINLLB register value	Matched

CMPLB = 1'b1

A/D-converted value ≥ ADWINULB register value	Not matched
ADWINLLB register value < A/D-converted value < ADWINULB register value	Matched
A/D-converted value ≤ ADWINLLB register value	Not matched

30.2.21 A/D Compare Function Window-B Status Register (ADCMPBSR)

The ADCMPBSR register stores the result of comparison by the compare window B function.

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPSTB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CMPSTB	Compare Window-B Flag	Indicates compare results of CH (AN000 to AN007) when window B is active (ADCMPCR.CMPBE = 1b) 0: Condition for comparison was not met. 1: Condition for comparison was met.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R0

CMPSTB Bits (Compare Window-B Flag)

These bits are status flags that indicate the comparison result of channels (AN000 to AN007) that are subject to the window B comparison condition. When the result of comparison on completion of A/D conversion matches the condition set in ADCMPBNSR.CMPLB, the corresponding flags are set to 1. When the ADCMPCR.CMPBIE bit is 1, a compare interrupt (S12ADCMPBI0) request is generated when the setting of the flag becomes 1. The value 1 cannot be written to the CMPSTB bit.

[Setting “1” condition]

When ADCMPCR.CMPBE = 1b, The condition set in ADCMPBNSR.CMPLB is met.

[Clearing “0” condition]

0 is written after reading 1.

30.2.22 A/D Compare Function AB Status Monitor Register (ADWINMON)

The ADWINMON register can be used to monitor comparison results and combination results.

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	MON CMPB	MON CMPA	—	—	—	MON COMB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b5	MONCMPB	Comparison Result Monitor B	0: Window B comparison conditions are not met. 1: Window B comparison conditions are met.	R
b4	MONCMPA	Comparison Result Monitor A	0: Window A comparison conditions are not met. 1: Window A comparison conditions are met.	R
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b0	MONCOMB	Combination Result Monitor	Indicates the combination result. This bit is valid while both window A and B are active. 0: Window A/B composite conditions are not met. 1: Window A/B composite conditions are met.	R

MONCMPB Bit (Comparison Result Monitor B)

This bit is a read-only bit which is read as 1 when the A/D-converted value of the target channel for window B meets the condition set in the ADCMPBNSR.CMPLB bit, and is read as 0 when it does not meet the condition.
[Setting “1” condition]
Under the condition that ADCMPCR.CMPBE = 1b, the condition set in ADCMPBNSR.CMPLB is met.
[Setting “0” condition]
Under the condition that ADCMPCR.CMPBE = 1b, the condition set in ADCMPBNSR.CMPLB is not met.
When ADCMPCR.CMPBE = 0b (Automatic clearing is performed when the value of ADCMPCR.CMPBE is changed from 1b to 0b.)

MONCMPA Bit (Comparison Result Monitor A)

This bit is a read-only bit which is read as 1 when the A/D-converted value of the target channel for window A meets the condition set in ADCMPLR0 and ADCMPLER, and is read as 0 when it does not meet the condition.
[Setting “1” condition]
Under the condition that ADCMPCR.CMPAE = 1b, the condition set in ADCMPLR0.CMPLCHAn is met.
[Setting “0” condition]
Under the condition that ADCMPCR.CMPAE = 1b, the condition set in ADCMPLR0.CMPLCHAn is not met.
When ADCMPCR.CMPAE = 0b (Automatic clearing is performed when the value of ADCMPCR.CMPAE is changed from 1b to 0b.)

MONCOMB Bit (Combination Result Monitor)

This read-only bit indicates a result of combining comparison condition result A and comparison result condition B with the combination condition set in the ADCMPCR.CMPAB[1:0] bits.
[Setting “1” condition]
Under the condition that ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1, the combination condition set in the ADCMPCR.CMPAB[1:0] bits is met.
[Setting “0” condition]
The combination condition set in the ADCMPCR.CMPAB[1:0] bits is not met.
When ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0

30.2.23 Data Format

The data formats in this module are shown below.

Data Format (1)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	DATA[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b7 to b0	DATA[7:0]	A/D-converted value/compare level	8-bit A/D-converted value	R
			8-bit compare level	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R0

Data Format (2)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DATA[7:0]								—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

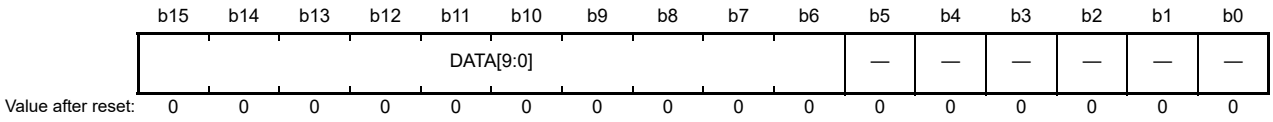
Bit	Symbol	Bit Name	Function	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b15 to b8	DATA[7:0]	A/D-converted value/compare level	8-bit A/D-converted value	R
			8-bit compare level	R/W

Data Format (3)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DATA[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

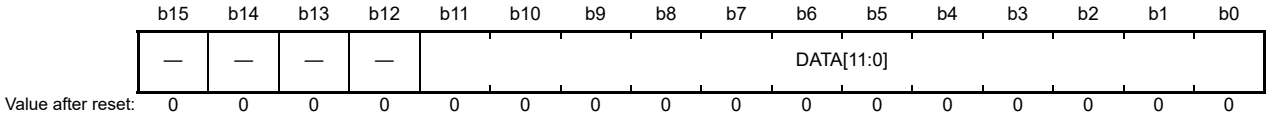
Bit	Symbol	Bit Name	Function	R/W
b9 to b0	DATA[9:0]	A/D-converted value/compare level	10-bit A/D-converted value	R
			10-bit compare level	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R0

Data Format (4)



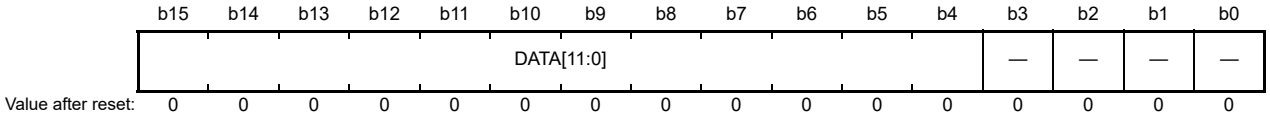
Bit	Symbol	Bit Name	Function	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b15 to b6	DATA[9:0]	A/D-converted value/compare level	10-bit A/D-converted value	R
			10-bit compare level	R/W

Data Format (5)



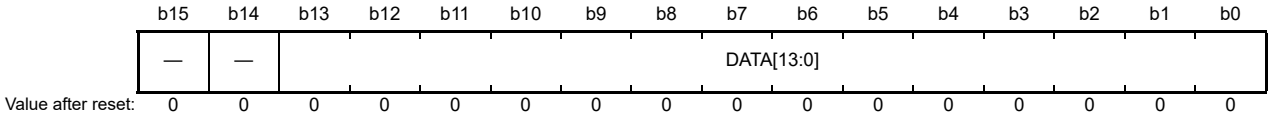
Bit	Symbol	Bit Name	Function	R/W
b11 to b0	DATA[11:0]	A/D-converted value/compare level	12-bit A/D-converted value	R
			12-bit compare level	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R0

Data Format (6)



Bit	Symbol	Bit Name	Function	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R0
b15 to b4	DATA[11:0]	A/D-converted value/compare level	12-bit A/D-converted value	R
			12-bit compare level	R/W

Data Format (7)



Bit	Symbol	Bit Name	Function	R/W

b15 to b0	DATA[15:0]	A/D-converted value/compare level	16-bit A/D-converted value	R
			16-bit compare level	R/W

30.3 Operation

30.3.1 Scanning Operation

In scanning, A/D conversion is performed sequentially on the analog inputs of the specified channels.
A scan conversion is performed in three operating modes: single scan mode, continuous scan mode, and group scan mode. In single scan mode, one or more specified channels are scanned once. In continuous scan mode, one or more specified channels are scanned repeatedly until the ADST bit in ADCSR register is cleared to 0 from 1 by software.
In group scan mode, the selected channels of group A, the selected channels of group B, and the selected channels of group B are scanned once after starting to be scanned according to the respective synchronous triggers.
In single scan mode and continuous scan mode, A/D conversion is performed for ANn channels selected by the ADANSA0 register, starting from the channel with the smallest number n. In group scan mode, A/D conversion is performed for ANn channels of group A selected by the ADANSA0 register first, and then performed for ANn channels of group B selected by the ADANSB0 register, and then performed for ANn channels of group C selected by the ADANSC0 register, respectively, starting from the channel with the smallest number n.
When self-diagnosis is selected, it is executed once at the beginning of each scan and one of the three voltages internally generated in the A/D converter is converted.
Double trigger mode is to be used with single scan mode or group scan mode. With double trigger mode being enabled (set ADCSR.DBLE to 1) , A/D conversion data of a channel selected by the DBLANS[4:0] bits in ADCSR register is duplicated only if the conversion is started by any of the synchronous triggers selected by the TRSA[5:0] bits in ADSTRGR register.
In group scan mode, the double trigger function can be used only for group A.

Extended double trigger mode means that double trigger mode is enabled, and the following synchronous triggers (two types of synchronous trigger source enabled) are selected as the A/D conversion start trigger in ADSTRGR.TRSA[5:0].

- TRG4AN or TRG4BN (Sets ADSTRGR.TRSA[5:0] to “001011”.)
- TRG7AN or TRG7BN (Sets ADSTRGR.TRSA[5:0] to “001111” .)
- ADTRGA0 or ADTRGB0 (Sets ADSTRGR.TRSA[5:0] to “011001”.)
- ADTRGA1 or ADTRGB1 (Sets ADSTRGR.TRSA[5:0] to “011010”.)
- ADTRGA2 or ADTRGB2 (Sets ADSTRGR.TRSA[5:0] to “011011”.)
- ADTRGA3 or ADTRGB3 (Sets ADSTRGR.TRSA[5:0] to “011100”.)

In extended double trigger mode, in addition to normal double trigger mode operation, A/D conversion data triggered by TRGnAN (n = 4, 7) and ADTRGAm (m = 0 to 3) is stored in A/D data duplication register A (ADDBLDRA), and A/D conversion data triggered by TRGnBN (n = 4, 7) and ADTRGBm (m = 0 to 3) is stored in A/D data duplication register B (ADDBLDRB).

If two types of trigger sources have occurred simultaneously, the A/D conversion data is stored in A/D data duplication register B (ADDBLDRB) without being sorted by the trigger sources. Note that if a new trigger is input during A/D conversion caused by another trigger, the new trigger is ignored.

30.3.2 Single Scan Mode

30.3.2.1 Basic Operation

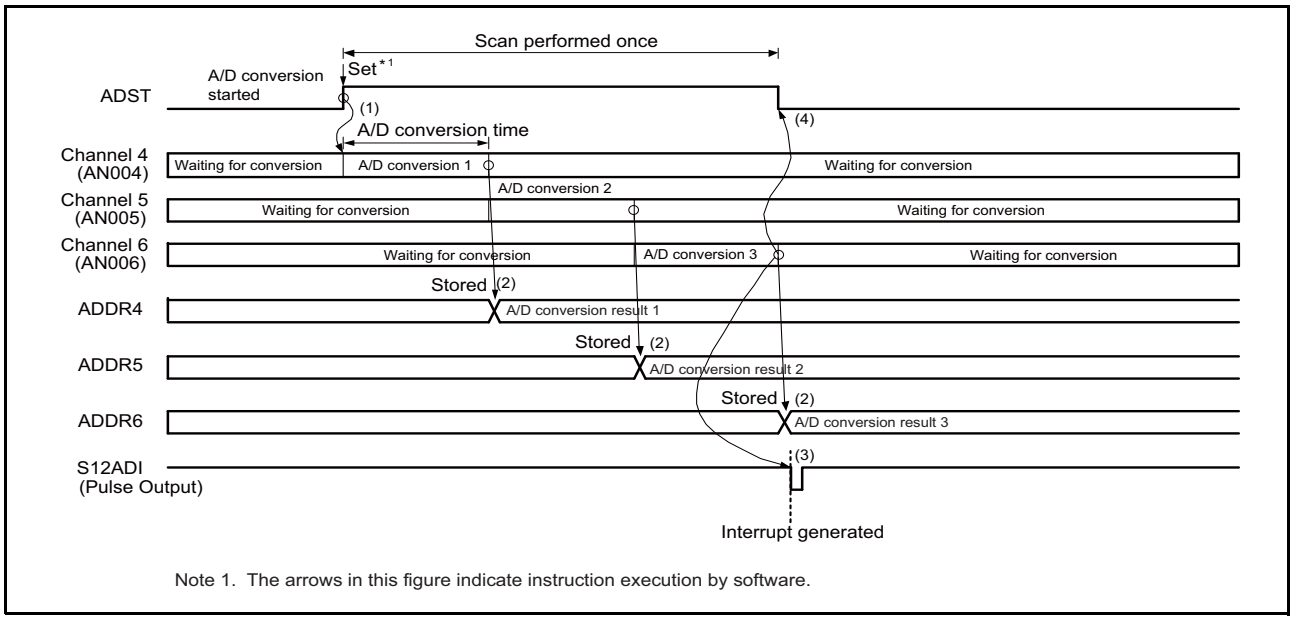
In basic operation of single scan mode, A/D conversion is performed once on the analog input of the specified channels as below.

(1) When the ADST bit in ADCSR register is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (MTU, GPT), or input of an asynchronous trigger. A/D conversion is performed for ANn channels selected by the ADANSA0 register, starting from the channel with the smallest number n.

(2) Each time A/D conversion of a single channel is completed, the result of A/D conversion is stored in the corresponding A/D data register (ADDRy).

(3) When A/D conversion of all the selected channels is completed, an S12ADI0 interrupt request is generated if the ADIE bit in ADCSR is 1 (S12ADI0 interrupt upon scanning completion is enabled).

(4) The ADST bit in ADCSR remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels is completed. Then the A/D converter enters a waiting state.



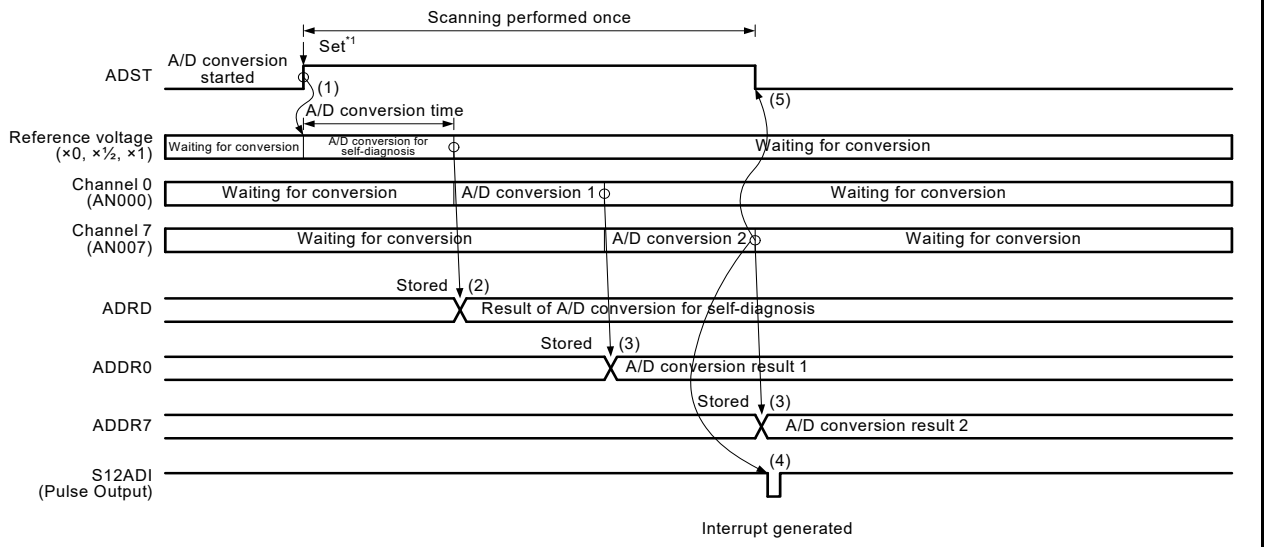
Note 1. The arrows in this figure indicate instruction execution by software.

Figure 30.3 Example of Operation in Single Scan Mode (Basic Operation: AN004 to AN006 Selected)

30.3.2.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected, A/D conversion is first performed for the reference voltage AVcc supplied to the A/D converter, and then A/D conversion is performed once on the analog input of the selected channels as below.

(1) A/D conversion for self-diagnosis is first started when the ADST bit in ADCSR is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (MTU, GPT), or an asynchronous trigger input.
(2) When A/D conversion for self-diagnosis is completed, the A/D conversion result is stored into the A/D self-diagnosis data register (ADRD). A/D conversion is then performed for ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.
(3) Each time A/D conversion of a single channel is completed, the A/D conversion result is stored into the corresponding A/D data register (ADDRy).
(4) When A/D conversion of all the selected channels is completed, an S12ADI0 interrupt request is generated if the ADIE bit in ADCSR is 1 (S12ADI0 interrupt upon scanning completion enabled).
(5) The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels is completed. Then the A/D converter enters a waiting state.



Note 1. The arrows in this figure indicate instruction execution by software.

Figure 30.4 Example of Operation in Single Scan Mode
(Basic Operation: AN000 and AN007 Selected + Self-Diagnosis)

30.3.2.3 A/D Conversion in Double Trigger Mode

When double trigger mode is selected in single scan mode, A/D conversion is performed for two rounds of single scan operation started by a synchronous trigger (MTU, GPT) as a sequence as shown below. Self-diagnosis should be deselected.
Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated to the DBLANS[4:0] bits in ADCSR and setting the DBLE bit in ADCSR to 1. When the DBLE bit in ADCSR is set to 1, channel selection using the ADANSA0 register is invalid. In double trigger mode, a synchronous trigger (MTU, GPT) should be selected using the TRSA[5:0] bits in ADSTRGR; the EXTRG bit and TRGE bit in ADCSR should be set to 0 and 1, respectively. Software trigger should not be used.

(1) When the ADST bit in ADCSR is set to 1 (A/D conversion start) by a synchronous trigger input (MTU, GPT), A/D conversion is started on the single channel selected by the DBLANS[4:0] bits in ADCSR.
(2) Each time A/D conversion of a single channel is completed, the A/D conversion result is stored into the corresponding A/D data register (ADDRy).
(3) The ADST bit in ADCSR is automatically cleared to 0 and the A/D converter enters a waiting state. Here, an S12ADI0 interrupt request is not generated irrespective of the ADIE (S12ADI0 interrupt upon scanning completion enabled) bit setting in ADCSR.
(4) When the ADST bit in ADCSR is set to 1 (A/D conversion start) by the second synchronous trigger input, A/D conversion is started on the single channel selected by the DBLANS[4:0] bits in ADCSR.
(5) When A/D conversion is completed, the A/D conversion result is stored into the A/D data duplication register (ADDBLDR), which is exclusively used in double trigger mode.
(6) If the ADIE bit in ADCSR is 1 (S12ADI0 interrupt upon scanning completion enabled), an S12ADI0 interrupt is generated.
(7) The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion is completed. Then the A/D converter enters a waiting state.

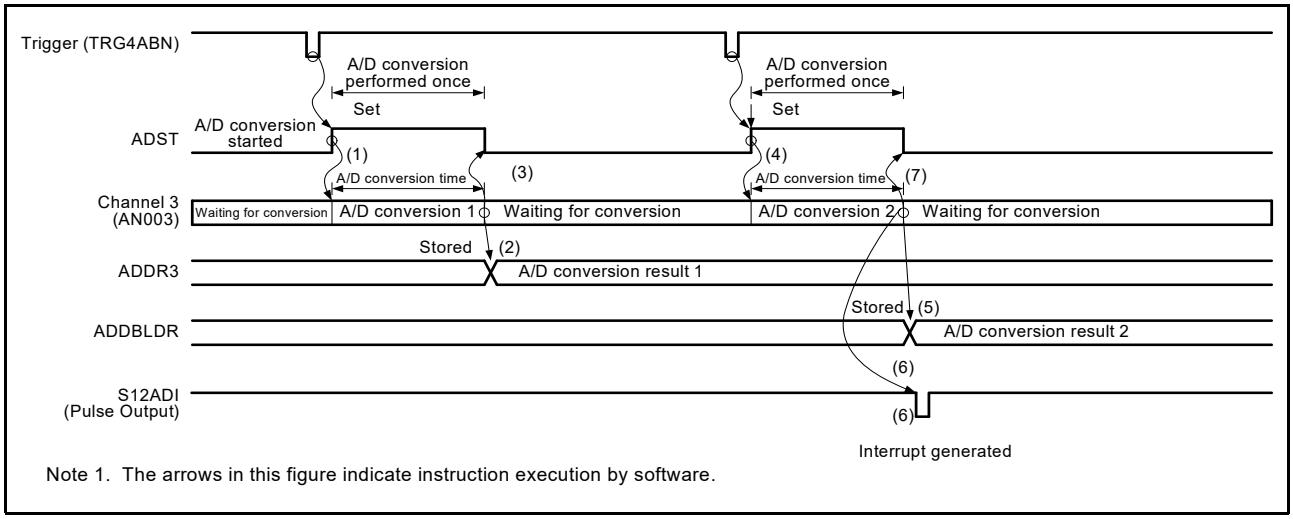


Figure 30.5 Example of Operation in Single Scan Mode
(Double Trigger Mode Selected; AN003 Duplicated; TRG4ABN is selected as the trigger)

30.3.2.4 Extended Operations When Double Trigger Mode is Selected

When double trigger mode is selected in single scan mode, two rounds of single scan operation are performed as shown below.

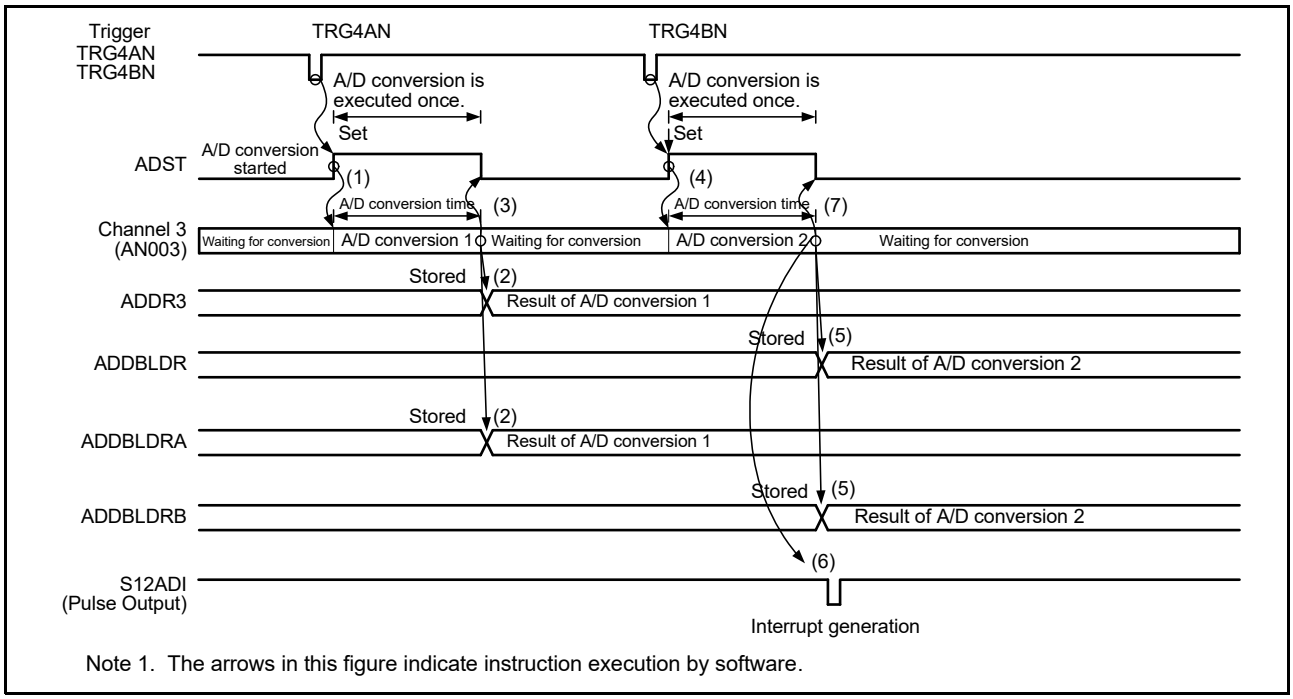
In double trigger extended mode, should be selected TRG4AN or TRG4BN, TRG7AN or TRG7BN, ADTRGA0 or ADTRGB0, ADTRGA1 or ADTRGB1, ADTRGA2 or ADTRGB2, and ADTRGA3 or ADTRGB3 using the TRSA[5:0] bits in ADSTRGR register; the EXTRG bit and TRGE bit in ADCSR register should be set to 0 and 1, respectively.

Software trigger should not be used.

Self-diagnosis should be deselected.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated to the DBLANS[4:0] bits in ADCSR register and setting the DBLE bit in ADCSR register to 1. When the DBLE bit in ADCSR register is set to 1, channel selection using the ADANSA0 register is invalid.

(1) A/D conversion for the single channel selected by the ADCSR.DBLANS[4:0] bits starts when the TRG4AN input sets the ADCSR.ADST bit to 1 (starting A/D conversion).
(2) The result is stored in the corresponding A/D data register (ADDRy) and in A/D data-duplication register A (ADDBLDRA) on completion of the A/D conversion for the channel.
(3) The ADST bit is automatically cleared and the A/D converter enters the waiting state. An S12ADI0 interrupt is not generated at this time, regardless of the setting of the ADCSR.ADIE bit (i.e. whether or not this is set to enable S12ADI0 interrupts in response to scan completion).
(4) When the TRG4BN input sets the ADCSR.ADST bit to 1 (starting A/D conversion), conversion for the single channel selected by the ADCSR.DBLANS[4:0] bits starts.
(5) The result is stored in the A/D data-duplication register (ADDBLDR) and in A/D data-duplication register B (ADDBLDRB) on completion of A/D conversion.
(6) An S12ADI0 interrupt is generated if the setting of the ADCSR.ADIE bit is 1 (S12ADI0 interrupt upon scanning completion enabled).
(7) The ADST bit retains the value 1 (starting A/D conversion) during A/D conversion and is automatically cleared on completion of conversion, after which the A/D converter enters the waiting state.



Note 1. The arrows in this figure indicate instruction execution by software.

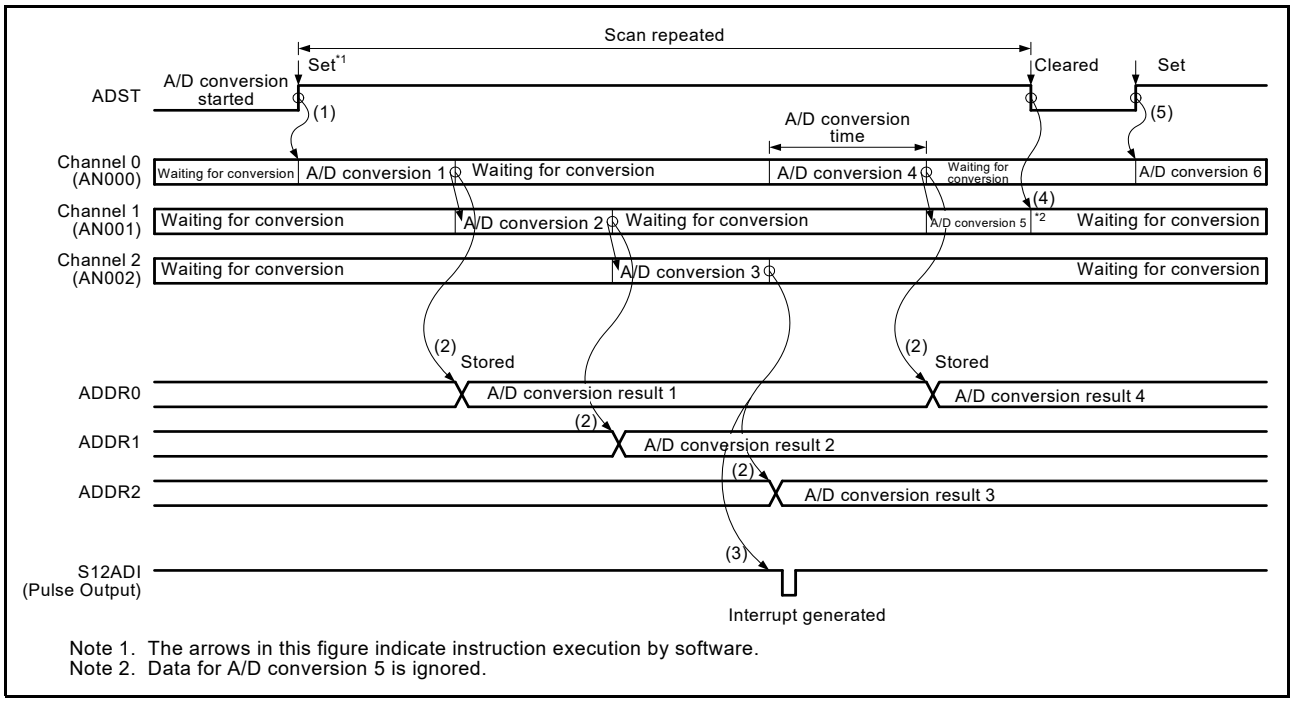
Figure 30.6 Example of Operation in Single Scan Mode
(Duplication Selected for AN003, TRG4AN or TRG4BN Selected)

30.3.3 Continuous Scan Mode

30.3.3.1 Basic Operation

In basic operation of continuous scan mode, A/D conversion is performed repeatedly on the analog input of the channels selected as below.

(1) When the ADST bit in ADCSR is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (MTU, GPT), or an asynchronous trigger input, A/D conversion is performed for ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.
(2) Each time A/D conversion of a single channel is completed, the A/D conversion result is stored into the corresponding A/D data register (ADDRy).
(3) When A/D conversion of all the selected channels is completed, an S12ADI0 interrupt is generated if the ADCSR.ADIE bit is 1 (S12ADI0 interrupt upon scanning completion enabled). The A/D converter sequentially starts A/D conversion for ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.
(4) The ADST bit in ADCSR is not automatically cleared and steps 2 and 3 are repeated as long as the bit remains 1 (A/D conversion start). When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the A/D converter enters a waiting state.
(5) When the ADST bit is later set to 1 (A/D conversion start), A/D conversion is started again for ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.



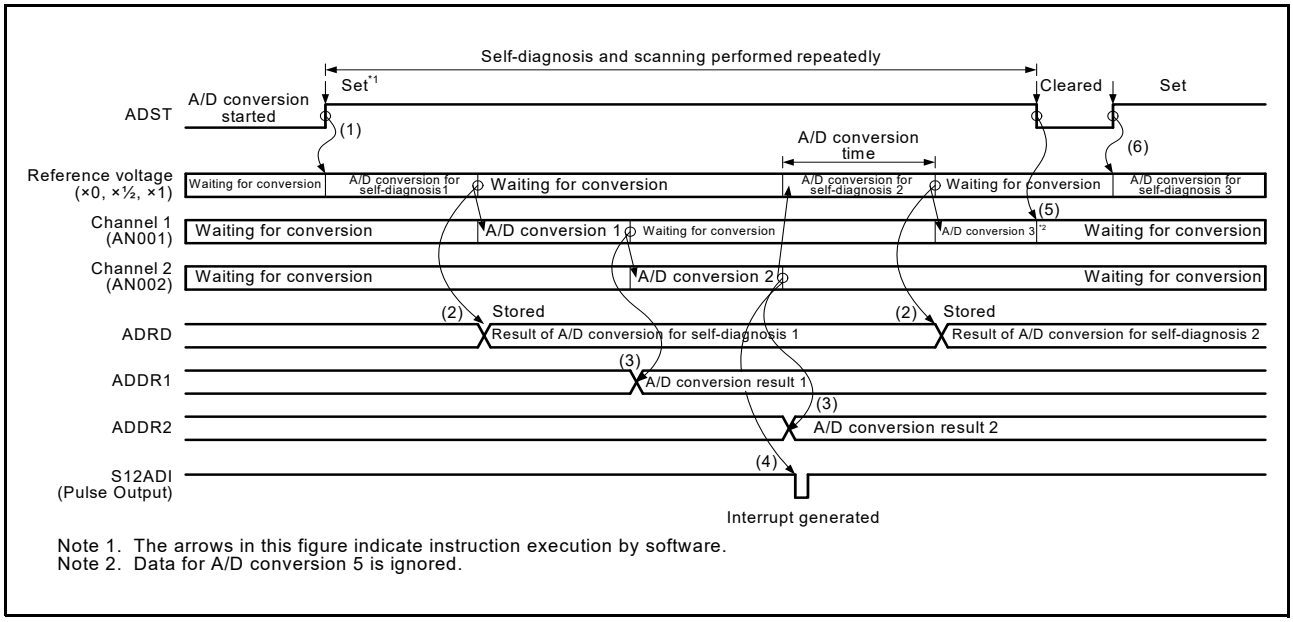
Note 1. The arrows in this figure indicate instruction execution by software.
Note 2. Data for A/D conversion 5 is ignored.

Figure 30.7 Example of Operation in Continuous Scan Mode (Basic Operation: AN000 to AN002 Selected)

30.3.3.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected at the same time, A/D conversion is first performed for the reference voltage AVcc supplied to the A/D converter, and then A/D conversion is performed on the analog input of the selected channels, which sequence is repeated as below.

(1) A/D conversion due to self-diagnosis is first started when the ADST bit in ADCSR is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (MTU, GPT), or an asynchronous trigger input.
(2) When A/D conversion due to self-diagnosis is completed, the A/D conversion result is stored into the A/D self-diagnosis data register (ADRD). A/D conversion is then performed for ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.
(3) Each time A/D conversion of a single channel is completed, the A/D conversion result is stored into the corresponding A/D data register (ADDRy).
(4) When A/D conversion of all the selected channels is completed, an S12ADI0 interrupt is generated if the ADCSR.ADIE bit is 1 (S12ADI0 interrupt upon scanning completion is enabled). At the same time, the A/D converter starts A/D conversion due to self-diagnosis and then starts A/D conversion on ANn pins selected by the ADANSA0 register, starting from the channel with the smallest number n.
(5) The ADST bit in ADCSR is not automatically cleared and steps 2 to 4 are repeated as long as the bit remains 1. When the ADST bit in ADCSR is set to 0 (A/D conversion stop), A/D conversion stops and the A/D converter enters a waiting state.
(6) When the ADST bit is later set to 1 (A/D conversion start), conversion is started again from the A/D conversion due to self-diagnosis.



Note 1. The arrows in this figure indicate instruction execution by software.
Note 2. Data for A/D conversion 5 is ignored.

Figure 30.8 Example of Operation in Continuous Scan Mode
(Basic Operation; AN001 and AN002 Selected + Self-Diagnosis)

30.3.4 Group Scan Mode

30.3.4.1 Basic Operation

Either two (group A, B) or three (group A, B, C) can be selected for the number of groups to be used in group scan mode. In basic operation of group scan mode, A/D conversion is performed once on the analog inputs of all the specified channels in group A and group B or group A, group B, and group C after scanning is started by a synchronous trigger as below. Scan operation of each group is similar to the scan operation in single scan mode.
The synchronous triggers of group A, B, and C can be selected using the TRSA[5:0], TRSB[5:0], and TRSC[5:0] bits in ADSTRGR, respectively. The different triggers should be set for group A, group B, and group C to prevent simultaneous scan operation of group A, group B, and group C. Software trigger should not be used.
The ADANSA0 register is used to select the channels subject to scan operation for group A. The ADANSB0 register is used to select the channels subject to scan operation for group B. The ADANSC0 register is used to select the channels subject to scan operation for group C.
When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed for group A and group B or group A, group B, and group C.
The following describes operation in group scan mode using a trigger of the MTU. Specifically, the TRG4AN, TRG4BN, and TRG4ABN triggers of the MTU are assumed to be used to start conversion of group A, group B, and group C, respectively.

(1) Scanning of group A is started by the TRG4AN trigger of the MTU.
(2) When group A scanning is completed, an S12ADI0 interrupt is generated if the ADIE bit in ADCSR is 1 (S12ADI0 interrupt upon scanning completion is enabled).
(3) Scanning of group B is started by the TRG4BN trigger of the MTU.
(4) When group B scanning is completed, a S12GBADI0 interrupt is generated if the GBADIE bit in ADCSR is 1 (S12GBADI0 interrupt upon scanning completion is enabled).
(5) Scanning of group C is started by the TRG4ABN trigger of the MTU.
(6) When group C scanning is completed, a S12GCADI0 interrupt is generated if the GBADIE bit in ADCSR is 1 (S12GCADI0 interrupt upon scanning completion is enabled).

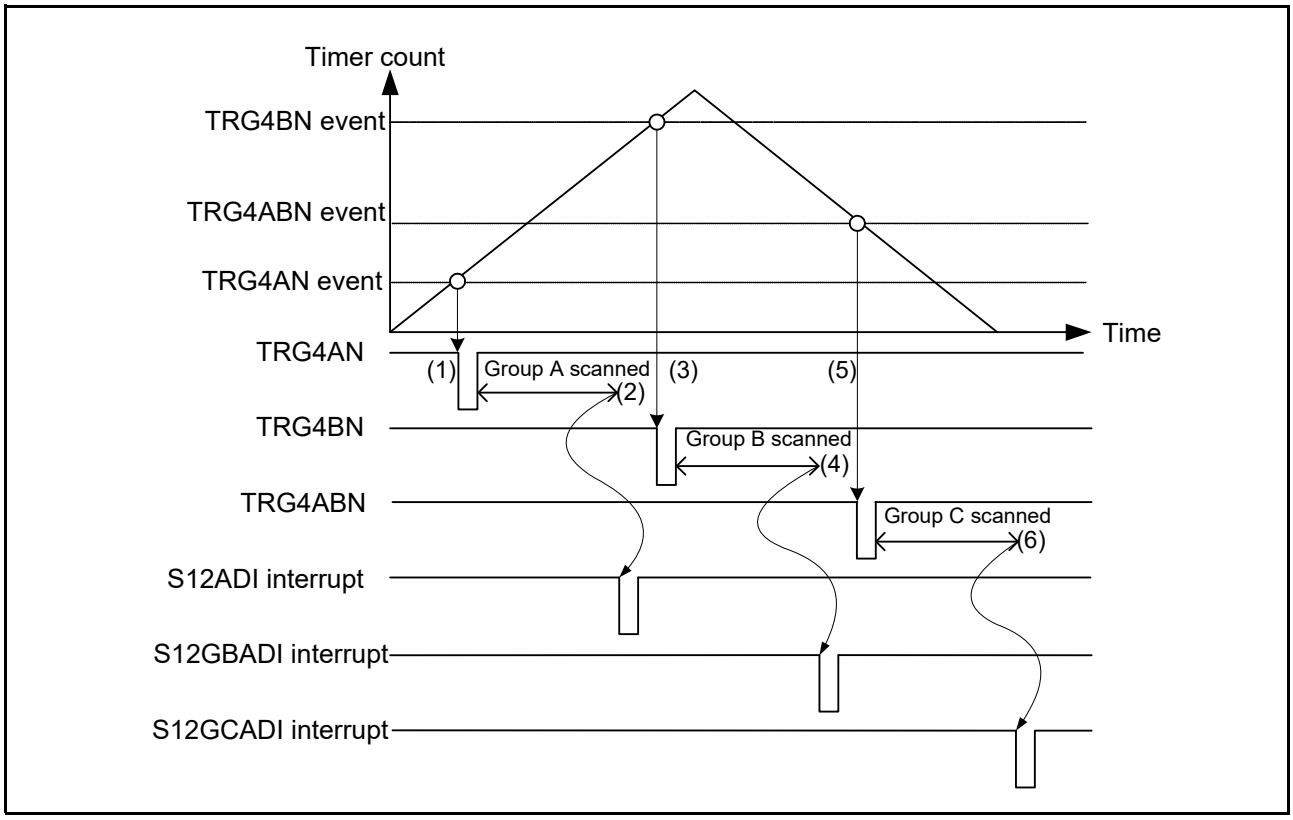


Figure 30.9 Example of Operation in Group Scan Mode (Basic Operation: Triggers from MTU Used)

30.3.4.2 A/D Conversion in Double Trigger Mode

When double trigger mode is selected in group scan mode, A/D conversion is performed for two rounds of single scan operation started by a synchronous trigger (MTU, GPT) as a sequence for group A. For group B and group C, single scan operation started by a synchronous trigger (MTU, GPT) is performed once.
In group scan mode, the synchronous triggers of group A, B, and C can be selected using the TRSA[5:0], TRSB[5:0], and TRSC[5:0] bits in ADSTRGR, respectively. The different triggers should be selected for group A, group B, and group C to prevent simultaneous A/D conversion of group A, group B and group C. Software trigger, or asynchronous trigger (ADTRG#) should not be used.
When TRG4AN or TRG4BN, TRG7AN or TRG7BN, ADTRGA0 or ADTRGB0, ADTRGA1 or ADTRGB1, ADTRGA2 or ADTRGB2, or ADTRGA3 or ADTRGB3 is selected as the synchronous trigger for group A (the ADSTRGR.TRSA[5:0] bits), operation proceeds in extended double trigger mode.
The DBLANS[4:0] bits in the ADCSR register are used to select the channels subject to scan operation for group A. The ADANSB0 register is used to select the channels subject to scan operation for group B. The ADANSC0 register is used to select the channels subject to scan operation for group C.
When double trigger mode is selected in group scan mode, self-diagnosis cannot be selected.
Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated to the DBLANS[4:0] bits in ADCSR and setting the DBLE bit in ADCSR to 1.
The following describes operation in group scan mode with double trigger mode using a trigger of the MTU. Specifically, the TRG4ABN, TRGA0N, and TRGA1N triggers of the MTU are assumed to be used to start conversion of group A, group B, and group C, respectively.

(1) Scanning of group C is started by the TRGA1N trigger of the MTU.
(2) When group C scanning is completed, a S12GCADI0 interrupt is generated if the GCADIE bit in ADGCTRGR is 1 (S12GCADI0 interrupt upon scanning completion is enabled).
(3) Scanning of group B is started by the TRGA0N trigger of the MTU.
(4) When group B scanning is completed, a S12GBADI0 interrupt is generated if the GBADIE bit in ADCSR is 1 (S12GBADI0 interrupt upon scanning completion is enabled).
(5) The first scanning of group A is started by the first TRG4ABN trigger of the MTU.
(6) When the first scanning of group A is completed, the conversion result is stored into the corresponding A/D data register (ADDRy); an S12ADI0 interrupt is not generated irrespective of the ADIE bit setting in ADCSR.
(7) The second scanning of group A is started by the second TRG4ABN trigger of the MTU.
(8) When the second scanning of group A is completed, the conversion result is stored into the ADDBLDR register. An S12ADI0 interrupt is generated if the ADIE bit in ADCSR is 1 (S12ADI0 interrupt is enabled).
(9) The second scanning of group B is started by the second TRGA0N trigger of the MTU.
(10) When the second scanning of group B is completed, an S12GBADI0 interrupt is generated if the GBADIE bit in ADCSR is 1 (S12GBADI0 interrupt is enabled).
(11) The second scanning of group C is started by the second TRGA1N trigger of the MTU.
(12) When the second scanning of group C is completed, an S12GCADI0 interrupt is generated if the GCADIE bit in ADGCTRGR is 1 (S12GCADI0 interrupt is enabled).

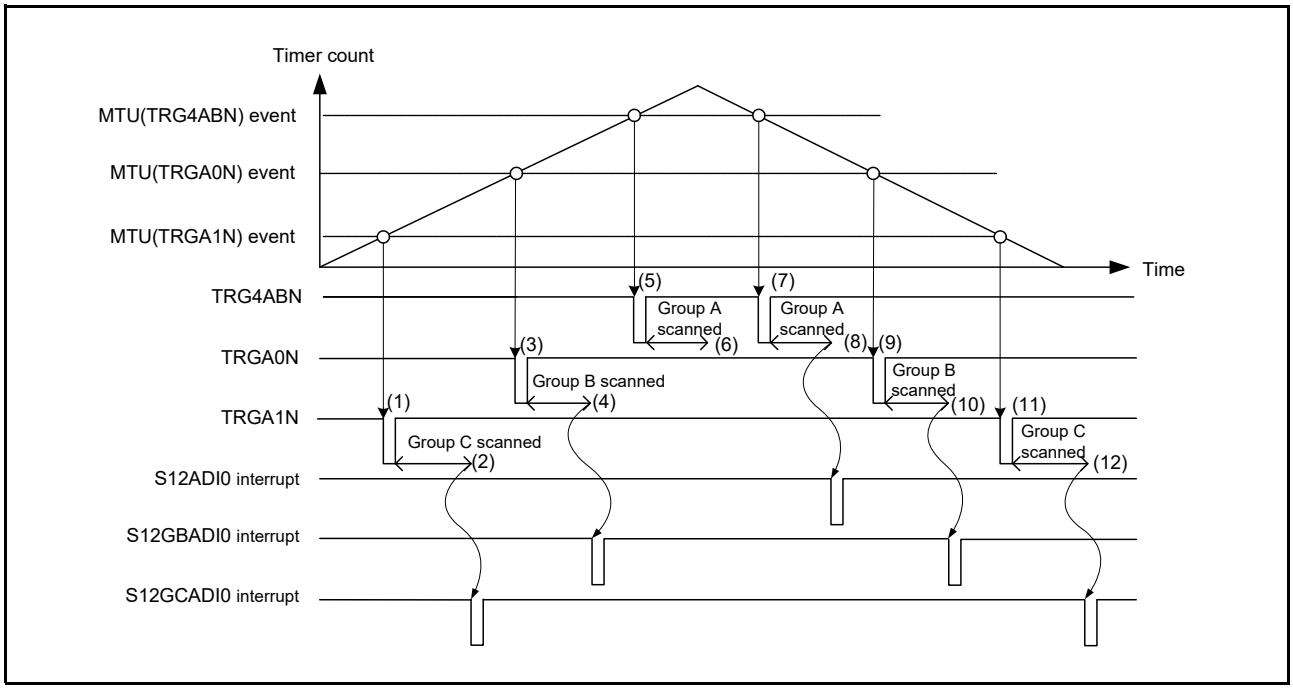

Figure 30.10 Example of Operation in Group Scan Mode with Double Trigger Mode
(Basic Operation: Triggers from MTU Used)

30.3.4.3 Group Priority Control

Setting the ADGSPCR.PGS bit to 1 in group scan mode makes operation proceed under group priority control.
The order of group priority is group A > group B > group C. The number of groups to be used in group scan mode can be selected from either two (group A, B) or three (group A, B, C) by setting ADGCTRGR.GRCE.
When setting the ADGSPCR.PGS bit to 1, follow the procedure described in Figure 30.11. If the procedure is not followed, A/D conversion operation and stored data are not guaranteed.
In operation in basic group scan mode, input of the trigger for the other group during scan operation in group A, group B, or group B is ignored, and scan operations in group A, group B, or group C are the same in single scan mode.
Under group priority control, if a priority group trigger is input during scan operation for low priority group, scan operation for low priority group is discontinued and scan operation for priority group proceeds.
If the setting of the ADGSPCR.GBRSCN bit is 0, the low priority group enters the waiting state on completion of the scan operation for priority group. Additionally, trigger input for the low priority group that occurs during scanning is ignored.
If the setting of the ADGSPCR.GBRSCN bit is 1, the converter automatically restarts scanning for low priority group after completion of the scan operation for priority group.
Additionally, trigger input for the low priority group that occurs during scanning for the priority group is valid, and on completion of the scan for the priority group, scanning for the low priority group is automatically executed.
If the setting of the ADGSPCR.GBRSCN bit is 1 and ADGSPCR.LGRRS bit is 0, the converter restarts scanning for low priority group from the head of the group.
Additionally, when ADGSPCR.LGRRS is set to 1, scan for the low priority group is re-executed from the interrupted channel Note that when the self-diagnosis function is used, scan is re-executed from the interrupted channel on completion of self-diagnosis.

Table 30.13 shows the relation between the setting of the ADGSPCR.GBRSCN bit and operation in response to trigger input during scanning.
When the ADGSPCR.GBRP bit is set to 1, single scan is continuously performed as scanning operation for the lowest priority group.
When setting a trigger in group scan mode, select a synchronous trigger for group A using the ADSTRGR.TRSA[5:0] bits, select a synchronous trigger for group B different from that of group A using the ADSTRGR.TRSB[5:0] bits, and select a synchronous trigger for group C different from those of group A and group B using the ADGCTRGR.TRSC[5:0] bits.
When two groups are enabled (the ADGCTRGR.GRCE bit is set to 0) in group scan mode and the ADGSPCR.GBRP bit is set to 1, set the ADSTRGR.TRSB[5:0] bits to 3Fh.
Additionally, when three groups are enabled (the ADGCTRGR.GRCE bit is set to 1) in group scan mode and the ADGSPCR.GBRP bit is set to 1, set the ADGCTRGR.TRSC[5:0] bits to 3Fh.
Furthermore, as targets for scan operation, select channels for group A, group B, and group C using the ADANSA0, ADANSB0, and ADANSC0 registers, respectively.

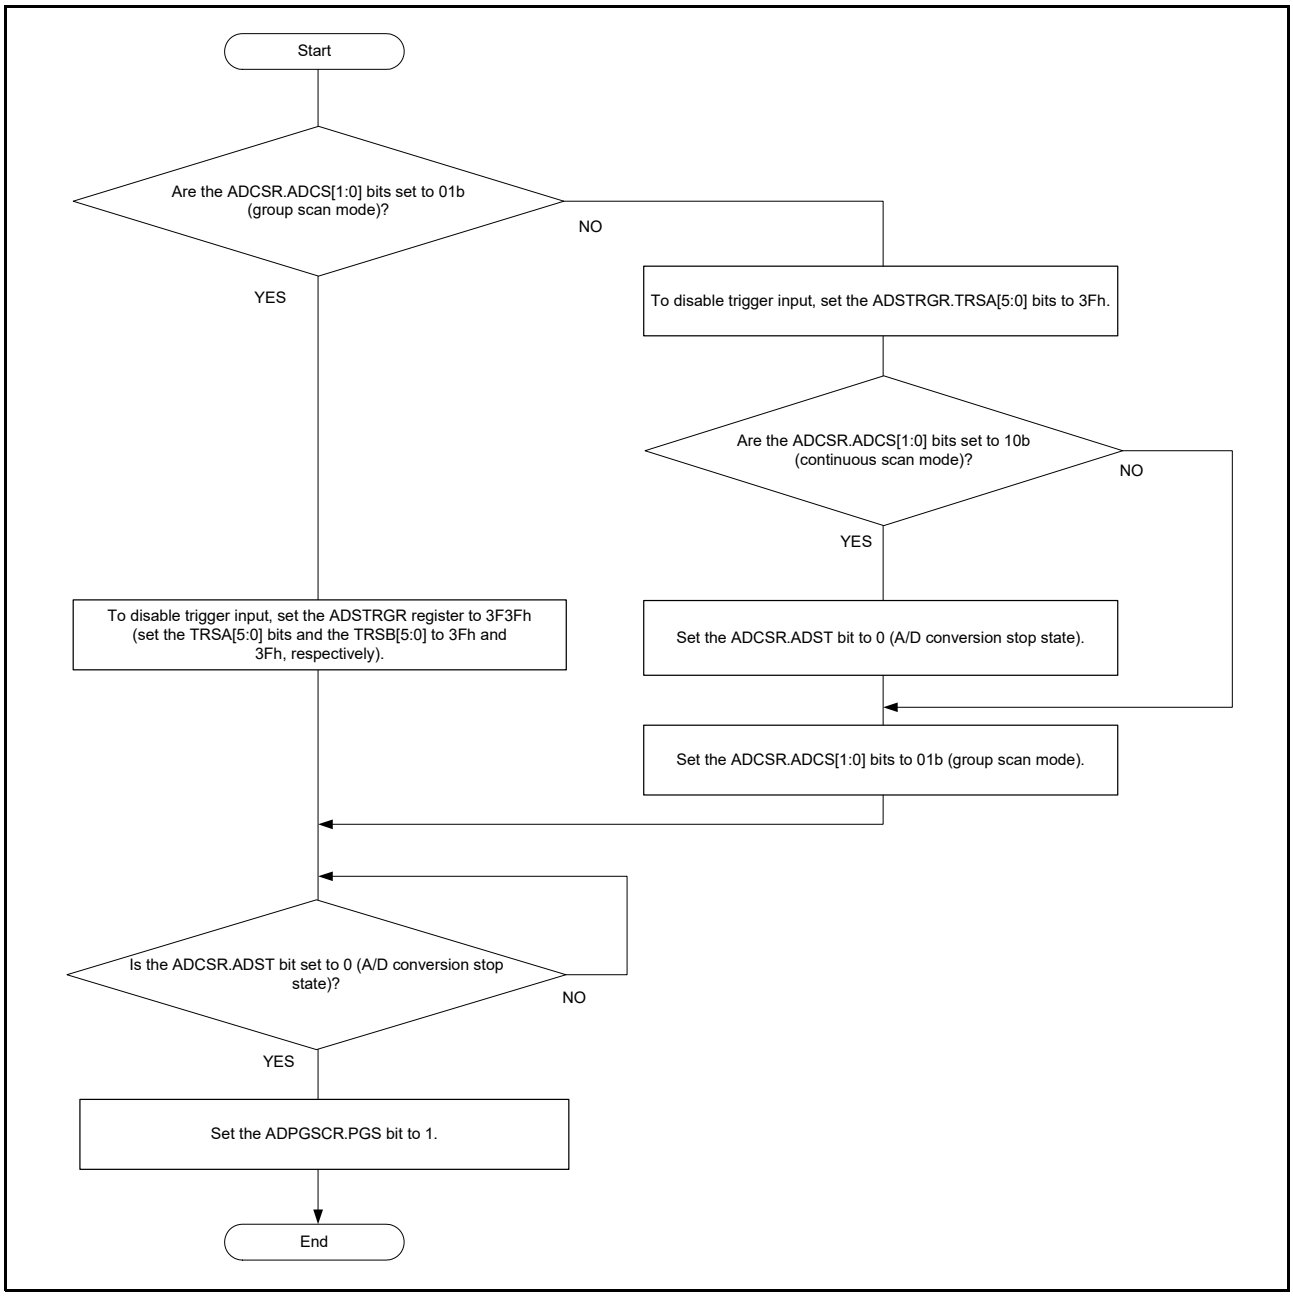

Figure 30.11 Flow of Setting the ADPGSCR.PGS Bit

Table 30.13 Control of Scan Operations According to the Settings of the ADGSPCR.GBRSCN Bit

A/D Conversion Operation	Trigger Input	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
When A/D conversion for group A is in progress	Input of trigger for group A	Trigger input is ineffective.	Trigger input is ineffective.
	Input of trigger for group B	Trigger input is ineffective.	A/D conversion is performed on group B after A/D conversion on group A is completed.
	Input of trigger for group C	Trigger input is ineffective.	A/D conversion is performed on group C after A/D conversion on group A is completed.
When A/D conversion for group B is in progress	Input of trigger for group A	Conversion for group B that is in progress is discontinued and conversion for group A starts.	• Conversion in progress for group B is discontinued and conversion for group A starts. • Conversion for group B starts after conversion for group A is completed.
	Input of trigger for group B	Trigger input is ineffective.	• Trigger input is ineffective.
	Input of trigger for group C	Trigger input is ineffective.	• Conversion for group C starts after conversion for group B is completed.
When A/D conversion for group C is in progress	Input of trigger for group A	Conversion for group C that is in progress is discontinued and conversion for group A starts.	• Conversion in progress for group C is discontinued and conversion for group A starts. • Conversion for group C starts after conversion for group A is completed.
	Input of trigger for group B	Conversion for group C that is in progress is discontinued and conversion for group B starts.	• Conversion in progress for group C is discontinued and conversion for group B starts. • Conversion for group C starts after conversion for group B is completed.
	Input of trigger for group C	Trigger input is ineffective.	Trigger input is ineffective.

When using group priority control operation mode, refer to the following table, and select the desired operation mode and set the register.

Table 30.14 Group Priority Control Settings and Operation Mode for Two Groups (ADGSPCR.PGS = 1, ADGCTRGR.GRCE = 0)

ADGSPCR GBRSCN	LGRRS	GBRP	Operation Category
0	—	0	Group priority control for two groups (A, B) When a trigger for group A is input, the group B scanning is ended (no re-execution).
1	0	0	Group priority control for two groups (A, B) After the group B scanning is interrupted, the group B scan is restarted from the head of the channels specified in ADANSB0 on completion of the group A scan.
1	1	0	Group priority control for two groups (A, B) After the group B scanning is interrupted, the group B scan is restarted from the interrupted channel*1 of the channels specified in ADANSB0 on completion of the group A scan.
—	0	1	Group priority control for two groups (A, B) Single scan is continuously performed on group B without any start trigger input. After the group B scanning is interrupted, single scan is restarted from the head of the channels specified in ADANSB0 on completion of the group A scan.
1	1	1	Group priority control for two groups (A, B) Single scan is continuously performed on group B without any start trigger input. After the group B scanning is interrupted, single scan is restarted from the interrupted channel*1 of the channels specified in ADANSB0 on completion of the group A scan.

Note: When the self-diagnosis function is enabled (ADCER.DIAGM = 1), A/D conversion for the interrupted channel starts on completion of self-diagnosis.

Table 30.15 Group Priority Control Settings and Operation Mode for Three Groups (ADGSPCR.PGS = 1, ADGCTRGR.GRCE = 1)

ADGSPCR			
GBRSCN	LGRRS	GBRP	Operation Category
0	—	0	Group priority control for three groups (A, B, C) When a trigger for group A is input, the group B scanning is ended (no re-execution). When a trigger for group A or group B is input, the group C scanning is ended (no re-execution).
0	—	1	Group priority control for three groups (A, B, C) When a trigger for group A is input, the group B scanning is ended (no re-execution). Single scan is continuously performed on group C without any start trigger input. After the group C scanning is interrupted, the scan is restarted from the head of the channels specified in ADANSC0 on completion of the group A/B scan.
1	0	0	Group priority control for three groups (A, B, C) After the group B scanning is interrupted, the scan is restarted from the head of the channels specified in ADANSB0 on completion of the group A scan. After the group C scanning is interrupted, the scan is restarted from the head of the channels specified in ADANSC0 on completion of the group A/B scan.
1	1	0	Group priority control for three groups (A, B, C) After the group B scanning is interrupted, the scan is restarted from the interrupted channel* of the channels specified in ADANSB0 on completion of the group A scan. After the group C scanning is interrupted, the scan is restarted from the interrupted channel* of the channels specified in ADANSC0 on completion of the group A/B scan.
1	0	1	Group priority control for three groups (A, B, C) After the group B scanning is interrupted, the scan is restarted from the head of the channels specified in ADANSB0 on completion of the group A scan. Single scan is continuously performed on group C without any start trigger input. After the group C scanning is interrupted, single scan is restarted from the head of the channels specified in ADANSC0 on completion of the group A/B scan.
1	1	1	Group priority control for three groups (A, B, C) After A/D conversion on group B is interrupted, the A/D conversion is restarted from the interrupted channel* of the channels specified in ADANSB0 on completion of the group A scan. Single scan is continuously performed on group C without any start trigger input. After the group C scanning is interrupted, single scan is restarted from the interrupted channel* of the channels specified in ADANSC0 on completion of the group A/B scan.

Note: When the self-diagnosis function is enabled (ADCER.DIAGM = 1), A/D conversion for the interrupted channel starts on completion of self-diagnosis.

(1) Group priority control for two groups (when ADGSPCR.PGS = 1, ADGCTRGR.GRCE = 0)

The following examples 1 to 3 describes the operations in group scan mode under group scan mode group priority operation (ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

Example of operation (1) "Trigger input for group A during group B scanning" with rescan enabled

(1) When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), conversion for the ANn channel pins selected in the ADANSB0 register starts in order from the channel with the lowest number.
(2) On completion of A/D conversion for a channel, the result is stored in the corresponding A/D data register (ADDRy).
(3) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scanning for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) On completion of A/D conversion on a single channel, the result is stored in the corresponding A/D data register (ADDRy).
(5) An S12ADI0 interrupt is generated if the setting of the ADCSR.ADIE bit is 1 (S12ADI0 interrupt upon scanning completion is enabled).
(6) If the ADGSPCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), conversion for the ANn channels of group B selected in the ADANSB0 register starts in order from the channel with the lowest number n while the ADCSR.ADST bit holds 1.
(7) On completion of A/D conversion on a single channel, the result is stored in the corresponding A/D data register (ADDRy).
(8) An S12GBADI0 interrupt is generated if the setting of the ADCSR.GBADIE bit is 1 (S12GBADI0 interrupt upon group B scanning completion enabled).
(9) The ADCSR.ADST bit is automatically cleared on completion of all scanning, after which the A/D converter enters the waiting state.

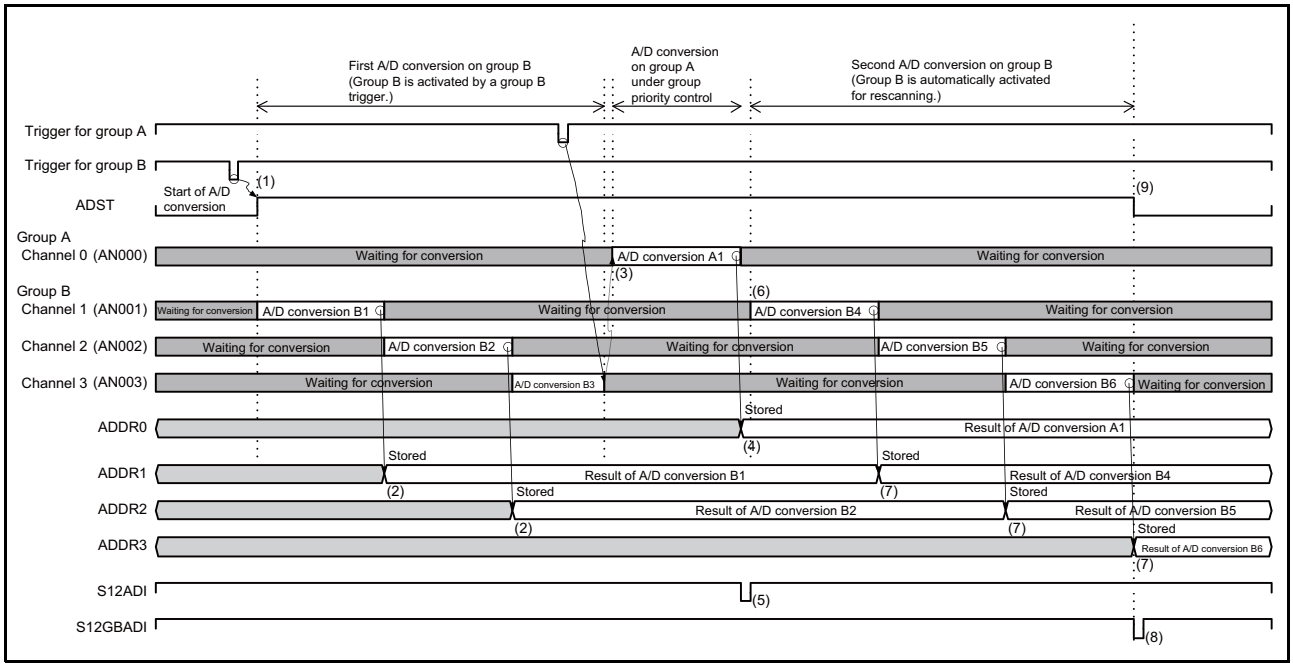

Figure 30.12 Example of Operations under Group Priority Control (1)
"Trigger Input for Group A during Group B Scanning" with Rescan Enabled
(when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Example of operation (2) "Trigger input for group A during group B rescanning" with rescan enabled

Figure 30.13 shows an example when a group A trigger is input again during rescanning operation on group B. Even during rescanning, if a trigger for group A is input, group A scan starts and on completion of the group A scan, group B scan starts.

Operation related to the ADST bit, storage of the A/D conversion result in the A/D data register y (ADDRy), and interrupt request is the same as that of Example of operation (1).

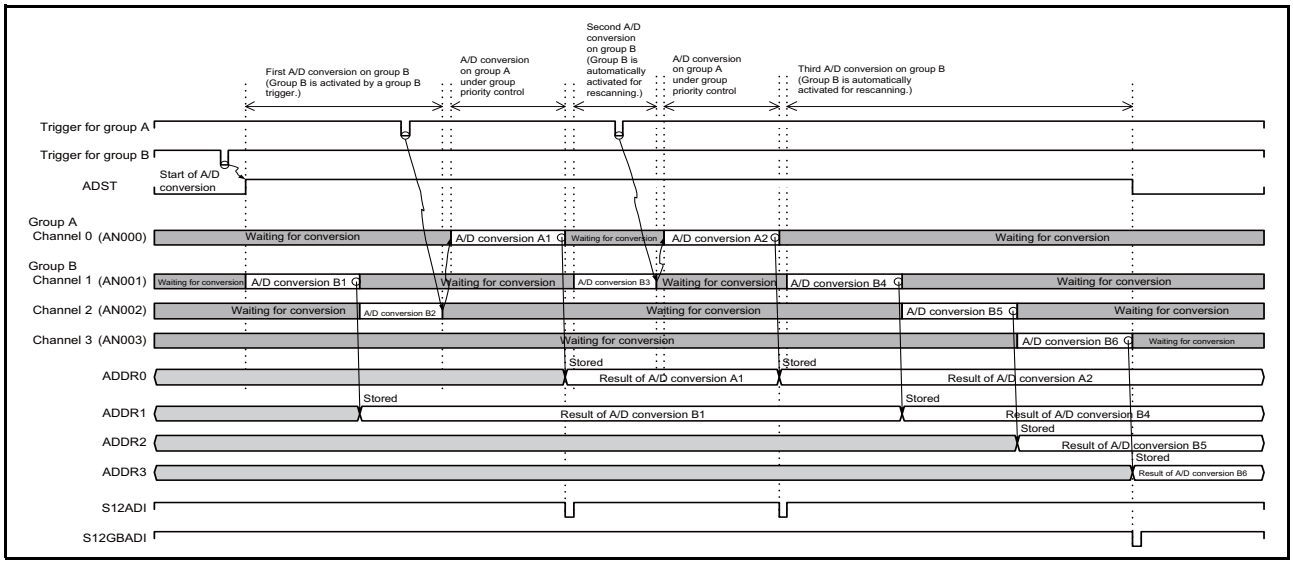

Figure 30.13 Example of Operations under Group Priority Control (2) "Trigger Input for Group A during Group B Rescanning" with Rescan Enabled(when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 0)

Example of operation (3) "Trigger input for group B during group A scanning" with rescan enabled

This section describes operation when the ADGPSCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), and a trigger for group B is input during group A scanning.
When the ADGPSCR.GBRSCN bit is set to 0, any trigger for group B that is input during group A scanning is invalid.

(1) When a group A trigger input sets the ADCSR.ADST bit to 1 (starting A/D conversion), conversion for the ANn channel pins of group A selected in the ADANSA0 register starts in order from the channel with the lowest number n.
(2) When a trigger for group B is input during group A scanning, group B enters the scan-ready state.
(3) On completion of A/D conversion on a single channel, the result is stored in the corresponding A/D data register (ADDRy).
(4) After that, an S12ADI0 interrupt is generated if the setting of the ADCSR.ADIE bit is 1 (S12ADI0 interrupt upon scanning completion is enabled).
(5) On completion of the group A scan, scan for the ANn channels of group B selected in the ADANSB0 register is performed in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1.
(If a trigger for group A is input during group B scanning, as in Example of operation (1), group A scan starts and on completion of the group A scan, group B scan starts.)
(6) On completion of A/D conversion on a single channel, the result is stored in the corresponding A/D data register (ADDRy).
(7) After that, an S12GBADI0 interrupt is generated if the setting of the ADCSR.GBADIE bit is 1 (S12GBADI0 interrupt upon group B scanning completion enabled).
(8) The ADCSR.ADST bit is automatically cleared on completion of all scanning, after which the A/D converter enters the waiting state.

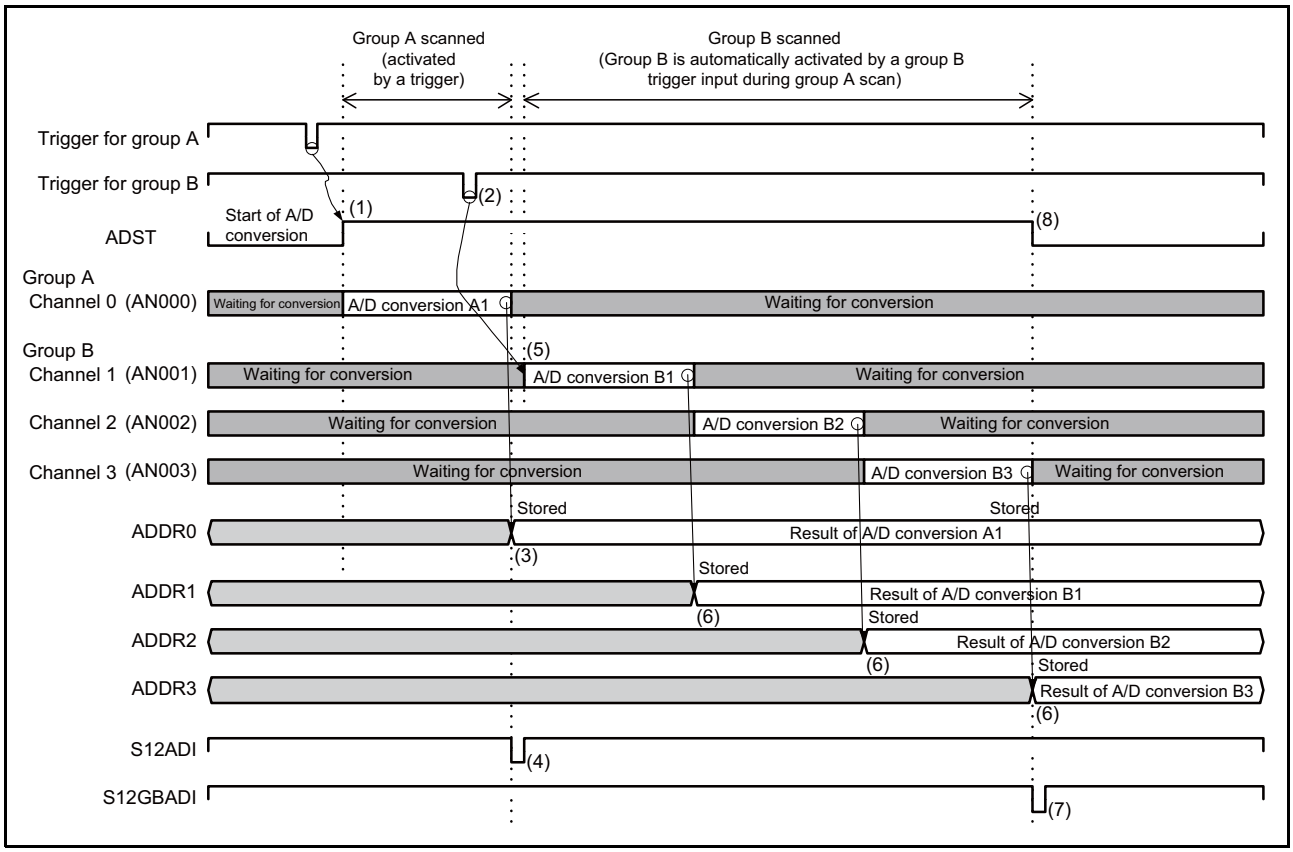

Figure 30.14 Example of Operations under Group Priority Control (3) "Trigger Input for Group B during Group A Scanning" with Rescan Enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 0)

Example of operation (4) describes group priority control in group scan mode (ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

Example of operation (4) "Trigger input for group A during group B scanning" with rescan disabled

(1) When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), scan for the ANn channels selected in the ADANSB0 register starts in order from the channel with the smallest number n.
(2) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(3) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scan for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(5) On completion of the group A scan, an S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(6) The ADST bit is automatically cleared on completion of the group A scan and the A/D converter enters the waiting state. Group B scan is not performed until the next input of a trigger for group B.

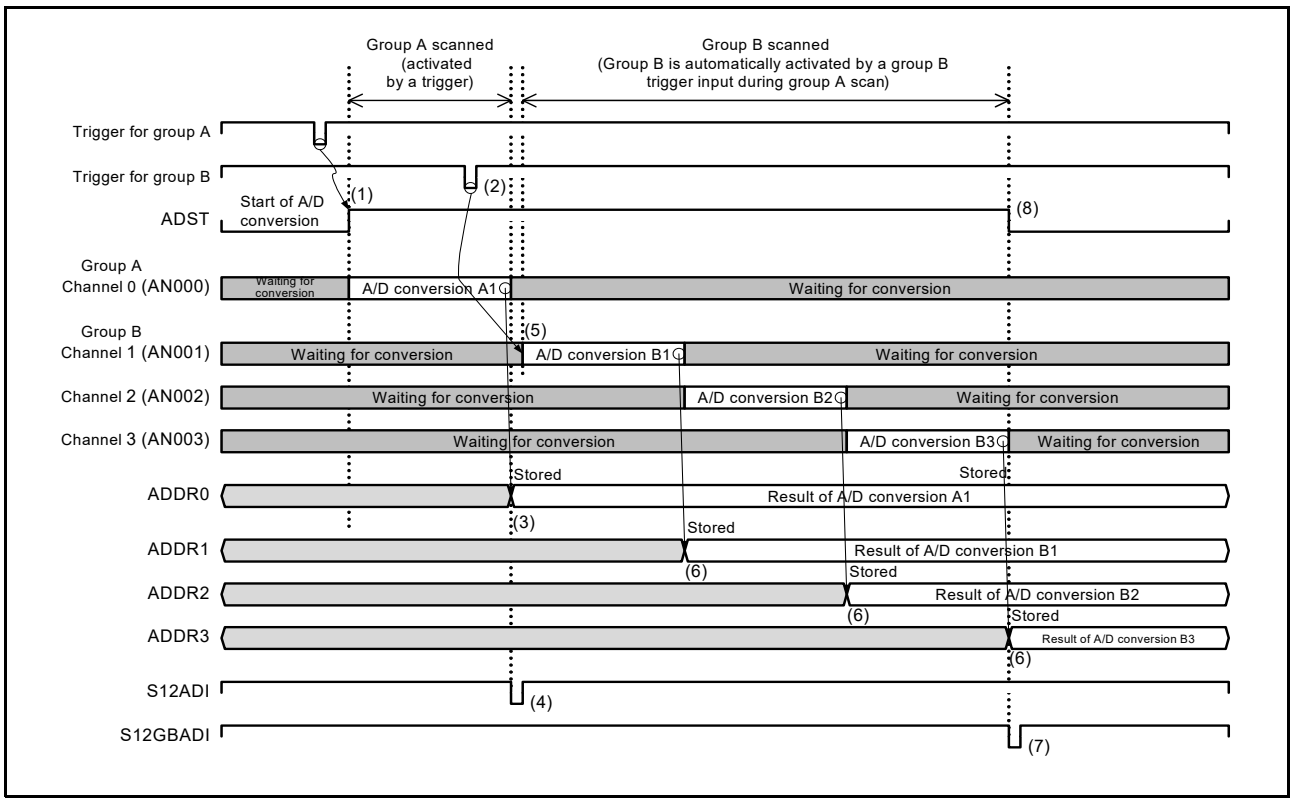

Figure 30.15 Example of Operations under Group Priority Control (4) "Trigger Input for Group A during Group B Scanning" with Rescan Disabled (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 0)

Example of operation (5) describes group priority control in group scan mode (ADGSPCR.GBRP = 1 and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 and 2 are selected for group B. When the ADGCTRGR.GRCE bit is set to 1, single scan is performed continuously on group C and group B scan starts in response to trigger input.

Example of operation (5) "Continuous Operation of Single Scan for Group B"

(1) When ADGSPCR.GBRP is set to 1, the ADCSR.ADST bit is set to 1 (starting A/D conversion), and scan for the ANn channels selected in the ADANSB0 register starts in order from the channel with the smallest number n.
(2) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(3) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scan for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(5) On completion of the group A scan, an S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(6) If the ADGSPCR.GBRP bit is set to 1 (performing single scan continuously), group B scan for the ANn channels selected in the ADANSB0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1.
(7) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(8) An S12GBADI0 interrupt request is generated if the ADCSR.GBADIE bit is set to 1 (S12GBADI0 interrupt upon group B scanning completion is enabled).
(9) If the ADGSPCR.GBRP bit is set to 1 (performing single scan continuously), group B scan for the An channels selected in the ADANSB0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1.

Disable group B trigger input to perform a single scan operation continuously on group B.
Steps 6 to 9 are repeated as long as the ADGSPCR.GBRP bit is set to 1. Clearing of the ADCSR.ADST bit is prohibited while the ADGSPCR.GBRP bit is set to 1. Follow the procedure for clearing operation by software through the ADCSR.ADST bit, shown in section 30.5.2, Notes on Stopping A/D Conversion, to forcibly stop scanning when ADGSPCR.GBRP = 1.

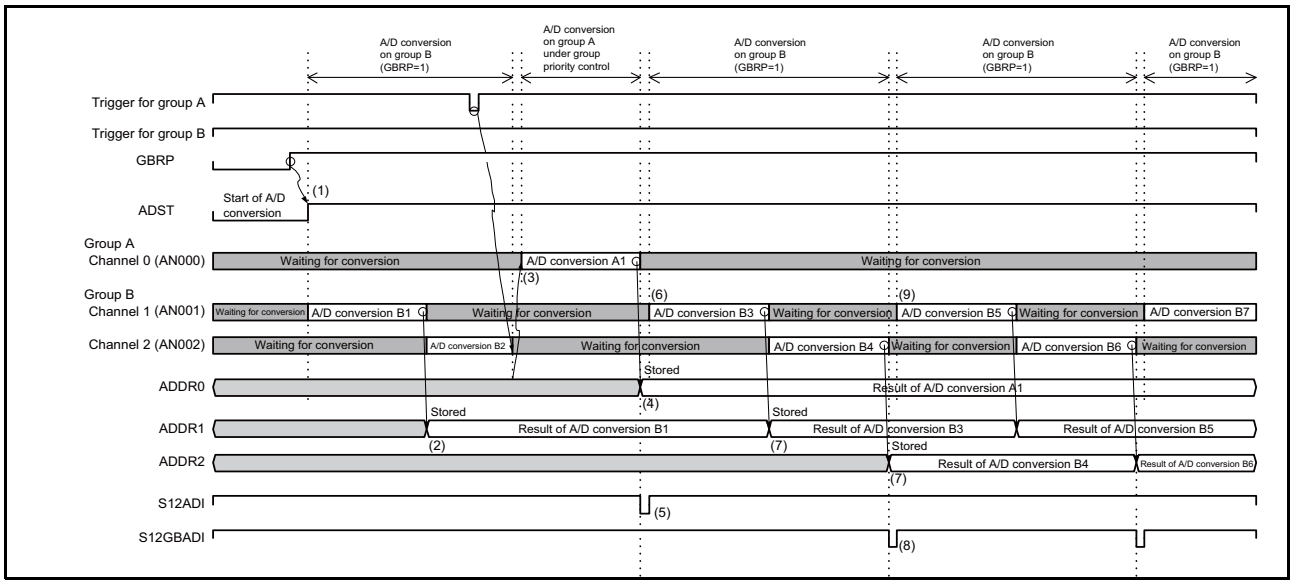

Figure 30.16 Example of Operations under Group Priority Control (5) "Continuous Operation of Single Scan for Group B" (when ADGSPCR.GBRP = 1, ADGSPCR.LGRRS = 1'b0, ADGCTRGR.GRCE = 0)

(2) Group priority control for three groups (when ADGSPCR.PGS = 1, ADGCTRGR.GRCE = 1)
Examples of operation (1) to (3) describe group priority control in group scan mode (ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 1) when channel 0 is selected for group A, channels 1, 2 are selected for group B, and channels 3, 4 are selected for group C. The priority group means group A and group B for group C, and group A for group B.

Example of operation (1) "Trigger input for priority group during scanning for low priority group" with rescan enabled

(1) When input of a trigger for group C sets the ADCSR.ADST bit to 1 (starting A/D conversion), scan for the ANn channels selected in the ADANSC0 register starts in order from the channel with the smallest number n.
(2) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(3) When a trigger for group B is input during group C scanning, the group C scanning is interrupted while the ADCSR.ADST bit holds 1, and group B scan for the ANn channels selected in the ADANSB0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(5) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scan for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(6) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(7) An S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(8) If the ADGSPCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), group B scan for the ANn channels selected in the ADANSB0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group B scan starts from the channel on which A/D conversion was interrupted.
(9) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(10) An S12GBADI0 interrupt request is generated if the ADCSR.GBADIE bit is set to 1 (S12GBADI0 interrupt upon group B scanning completion is enabled).
(11) If the ADGSPCR.GBRSCN bit is set to 1, group C scan for the ANn channels selected in the ADANSC0 register starts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group C scan starts from the channel on which A/D conversion was interrupted.
(12) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(13) An S12GCADI0 interrupt request is generated if the ADGCTRGR.GCADIE bit is set to 1 (S12GCADI0 interrupt upon group C scanning completion is enabled).
(14) The ADCSR.ADST bit is automatically cleared on completion of all the scans and the A/D converter enters the waiting state.

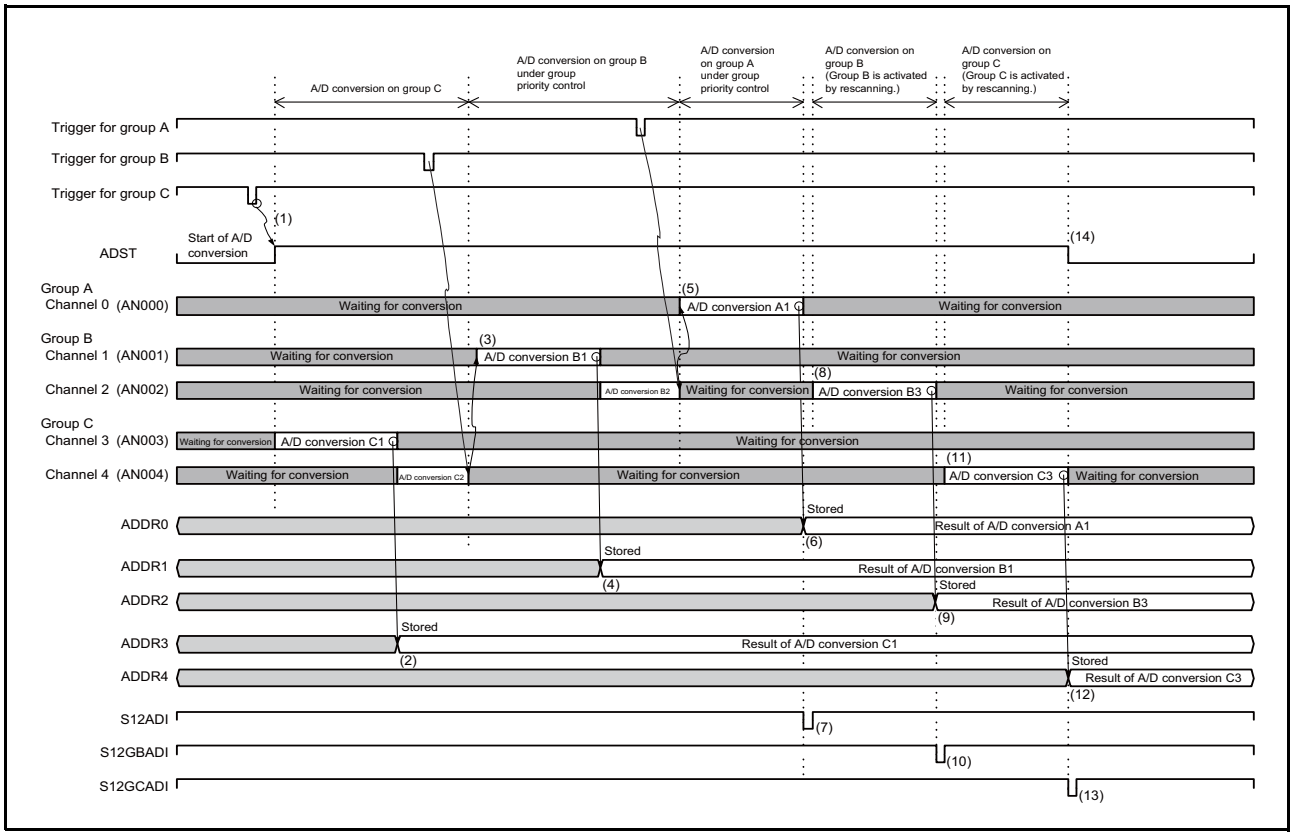

Figure 30.17 Example of Operations under Group Priority Control (1) "Trigger Input for Priority Group during Scanning for Low Priority Group" with Rescan Enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 1)

Example of operation (2) "Trigger input for priority group during rescanning for low priority group" with rescan enabled

Figure 30.18 describes the case in which a trigger for group A is input during group B rescanning.
Even during rescanning for a low priority group, if a trigger for a priority group (priority group to group C includes group A and group B, and that to group B includes group A) is input, the priority group scan starts and on completion of the priority group scan, scan for the interrupted low priority group starts.
Operation related to the ADST bit, storage of the A/D conversion result in the A/D data register y (ADDRy), and interrupt request is the same as that of Example of operation (1).

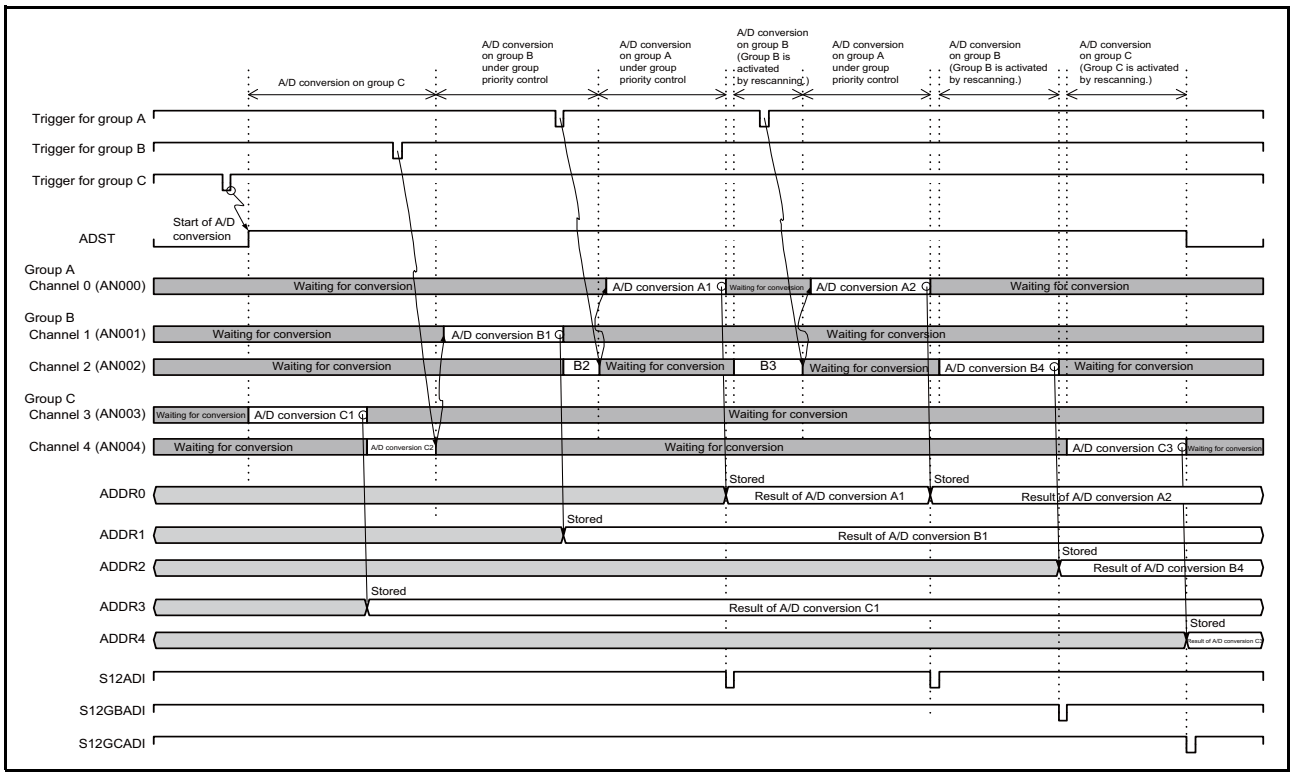

Figure 30.18 Example of Operations under Group Priority Control (2) "Trigger Input for Priority Group during Rescanning for Low Priority Group" with Rescan Enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 1)

Example of operation (3) "Trigger input for low priority group during scanning for priority group" with rescan enabled

This section describes operation when the ADGPSCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), and a trigger for a low priority group is input during scanning for a priority group. When the ADGPSCR.GBRSCN bit is set to 0, any trigger for a low priority group that is input during scanning for a priority group is invalid.

(1) When input of a trigger for group A sets the ADCSR.ADST bit to 1 (starting A/D conversion), scan for the ANn channels of group A selected in the ADANSA0 register starts in order from the channel with the smallest number n.
(2) When a trigger for group B is input during group A scanning, group B enters the scan-ready state.
(3) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(4) On completion of the group A scan, an S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(5) On completion of the group A scan, scan for the ANn channels of group B selected in the ADANSB0 register is performed in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group B scan starts from the channel on which A/D conversion was interrupted.
(If a trigger for group A is input during group B scanning, as in Example of operation (1), group A scan starts and on completion of the group A scan, group B scan starts.)
(6) When a trigger for group C is input during group B scanning, group C enters the scan-ready state.
(7) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(8) On completion of the group B scan, an S12GBADI0 interrupt request is generated if the ADCSR.GBADIE bit is set to 1 (S12GBADI0 interrupt upon scanning completion is enabled).
(9) On completion of the group B scan, scan for the ANn channels of group C selected in the ADANSC0 register is performed in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group C scan starts from the channel on which A/D conversion was interrupted.
(If a trigger for group A or group B is input during group C scanning, as in Example of operation (1), group A or group B scan starts and on completion of the scan, group C scan starts.)
(10) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(11) On completion of the group C scan, an S12GCADI0 interrupt request is generated if the ADGCTRGR.GCADIE bit is set to 1 (S12GCADI0 interrupt upon scanning completion is enabled).
(12) The ADCSR.ADST bit is automatically cleared on completion of all the scans and the A/D converter enters the waiting state.

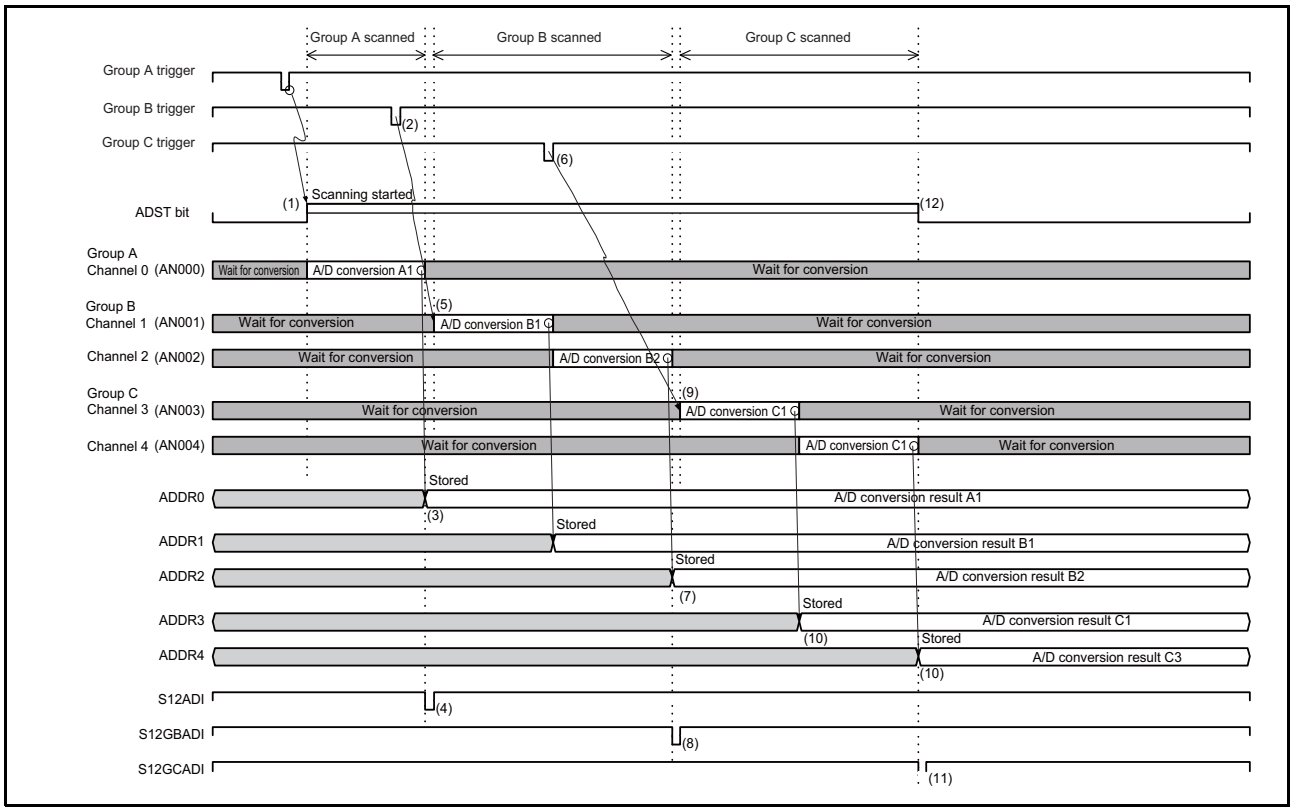

Figure 30.19 Example of Operations under Group Priority Control (3) "Trigger Input for Low Priority Group during Scanning for Priority Group" with Rescan Enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 1'b1, ADGCTRGR.GRCE = 1)

Examples of operation (4) describes group priority control in group scan mode (ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A, channels 1, 2 are selected for group B, and channels 3, 4 are selected for group C.

Example of operation (4) "Trigger input for priority group during scanning for low priority group" with rescan disabled

(1) When input of a trigger for group C sets the ADCSR.ADST bit to 1 (starting A/D conversion), scan for the ANn channels selected in the ADANSC0 register starts in order from the channel with the smallest number n.
(2) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(3) When a trigger for group B is input during group C scanning, the group C scanning is interrupted while the ADCSR.ADST bit holds 1, and group B scan for the ANn channels selected in the ADANSB0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(5) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scan for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(6) On completion of the group A scan, an S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(7) The ADST bit is automatically cleared on completion of the group A scan and the A/D converter enters the waiting state. Scan for group B and group C is not performed until the next input of a trigger for each group.

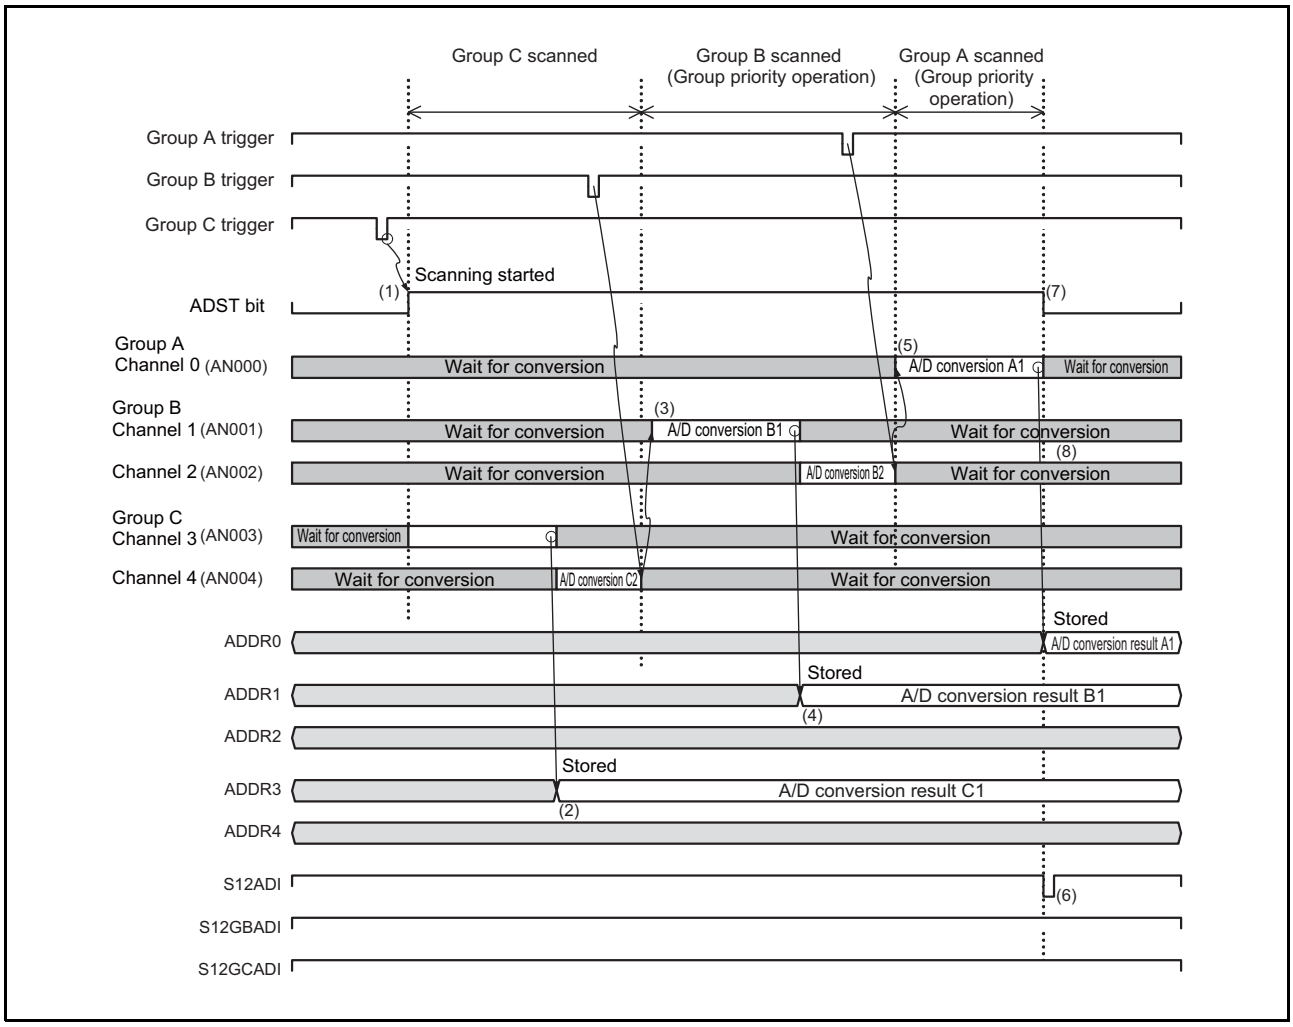

Figure 30.20 Example of Operations under Group Priority Control (4) "Trigger Input for Priority Group during Scanning for Low Priority Group" with Rescan Disabled (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, ADGSPCR.LGRRS = 1)

Examples of operation (5) describes group priority control in group scan mode (ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 1, and ADGSPCR.LGRRS = 1) when channel 0 is selected for group A, channel 1 is selected for group B, and channels 2, 3 are selected for group C.
When the ADGCTRGR.GRCE bit is set to 0, single scan is performed continuously on group B and input of a trigger for group C is invalid.

Example of operation (5) "Continuous Operation of Single Scan for Group C"

(1) When ADGSPCR.GBRP is set to 1, the ADCSR.ADST bit is set to 1 (starting A/D conversion), and scan for the ANn channels selected in the ADANSC0 register starts in order from the channel with the smallest number n.
(2) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(3) When a trigger for group B is input during group C scanning, the group C scanning is interrupted while the ADCSR.ADST bit holds 1, and group B scan for the ANn channels selected in the ADANSB0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(4) When a trigger for group A is input during group B scanning, the group B scanning is interrupted while the ADCSR.ADST bit holds 1, and group A scan for the ANn channels selected in the ADANSA0 register starts in order from the channel with the smallest number n. If A/D conversion is not completed at the time of interruption, the A/D conversion result is not stored in the A/D data register y (ADDRy).
(5) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(6) An S12ADI0 interrupt request is generated if the ADCSR.ADIE bit is set to 1 (S12ADI0 interrupt upon scanning completion is enabled).
(7) If the ADGSPCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), group B scan for the ANn channels selected in the ADANSB0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group B scan starts from the channel on which A/D conversion was interrupted.
(8) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(9) An S12GBADI0 interrupt request is generated if the ADCSR.GBADIE bit is set to 1 (S12GBADI0 interrupt upon group B scanning completion is enabled).
(10) If the ADGSPCR.GBRSCN bit is set to 1 (rescan is performed on the group interrupted due to group priority control), group C scan for the ANn channels selected in the ADANSC0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1. At this time, if the ADGSPCR.LGRRS bit is set to 1, group C scan starts from the channel on which A/D conversion was interrupted.
(11) On completion of A/D conversion on a single channel, the A/D conversion result is stored in the corresponding A/D data register y (ADDRy).
(12) An S12GCADI0 interrupt request is generated if the ADGSPCR.GBCDIE bit is set to 1 (S12GCADI0 interrupt upon group C scanning completion is enabled).
(13) If the ADGSPCR.GBRP bit is set to 1 (performing single scan continuously), group C scan for the An channels selected in the ADANSC0 register restarts in order from the channel with the smallest number n while the ADCSR.ADST bit holds 1.

Disable group B trigger input to perform a single scan operation continuously on group C.
Steps 13, 11, 12, and then 13 are repeated as long as the ADGSPCR.GBRP bit is set to 1.
Clearing of the ADCSR.ADST bit is prohibited while the ADGSPCR.GBRP bit is set to 1.
Follow the procedure for clearing operation by software through the ADCSR.ADST bit, shown in section 30.5.2, Notes on Stopping A/D Conversion, to forcibly stop scanning when ADGSPCR.GBRP = 1.

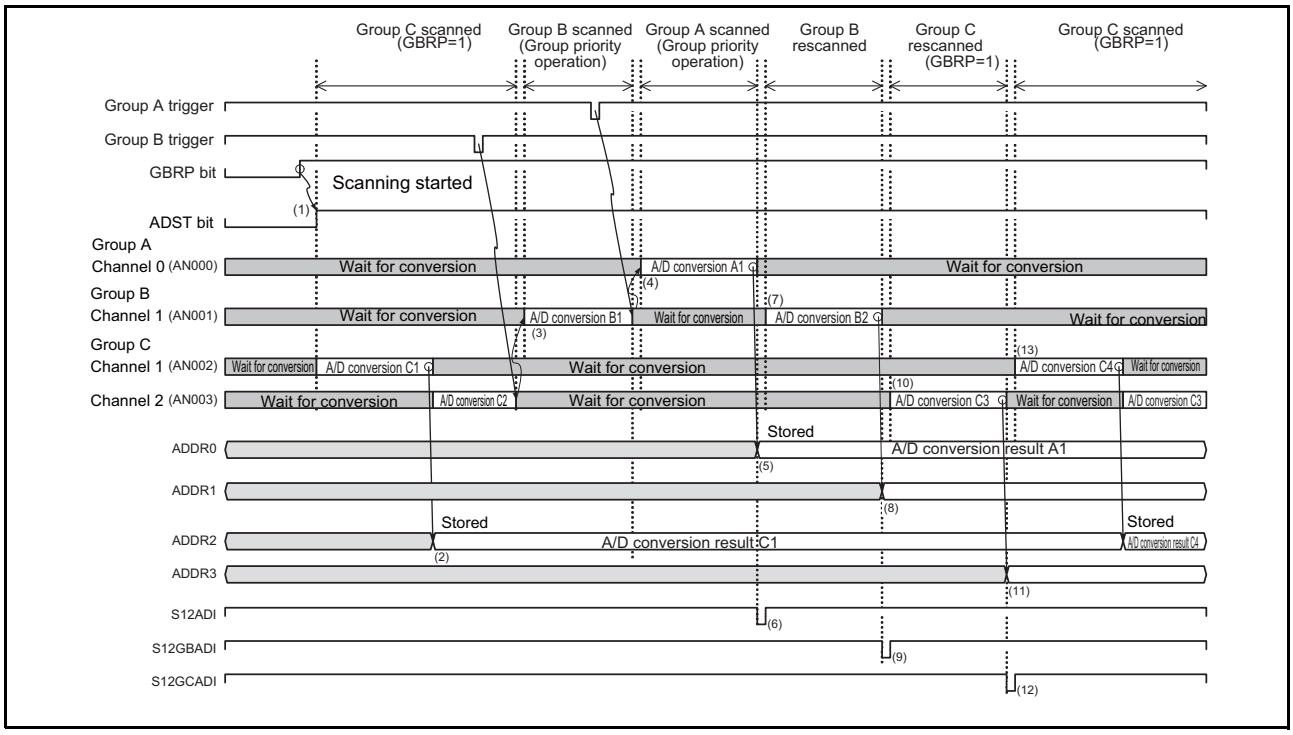

Figure 30.21 Example of Operations under Group Priority Control "Continuous Operation of Single Scan for Group C" (when ADGSPCR.GBRP = 1, ADGSPCR.LGRRS = 1)

30.3.5 Comparison (Window A, Window B)

30.3.5.1 Compare Function Window A/B

Comparison is of a reference value set in a register with the result of A/D conversion on selected channels.
A reference value can be set for each window (A/B).
Self-diagnosis function and double-triggered mode are not available while comparison is in use.
The main difference between window A and window B is that the number of channels which can be selected in window B is one and the interrupt output signal is different.
Operation using comparison in combination with continuous scan mode is described below.

(1) A/D conversion is started in the order of the selected channels when ADCSR.ADST is set to 1 (to start A/D conversion) by software, or in response to a synchronous trigger (MTU, GPT) or asynchronous trigger.
(2) When A/D conversion is completed, the result is stored in the A/D Data Register y (ADDRy).
When ADCMPCR.CMPAE = 1'b1, if the channel is set to a target for window A in the ADCMPANSRy and ADCMPANSER registers, the result is compared with the ADCMPDR0/1 register settings. If ADCMPCR.CMPAE = 1'b1, the register is selected for Window-A by the settings of the ADCMPANSRy and ADCMPANSER registers, its value is then compared with that of the ADCMPDR0 or ADCMPDR1 registers.
When ADCMPCR.CMPBE = 1'b1, if the channel is set to a target for window B in the ADCMPBNSR register, the result is compared with the ADWINULB/ADWINLLB register settings. If ADCMPCR.CMPBE = 1'b1, the register is selected for Window-B by the settings of the ADCMPBNSR register, its value is then compared with that of the ADWINULB or ADWINLLB registers.
(3) If the result of comparison meets the condition set in the ADCMPLR0 and ADCMPLER registers, the Window-A flag bits ADCMPSR0.CMPSTCHA0n, ADCMPSR1.CMPSTCHA1n, ADCMPSER.CMPSTTSA, and ADCMPSER.CMPSTOCA are set to 1. If the setting of the ADCMPCR.CMPAIE bit is 1 at this time, an S12ADCMPAI0 interrupt request (level) is also generated.
If the result of comparison meets the condition set in the ADCMPBNSR.CMPLB bit, the Window-B flag bit ADCMPBSR.CMPSTB is set to 1. If the setting of the ADCMPCR.CMPBIE bit is 1 at this time, an S12ADCMPBI0 interrupt request (level) is also generated.
(4) When comparison is completed for all selected A/D conversion, A/D conversion is started again.
(5) If the setting of the ADCSR.ADST bit is 0 (A/D conversion stop) after the S12ADCMPAI0 or S12ADCMPBI0 interrupt is accepted, processing proceeds for channels that have the compare flag.
(6) The S12ADCMPAI0 interrupt signal is deasserted when all of the Window-A compare flags have been cleared. The S12ADCMPBI0 interrupt signal is deasserted when all of the Window-B compare flags have been cleared. To start further comparison, start A/D conversion again.

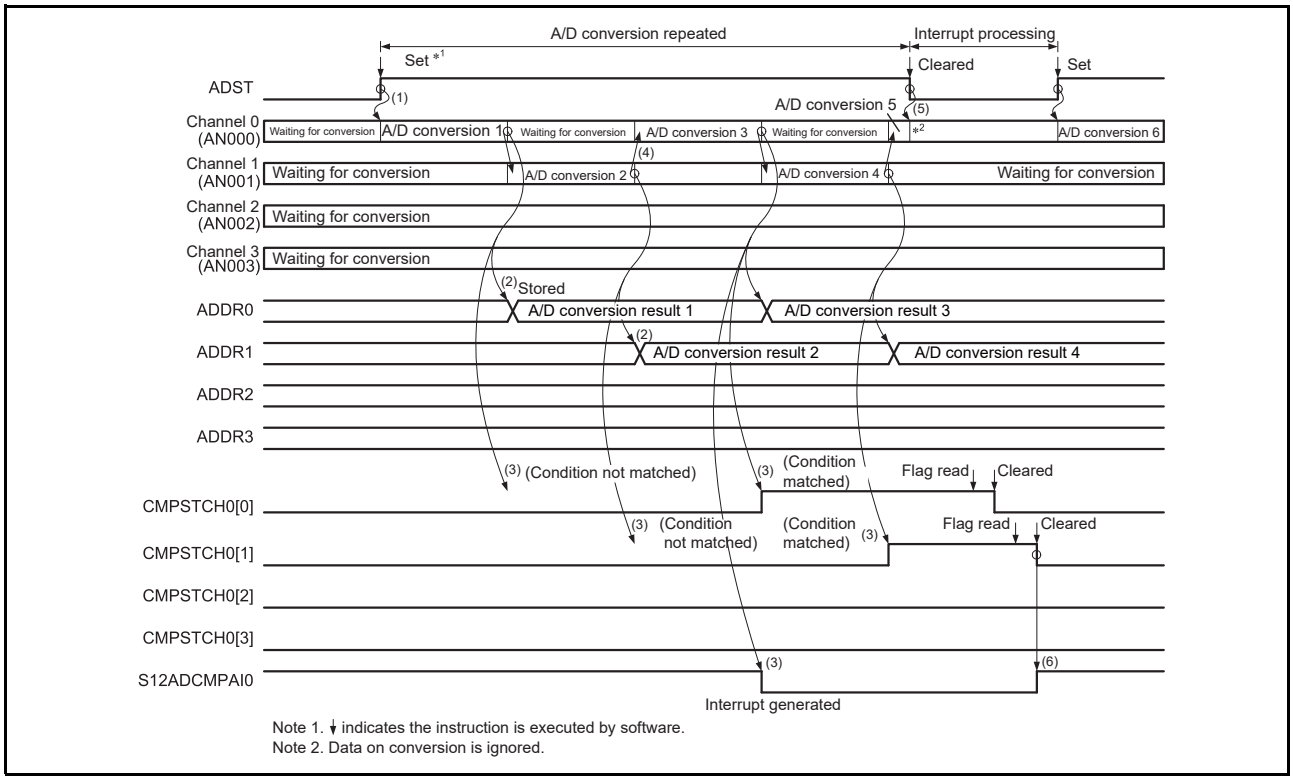

Figure 30.22 Operation Example of Comparison (AN000 to AN003 Comparison Targets)

30.3.5.2 Restrictions on the Compare Function

The following restrictions apply to the compare function:

1. Self-diagnosis function and double-triggered mode are not available while comparison is in use. (ADRD, ADDBLDR, ADDBLDRA, and ADDBLDRB are not subject to the compare function.)
2. An identical channel cannot be set in window A and window B.
3. Specify the settings so that upper-side reference value ≥ lower-side reference value.

30.3.6 Analog Input Sampling and Scan Conversion Time

Scan conversion can be activated either by a software trigger; a synchronous trigger; or ADTRG# (an external trigger). After the start-of-scanning-delay time (tD) has elapsed, processing for disconnection detection assistance, and processing of conversion for self-diagnosis proceed, and this is followed by A/D conversion.

Figure 30.23 shows the scan conversion timing in which scan conversion is activated by a software trigger or a synchronous trigger. Figure 30.24 shows the scan conversion timing in which scan conversion is activated by ADTRG# (an external trigger). The scan conversion time (tSCAN) includes the start-of-scanning-delay time (tD), disconnection detection assistance processing time (tDIS)*2, self-diagnosis A/D conversion processing time (tDIAG)*3, A/D conversion processing time (tCONV), and end-of-scanning-delay time (tED).

The A/D conversion processing time (tCONV) consists of input sampling time (tSPL) and time for conversion by successive approximation (tSAM). The sampling time (tSPL) is used to charge sample-and-hold circuits in the A/D converter. If there is not sufficient sampling time due to the high impedance of an analog input signal source, or if the A/D conversion clock (ADCLK) is slow, sampling time can be adjusted using the ADSSTR register.

The time for conversion by successive approximation (tSAM) is at 13 ADCLK states with 12-bit accuracy selected, 11 ADCLK states with 10-bit accuracy selected, and 9 ADCLK states with 8-bit accuracy selected. Table 30.16 shows the scan conversion time.

The scan conversion time (tSCAN) in single scan mode for which the number of selected channels is n can be determined as follows:

$tSCAN = tD + (tDIS \times n) + tDIAG + (tCONV \times n)^{*3} + tED$

The scan conversion time for the first cycle in continuous scan mode is tSCAN for single scan minus tED. The scan conversion time for the second and subsequent cycles in continuous scan mode is fixed to $(tDIS \times n) + tDIAG + tDSD + (tCONV \times n)^{*3}$.

Note 1. When disconnection detection assistance is not selected, tDIS = 0.
Note 2. When the self-diagnosis function is not used, tDIAG = 0 and tDSD = 0.
Note 3. Although when the sampling time (tSPL) of the selected channels is identical, "tCONV × n" is applied, when it differs according to the channel, the sum of the sampling time (tSPL) and successive approximation (tSAM) of each channel is applied.

Table 30.16 Times for Conversion during Scanning (in Numbers of Cycles of the ADCLK and PCLKH)

Item			Symbol		Type/Conditions			Unit
					Synchronous Trigger*3	External (Asynchronous) Trigger	Software Trigger	
Scan start processing time*1*2	A/D conversion on group under group priority control.	Low priority groups are to be interrupted (The priority group is activated after the low priority group is stopped by an A/D conversion source of the priority group)	tD		2 PCLK + 6 ADCLK	—	—	Cycle
		Low priority groups are not to be interrupted (Activation by an A/D conversion source of the priority group)			2 PCLK + 4 ADCLK	—	—	
	A/D conversion when self-diagnosis is enabled	A/D conversion for self-diagnosis is to be started.			2 PCLK + 6 ADCLK	4 PCLK + 6 ADCLK	6 ADCLK	
	Other than above				2 PCLK + 4 ADCLK	4 PCLK + 4 ADCLK	4 ADCLK	
Disconnection detection assistance processing time			tDIS		The setting of ADNDIS[3:0] (initial value = 00h) × ADCLK			
Self-diagnosis conversion processing time*1	Sampling time		tDIAG	tSPL	The setting of ADSSTR0 (initial value = 0Bh) × ADCLK			
	Time for conversion by successive approximation	12-bit conversion accuracy		tSAM	15 ADCLK			
		10-bit conversion accuracy			13 ADCLK			
		8-bit conversion accuracy			11 ADCLK			
	After completion of self-diagnosis conversion. Normal A/D conversion is to be started.			tDED	2 ADCLK			
	Self-diagnosis conversion is to be started after completion of conversion for continuous scan on the last channel.		tDSD		2 ADCLK			
A/D conversion processing time*1	Sampling time		tCONV	tSPL	The setting of ADSSTRn (n = 0 to 7) (initial value = 0Bh) × ADCLK			
	Time for conversion by successive approximation	12-bit conversion accuracy		tSAM	13 ADCLK			
		10-bit conversion accuracy			11 ADCLK			
		8-bit conversion accuracy			9 ADCLK			
Scan end processing time*1			tED		1 PCLK + 3 ADCLK			

Note 1. Refer to Figure 30.23 and Figure 30.24 for illustration of times tD, tDIAG, tCONV, and tED.
Note 2. This is the maximum time required from software writing or trigger input to A/D conversion start.
Note 3. This does not include the time consumed in the path from timer output to trigger input.

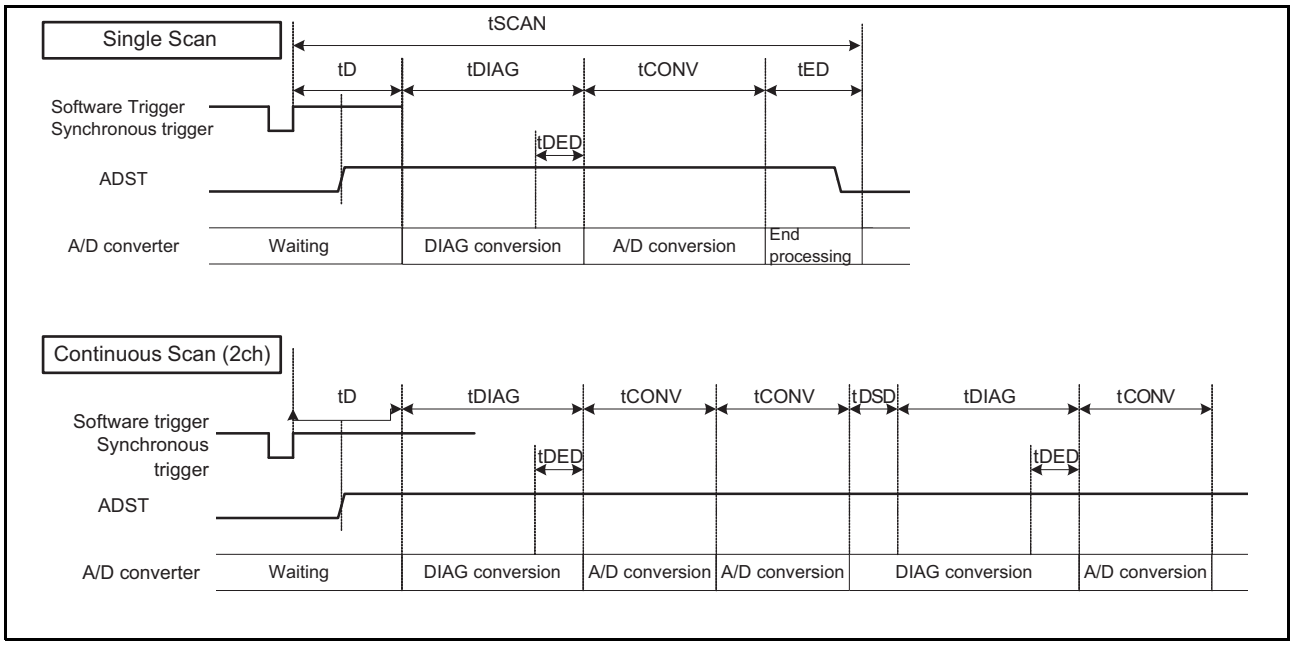

Figure 30.23 Scan Conversion Timing (Activated by Software or Synchronous Trigger Input)

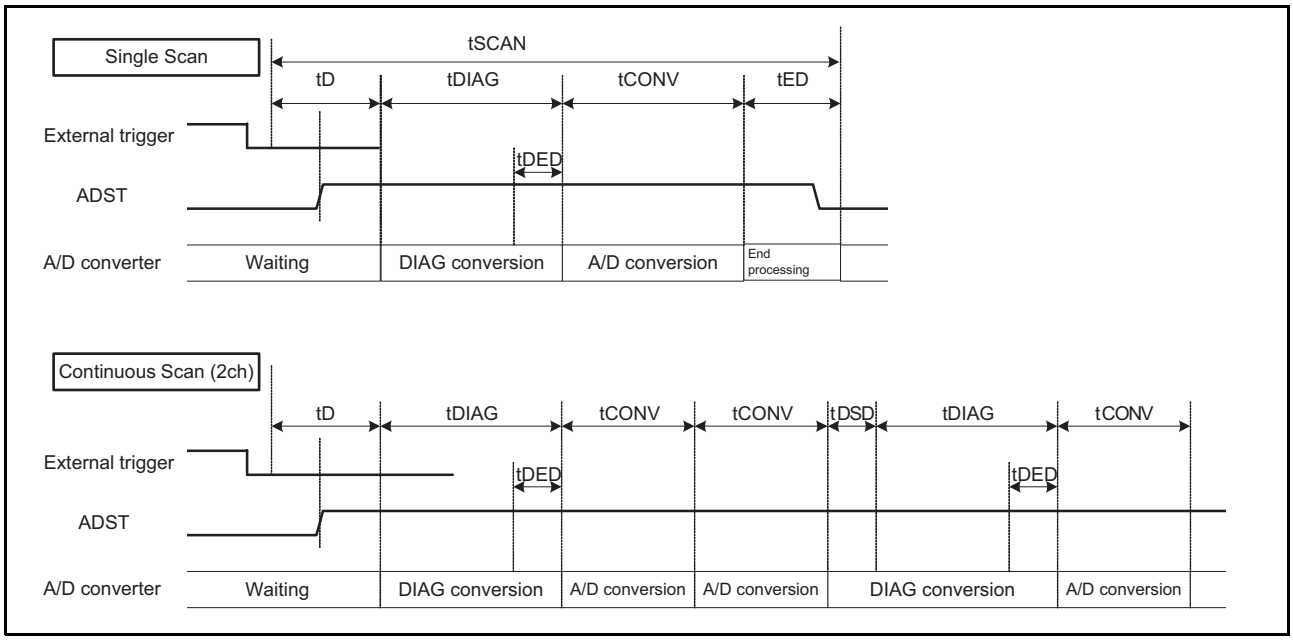

Figure 30.24 Scan Conversion Timing (Activated by Asynchronous Trigger Input (ADTRG#))

30.3.6.1 Timing of Scan Interruption and Start under Group Priority Control

Under group priority control, the timing of scan interruption and start is as follows.

1. Timing of interruption of scanning for the low priority group and start of scan for the priority group
2. Timing of restart of scan for the interrupted low priority group, and timing of start of scan for the low priority group after completion of scan for the high priority group in response to a trigger for the low priority group accepted during scanning for the high priority group
3. Timing of continuous operation of single scan for the low priority group

Figure 30.25 shows these timings, respectively.
The timing of interruption/start of scan for group A and group C or group B and group C is the same as the timing of interruption/start of scan for group A and group B shown in Figure 30.25. The timing of continuous operation of single scan is the same for both group B (using two groups) and group C (using three groups).

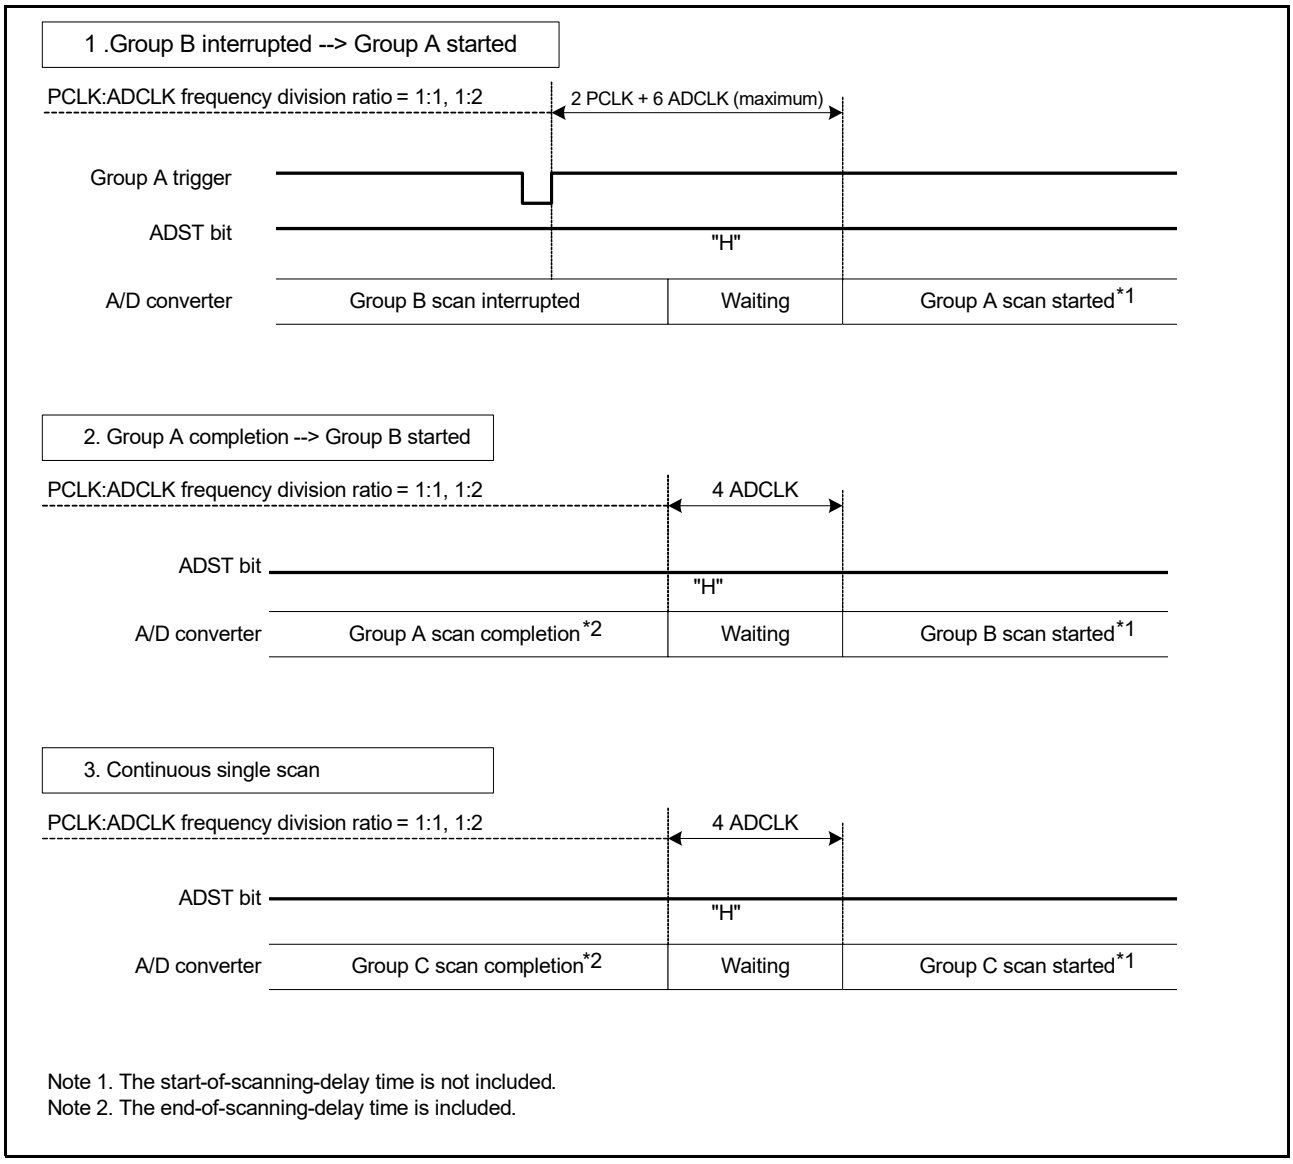

Figure 30.25 Timing of Scan Interruption and Start under Group Priority Control

30.3.7 Usage Example of Register Automatic Clearing Function

Setting the ACE bit in ADCER register to 1 automatically clears the A/D Data Register y (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB) to 0000h when the A/D data registers are read by the CPU or DMAC.
This function enables detection of update failures of the A/D data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB). The following describes the examples in which the function to automatically clear the ADDRy register is enabled and disabled.
In a case where the ACE bit in ADCER register is 0 (automatic clearing is disabled), if the A/D conversion result (0222h) is not written to the ADDRy register for some reason, the old data (0111h) will be the ADDRy value. Furthermore, if this ADDRy value is read into a general register using an A/D scan end interrupt, the old data (0111h) can be saved in the general register. When checking whether there is an update failure, it is necessary to frequently save the old data in the RAM or a general register.
In a case where the ACE bit in ADCER register is 1 (automatic clearing is enabled), when ADDRy = 0111h is read by the CPU or DMAC, ADDRy is automatically cleared to 0000h. After that, if the A/D conversion result 0222h cannot be transferred to ADDRy for some reason, the cleared data (0000h) remains as the ADDRy value. If this ADDRy value is read into a general register using an A/D scan end interrupt at this point, 0000h will be saved in the general register. Occurrence of an ADDRy update failure can be determined by simply checking that the read data value is 0000h.

30.3.8 A/D-Converted Value Addition/Average Function

In A/D-converted value addition function, the same channel is A/D-converted 2, 3, 4, or 16 consecutive times and the sum of the converted values is stored in the data register. In A/D-converted value average function, the same channel is A/D converted 2 or 4 consecutive times and the mean of the converted values is stored in the data register. The use of the average of these results can improve the accuracy of A/D conversion, depending on the types of noise components that are present. This function, however, cannot always guarantee an improvement in A/D conversion accuracy.
The A/D-converted value addition/average function can be specified when A/D conversion of the channel select analog input is selected.

Note 1. The addition count can be set to 16 only when 12-bit conversion accuracy is selected.

30.3.9 Disconnection Detection Assist Function

This converter incorporates the function to fix the charge for sampling capacitance to the specified state before start of A/D conversion. This function enables disconnection detection in wiring of analog inputs.
Figure 30.26 illustrates the A/D conversion operation when the disconnection detection assist function is used. Figure 30.27 shows an example of disconnection detection when precharge is selected. Figure 30.28 shows an example of disconnection detection when discharge is selected.

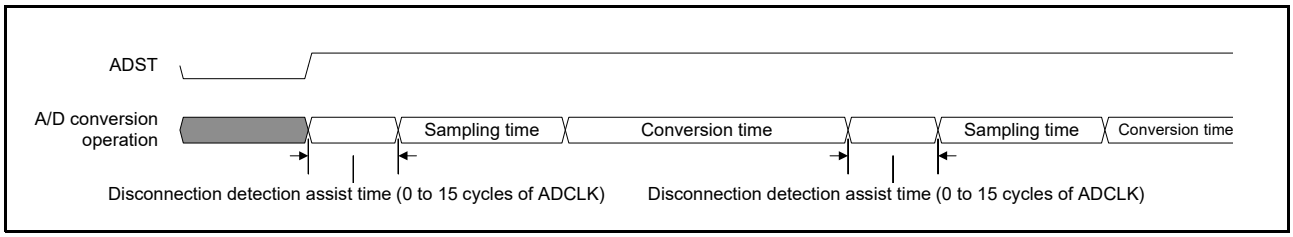

Figure 30.26 Operation of A/D Conversion when the Disconnection Detection Assist Function is Used

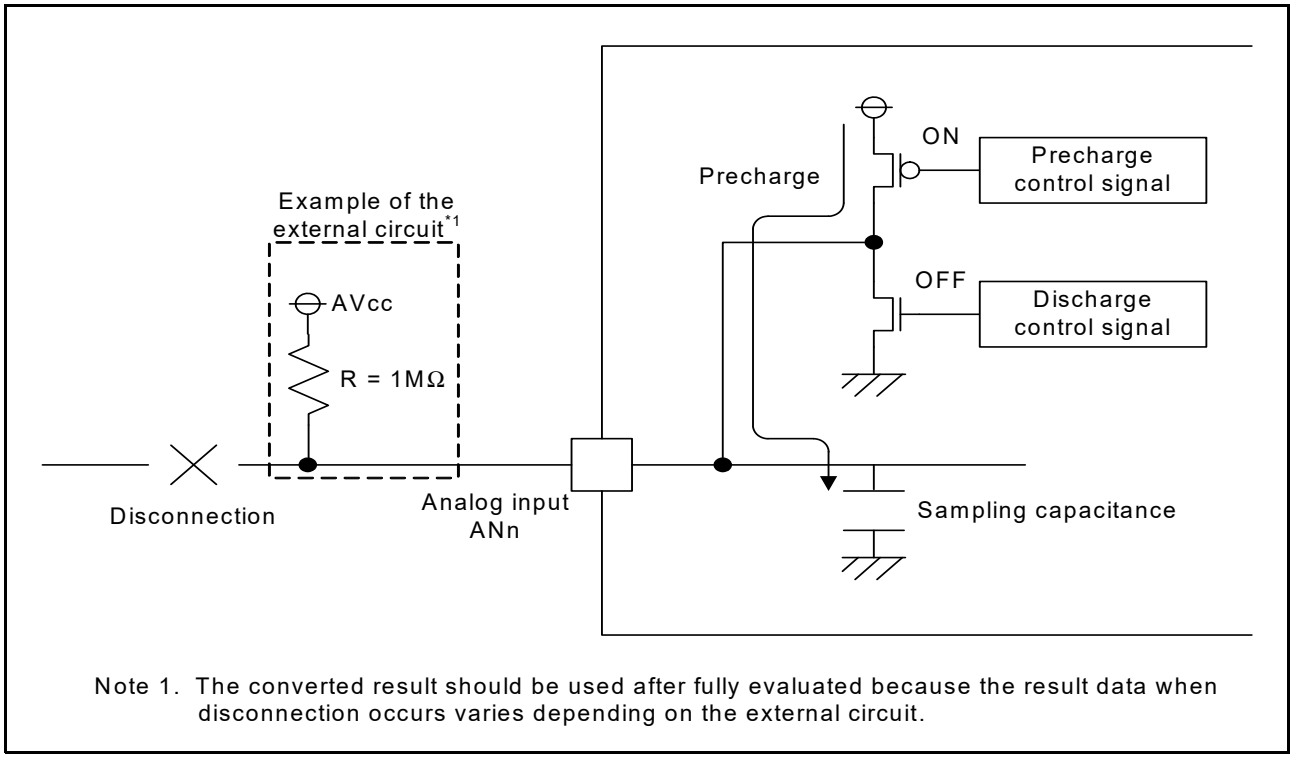

Figure 30.27 Example of Disconnection Detection when Precharge is Selected

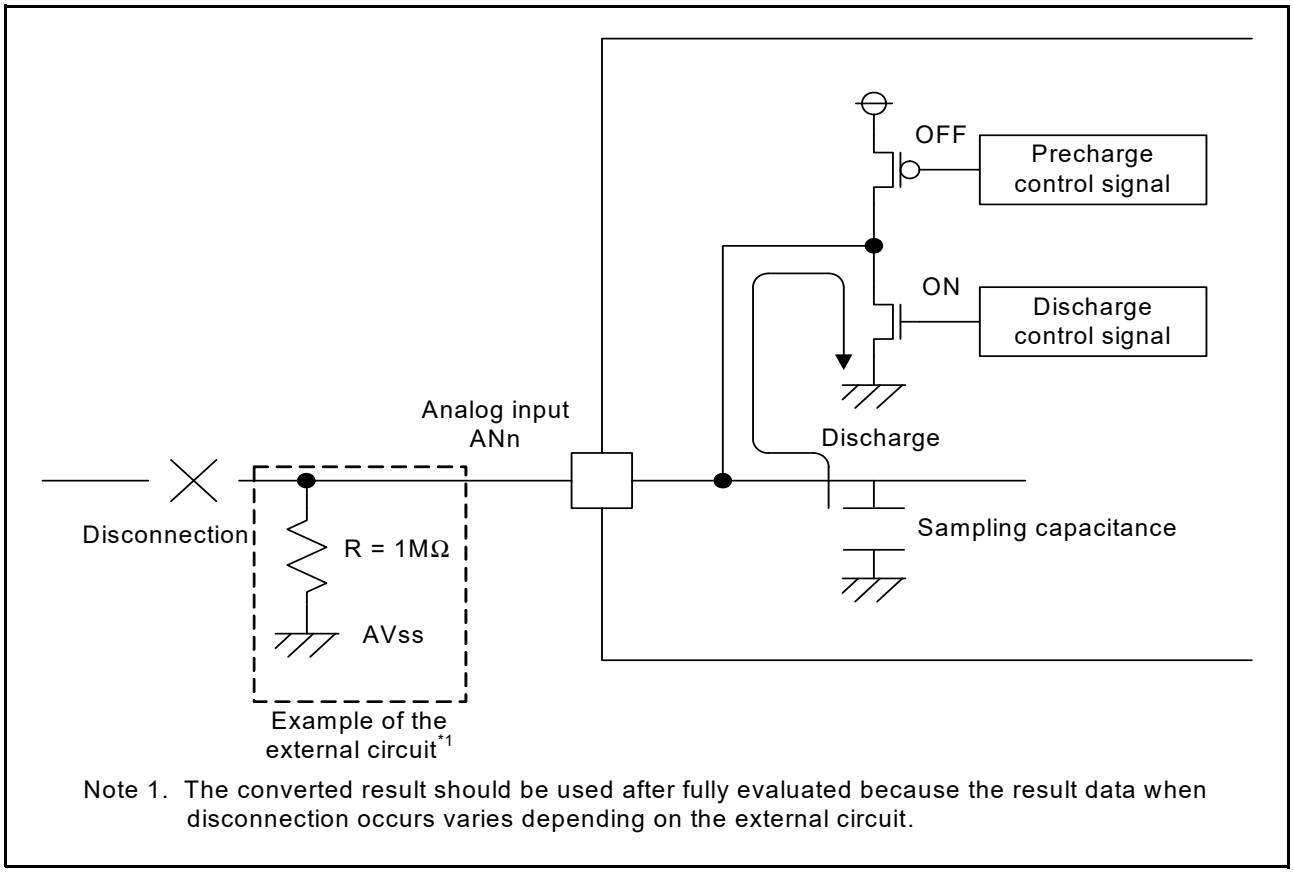

Note 1. The converted result should be used after fully evaluated because the result data when disconnection occurs varies depending on the external circuit.

Figure 30.28 Example of Disconnection Detection when Discharge is Selected

30.3.10 Starting A/D Conversion with Asynchronous Trigger

The A/D conversion can be started by the input of an asynchronous trigger.
To start up the A/D converter by an asynchronous trigger, after setting general-purpose I/O pin function, the A/D conversion start trigger select bits (ADSTRGR.TRSA[5:0]) should be set to 0h and a high-level signal should be input to the asynchronous trigger (ADTRG# pin). Both the ADCSR.TRGE and ADCSR.EXTRG bits then should be set to 1.
Figure 30.29 shows a timing of the asynchronous trigger input.
An asynchronous trigger cannot be selected for group B and group C used in group scan mode. For details about the settings of the pin function, see section 51, GPIO.

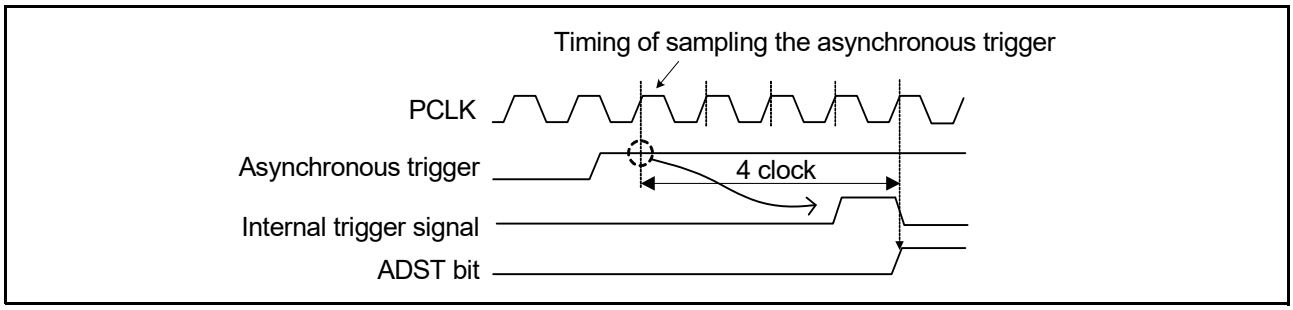

Figure 30.29 Asynchronous Trigger Input Timing

30.3.11 Starting A/D Conversion with Synchronous Trigger from Peripheral Module

The A/D conversion can be started by a synchronous trigger (one pulse of "L" in PCLK synchronization) from MTU or GPT. To start the A/D conversion by a synchronous trigger, the ADCSR.TRGE bit should be set to 1, the ADCSR.EXTRG bit should be cleared to 0, and the relevant sources should be selected by the ADSTRGR.TRSA[5:0] and ADSTRGR.TRSB[5:0] bits.

30.4 Interrupt Sources and DMAC Transfer Requests

30.4.1 Interrupt Requests

The A/D converter can send scan end interrupt requests S12ADI0, S12GBADI0, and S12GCADI0 to the CPU. The module also generates the S12ADCMPAI0 and S12ADCMPBI0 interrupt for the CPU in response to matches with a condition for comparison.
Setting the ADCSR.ADIE bit to 1 and 0 enables and disables an S12ADI0 interrupt, respectively; similarly, setting the ADCSR.GBADIE bit to 1 and 0 enables and disables an S12GBADI0 interrupt, respectively.
Setting the ADCMPCR.CMPAIE bit to 1 and 0 enables and disables an S12ADCMPAI0 interrupt, respectively.
Setting the ADCMPCR.CMPBIE bit to 1 and 0 enables and disables an S12ADCMPBI0 interrupt, respectively.
In addition, the DMAC can be started up when an S12ADI0, an S12GBADI0, or an S12GCADI0 interrupt is generated. Using an S12ADI0, an S12GBADI0, or an S12GCADI0 interrupt to allow the DMAC to read the converted data enables continuous conversion without burden on software.
For details on DMAC settings, see section 9, Direct Memory Access Controller.

30.5 Usage Notes

30.5.1 Notes on Reading Data Registers

The A/D data registers, A/D data duplication registers, A/D data duplication register A, A/D data duplication register B, and A/D self-diagnosis data register should be read in word units. If a register is read twice in byte units, that is, the upper byte and lower byte are separately read, the A/D-converted value having been read first may disagree with the A/D-converted value having been read for the second time. To prevent this, the data registers should never be read in byte units.

30.5.2 Notes on Stopping A/D Conversion

30.5.2.1 A/D Conversion Stopping Procedure

To stop A/D conversion when an asynchronous trigger or a synchronous trigger has been selected as the condition for starting A/D conversion, follow the procedure in Figure 30.30.

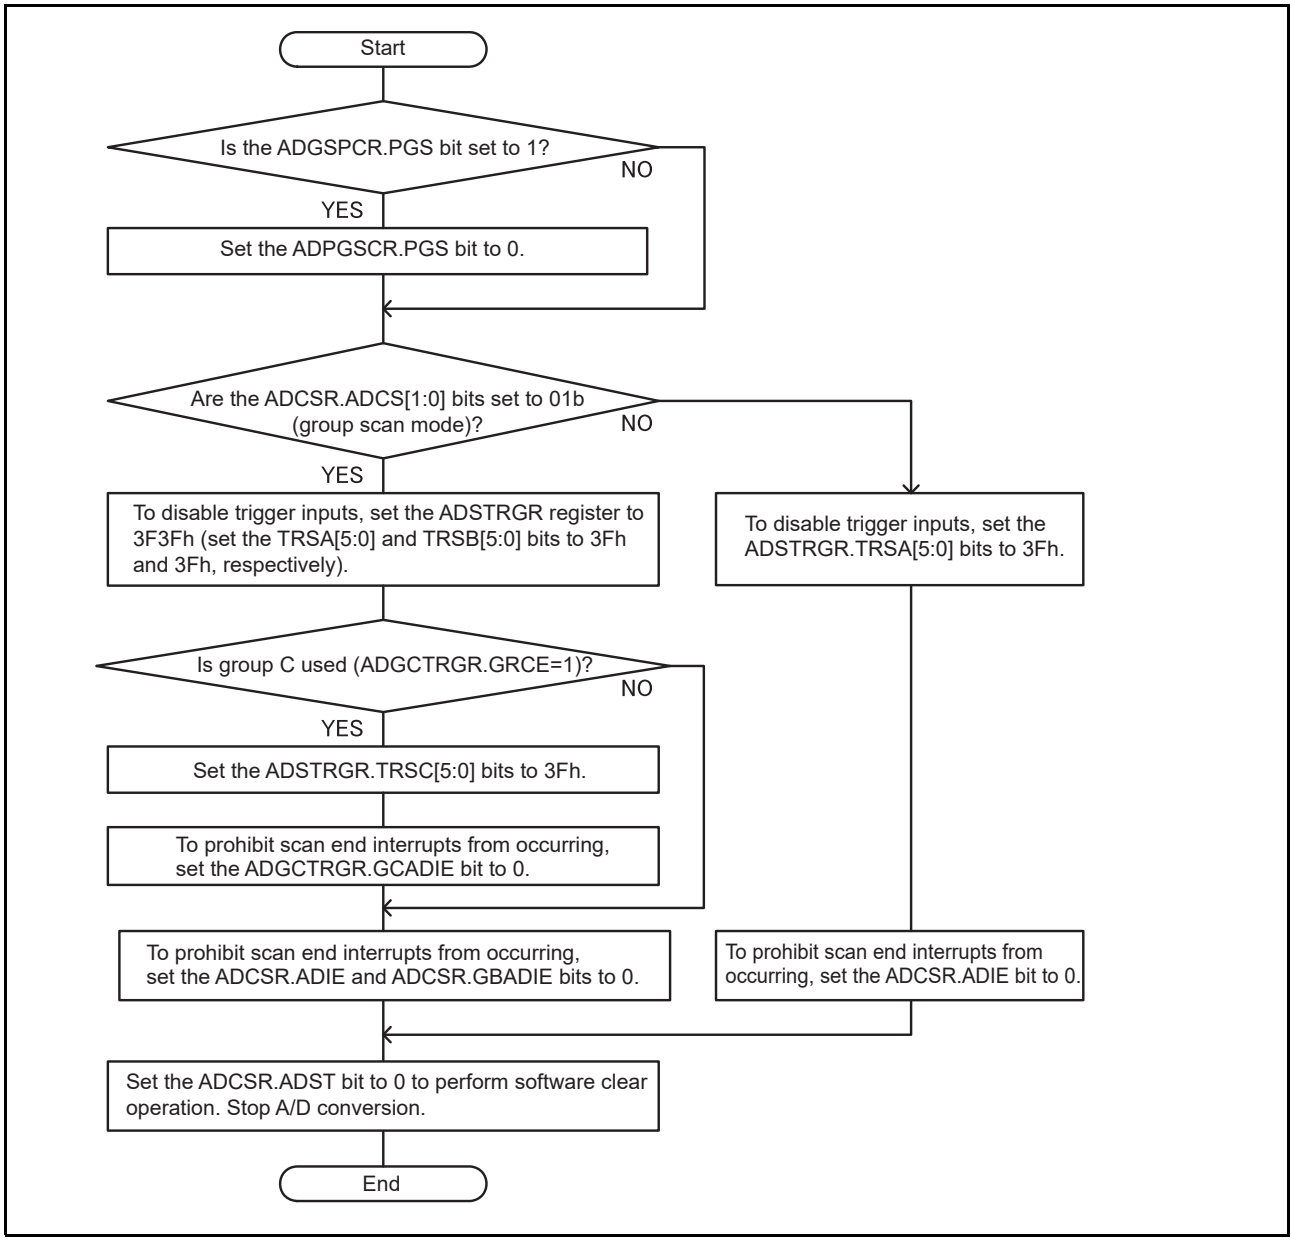

Figure 30.30 Procedures for Clear Operation by Software through the ADCSR.ADST Bit

Note: It takes two ADCLK cycles from software clear operation to the stop of scanning. To set the following operation after executing the software clear operation, a wait of at least two ADCLK cycles should be included.
- Scan end interrupt enable
- A/D conversion start by software
- Trigger input enable setting

30.5.2.2 Notes on Modes and Status Bits

Initialize or reset individually the voltage status in self-diagnosis, odd/even determination in double trigger mode, and the monitor bits in the compare function, if necessary.

- The reset value of voltage status in self-diagnosis can be selected in ADCER.DIAGVAL[1:0] after ADCER.DIAGLD is set to 1.
- Double trigger mode operates from the first scan after ADCSR.DBLE is set to 1 from 0.
- To initialize the monitor bits (MONCMPA, MONCMPB, MONCMPA) in the compare function, set ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0.

30.5.3 A/D Conversion Restarting Timing and Termination Timing

It takes a maximum of six ADCLK cycles for the idle analog unit of the A/D converter to be restarted by setting the ADST bit in ADCSR register to 1. It takes a maximum of two ADCLK cycles for the operating analog unit of the 12-bit A/D converter to be terminated by setting the ADST bit in ADCSR register to 0.

30.5.4 Notes on Scan End Interrupt Handling

When scanning the same analog input twice using any trigger, the first A/D-converted data is overwritten with the second A/D-converted data in the case that the CPU does not complete reading out the A/D-converted data by the time the A/D conversion of the first analog input for the second scan ends after the first scan end interrupt is generated.

30.5.5 Module Standby Function Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Releasing the module standby mode enables access to the registers. After canceling module standby mode, wait for at least 1 µs before starting A/D conversion.
For details, see section 52, Power-Down Modes.

30.5.6 Notes on Entering Low Power Consumption States

Before entering the Power-Down mode, make sure to stop A/D conversion. Here, set the ADST bit in ADCSR register to 0, and secure certain period of time until the analog unit of the A/D converter is stopped.
Follow the procedure given below to secure this time.
Follow the procedure for clear operation by software through the ADCSR.ADST bit, shown in Figure 30.30. After that, wait for two clock cycles of ADCLK before entering the Power-Down mode.

30.5.7 Notes on Canceling Software Standby Mode

After canceling software standby mode, wait for the oscillation stabilization time to elapse and then wait for at least 1 µs before starting A/D conversion. For details, see section 52, Power-Down Modes.

30.5.8 Error in Absolute Accuracy When Disconnection Detection Assistance is in Use

Using disconnection detection assistance leads to an error in absolute accuracy of the A/D converter. This is because an error voltage is input to the analog input pins due to the resistive voltage division between the pull-up or pull-down resistor (Rp) and the resistance of the signal source (Rs). This error in absolute accuracy is calculated from the following formula. Only use disconnection detection assistance after thorough evaluation.

Maximum error in absolute accuracy (LSB) = 4095 × Rs / Rp

30.5.9 Range of Voltage on the Analog Input Pins

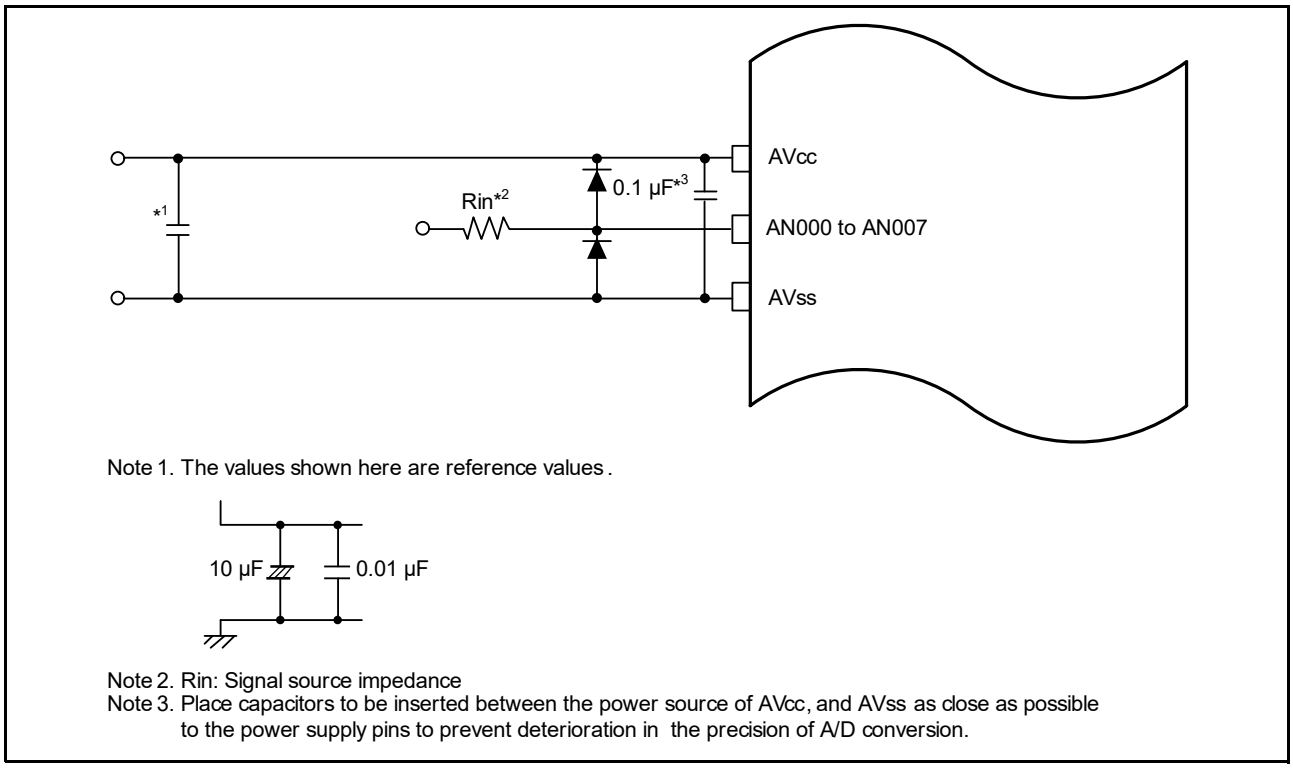
The voltage to be applied on the analog input pin should be in the range AVss ≤ AN00n (n = 0 to 7) ≤ AVcc.
Using this LSI chip with a voltage out of the allowed range may adversely affect the reliability of the LSI.

30.5.10 Notes on Board Design

When designing a board, as much as possible make sure that the signal wiring runs for the digital and analog circuits do not overlap or are not placed close to each other in the layout. Otherwise, electromagnetic induction and so on will occur, and this may adversely affect the precision of the values produced by A/D conversion.
The analog signals (AN000 to AN007) and analog power source (AVcc) are separated from the digital circuits by using the analog ground (AVss). Be sure to connect a 0.1µF capacitor between the analog power source and analog ground.
The analog ground (AVss) should be connected to a stable digital ground (Vss) on the board (single-point ground plane connection).

30.5.11 Notes on Noise Prevention

To avoid damage to the analog input pins (AN000 to AN007) due to abnormal voltages such as excessive surges, connect protection circuits to the analog input pins (AN000 to AN007) with reference to that shown in Figure 30.31.



Note 1. The values shown here are reference values.

Note 2. Rin: Signal source impedance
Note 3. Place capacitors to be inserted between the power source of AVcc, and AVss as close as possible to the power supply pins to prevent deterioration in the precision of A/D conversion.

Figure 30.31 Example of a Protection Circuit for the Analog Inputs

31. NAND Flash Controller

31.1 Overview

The NAND flash controller supports the functionality of the high-level interface described in the ONFI 1.x specifications.

31.1.1 Features

- Compatibility
  - Compatible with the ONFi 1.x specification. (8 bits)
    Note that this does not apply in cases where timing mode 3, 4, or 5 is in use.
  - Support for the Small Block devices
  Note: Only devices that allow to disable CE signal when device is in the busy state are supported.
  - Support for the low capacity devices (which use four address bytes) with the help of generic sequence.
- DMA Controller
  - Scatter-gather mode/registers managed mode
  - 32-bit system memory addressing.
  - Programmable FIFO threshold as a trigger for the DMA controller
- Interrupt Controller
  - Each interrupt can be masked.
  - Each interrupt has its own status flag.
  - The status flags are also valid when the given interrupt is masked, and can be checked by the software polling mechanism.
  - Single interrupt signal output
- Data buffering
  - FIFO module based on dual port memory.
- ECC unit
  - The ECC module is based on the BCH algorithms.
  - The syndrome calculation, error detection and error correction phases in the BCH-based modules are pipelined.
  - The ECC unit supports the following options: 256-, 512-, and 1024-byte data blocks. The data block size depends on the selected ECC option.
- Advanced features
  - The page cache read/write sequences are supported.
  - The multiple planes read/write sequences are supported.
  - The multi-LUN work mode is supported.
  - Command queuing mechanism.

Note: A queue is used when a host writes to a register. The queue is used when writing is to registers other than those listed below.
– INT_STATUS
– STATUS
– FIFO_INIT
– ECC_STAT
– FIFO_DATA
Writing to the registers listed above is executed immediately. Writing to the other registers, on the other hand, is executed through command queuing.

- The advanced Bad Blocks Management system
  - Record tables are stored in the system memory.
  - Implementation of hardware with the search algorithm

31.1.2 Block Diagram

Figure 31.1 is a block diagram of this module.

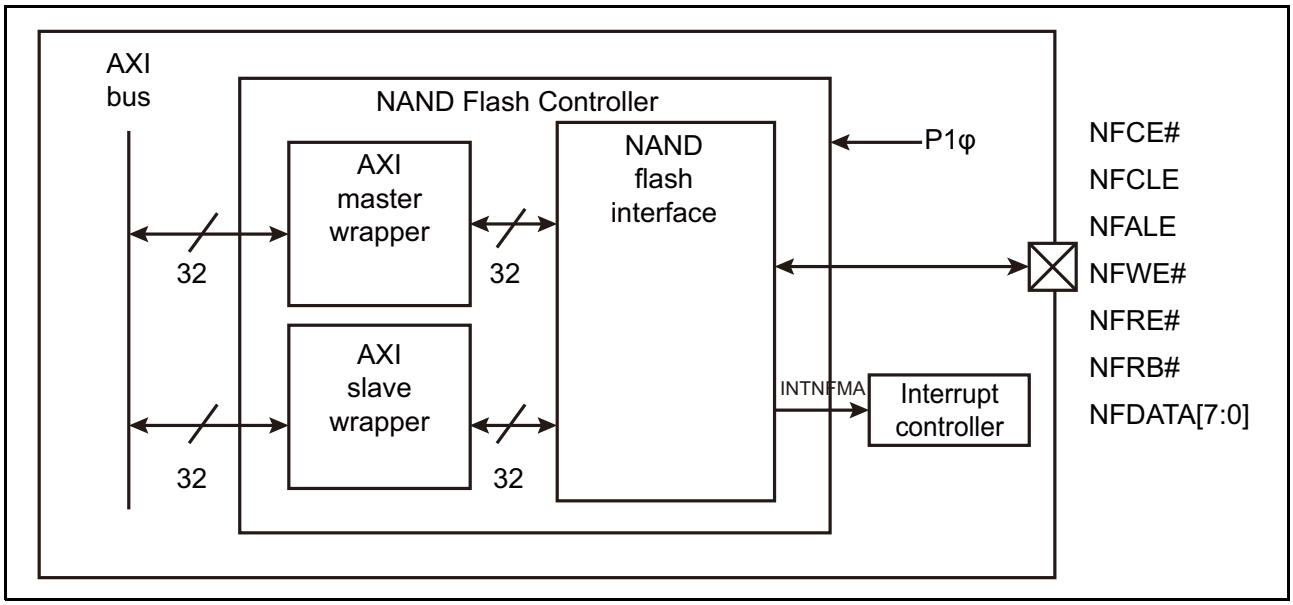


Figure 31.1 Block Diagram

The INTNFMA interrupt signal described in this section corresponds to the NAND interrupt sources of this controller.

31.1.3 External Pins

Table 31.1 lists the pin configuration.

Table 31.1 Pin Configuration

Name	I/O	Function
NFRE#	O	Read Enable
NFCE#	O	Chip Enable
NFCLE	O	Command Latch Enable
NFALE	O	Address Latch Enable
NFWE#	O	Write Enable
NFDATA[7:0]	I/O	Data
NFRB#	I	Ready/busy

31.1.4 Register Configuration

Table 31.2 shows the register configuration.

Table 31.2 Register Configuration

Name	Abbreviation	R/W	Address	Initial Value	Access Size
Controller commands register	COMMAND	R/W	H'E822C000	H'0000 0000	32
Main configurations register	CONTROL	R/W	H'E822C004	H'0000 0000	32
Controller status register	STATUS	R	H'E822C008	H'0000 0001	32
Mask register for the READ STATUS commands	STATUS_MASK	R/W	H'E822C00C	H'0000 4040	32
Interrupts mask register	INT_MASK	R/W	H'E822C010	H'0000 0000	32
Interrupts status register	INT_STATUS	R/W	H'E822C014	H'0000 0000	32

31.2 Register Description

31.2.1 Controller commands register (COMMAND)

COMMAND specifies the command sequence code and selects data.
The write of the command sequence code to this register triggers the programmed command sequence execution. If the execution cannot be started immediately, the transfer to this register is prolonged by the series of the WAIT responses. Each command sequence can generate an interrupt when it is completed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD_2[7:0]								CMD_1[7:0]/CMD_3[7:0]*1							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMD_0[7:0]								DATA_SEL	INPUT_SEL	CMD_SEQ[5:0] OPC[1:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CMD_2[7:0]	H'00	R/W	Code of the third command in a sequence
23 to 16	CMD_1[7:0]/ CMD_3[7:0]*1	H'00	R/W	Code of the second command in a sequence
15 to 8	CMD_0[7:0]	H'00	R/W	Code of the first command in a sequence
7	DATA_SEL	0	R/W	Data/FIFO selection 0: FIFO selected 1: DATA register selected
6	INPUT_SEL	0	R/W	Input module selection 0: select the registers in the Slave I/F Unit (SIU) module as input 1: select the DMA module as input
5 to 0	CMD_SEQ[5:0]	H'00	R/W	Command code

Note 1. Depending on the selected command sequence, this field will store CMD1 or CMD3 code.
In the generic sequence, both commands are used in a single sequence.

31.2.2 Main configurations register (CONTROL)

CONTROL stores the common configuration parameters.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
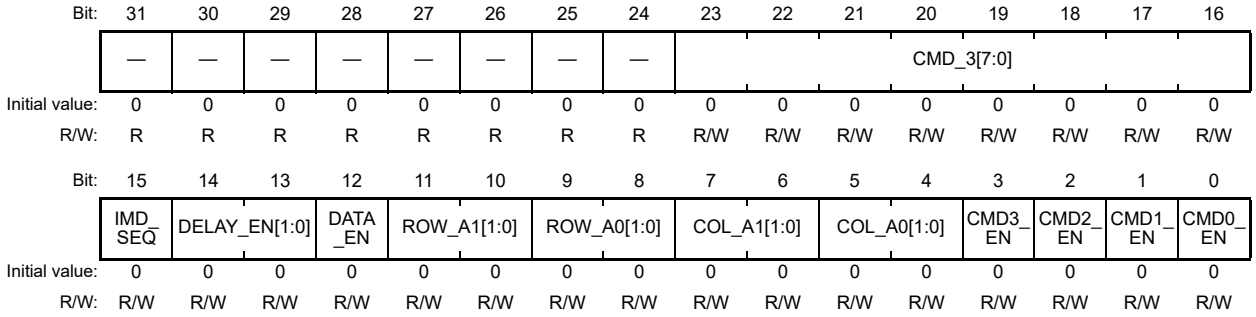
R/W:	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23	AUTO_READ_STAT_EN	0	R/W	Auto Read Status mode enable If active, the controller reads the status after the PROGRAM PAGE and ERASE BLOCK commands. It can trigger an interrupt. The ERROR_MASK field in the STATUS_MASK register must be configured when this feature is enabled. After executing a PROGRAM PAGE or ERASE BLOCK command, you can use the field to check the state following the operation (in terms of success or failure). 0: Auto Read Status mode disabled 1: Auto Read Status mode enabled
22	MLUN_EN	0	R/W	Multi LUN mode enables If active, it enables controller multi LUN work mode 0: Multi LUN mode disabled 1: Multi LUN mode enabled For more details, see section 31.3.4, Multi LUN Work Mode.
21	SMALL_BLOCK_EN	0	R/W	Enable small block mode In this mode, the controller sends only a single byte as the column address instead of two bytes, as done in the big block NAND Flash devices. 0: big block mode enabled 1: small block mode enabled Note: Only devices that allow to disable CE signal when device is in the busy state are supported.
20 to 18	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17	ADDR1_AUTO_INCR	0	R/W	Address auto increment for row address register 1 (ADDR1_ROW) When this bit is set, sending any command sequence using address register 1 causes the increment of address register 1. 0: auto increment disabled 1: auto increment enabled
16	ADDR0_AUTO_INCR	0	R/W	Address auto increment for row address register 0 (ADDR0_ROW) When this bit is set, sending any command sequence using address register 0 causes the increment of address register 0 0: auto increment disabled 1: auto increment enabled
15	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
14	PROT_EN	0	R/W	Protect mechanism enable 0: protect disabled 1: protect enabled

Bit	Bit Name	Initial Value	R/W	Description
13	BBM_EN	0	R/W	Bad Block Management enable flag For more details, see section 31.3.5, Remapping Mechanism.
12 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7, 6	BLOCK_ SIZE[1:0]	H'0	R/W	The Block Size 00: 32 pages per block 01: 64 pages per block 10: 128 pages per block 11: 256 pages per block
5	ECC_EN	0	R/W	Hardware ECC support enable 0: ECC disabled 1: ECC enabled Hardware ECC can be used only when m* (ECC_BLOCK_SIZE) ≤ DATA_SIZE ≤ m* (ECC_BLOCK_SIZE + 32), where m is 1,2,3...
4	INT_EN	0	R/W	Global Interrupt enable 0: Interrupts disabled 1: Interrupts enabled For more details, see section 31.3.6, Interrupts Mechanism.
3	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
2, 1	ECC_BLOCK_ SIZE[1:0]	H'0	R/W	The ECC Block Size: 00: 256 bytes 01: 512 bytes 10: 1024 bytes 11: not available The ECC block size can be changed only when all memory devices are ready.
0	READ_STATUS_ EN	0	R/W	Automatically READ STATUS/check RnB lines The STATUS_MASK field in the STATUS_MASK register must be configured when this feature is enabled. This bit is used to select how the controller detects the ready or busy state of the device. 0: The controller checks RnB lines. 1: The controller sends READ STATUS commands. Note: Automatically sent READ STATUS command is only available in devices compatible with ONFI 1.0.

31.2.3 GENERIC_SEQ register (GEN_SEQ_CTRL)

GENERIC_SEQ is used to parameterize the generic sequences. For more details, see section 31.3.2, Generic Sequence. For examples, see Table 31.7.



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD_3[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IMD_SEQ	DELAY_EN[1:0]		DATA_EN	ROW_A1[1:0]		ROW_A0[1:0]		COL_A1[1:0]		COL_A0[1:0]		CMD3_EN	CMD2_EN	CMD1_EN	CMD0_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	CMD_3[7:0]	H'00	R/W	Command 3 code value
15	IMD_SEQ	0	R/W	Enable immediate command execution This bit allows the command sequence to be executed without checking the selected target state. 0: feature disabled 1: feature enable
14, 13	DELAY_EN[1:0]	H'0	R/W	Enable the busy 0 or 1 phase These bits allow enabling or disabling the presence of the "busy" phase in the generic sequence. 00: disable both delays 01: enable delay 0 10: enable delay 1 11: disable both delays
12	DATA_EN	0	R/W	Enable data part sequence This bit allows enabling or disabling the data phase of the generic sequence. 0: disable data phase 1: enable data phase
11, 10	ROW_A1[1:0]	H'0	R/W	Row Address Cycles The number of bytes of row addresses to be sent to the NAND Flash device 00: 0 address cycles 01: 1 address cycle 10: 2 address cycles 11: 3 address cycles
9, 8	ROW_A0[1:0]	H'0	R/W	Row Address Cycles The number of bytes of row addresses to be sent to the NAND Flash device 00: 0 address cycles 01: 1 address cycle 10: 2 address cycles 11: 3 address cycles
7, 6	COL_A1[1:0]	H'0	R/W	Column Address Cycles The number of bytes of column addresses to be sent to the NAND Flash device 00: 0 address cycles 01: 1 address cycle 10: 2 address cycles 11: setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
5, 4	COL_A0[1:0]	H'0	R/W	Column Address Cycles The number of bytes of column addresses to be sent to the NAND Flash device 00: 0 address cycles 01: 1 address cycle 10: 2 address cycles 11: setting prohibited
3	CMD3_EN	0	R/W	Enable Command 3 Phase This bit allows enabling or disabling the presence of the “command 3” phase in the generic sequence. 1: enable 0: disable
2	CMD2_EN	0	R/W	Enable Command 2 phase This bit allows enabling or disabling the presence of the “command 2” phase in the generic sequence. 1: enable 0: disable
1	CMD1_EN	0	R/W	Enable Command 1 phase This bit allows enabling or disabling the presence of the “command 1” phase in the generic sequence. 1: enable 0: disable
0	CMD0_EN	0	R/W	Enable Command 0 phase This bit allows enabling or disabling the presence of the “command 0” phase in the generic sequence. 1: enable 0: disable

31.2.4 Controller status register (STATUS)

STATUS stores the NAND Flash controller and connected device status flags. These flags can be used to obtain the current controller internal state.

The CTRL_STAT flag is set after the controller starts to execute the requested command for the selected NAND Flash device, and it is active while the command execution is not completed. Command execution can be divided into two phases. In the first phase, the command sequence is executed at the moment when the NAND Flash device goes into the busy state. After that, the controller stores information about the pending operation on the selected device. In the second phase, the controller automatically finishes the pending command execution based on the previously stored data. As long as this flag is set, the controller does not accept any new commands.

The MEM0_ST flag indicates the state of the NAND flash device. The flag has the same function as the NAND Flash device RnB line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD_ID[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	DATA_REG_ST	DATASIZE_ERROR_ST	CTRL_STAT	—	—	—	—	—	—	—	MEM0_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	CMD_ID[7:0]	H'00	R	Command ID The current command under execution identification marker added before command was put in to the command FIFO.
15 to 11	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	DATA_REG_ST	0	R	The DATA_REG: Resetting of this flag is possible only by reading the data from the DATA_REG register. 1: data in DATA_REG is available 0: data in DATA_REG is not available
9	DATASIZE_ERROR_ST	0	R	The Data Size value error This bit indicates that the value written to the DATA_SIZE register is not correct when the ECC is enabled. For details on the values of the correct size of data, see the description of the DATA_SIZE register. 0: correct value 1: incorrect value
8	CTRL_STAT	0	R	The main controller status bit 0: controller ready 1: controller busy
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	MEM0_ST	1	R	Device 0 status flag 1: device ready 0: device busy

Note: When using the READ PARAMETER PAGE command, the block size for the ECC memory (ECC_BLOCK_SIZE) must be the same as that set in the DATA_SIZE register.
When using the SET FEATURES, GET FEATURES, or READ ID command, disable the ECC function.

31.2.5 LUN status register (LUN_STATUS_0)

LUN_STATUS_0 allows to access the LUN status information. Each bit of the LUN status field contain the status of single LUN of device. The busy state is indicated as "0", and the ready state is indicated as "1".

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	MEM0_LUN[7:0]	H'FF	R	Memory 0 LUN-s status field.

31.2.6 Interrupts mask register (INT_MASK)

INT_MASK allows masking of the selected interrupts source in the NAND Flash controller. The masked interrupts still set the corresponding bits in the status register, but do not assert the interrupt signal.

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24	ECC_ INT0_EN	0	R/W	Enables the interrupt from the ECC module status for Memory device 0. 0: interrupt disabled 1: interrupt enabled
23 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	STAT_ERR_ INT0_EN	0	R/W	Enables the interrupt when the most recently finished operation on the Memory device 0 failed. This applies to PROGRAM PAGE and ERASE BLOCK operations. It is not valid following a READ-series operation. 0: interrupt disabled 1: interrupt enabled
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	MEM0_RDY_ INT_EN	0	R/W	The memory device 0 is ready for the new command. 0: interrupt disabled 1: interrupt enabled For more details see Figure 31.31.
7	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	PG_SZ_ERR_ INT_EN	0	R/W	Data Size error occur. 0: interrupt disabled 1: interrupt enabled
5	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
4	TRANS_ERR_ EN	0	R/W	The transfer on the slave interface error 0: interrupt disabled 1: interrupt enabled
3	DMA_INT_EN	0	R/W	DMA transfer ended. 0: interrupt disabled 1: interrupt enabled
2	DATA_REG_ INT_EN	0	R/W	Data in DATA_REG is available. 0: interrupt disabled 1: interrupt enabled

Bit	Bit Name	Initial Value	R/W	Description
1	CMD_END_ INT_EN	0	R/W	Command sequence ended. 0: interrupt disabled 1: interrupt enabled For more details see Figure 31.31, Command Sequence End and Memory-Ready Interrupts.
0	PROT_ INT_EN	0	R/W	Erase/Write protected area interrupt enable 0: interrupt disabled 1: interrupt enabled

31.2.7 Interrupts status register (INT_STATUS)

INT_STATUS stores the NAND Flash controller interrupt flags. If the given bit is 0, the corresponding interrupt condition is not met. If the given bit is 1, the corresponding interrupt condition is met.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ECC_INT0_FL	—	—	—	—	—	—	—	STAT_ERR_INT0_FL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	MEM0_RDY_INT_FL	—	PG_SZ_ERR_INT_FL	—	TRANS_ERR_FL	DMA_INT_FL	DATA_REG_INT_FL	CMD_END_INT_FL	PROT_INT_FL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24	ECC_INT0_FL	0	R/W	Selected flag (source is ECC_UNC_0, ECC_ERROR_0 or ECC_OVER_0) in the ECC module is set.
23 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	STAT_ERR_INT0_FL	0	R/W	Most recently finished operation on the Memory device 0 failed. This applies to PROGRAM PAGE and ERASE BLOCK operations. It is not valid following a READ-series operation.
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	MEM0_RDY_INT_FL	0	R/W	The memory device 0 is ready for the new command.
7	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	PG_SZ_ERR_INT_FL	0	R/W	Data Size error flag When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions. Interrupt condition is met when the value written to the DATA_SIZE register is not correct.
5	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
4	TRANS_ERR_FL	0	R/W	The transfer on the slave interface error The flag is set when the access to the FIFO memory has the opposite direction to the current FIFO configuration.
3	DMA_INT_FL	0	R/W	DMA transfer ended flag.
2	DATA_REG_INT_FL	0	R/W	Data in DATA_REG is available.
1	CMD_END_INT_FL	0	R/W	Transfer sequence ended.
0	PROT_INT_FL	0	R/W	Erase/Write protected area interrupt enable

31.2.8 ECC module control register (ECC_CTRL)

ECC_CTRL stores all configuration parameters required by the ECC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ERR_THRESHOLD[5:0]						—	—	—	—	—	ECC_CAP[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17,16	ECC_SEL[1:0]	H'0	R/W	The ECC interrupt source select These bits select the ECC module flag that will be used as a source for the interrupt signal: 00: select ECC_ERROR (correctable error) flag as interrupt source. 01: select ECC_UNC (uncorrectable error) flag as interrupt source. 1x: select ECC_OVER (acceptable errors level overflow) flag as interrupt source. The ECC_OVER flag is not set in response to an uncorrectable error (ECC_UNC_0 = 1).
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	ERR_ THRESHOLD [5:0]	H'00	R/W	The acceptable errors level The value of this field contains the number of errors that is acceptable. This field must be initialized by the application program.
7 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2 to 0	ECC_CAP[2:0]	H'0	R/W	The ECC module correction ability The correction ability can be changed only when memory devices are ready. 000: 2 001: 4 010: 8 011: 16 100: 24 All others: 32

31.2.9 ECC module status register (ECC_STAT)

ECC_STAT stores all ECC module status information.

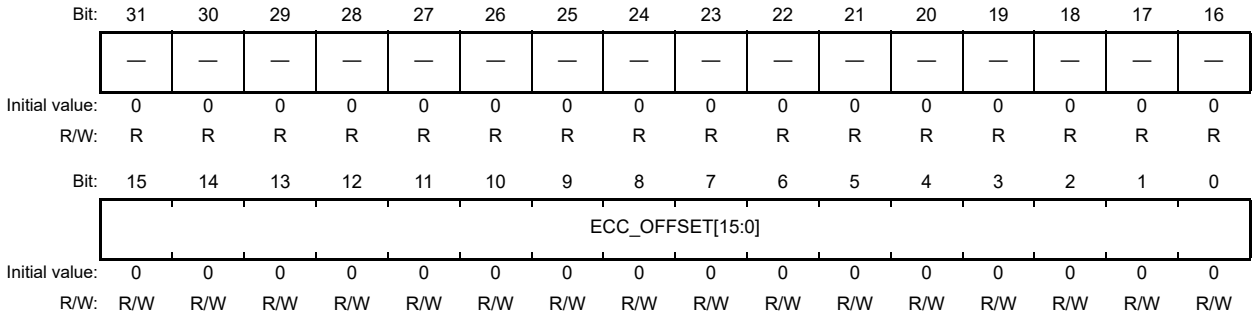
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_OVER_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECC_UNC_0	—	—	—	—	—	—	—	ECC_ERROR_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	ECC_OVER_0	0	R/W	The Memory device 0 acceptable errors level overflow The bit is set when the number of errors is bigger than the value of declared ERR_THRESHOLD bits. Uncorrectable errors are not counted.
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	ECC_UNC_0	0	R/W	The Memory device 0 uncorrectable error flag The bit is set when the uncorrectable error occur during the read operation.
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	ECC_ERROR_0	0	R/W	The Memory device 0 correctable error flag The bit is set when a correctable or uncorrectable error (ECC_UNC_0 = 1) occurs during reading.

31.2.10 ECC offset in the spare area register (ECC_OFFSET)

ECC_OFFSET stores the offset value from the beginning of the page to the place where correction words will be stored. The value of the ECC_OFFSET register must be bigger than the value in the DATA_SIZE register.
In small block mode, the value in ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device just behind the data.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	ECC_ OFFSET[15:0]	H'0000	R/W	Correction words block offset

31.2.11 ECC error level counter register (ECC_CNT)

ECC_CNT stores number of value detected during last page read operation. This register content is not automatically cleared, it must be done by software. The new page read operation does not overwrite previous register value. Register contain value of the largest error level detected in processed ECC blocks.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	ERR_LVL[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	ERR_LVL[5:0]	H'00	R/W	Detected error level Uncorrectable errors are not counted.

31.2.12 Column/row address registers (ADDR[1:0]_COL, ADDR[1:0]_ROW)

ADDR[1:0]_COL and ADDR[1:0]_ROW store the address that will be used by the next command sequence during access to the NAND Flash device.

ADDR [1:0] _COL:

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[1:0]_COL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	ADDR[1:0]_ COL[15:0]	H'0000	R/W	Column address, A15-A0 address bits

ADDR [1:0] _ROW:

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADDR[1:0]_ROW[23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[1:0]_ROW[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	ADDR[1:0]_ ROW[23:0]	H'00 0000	R/W	Row address, A39-A16 address bits (Page address, Block address and LUN address in the ONFI case)

Note 1. There is no register that defines the total memory size of the NAND Flash memory chip, thus the controller is not able to determine which address bits in ADDR [1:0]_COL and ADDR[1:0]_ROW are important and which must be zero. For this reason, the software must take special care with the values written to these registers. Incorrect values of unused address bits (none '0' values) can cause errors in memory access.
A relation between address registers and memory device address width is configured by the command sequence field of the COMMAND register. This field determines which command sequence has to be used and how many address bytes are used when addressing a NAND Flash memory device.

(Example: In order to erase blocks, the three address cycles containing the row address are written into the NAND Flash memory device. The NAND Flash Controller automatically writes bits A39-A16 to the NAND Flash device).
Refer to section 31.3.1 (2), Command Sequence Encoding and Table 31.6, Command Sequence Encoding in order to see how many address cycles are written into the NAND Flash memory device by each Command Sequence.
The address written to the address register must be aligned according to the NAND Flash device. Unused bits must be padded with zeros.

Note 2. When the auto increment for the row address register is enabled, the proper value of this register can be read only when the bit CTRL_STAT in STATUS register is clear.

Table 31.3 Address Registers and Address Bytes Relationship

Address Cycle	I/O 0	I/O 1	I/O 2	I/O 3	I/O 4	I/O 5	I/O 6	I/O 7
1st cycle	A0	A1	A2	A3	A4	A5	A6	A7
2nd cycle	A8	A9	A10	A11	A12	A13	A14	A15
3rd cycle	A16	A17	A18	A19	A20	A21	A22	A23
4th cycle	A24	A25	A26	A27	A28	A29	A30	A31
5th cycle	A32	A33	A34	A35	A36	A37	A38	A39

31.2.13 Page size value register (DATA_SIZE)

DATA_SIZE stores the value of the data block size. The data size value is remembered as the number of bytes per transferred block, but its size must be declared as the multiple of the chosen NAND Flash word size. The unused bits for the given word size configuration are ignored and replaced with zeros.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DATA_SIZE[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
14 to 0	DATA_ SIZE[14:0]	H'0000	R/W	Data size The value of this field defines data size.

Note: Write the proper value to the DATA_SIZE register when ECC is enabled:
(ECC_BLOCK_SIZE) × m ≤ DATA_SIZE ≤ (ECC_BLOCK_SIZE + 32) × m, Where m is 1, 2, 3 …

Here is an example of correct DATA_SIZE values when ECC_BLOCK_SIZE equals 512 bytes.

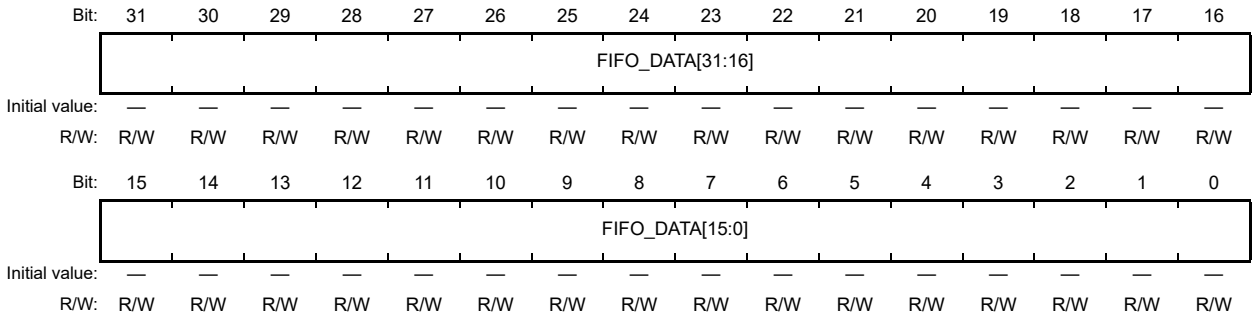
Table 31.4 Example of Correct DATA_SIZE Values

DATA_SIZE Value	Setting
H'0000	Not allowed
….	….
H'001F	Not allowed
H'0020	Not allowed
H'0021	Not allowed
….	….
H'01FF	Not allowed
H'0200	Allowed
H'0201	Allowed
….	….
H'0220	Allowed
H'0221	Not allowed
….	….
H'03FF	Not allowed
H'0400	Allowed
H'0401	Allowed
….	….
H'0440	Allowed
H'0441	Not allowed
….	….

Note 1. ECC_BLOCK_SIZE equals 512 bytes.

31.2.14 FIFO module interface register (FIFO_DATA)

FIFO_DATA is used as an entry point to the FIFO module. The CPU can access the FIFO module by reading from or writing to FIFO_DATA in the same way as it accesses any other register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFO_DATA [31:0]	Undefined	R/W	FIFO Data

Note: FIFO_DATA can be accessed after the read or write command is issued.

31.2.15 Bad block management (BBM) control register (BBM_CTRL)

BBM_CTRL stores the BBM specific control parameters.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RMP_INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0.
0	RMP_INIT	0	R/W	Remap initial flag If set, this flag forces the BBM module to reread the remapping table after it was updated by software. This flag is set by software and cleared by hardware after the remapping table is re-read.

31.2.16 Records table pointer register (DEV0_PTR)

The bad block management mechanism uses the tables in the system memory to store the remapping records. DEV0_PTR stores the table of the remapping record address.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PTR_ADDR[11:2]										—	—

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 2	PTR_ ADDR[11:2]	H'000	R/W	Remap table pointer The field contains an address of the remap table in the internal memory.
1 to 0	—	ALL 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

31.2.17 Records table size register (DEV0_SIZE)

The bad block management mechanism implemented in the controller uses the tables in the system memory to store the remapping records. Each table can store a variable number of records depending on the number of bad blocks in the NAND Flash device.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

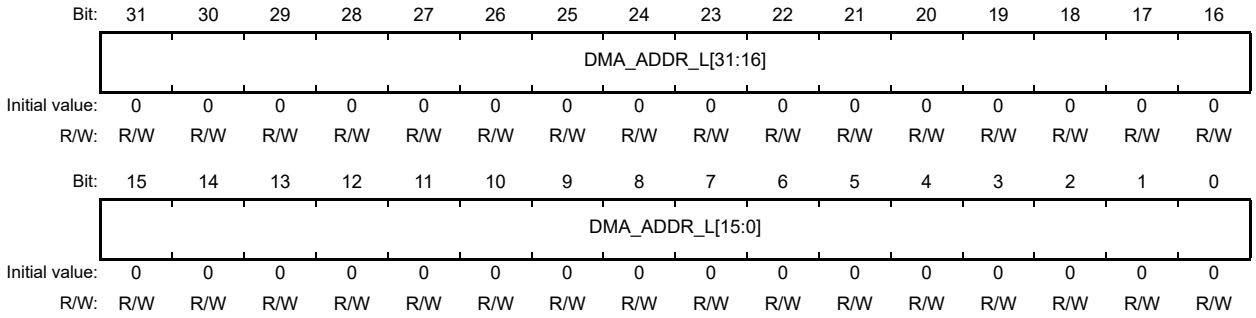
	—	—	—	—	DEV_SIZE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 0	DEV_SIZE[11:0]	H'000	R/W	Number of records

31.2.18 DMA base address register (DMA_ADDR_L)

DMA_ADDR_L holds the DMA base address. The register contains the address of the first data in the data block in the system memory, or the address of the first descriptor. The DMA module can read data from the memory location set by DMA_ADDR and write it to the FIFO module, or read data from the FIFO module and write it to the memory, starting from the location indicated by the DMA_ADDR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_ADDR_L [31:0]	H'0000 0000	R/W	DMA base address The two least significant bits are ignored, thus the address must be aligned to 32-bit words.

31.2.19 DMA counter initial value register (DMA_CNT)

DMA_CNT defines the number of bytes that will be transferred by the DMA module. The register remains unchanged during transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT_INIT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT_INIT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT_INIT [31:0]	H'0000 0000	R/W	Bytes counter initial value The field contains data page length in bytes (H'0000 0004 to H'FFFF FFFC). Specify a multiple of four as the number of bytes to be transferred.

31.2.20 DMA control register (DMA_CTRL)

DMA_CTRL is a control register for the DMA channel. This register defines the parameters of the DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DMA_ START	—	DMA_ MODE	DMA_ BURST[2:0]			—	DMA_ READY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7	DMA_START	0	R/W	Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. For more details see section 31.4.2 (2), DMA Description.
6	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
5	DMA_MODE	0	R/W	DMA work mode 0: the registers managed mode 1: the Scatter-Gather mode
4 to 2	DMA_BURST [2:0]	H'0	R/W	Burst Type Specify the DMA transfer type. 000: incrementing burst transfer (address increment) Others: Setting prohibited.
1	—	0	R	Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	DMA_READY	1	R	DMA ready flag The flag is set when transfer is completed.

31.2.21 DMA trigger level value register (DMA_TRIG_TLVL)

DMA_TRIG_TLVL specifies the data FIFO occupancy level that will trigger the DMA module. For more details see section 31.4.2 (2), DMA Description.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DMA_TRIG_TLVL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	DMA_TRIG_TLVL[7:0]	H'00	R/W	DMA trigger level The trigger level is counted using the 32-bit words as entity.

31.2.22 Mask register for the READ STATUS commands (STATUS_MASK)

The STATE_MASK bits are used to mark the ready/busy bits of the status byte in the NAND Flash device. These bits are used during the internal read status operation. In the ONFI specification, the user must mask all fields except RDY or ARDY (depending on the application).
The ERROR_MASK bits are used to mask unused fields when the controller automatically reads the status of the NAND Flash memory device. In the ONFI specification, the user must mask all fields except FAIL or FAILC (depending on the application).

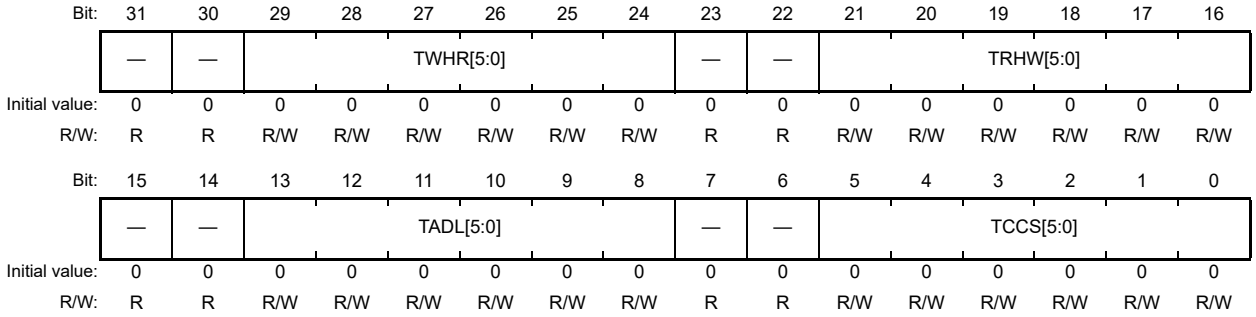
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERROR_MASK[7:0]								STATE_MASK[7:0]							
Initial value:	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	ER-ROR_MASK[7:0]	H'40	R/W	Error State Mask Used to mask the error bits if automatic read status feature is enabled.
7 to 0	STATE_ MASK[7:0]	H'40	R/W	State Mask Used to mask status bits when the read status command is used to obtain the NAND flash status.

31.2.23 Command sequence timing configuration register 0 (TIME_SEQ_0)

TIME_SEQ_0 controls the waveform timing parameters. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
29 to 24	TWHR[5:0]	H'00	R/W	NFWE# high to NFRE# low time
23, 22	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
21 to 16	TRHW[5:0]	H'00	R/W	NFRE# high to NFWE# low time
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	TADL[5:0]	H'00	R/W	ALE to data start time
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	TCCS[5:0]	H'00	R/W	Change column setup

31.2.24 Command sequence timing configuration register 1 (TIME_SEQ_1)

TIME_SEQ_1 controls the waveform timing parameters. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TRR[5:0]						—	—	TWB[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	TRR[5:0]	H'00	R/W	Read High to Read Low Time TRR is the time between a rising edge on the read/busy input line and the assertion of the read enable signal.
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	TWB[5:0]	H'00	R/W	tWB delay The time measured from a rising edge of the NFWE# signal to a falling edge on the RnB line.

31.2.25 Generic sequence timing configuration register 0 (TIME_GEN_SEQ_0)

TIME_GEN_SEQ_0 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
29 to 24	t0_d3[5:0]	H'00	R/W	Command to Data Time The time between the sending of a command and the data transfer.
23, 22	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
21 to 16	t0_d2[5:0]	H'00	R/W	Command to Delay Time The wait time between the sending of a command to the NAND flash memory device and the memory becoming ready.
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	t0_d1[5:0]	H'00	R/W	Command to Command time The time between two subsequent commands sent to the NAND Flash memory device.
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	t0_d0[5:0]	H'00	R/W	Command to Address time The time between sending a command and sending the address to the NAND Flash memory device.

31.2.26 Generic sequence timing configuration register 1 (TIME_GEN_SEQ_1)

TIME_GEN_SEQ_1 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
29 to 24	t0_d7[5:0]	H'00	R/W	Address to Data time The time between sending the address and data transferring.
23, 22	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
21 to 16	t0_d6[5:0]	H'00	R/W	Address to Delay Time The wait time after the sending of an address to the NAND flash memory device and the memory becoming ready.
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	t0_d5[5:0]	H'00	R/W	Address to Address Time The time between the sending of an address to the NAND flash memory device and that of the next address.
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	t0_d4[5:0]	H'00	R/W	Address to Command time The time between sending the address and sending a command to the NAND Flash memory device.

31.2.27 Generic sequence timing configuration register 2 (TIME_GEN_SEQ_2)

TIME_GEN_SEQ_2 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	t0_d11[5:0]						—	—	t0_d10[5:0]

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
29 to 24	t0_d11[5:0]	H'00	R/W	Data to Delay Time The wait time between the data transfer to the NAND flash memory device and the memory becoming ready.
23, 22	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
21 to 16	t0_d10[5:0]	H'00	R/W	Data to Command time The time between data transferring and sending a command to the NAND Flash memory device.
15, 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 8	t0_d9[5:0]	H'00	R/W	Delay to Command Time The time between the memory becoming ready and the sending of a command to the NAND flash memory device.
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	t0_d8[5:0]	H'00	R/W	Delay to Data time The time between waiting until the memory is ready and data transferring.

31.2.28 Generic sequence timing configuration register 3 (TIME_GEN_SEQ_3)

TIME_GEN_SEQ_3 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	t0_d12[5:0]	H'00	R/W	Data to Sequence End Time The time between the data transferring phase and the end of the sequence. The sequence is ended when any other sequence phases are not enabled.

31.2.29 Timing configuration register (TIMINGS_ASYN)

TIMINGS_ASYN controls the timing parameters for two waveforms shown in Figure 31.2 (upper waveform: read; lower waveform: write).

All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TRWH[3:0]				TRWP[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 4	TRWH[3:0]	H'0	R/W	NFRE# or NFWE# high hold time
3 to 0	TRWP[3:0]	H'0	R/W	NFRE# or NFWE# pulse width

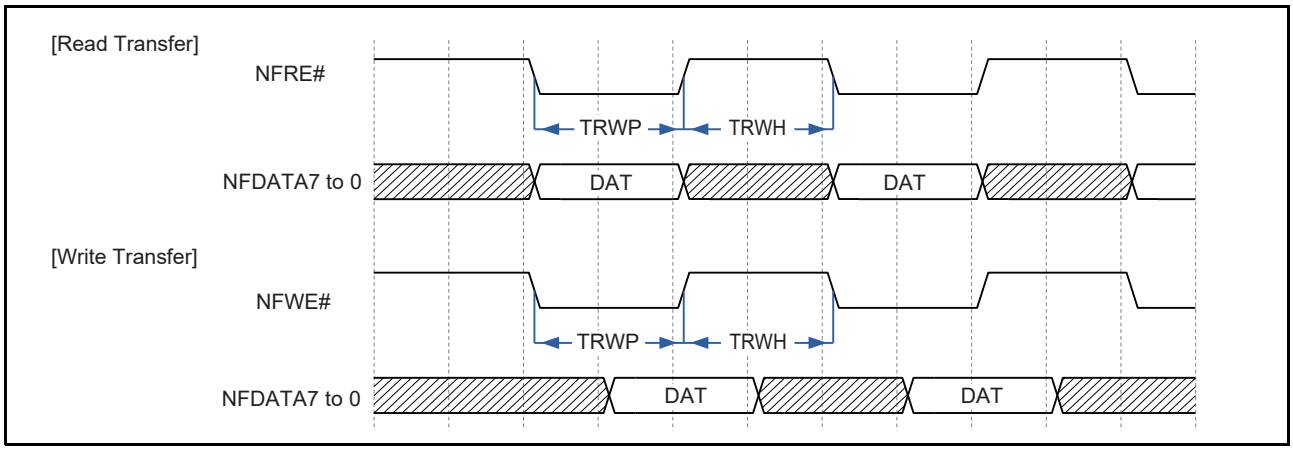

Figure 31.2 Asynchronous Timings

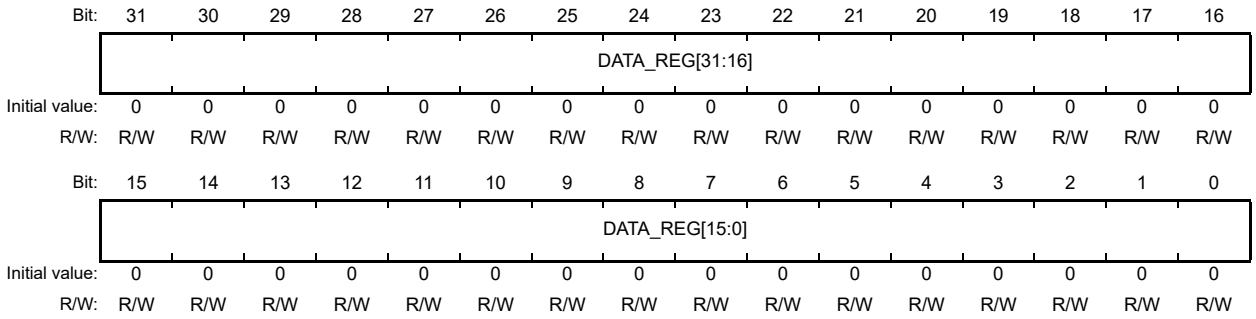
31.2.30 Data register (DATA_REG)

DATA_REG is used for storage of the data that is read in the registered mode. The registered mode is allowed in the read direction only.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA_REG [31:0]	H'0000 0000	R/W	DATA_REG

31.2.31 Data register size selection register (DATA_REG_SIZE)

DATA_REG_SIZE allows the selection of data size in the registered work mode. The data size in the registered mode is limited to four bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DATA_REG_SIZE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1, 0	DATA_REG_SIZE[1:0]	H'0	R/W	DATA_REG_SIZE register Allows selection of the number of valid bytes in the DATA register: 00: single byte valid 01: two lower bytes valid 10: three lower bytes valid 11: all four bytes valid

31.2.32 FIFO control register (FIFO_INIT)

FIFO_INIT is used to clear (flush) the FIFO.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFO_INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	FIFO_INIT	0	W	FIFO Initialization bit The setting of this bit causes the flushing of FIFO. It is not necessary to set this bit before sending each command to the NAND Flash memory device. This bit is only used when the previous FIFO contents need to be cleared before a new operation.

31.2.33 FIFO status register (FIFO_STATE)

FIFO_STATE contains the data buffer status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DF_W_EMPTY	DF_R_FULL	CF_ACCPT_W	CF_ACCPT_R	CF_FULL	CF_EMPTY	DF_W_FULL	DF_R_EMPTY
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7	DF_W_EMPTY	1	R	FIFO empty state bit This bit indicates that there is no data in the FIFO available. This flag is valid for the write direction.
6	DF_R_ FULL	0	R	FIFO full state bit This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the read direction.
5	CF_ACCPT_W	0	R	Command FIFO accept flag – write direction If this flag is set, the next write access will finish with an additional delay.
4	CF_ACCPT_R	1	R	Command FIFO accept flag – read direction If this flag is set, the command FIFO will accept a read transfer with a delay.
3	CF_FULL	0	R	Command FIFO full flag This bit indicates the status of the command FIFO. Do not use this bit to check if the FIFO can accept the next transfer.
2	CF_EMPTY	1	R	Command FIFO empty flag This bit indicates the status of the command FIFO. Do not use this bit to check if the FIFO can accept the next transfer.
1	DF_W_FULL	0	R	FIFO full state bit This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the write direction.
0	DF_R_EMPTY	1	R	FIFO empty state bit This bit indicates that there is no data in the FIFO available. This flag is valid for the read direction.

31.2.34 MLUN register (MLUN)

MLUN contains the LUN address offset bits and number of available LUNs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	LUN_SEL[1:0]		—	—	—	—	—	MLUN_IDX[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	LUN_SEL[1:0]	00	R/W	Number of the logical units (LUNs) 00: Two 01: Four 10: Eight
7 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2 to 0	MLUN_IDX[2:0]	000	R/W	LUN address offset These bits hold the offset to the LUN address from bit zero of the last address byte. These bits indicate the bit index for the address that identifies valid LUNs.

31.2.35 CMD ID initial value register (CMD_MARK)

CMD_MARK allows to write initial value to the command marking generator in the register Slave I/F Unit (SIU).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CMD_ID[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	CMD_ID[7:0]	H'00	W	CMD ID initial value

31.3 Operation

31.3.1 Command Generation

This NAND flash controller provides parameterized command sequences to support future functional expansion (new commands) of NAND flash devices.

(1) Instruction Encoding

The controller instruction field is constant and has 32 bits. The instruction field contains the command sequence code and optional parameters. Those parameters are:

- The command codes present in the instruction sequence.
- The flag used to select data destination; possible options are data register and FIFO module.
- The flag used to select data source/sink for the command sequence. The possible choices are the registers or the DMA unit.
- The command sequence code.

If the given command sequence does not use all parameter fields, unused fields are ignored. The instruction encoding scheme is presented in the table below:

Table 31.5 Instruction Encoding

Field Name	Bits	Description
CMD_2	[31:24]	Code of the third command in a sequence
CMD_1/CMD3*1	[23:16]	Code of the second or fourth command in a sequence
CMD_0	[15:8]	Code of the first command in a sequence
DATA_SEL	[7]	Data register/FIFO select 0 – FIFO selected 1 – DATA register selected
INPUT_SEL	[6]	Input module select flag 0 – Select the SIU module as input 1 – Select the DMA module as input
CMD_SEQ	[5:0]	Command code.

Note 1. Depending on the selected command sequence, this field will store the CMD1 or CMD3 code. Both commands are never used in a single sequence.

(2) Command Sequence Encoding

The NAND Flash controller defines the set of commands, addresses and data sequences that allows implementation of all present and many future instructions. The following description of those sequences is adequate to define most of the future NAND Flash device instructions.

Table 31.6 contains the command sequence encoding details. Each sequence is encoded according to the fields defined in GENERIC_SEQUENCE_CTRL.
For more details, section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

Table 31.6 Command Sequence Encoding

Sequence Symbol	Sequence Encoding	CMD0	CMD1	CMD2	CMD3	COL _A0*2	COL _A1	ROW _A0	ROW _A1	DATA _EN	DELAY _EN	IMD _SEQ*3
SEQ_0	000000	√	—	—	—	—	—	—	—	—	DELAY_1	—
SEQ_1	100001	√	—	—	—	1	—	—	—	√	—	—
SEQ_2	100010	√	—	—	—	1	—	—	—	√	DELAY_0	—
SEQ_3	000011	√	—	—	—	1	—	—	—	√	DELAY_1	—
SEQ_4	100100	√	—	—	—	—	—	—	—	√	—	√
SEQ_5	100101	√	—	—	—	—	—	3	—	√	—	√
SEQ_6	100110	√	—	√	—	2(1)	—	—	—	√	—	—
SEQ_7	100111	√	—	√	—	2(1)	—	3	—	√	DELAY_0	—
SEQ_8	001000	√	—	—	—	2(1)	—	—	—	√	—	—

SEQ_12	001100	√	√	—	—	2(1)	—	3	—	√	DELAY_1	—
SEQ_13	001101	√	—	—	—	2(1)	—	3	—	√	DELAY_1	—
SEQ_14	001110	√	√	—	—	—	—	3	—	—	DELAY_1	—
SEQ_15	101111	√	—	√	√	2	2	3	3	√	DELAY_0	—
SEQ_17	110001	√	—	—	—	2(1)	—	3	—	√	DELAY_1	—
SEQ_18	110010	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
SEQ_19	010011	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
SEQ_20	110100	√	—	—	—	—	—	3	—	—	DELAY_1	—
SEQ_21	110101	√	—	—	—	1	—	—	—	—	—	—
SEQ_22	110110	√	—	√	—	2(1)	2	—	3	√	DELAY_0	—
SEQ_23	010111	√	√	—	—	—	—	3	—	√	DELAY_1	—
SEQ_24	011000	√	—	√	√	—	—	3	3	—	DELAY_0	—
SEQ_25	111001	√	—	√	√	2(1)	2	3	—	√	—	—

Note 1. SEQ_18 and SEQ_19 are the parameterized Generic Sequences. GEN_SEQ_CTRL defines which parts of sequences are executed.

Note 2. The value given in the brackets relates to the small block mode. In this mode, the controller sends only a single byte as the column address.

Note 3. MD_SEQ - The command will be sent immediately.

Note: Gray rows – read from NAND Flash memory;
White rows – write to NAND Flash memory;
Blue rows – Non- directional commands

(a) SEQ_0 Sequence

This non-directional sequence is composed from only one command. After the command is written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (tWB) passes or the device is ready, the sequence ends. The figure below shows the sequence.

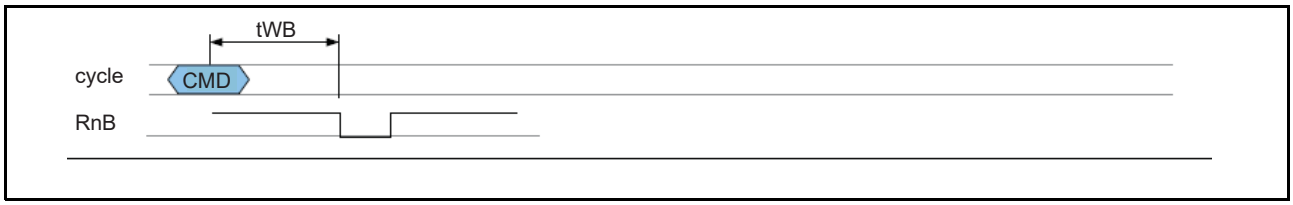

Figure 31.3 SEQ_0 Sequence

(b) SEQ_1 Sequence

This is a read-sequence that is composed from a single command cycle, single address cycle and the single data cycle with a programmable number of read sequences. After the address sequence is finished, the controller measures the standard delay of first data read after the last write (tWHR). Next, the read data words are written to the FIFO module. The input module is selected by the INPUT_SEL field of the COMMAND register, the source for the address is placed in the ADDR0_COL register, and the commend code is stored in the CMD_0 field. The figure below shows the sequence execution:

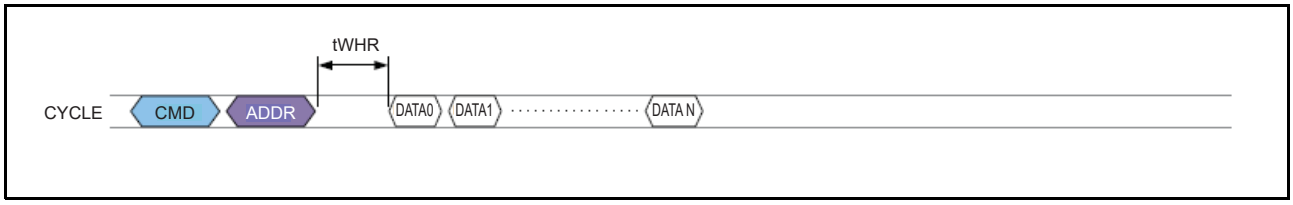

Figure 31.4 SEQ_1 Sequence

(c) SEQ_2 Sequence

This is a read-sequence and it is similar to the SEQ_1 sequence except that after the address cycle the controller expects that device goes to the busy state. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The figure below shows the sequence execution:

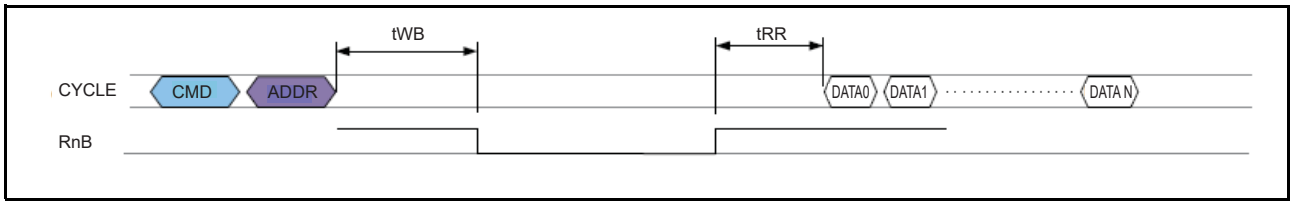

Figure 31.5 SEQ_2 Sequence

(d) SEQ_3 Sequence

This is a write-sequence that is composed from a single command cycle, single address cycle and single data cycle with a programmable number of write sequences. After the address sequence is finished, the controller measures the standard delay of first data write after the last address cycle (tADL). The written words are read from the FIFO module.
The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The input module is selected by the INPUT_SEL field of the COMMAND register; the source for the address is placed in the ADDR0_COL register, and the commend code is stored in the CMD_0 field. The figure below shows the sequence execution:

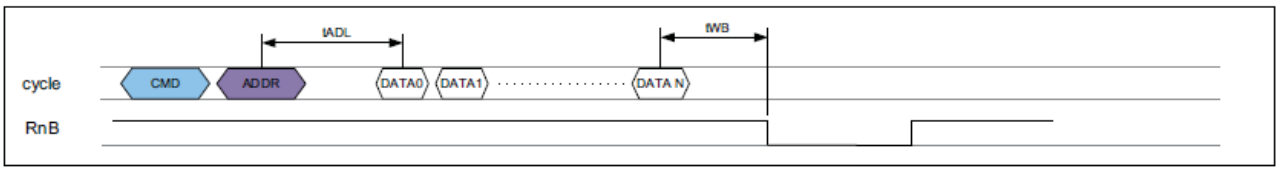

Figure 31.6 SEQ_3 Sequence

(e) SEQ_4 Sequence

This is a special read-sequence that is used to implement the read status command sequences. The command is sent immediately. The sequence is composed of a single command cycle and a single data cycle. Between those cycles, the delay is counted (tWHR). The command code is read from the CMD_0 field.
When the DATA register is selected in the COMMAND register, the data is stored in the DATA register. The user defines the number of data in the DATA_REG_SIZE register. The registered mode is allowed only for the read direction.
When the FIFO register is selected in the COMMAND register, the data is stored in the FIFO. Because user has to change DATA_SIZE register, the command will be sent when all memories are ready and the Controller is in the idle state. The figure below shows the sequence execution:

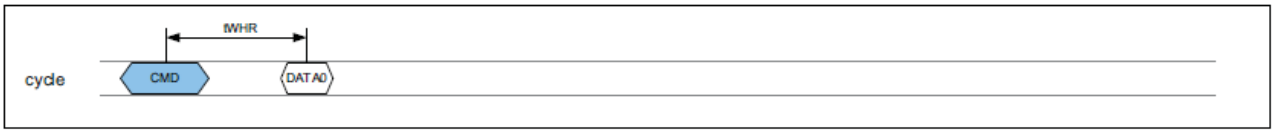

Figure 31.7 SEQ_4 Sequence

(f) SEQ_5 Sequence

This is a read-sequence and it is similar to the SEQ_4 sequence. The command is sent immediately. The only difference is that after the command cycle, an additional address cycle is performed. The ADDR0_ROW register is used in this sequence. The figure below shows the sequence execution:

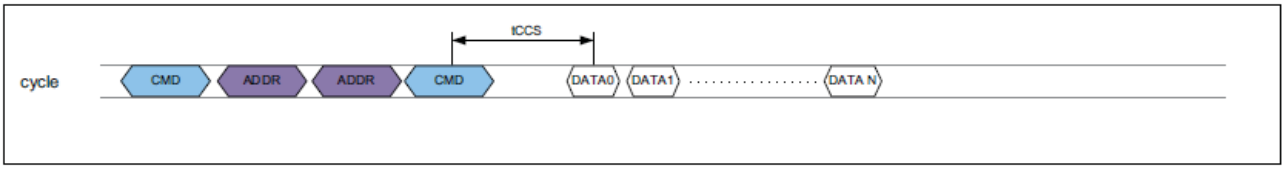

Figure 31.8 SEQ_5 Sequence

(g) SEQ_6 Sequence

This is a read-sequence. The sequence of command cycle, address cycle, command cycle is executed. After that, the delay from the change column to the next operation (tCCS) is measured. Finally, the read data cycle is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

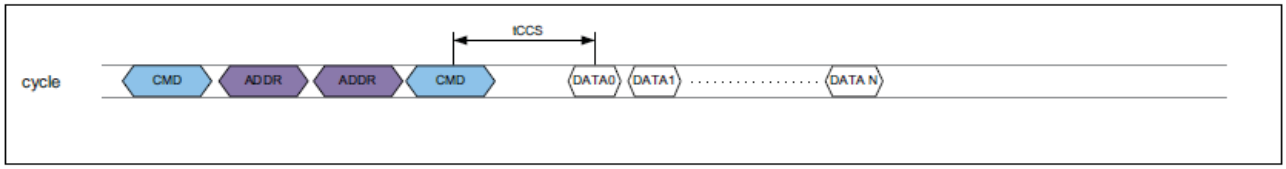

Figure 31.9 SEQ_6 Sequence

(h) SEQ_7 Sequence

This read-sequence is similar to the SEQ_6 sequence, differing only because the address cycle in this sequence is composed of five bytes (ADDR0_COL and ADDR0_ROW) instead of two bytes. All else is the same as in the SEQ_6 sequence. The figure below shows the sequence execution:

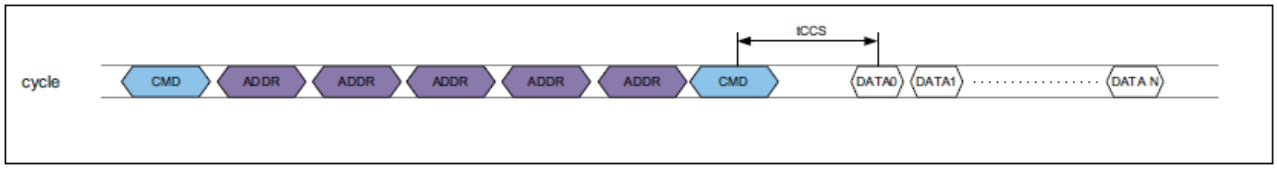

Figure 31.10 SEQ_7 Sequence

(i) SEQ_8 Sequence

This is a write-sequence. First, the sequence of command cycle and two bytes address cycle is executed. Next, the delay after the column address changes (tCCS) is measured. Finally, the single data cycle with programmable number of write sequences is executed. The first command code is encoded in the CMD_0 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

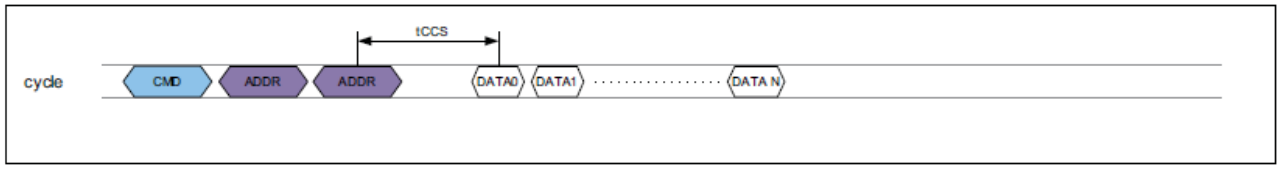

Figure 31.11 SEQ_8 Sequence

(j) SEQ_9 Sequence

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

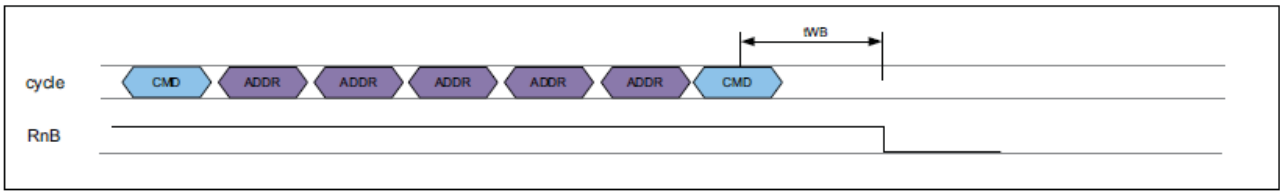

Figure 31.12 SEQ_9 Sequence

(k) SEQ_10 Sequence

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. Finally data block is read. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

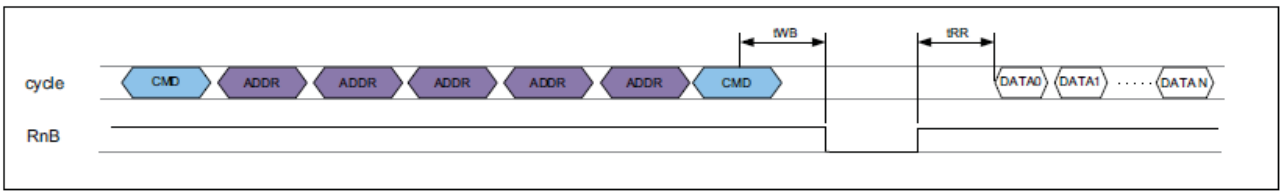

Figure 31.13 SEQ_10 Sequence

(l) SEQ_11 Sequence

This is the read-sequence. The first step is to execute the command cycle. Next, the device goes to the busy state. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. As soon as the device reaches the ready state, the write data cycle with configurable read sequences is executed. The command code is encoded in the CMD_0 instruction field; the input module is selected by the INPUT_SEL field. The number of transferred bytes are configured using the DATA_SIZE register. The figure below shows the sequence execution:

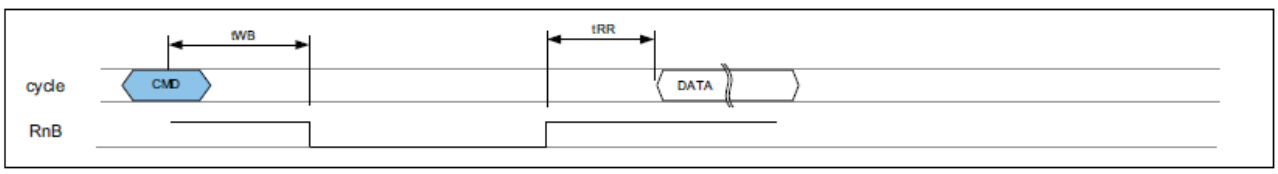

Figure 31.14 SEQ_11 Sequence

(m) SEQ_12 Sequence

This is a write-sequence. The SEQ_12 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL) and, after the second command cycle, another delay is measured (tWB). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

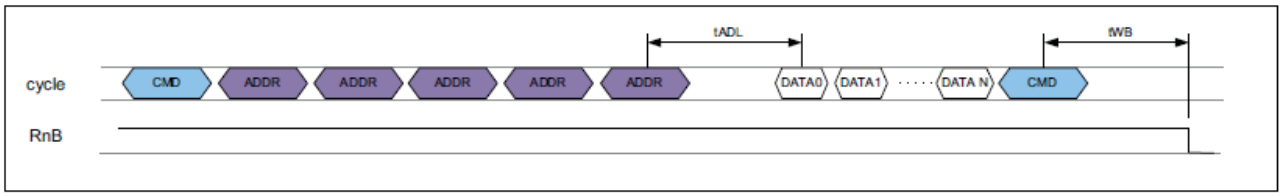

Figure 31.15 SEQ_12 Sequence

(n) SEQ_13 Sequence

This is a write-sequence. The SEQ_13 sequence is a series of command cycle and address cycles, data cycle with a configurable number of write operations. Between the last address cycle and first data cycle, a delay is measured (tADL). The command code is encoded in the CMD_0 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

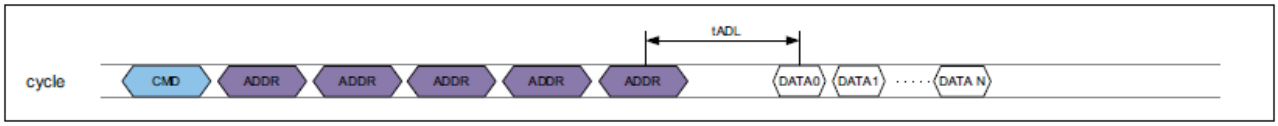

Figure 31.16 SEQ_13 Sequence

(o) SEQ_14 Sequence

This is a non-directional sequence. First, the series of command cycle, address cycle, command cycle is executed. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW and ADDR0_COL registers are used in this sequence. The figure below shows the sequence execution:

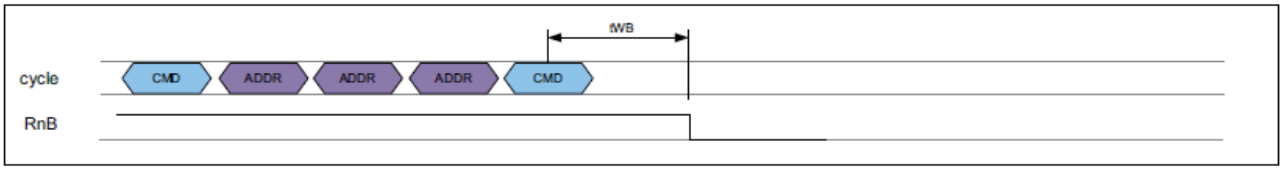

Figure 31.17 SEQ_14 Sequence

(p) SEQ_15 sequence

This is a read-sequence. First, the series of command cycle, address cycle, second command cycle, second address cycle, third command cycle is executed. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. After the NAND Flash device returns to the ready state, the data sequence, with a configurable number of read operations, is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the third command code is encoded in the CMD_2 instruction field. In this sequence, both address registers are used. The ADDR0_ROW and ADDR0_COL register content is sent after the first command in the sequence, the ADDR1_ROW and ADDR1_COL register content is sent after the second command in the sequence. The figure below shows the sequence execution:

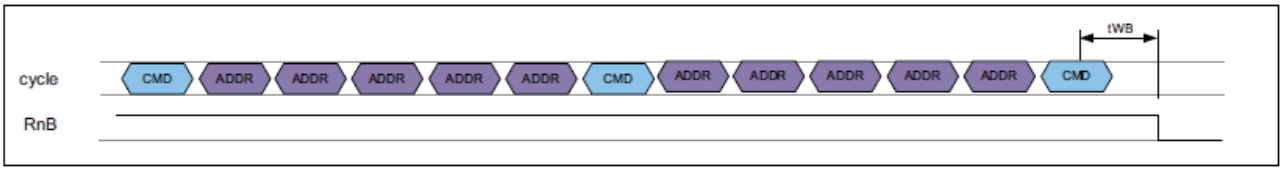

Figure 31.18 SEQ_15 Sequence

(q) SEQ_17 sequence

This is a read-sequence. This sequence is similar to the SEQ_10 sequence, except that the second command cycle is omitted. This sequence is implemented to use small block memories. The controller sends only four bytes of the address when the small block mode is enabled. The figure below shows the sequence execution:

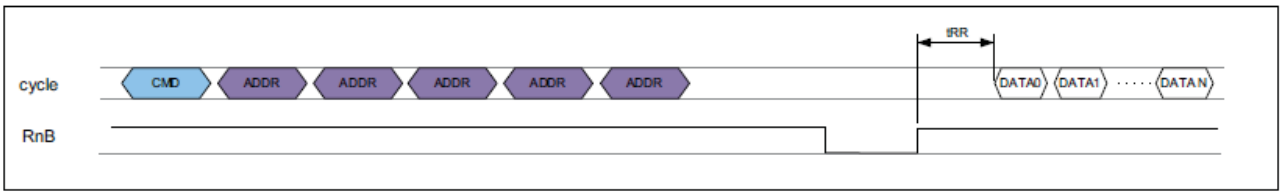

Figure 31.19 SEQ_17 Sequence

(r) SEQ_18 sequence

This generic read sequence is described in detail in section 31.3.2, Generic Sequence.

(s) SEQ_19 sequence

This generic write sequence is described in detail in section 31.3.2, Generic Sequence.

(t) SEQ_20 sequence

This non-directional sequence is composed from one command and three addresses bytes. After the command and addresses are written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (tWB) passes or the device is ready, the sequence ends. The figure below shows the sequence execution:

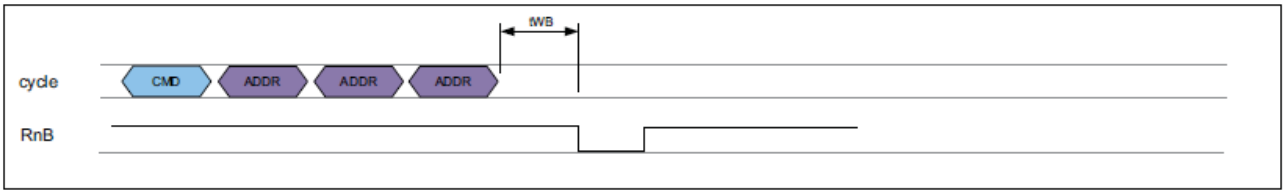

Figure 31.20 SEQ_20 Sequence

(u) SEQ_21 sequence

This non-directional sequence is composed from one command and one addresses byte. After the command and address are written to the NAND Flash device, the sequence ends. The figure below shows the sequence execution:

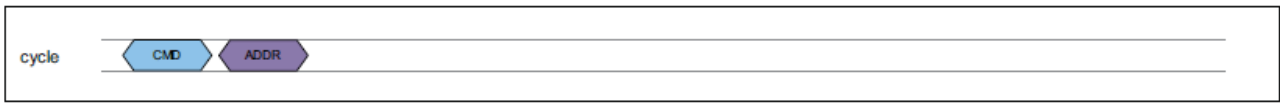

Figure 31.21 SEQ_21 Sequence

(v) SEQ_22 sequence

This is a read-sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL, ADDR1_COL and ADDR1_ROW registers are used in this sequence. The figure below shows the sequence execution:

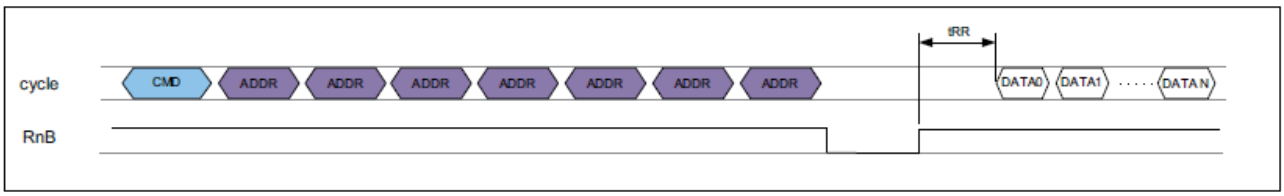

Figure 31.22 SEQ_22 Sequence

(w) SEQ_23 sequence

This is a write-sequence. The SEQ_23 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL) and, after the second command cycle, another delay is measured (tWB). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

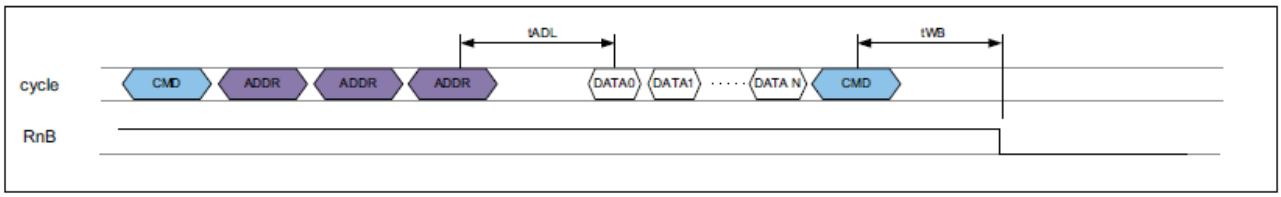

Figure 31.23 SEQ_23Sequence

(x) SEQ_24 sequence

This is a write-sequence. It is composed from the three commands cycles and two addresses cycles. Both addresses cycle contain the row address part. After the last command cycle the tWB delay is measured. The figure below shows the sequence execution.

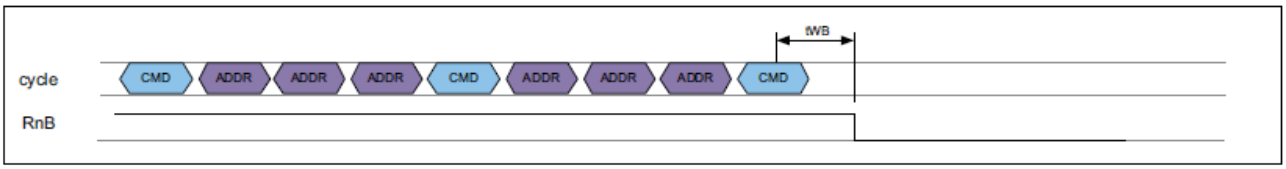

Figure 31.24 SEQ_24 Sequence

(y) SEQ_25 sequence

This is a read-sequence. It is composed from the three commands cycles and two addresses cycles. the first addresses cycle contain the column and row address part. The second address cycle contain only the column address part. After the last command cycle the tWHR delay is measured. The figure below shows the sequence execution.

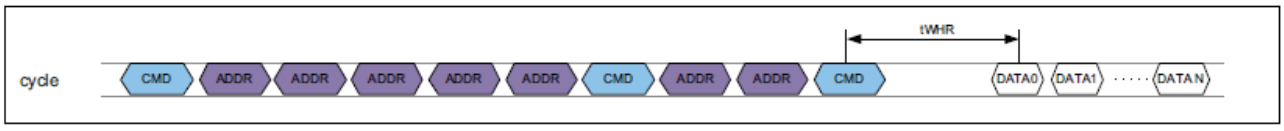

Figure 31.25 SEQ_25 Sequence

(z) SEQ_26 sequence

This is a write-sequence. The SEQ_26 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

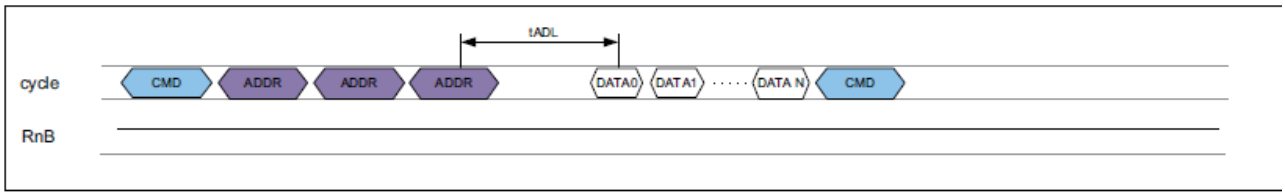

Figure 31.26 SEQ_26 Sequence

31.3.2 Generic Sequence

There will be cases where the set of predefined sequences above will not be sufficient to handle a new command sequence. If that occurs, the generic sequence feature of the NAND flash controller can be used.
This sequence is designed to mimic almost every available command supported by the NAND Flash devices; however, additional effort required to trigger such commands.
Generic sequence is executed in the following steps:

CMD0 – The first command in the sequence

The value of this command is stored in the CMD_0 field of the COMMAND register, described in section 31.2.1, Controller commands register (COMMAND).

ADDR0 – The first address sequence

This is enabled if the COL_A0 and ROW_A0 fields in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL) have values other than zero. In this phase, the address is sent to the NAND Flash device and is read from the ADDR0_COL and ADDR0_ROW registers. The number of the bytes in the address cycle is configured by the COL_A0 and ROW_A0 fields of the GEN_SEQ_CTRL register.

CMD1 – The fourth command in the sequence

The value of this command is stored in the CMD_1 field of the COMMAND register, described in section 31.2.1, Controller commands register (COMMAND). This is enabled by the CMD1_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

ADDR1 – The second address in the sequence

This is enabled if the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL) have a value other than zero. In this phase, the address is sent to the NAND Flash device from the ADDR1_COL and ADDR1_ROW registers.
The number of bytes in the address cycle is configured by the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register.

CMD2 – The third command in the sequence

The value of this command is stored in the CMD_2 field of the COMMAND register described in section 31.2.1, Controller commands register (COMMAND). This is enabled by the CMD2_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

DELAY0 – Waiting for the device to return to the ready state and continue the sequence.

This is enabled by the DELAY_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). Only one delay phase can be present in the generic sequence. For more details, see section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

DATA – The data phase of the sequence

This is enabled by the DATA_EN field in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). Additionally, the transfer direction must be selected by the sequence number. Sequence number 18 reads data from the NAND Flash memory, sequence number 19 writes data to the NAND Flash memory. The size of the transferred data block is configured by the DATA_SIZE register value.

CMD3 – The second command in the sequence

This is enabled by the CMD3_EN field in the GEN_SEQ_CTRL register described in the section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). The value of this command is stored in the CMD_3 field of the GEN_SEQ_CTRL register.

DELAY1 – Waiting for the device to return to the ready state and finish the sequence.

This is enabled by the DELAY_EN field in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). The controller waits for the device to return to the ready state and finish the sequence. Only one delay phase can be present in generic sequence.

The figure below presents the generic sequence composition:

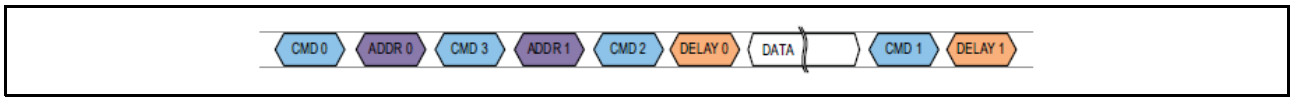

Figure 31.27 Generic Sequence

There are few constraints on the generic sequence usage:

- The DEL0 and DEL1 delay phases cannot both be enabled in a single command sequence.
- The TIMINGS _ASYN register must be set even when the generic sequence is used.

It is possible to force an immediate command sequence execution by enabling the IMD_SEQ bit in the GEN_SEQ_CTRL register. In this case, the triggered command will be executed even if the previously sent command for a selected device is not completed. If both the IMD_SEQ and DATA_EN flags are enabled in a single sequence, then the register must be selected as data source/sink. The IMD_SEQ is valid only for the read direction. This feature is intended to implement all state read operations.
After each step of the generic sequence, the programmable time delay is measured. These delays are configured using the TIME_GEN_SEQ[0-3] registers. Refer to the TIME_GEN_SEQ[0-3] registers description for further information and see figures below.

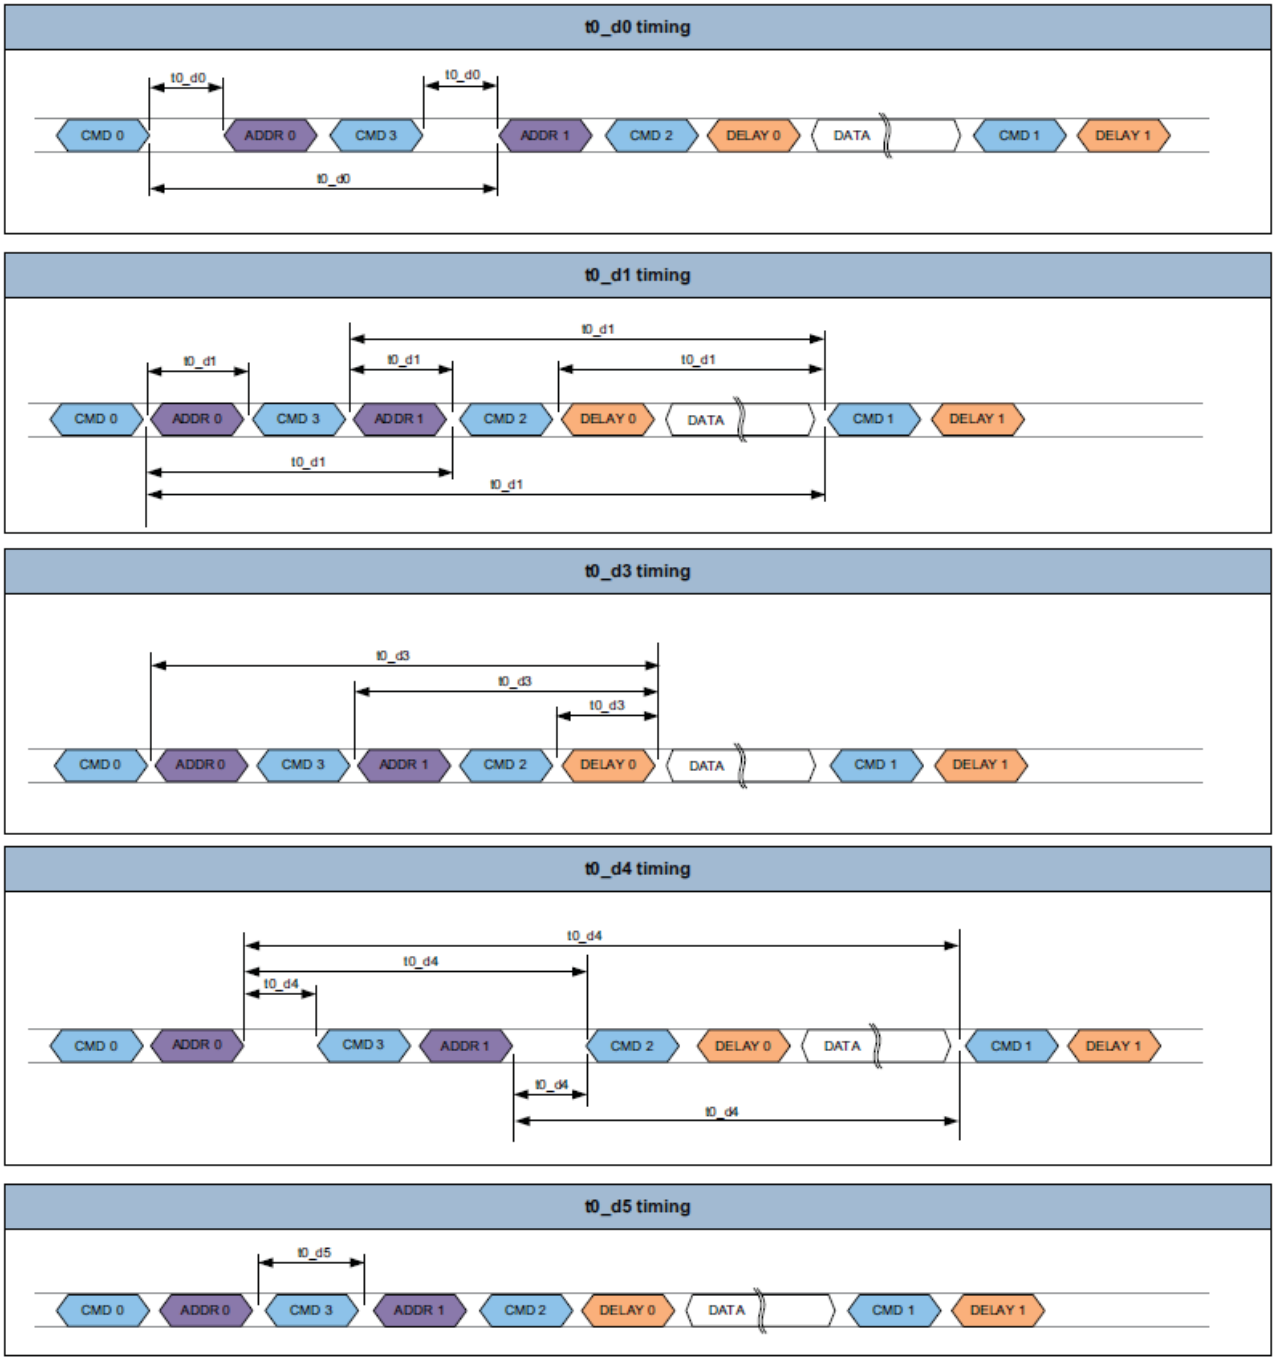

Figure 31.28 Generic Sequence Timing parameters (1)

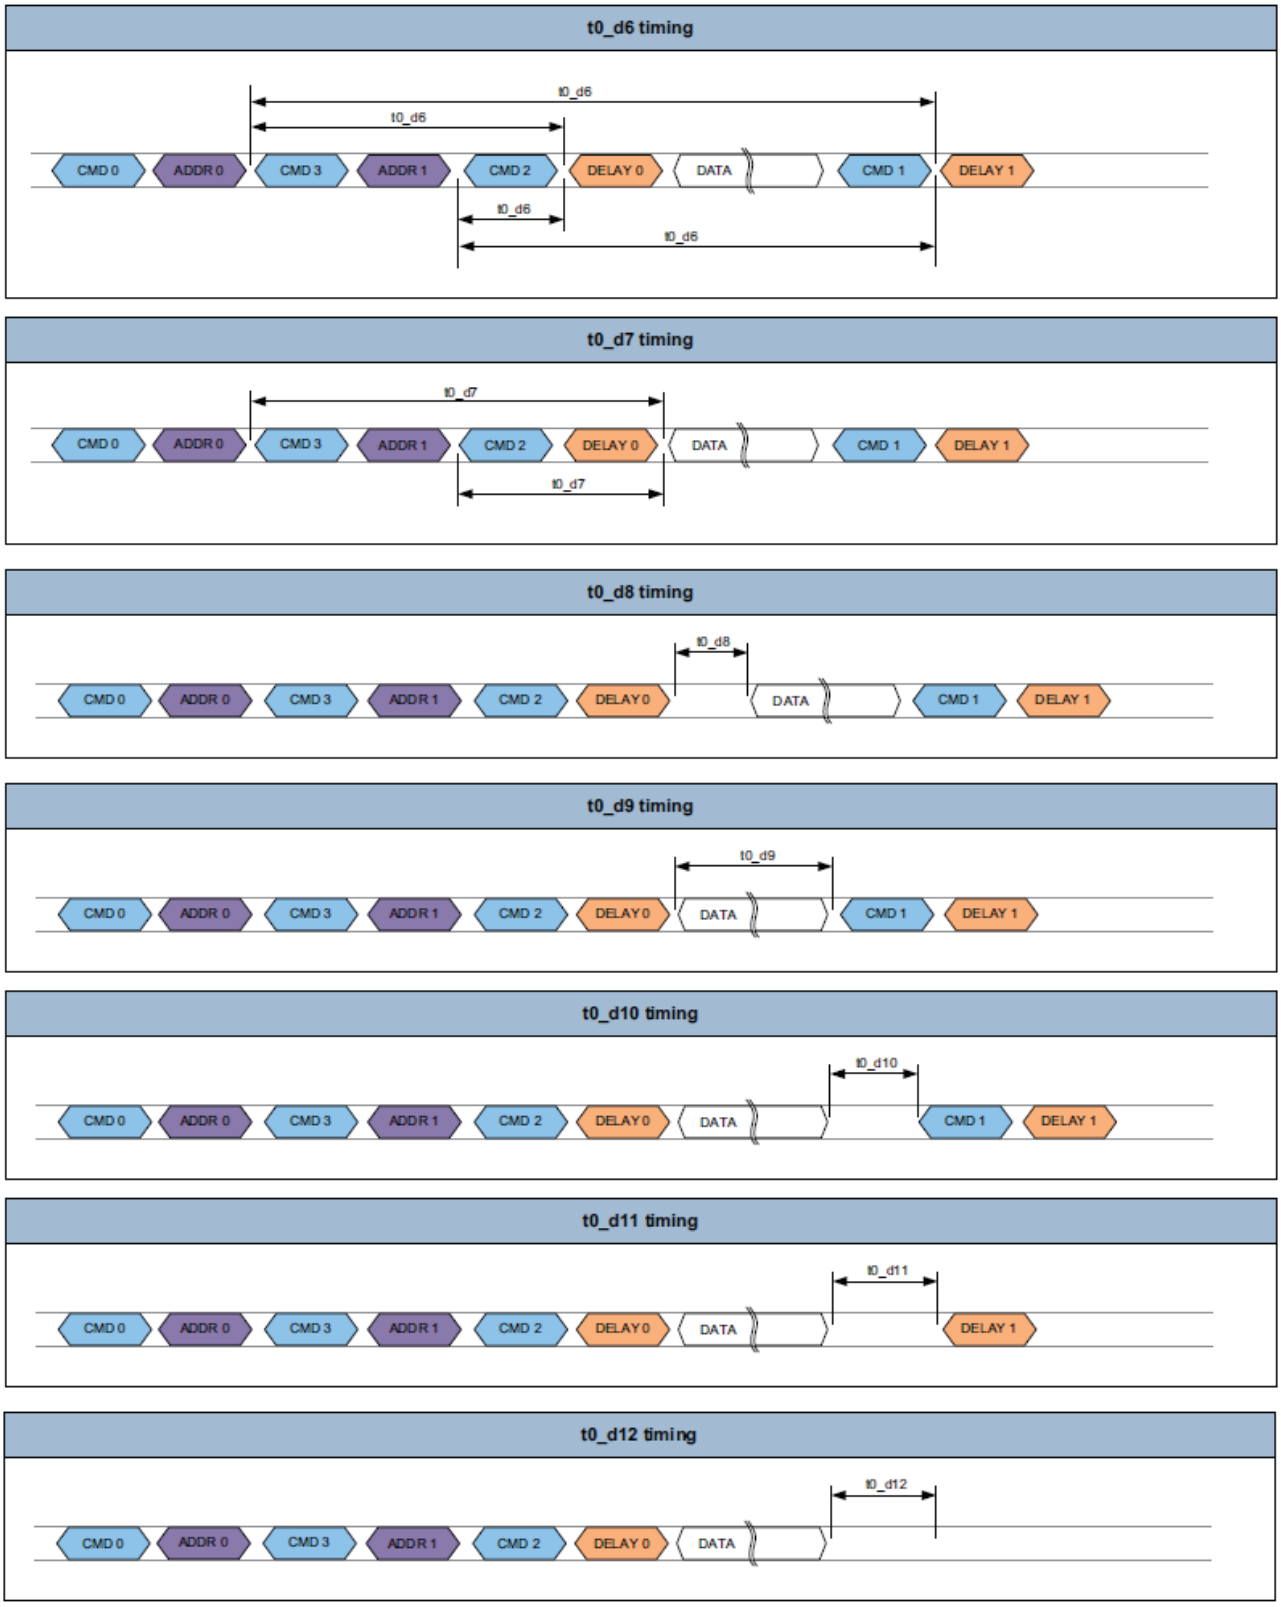

Figure 31.29 Generic Sequence Timing parameters (2)

31.3.3 Instructions

The implementation of the instruction set presented at this point is an example of how to use the instruction encoding scheme presented in section 31.3.1 (1), Instruction Encoding. This chapter and the command sequences presented previously give sufficient information to implement new commands and command sequences for future NAND Flash devices.

(1) Instructions Set

The table below contains the basic instruction defined to implement the all command sequences accessible in the ONFI 1.x standards.

Table 31.7 Instructions set

Instruction	CMD_0	CMD_1/CMD_3	CMD_2	CMD_SEQ	Send when Memory is Busy
Reset Commands					
RESET	H'FF	—	—	SEQ_0	No
Identification Operations					
READ ID	H'90	—	—	SEQ_1	No
READ PARAMETER PAGE	H'EC	—	—	SEQ_2	No
READ UNIQUE ID	H'ED	—	—	SEQ_2	No
Configuration Operations					
GET FEATURES	H'EE	—	—	SEQ_2	No
SET FEATURES	H'EF	—	—	SEQ_3	No
Status Operations					
READ STATUS	H'70	—	—	SEQ_4	Yes
SELECT LUN WITH STATUS	H'78	—	—	SEQ_5	Yes
LUN STATUS	H'71	—	—	SEQ_5	Yes
DEVICE STATUS	H'72	—	—	SEQ_4	Yes
VOLUME SELECT	H'E1	—	—	SEQ_21	Yes
Column Address Operations					
CHANGE READ COLUMN	H'05	—	H'E0	SEQ_6	No
SELECT CACHE REGISTER	H'06	—	H'E0	SEQ_7	No
CHANGE WRITE COLUMN	H'85	—	—	SEQ_8	No
CHANGE ROW ADDRESS	H'85	H'11	—	SEQ_12	No
Read Operations					
READ PAGE	H'00	—	H'30	SEQ_10	No
READ PAGE CACHE	H'31	—	—	SEQ_11	No
READ PAGE CACHE LAST	H'3F	—	—	SEQ_11	No
READ MULTIPLANE	H'00	H'32	—	SEQ_9	No
TWO PLANE PAGE READ	H'00	H'00	H'30	SEQ_15	No
QUEUE PAGE READ	H'07	—	H'37	SEQ_22	No
Program Operations					
PROGRAM PAGE	H'80	H'10	—	SEQ_12	No
PROGRAM PAGE IMD	H'80	H'10	—	SEQ_23	No
PROGRAM PAGE DEL	H'80	H'13	—	SEQ_23	No
PROGRAM PAGE 1	H'80	—	—	SEQ_13	No
PROGRAM PAGE CACHE	H'80	H'15	—	SEQ_12	No
PROGRAM MULTIPLATE	H'80	H'11	—	SEQ_12	No
WRITE PAGE	H'10	—	—	SEQ_0	No

Table 31.7 Instructions set

Instruction	CMD_0	CMD_1/CMD_3	CMD_2	CMD_SEQ	Send when Memory is Busy
WRITE PAGE CACHE	H'15	—	—	SEQ_0	No
WRITE MULTIPLATE	H'11	—	—	SEQ_0	No
Erase Operation					
ERASE BLOCK	H'60	H'D0	—	SEQ_14	No
ERASE MULTIPLATE	H'60	H'D1	—	SEQ_14	No
Copyback Operation					
COPYBACK READ	H'00	—	H'35	SEQ_10	No
COPYBACK PROGRAM	H'85	H'10	—	SEQ_9	No
COPYBACK PROGRAM1	H'85	—	—	SEQ_13	No
COPYBACK MULTIPLATE	H'85	H'11	—	SEQ_12	No
OTP Operation					
PROGRAM OTP	H'A0	H'10	—	SEQ_12	No
DATA PROTECT OTP	H'A5	H'10	—	SEQ_9	No
PAGE READ OTP	H'AF	—	H'30	SEQ_10	No

(2) RESET Command

(a) Command Description

The RESET command is used to put a target into a known condition and to abort command sequences in progress.

(b) Command Encoding

The RESET instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.8 RESET Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'FF	—	—	SEQ_0_ID

(3) READ ID Command

(a) Command Description

The READ ID command is used to read identifier codes programmed into the target. This command is accepted by the target only when all LUNs on the target are in the IDLE state.
When the command is followed by an address cycle of H'00, the target returns a 5-byte identifier code that includes the manufacturer's ID, device configuration, and part-specific information.
When the READ ID command is followed by an address cycle of H'20, the target returns the 4-byte ONFI identifier code.

(b) Command Encoding

The READ ID instruction uses the SEQ_1 commands sequence. The command is encoded, as shown in the table below:

Table 31.9 READ ID Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'90	0/1	0/1	SEQ_1_ID

(4) READ PARAMETER PAGE Command

(a) Command Description

The READ PARAMETER PAGE command is used to read the ONFI parameter page programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.
When the command is followed by an address cycle of H'00, the target goes into busy state. After the read process is completed, the controller enables the data output mode to read the parameter page.

(b) Command Encoding

The READ PARAMETER PAGE instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.10 READ PARAMETER PAGE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'EC	0/1	0/1	SEQ_2_ID

(5) READ UNIQUE ID Command

(a) Command Description

The READ UNIQUE ID instruction is used to read a unique identifier programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.
When the address cycle of H'00 is written to the target, then the target goes into busy state. After the read process is complete, the controller enables the data output mode to read the unique ID. Sixteen copies of the unique ID data are stored in the device. Each copy is 32 bytes. The first 16 bytes are unique data and the second 16 bytes are the complement of the first 16 bytes. The application program will XOR the first 16 bytes with the second 16 bytes. If the result is 16 bytes of H'FF, then that copy of the unique ID data is correct. In the event that there is a non-H'FF result, the application program repeats the XOR operation on a subsequent copy of the unique ID data.

(b) Command Encoding

The READ UNIQUE ID instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.11 READ UNIQUE ID Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'ED	0/1	0/1	SEQ_2_ID

(6) GET FEATURES Command

(a) Command Description

The GET FEATURES instruction reads the sub-feature parameters (P1-P4) from the specified feature address. This command is accepted by the target only when all LUNs on the target are idle.
When the H'EE command is followed by a feature address, the target goes into busy state. After the target internal read operation completes, the controller enables the data output mode to read the sub-feature parameters.

(b) Command Encoding

The GET FEATURES instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.12 GET FEATURES Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'EE	0/1	0/1	SEQ_2_ID

(7) SET FEATURES Command

(a) Command Description

The SET FEATURES instruction writes the sub-feature parameters (P1-P4) to the specified feature address to enable or disable target-specific features. This command is accepted by the target only when all LUNs on the target are idle.
The H'EF command is followed by a valid feature address. The possible address value depends on the features set implemented in the target device. The address cycle is followed by the configurable number of data cycles. Values of the address and data encoding scheme allowed are found in the device vendor documentation.

(b) Command Encoding

The SET FEATURES instruction uses the SEQ_3 commands sequence. The command is encoded, as shown in the table below:

Table 31.13 SET FEATURES Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'EF	0/1	0/1	SEQ_3_ID

(8) READ STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the READ STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7:0] for each data output request.
The READ STATUS command returns the status of the most recently selected LUN.

(b) Command Encoding

The READ STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 31.14 READ STATUS Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'70	0/1	—	SEQ_4_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state.
The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(9) DEVICE STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the DEVICE STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.
The DEVICE STATUS command returns the status of the most recently selected LUN.

(b) Command Encoding

The DEVICE STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 31.15 DEVICE STATUS Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'72	0/1	—	SEQ_4_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state.
The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(10) VOLUME SELECT Command

(a) Command Description

This command is accepted by all initialized devices that share a CE pin. The command may be executed with any volume on the target in any state. When the VOLUME SELECT command is issued, all volumes with unselected volume addresses will be deselected to save power. If the Volume address entered is invalid or does not match any appointed volume address, all volume addresses will be deselected. If the VOLUME SELECT command is not issued after CE high time then all volumes revert to their previous state.

(b) Command Encoding

The VOLUME SELECT instruction uses the SEQ_21 commands sequence. The command is encoded, as shown in the table below:

Table 31.16 VOLUME SELECT Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'E1	0/1	—	SEQ_21_ID

(11) SELECT LUN WITH STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7:0] for each data output request.
The SELECT LUN WITH STATUS command returns the state of the selected LUN.

(b) Command Encoding

The SELECT LUN WITH STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 31.17 SELECT LUN WITH STATUS Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'78	0/1	—	SEQ_5_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state.
The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(12) LUN STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.
The LUN STATUS command returns the status of the selected LUN.revert to their previous state.

(b) Command Encoding

The LUN STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 31.18 LUN STATUS Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H’71	0/1	—	SEQ_5_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state.
The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(13) CHANGE READ COLUMN Command

(a) Command Description

The CHANGE READ COLUMN command changes the column address of the selected cache register and enables data output of the last selected LUN. This command is accepted by the selected LUN when it is ready. Writing H’05 to the target command register, followed by two column address cycles containing the column address, followed by the H’E0 command puts the selected LUN into data output mode. The selected LUN stays in data output mode until another valid command is issued.

(b) Command Encoding

The CHANGE READ COLUMN instruction uses the SEQ_6 commands sequence. The command is encoded, as shown in the table below:

Table 31.19 CHANGE READ COLUMN Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H’E0	—	H’05	0/1	—	SEQ_6_ID

(14) SELECT CACHE REGISTER Command

(a) Command Description

The SELECT CACHE REGISTER command enables data output from the addressed LUN and the cache register at the specified column address. This command is accepted by a LUN when it is ready. Writing H'06 to the target command register, followed by two column address cycles, three row address cycles, and finally H'E0 enables data output mode on the addressed LUN and the cache register at the specified column address.

(b) Command Encoding

The SELECT CACHE REGISTER instruction uses the SEQ_7 commands sequence. The command is encoded, as shown in the table below:

Table 31.20 SELECT CACHE REGISTER Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'E0	—	H'06	0/1	—	SEQ_7_ID

(15) CHANGE WRITE COLUMN Command

(a) Command Description

The CHANGE WRITE COLUMN command changes the column address of the selected cache register and enables data input on the last selected LUN. Writing the H'85 to the target internal command register, followed by two column address cycles containing the column address puts the selected LUN into data input mode.

(b) Command Encoding

The CHANGE WRITE COLUMN instruction uses the SEQ_8 commands sequence. The command is encoded, as shown in the table below:

Table 31.21 CHANGE WRITE COLUMN Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'85	—	—	SEQ_8_ID

(16) CHANGE ROW ADDRESS Command

(a) Command Description

The CHANGE ROW ADDRESS command changes the row address (block and page) where the cache register contents are to be programmed in the NAND array. It also changes the column address of the selected cache register and enables data input on the specified LUN.

(b) Command Encoding

The CHANGE ROW ADDRESS instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.22 CHANGE ROW ADDRESS Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'11	H'85	0	—	SEQ_12_ID

(17) READ PAGE Command

(a) Command Description

The READ PAGE command copies a page from the NAND Flash array to its respective cache register and enables data output. This command is accepted by the LUN when it is ready. To read a page from the NAND Flash array, the controller writes the H'00 command to the target internal command register, then writes 5 address cycles to the address registers, and concludes with the H'30 command. The selected LUN is in the busy state while the data are transferred from the NAND flash array to the corresponding cache register. When the LUN is ready, data output is enabled for the cache register linked to the plane addressed in the READ PAGE command. The controller reads the programmed number of bytes to the FIFO.

(b) Command Encoding

The READ PAGE instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 31.23 READ PAGE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'30	—	H'00	0/1	0/1	SEQ_10_ID

(18) READ PAGE CACHE Command

(a) Command Description

The READ PAGE CACHE command reads the next sequential page within a block into the data register, while the previous page is output from the cache register. To issue this command, the controller writes H'31 to the target internal command register. After this command is issued, the R/B# goes LOW and the LUN goes into busy state. After that, the R/B# signal goes high and the LUN becomes busy and enters the cache operation state, in which the cache register is available and the specified page is copied from the NAND flash array to the data register. At this point, data is read from the cache register.

(b) Command Encoding

The READ PAGE CACHE instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 31.24 READ PAGE CACHE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'31	0/1	0/1	SEQ_11_ID

(19) READ PAGE CACHE LAST Command

(a) Command Description

The READ PAGE CACHE LAST command ends the READ PAGE CACHE sequence and copies a page from the data register to the cache register. This command is accepted by the LUN when it is ready. To issue the READ PAGE CACHE LAST command, the controller writes H'3F to the target internal command register. After this command is issued, R/B# goes LOW and the LUN goes into busy state. Afterwards, the R/B# goes HIGH and the LUN is ready. At this point, data from the targets cache register is read into the FIFO.

(b) Command Encoding

The READ PAGE CACHE LAST instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 31.25 READ PAGE CACHE LAST Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'3F	0/1	0/1	SEQ_11_ID

(20) READ MULTIPLANE Command

(a) Command Description

The READ MULTIPLANE command queues a plane to transfer data from the NAND array to its cache register. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for data transfer. To select the final plane and to begin the read operation for all previously queued planes, issue the READ PAGE command. All queued planes will transfer data from the NAND array to their cache registers.

(b) Command Encoding

The READ MULTIPLANE instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.26 READ MULTIPLANE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'32	H'00	—	—	SEQ_9_ID

(21) QUEUE PAGE READ Command

(a) Command Description

The QUEUE PAGE READ operation allows for partial-page reads by using a 7-address cycle. The first two bytes of the address cycle indicate the length of the page to read - those bytes are stored in ADDR0 register, followed by the column and row addresses - those bytes are stored in the ADDR1 register.
This can help overall performance should only a portion of the page data be needed because only the codeword containing the requested data will have ECC decoded. This command is exclusive for the CLEAR NAND devices.

(b) Command Encoding

The QUEUE PAGE READ instruction uses the SEQ_22 commands sequence. The command is encoded, as shown in the table below:

Table 31.27 QUEUE PAGE READ Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'37	—	H'07	—	—	SEQ_22_ID

(22) TWO PLANE PAGE READ command

(a) Command Description

This command was implemented to preserve the compatibility with the ONFI 1.x and some older devices.
The TWO PLANE PAGE READ (H'00-H'00-H'30) operation is similar to the PAGE READ (H'00-H'30) operation. It transfers two pages of data from the NAND Flash array to the data registers. Each page must be from a different plane on the same die. The software is responsible for generating correct addresses for the requested pages. Both the ADDR0 and ADDR1 address registers are used in this case.

(b) Command Encoding

The TWO PLANE PAGE READ instruction uses the SEQ_15 commands sequence. The command is encoded, as shown in the table below. In this case, both the address registers are used.

Table 31.28 QUEUE PAGE READ Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'30	H'00	H'00	0/1	0/1	SEQ_15_ID

(23) PROGRAM PAGE Command

(a) Command Description

The PROGRAM PAGE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes H'10 to the target internal command register. The selected LUN goes into the busy state.

(b) Command Encoding

The PROGRAM PAGE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.29 PROGRAM PAGE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'10	H'80	0	0/1	SEQ_12_ID

(24) PROGRAM PAGE IMMEDIATE Command

(a) Command Description

The PROGRAM PAGE IMMEDIATE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes H'10 to the target internal command register. The selected LUN goes into the busy state. This command writes only the row address to the NAND flash device.

(b) Command Encoding

The PROGRAM PAGE IMMEDIATE instruction uses the SEQ_23 commands sequence. The command is encoded, as shown in the table below:

Table 31.30 PROGRAM PAGE IMMEDIATE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'10	H'80	0	0/1	SEQ_23_ID

(25) PROGRAM PAGE DELAYED Command

(a) Command Description

The device's internal controller can automatically manage multi-plane programming. It does this with PROGRAM PAGE DELAYED command. When this command issued, the controller will delay issuing the program operation to the array until the address for the subsequent program operation is examined. If that operation allows the previous operation to complete as part of multi-plane operation, the controller will issue a multi-plane program to the array. Multi-plane operations are only completed if an LUN address from plane 0 is issued prior to a LUN address from plane 1. If the subsequent program operation does not allow the multi-plane operation, the controller will immediately start the previous program. It is presumed that the application program may use this command to initiate all the program operations. In this way the application program does not have to maintain information regarding multi-plane operation usage.

(b) Command Encoding

The PROGRAM PAGE DELAY instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.31 PROGRAM PAGE DELAY Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'13	H’80	0	0/1	SEQ_23_ID

(26) PROGRAM PAGE 1 Command

(a) Command Description

The PROGRAM PAGE 1 command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H’80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the commands sequence ends.

(b) Command Encoding

The PROGRAM PAGE 1 instruction uses the SEQ_13 commands sequence. The command is encoded, as shown in the table below:

Table 31.32 PROGRAM PAGE 1 Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H’80	0	0/1	SEQ_13_ID

(27) PROGRAM PAGE CACHE Command

(a) Command Description

The PROGRAM PAGE CACHE command allows the controller to input data to a cache register, copies the data from the cache register to the data register, and then moves the data register contents to the specified block and page address in the array of the selected LUN. After the data is copied to the data register, the cache register is available for additional PROGRAM PAGE CACHE or PROGRAM PAGE commands. The PROGRAM PAGE CACHE command is accepted by the LUN when it is ready.
To input a page to the cache register, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, H'15 is written to the command register. The selected LUN becomes busy, data is copied from the cache register to the data register that has become available through a previous program cache operation, and then the contents of the data register begins to be moved to the specified block and page address.

(b) Command Encoding

The PROGRAM PAGE CACHE instruction uses the SEQ_12 commands sequence. Command is encoded as shown in the table below.

Table 31.33 PROGRAM PAGE CACHE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'15	H'80	0	0/1	SEQ_12_ID

(28) PROGRAM MULTIPLANE Command

(a) Command Description

The PROGRAM MULTIPLANE command enables the controller to input data to the cache register for the addressed plane and to place the cache register data in the queue to be moved to the NAND array. This command can be issued one or more times. Each time a new plane address is specified that plane is also queued for data transfer. This command is accepted by the LUN when it is ready. The controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input beginning at the column address specified. When data input is complete, the controller writes H'11 to the target internal command register.

(b) Command Encoding

The PROGRAM PAGE CACHE instruction uses the SEQ_12 commands sequence. Command is encoded as shown in the table below.

Table 31.34 PROGRAM MULTIPLANE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'11	H'80	0	0/1	SEQ_12_ID

(29) WRITE PAGE Command

(a) Command Description

The WRITE PAGE command allows the controller to move data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes H’10 to the target internal command register.

(b) Command Encoding

The WRITE PAGE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.35 WRITE PAGE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H’10	—	—	SEQ_0_ID

(30) WRITE PAGE CACHE Command

(a) Command Description

The WRITE PAGE CACHE command allows the controller to move data from the targets cache register to the targets data register. This command is accepted by the LUN when it is ready. The controller writes H’15 to the target internal command register.

(b) Command Encoding

The WRITE PAGE CACHE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.36 WRITE PAGE CACHE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H’15	—	—	SEQ_0_ID

(31) WRITE MULTIPLANE Command

(a) Command Description

The WRITE MULTIPLANE command allows the controller to queue data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes H’11 to the target internal command register.

(b) Command Encoding

The WRITE MULTIPLANE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.37 WRITE MULTIPLANE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H’11	—	—	SEQ_0_ID

(32) ERASE BLOCK Command

(a) Command Description

The ERASE BLOCK command erases the specified block in the NAND array. This command is accepted by the LUN when it is ready. To erase a block, the controller writes H’60 to the target internal command register. Then three address cycles containing the row address are written; the column address is ignored. Finally, H’D0 is written to the target internal command register.

(b) Command Encoding

The ERASE BLOCK instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 31.38 ERASE BLOCK Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H’D0	H’60	—	—	SEQ_14_ID

(33) ERASE MULTIPLANE Command

(a) Command Description

The ERASE MULTIPLANE command queues a block in the specified plane to be erased from the NAND array. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for a block to be erased. This command is accepted by the LUN when it is ready. To queue a block to be erased, the controller writes H’60 to the command register.
Then three address cycles containing the row address are written; the column address is ignored.
Finally, H’D1 is written to the command register.

(b) Command Encoding

The ERASE MULTIPLANE instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 31.39 ERASE MULTIPLANE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H’D1	H’60	—	—	SEQ_14_ID

(34) COPYBACK READ Command

(a) Command Description

The COPYBACK READ command is functionally identical to the READ PAGE command, except that H'35 is written to the target internal command register instead of H'30. For more details, see section 31.3.4 (17), READ PAGE Command.

(b) Command Encoding

The COPYBACK READ instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 31.40 COPYBACK READ Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'35	—	H'00	0/1	0/1	SEQ_10_ID

(35) COPYBACK PROGRAM Command

(a) Command Description

The Copyback function reads a page of data from one location and then moves that data to a second location. The COPYBACK PROGRAM command is functionally identical to the PROGRAM PAGE command, except that when H'85 is written to the target internal command register, the cache register contents are not cleared. The SEQ_9 command sequence does not have the data phase, so the data from the cache register are written into the second location without modification. If data must be written with modification to the second location, the SEQ_12 command sequence, which includes the data phase, is used.

(b) Command Encoding

The COPYBACK PROGRAM instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.41 COPYBACK PROGRAM Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'10	H'85	—	—	SEQ_9_ID

(36) COPYBACK PROGRAM 1 Command

(a) Command Description

The COPYBACK PROGRAM 1 command is functionally identical to the PROGRAM PAGE 1 command, except that when H’85 is written to the target internal command register, the cache register contents are not cleared. See section 31.3.3 (26), PROGRAM PAGE 1 Command for further details.

(b) Command Encoding

The COPYBACK PROGRAM 1 instruction uses the SEQ_13 commands sequence. The command is encoded as shown in the table below:

Table 31.42 COPYBACK PROGRAM 1 Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	—	H'85	0	—	SEQ_13_ID

(37) COPYBACK MULTIPLANE Command

(a) Command Description

The COPYBACK MULTIPLANE command is functionally identical to the PROGRAM MULTIPLANE command, except that when H’85 is written to the target internal command register, cache register contents are not cleared. See section 31.3.3 (28), PROGRAM MULTIPLANE Command for further details.

(b) Command Encoding

The COPYBACK MULTIPLANE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.43 COPYBACK MULTIPLANE Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H’11	H’85	0	0/1	SEQ_12_ID

(38) PROGRAM OTP Command

(a) Command Description

The PROGRAM OTP command is used to write data to the pages within the OTP area. An entire page can be programmed at one time, or a page can be partially programmed up to four times. There is no ERASE operation for the OTP pages. To use the PROGRAM OTP command, the controller issues the H'A0 command. Next, 5 address cycles are issued. The address write is followed by a programmable number of data cycles. After data input is complete, the controller issues the H'10 command. The internal control logic automatically executes the proper programming algorithm and controls the necessary timing for programming and verification.

(b) Command Encoding

The PROGRAM OTP instruction uses the SEQ_12 commands sequence. The command is encoded as shown in the table below:

Table 31.44 PROGRAM OTP Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'10	H'A0	0	0/1	SEQ_12_ID

(39) DATA PROTECT OTP Command

(a) Command Description

The DATA PROTECT OTP command is used to protect all the data in the OTP area. After the data is protected, it cannot be further programmed. When the OTP area is protected, the pages within the area are no longer programmable and cannot be unprotected. To use the DATA PROTECT OTP command, the controller issues the H'A5 command. Next, the controller issues the following 5 addresses cycles.
Finally, the H'10 command is issued.

(b) Command Encoding

The DATA PROTECT OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.45 DATA PROTECT OTP Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
—	H'10	H'A5	—	—	SEQ_9_ID

(40) PAGE READ OTP Command

(a) Command Description

The PAGE READ OTP command is used to read data from a page within the OTP area. An OTP page within the OTP area is available for reading data whether or not the area is protected. To use the PAGE READ OTP command, the controller issues the H'AF command. Next, 5 address cycles are issued.
Finally, the H'30 command is issued. After internal read from the NAND matrix is ended, the data is copied to the FIFO.

(b) Command Encoding

The PAGE READ OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.46 PAGE READ OTP Instruction Encoding

CMD_2	CMD_1/CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
H'30	—	H'AF	0/1	0/1	SEQ_10_ID

31.3.4 Multi LUN Work Mode

The multi LUN work mode is enabled by setting the MLUN_EN bit in the CONTROL register. In this mode, the memory is divided into multiple LUNs, each of which is handled as a separate target. The active LUN number is decoded directly from the address value. The following parameters apply to the multi LUN work mode.

MLUN_IDX field in the MLUN register
This parameter provides the bit index for the last address byte, which contains the LUN selection bits. This parameter must be set according to the datasheet for the NAND Flash device that is in use.
The LUN_SEL bits in the MLUN register are used to set the number of LUNs in the device. The LUN_STATUS_0 register holds indicators of the states of the LUNs. Each effective bit corresponds to the state of a single LUN.

STATE_MASK field in the STATUS_MASK register
This parameter is used to mask parts of the LUN status byte that will be ignored during LUN ready/busy checks.

31.3.5 Remapping Mechanism

The remapping mechanism supports the bad blocks management (BBM) solution. The hardware remapping mechanism relieves software from the time-consuming operations of finding the physical address for the given linear address in the requested operation. The software initializes only the remapping tables for uses in the application of the NAND Flash device. It sorts those tables in ascending order, and then the whole operation of searching tables and substituting addresses is accomplished automatically.

The remapping solution uses two groups of the control registers:

- The pointer register DEV0_PTR. This register stores the address in the internal memory where record tables used by the BBM mechanism are placed.
- The size register DEV0_SIZE. This register stores the number of records in a table.

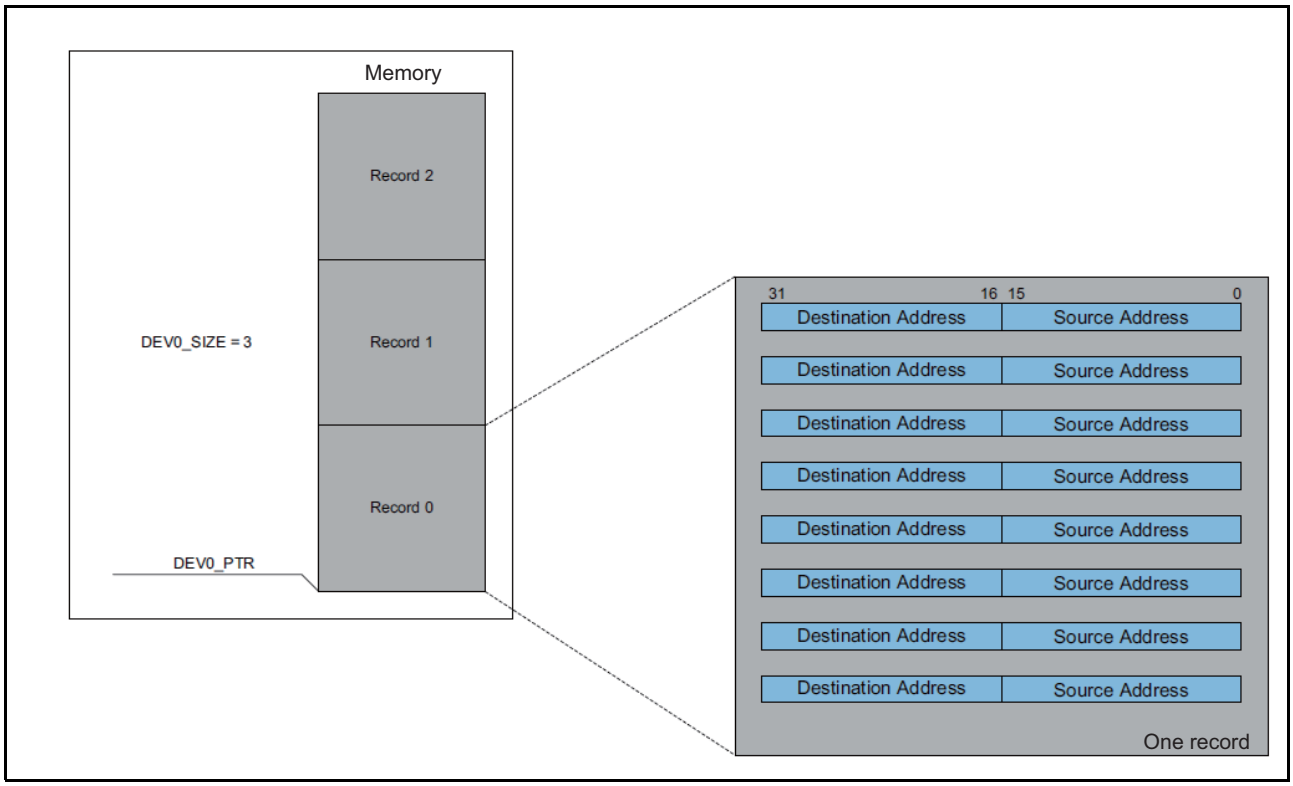

Figure 31.30 Example of BBM Records

Note: Store the block numbers of the destination and source addresses for transfer.
The source addresses for transfer should be arranged in ascending order in the record tables.
If some addresses in a record are not to be used, set the values for these addresses to H'FFFF_FFFF.

31.3.6 Interrupts Mechanism

The NAND Flash controller interrupt system uses two control registers:

The interrupt mask register – each bit of this register masks a single interrupt. The register is described in more detail in section 31.2.6, Interrupts mask register (INT_MASK).
The interrupt flag register – each bit of this register is an active flag from the single interrupt source.
The register is described in more detail in section 31.2.7, Interrupts status register (INT_STATUS).

In case an interrupt event occurs, i.e. the respective interrupt flag in INT_STATUS is 1, and its respective mask bit in INT_MASK is 1, the interrupt signal INTNFMA is asserted.
Note that the interrupt mask bits in INT_MASK affects only the interrupt signal INTNFMA, but not the flags in INT_STATUS.
A set flag in INT_STATUS must be cleared by the application program.
The available interrupt sources and their respective INT_STATUS flags are:

INT_STATUS.CMD_END_INT_FL

Command sequence finished interrupt – This interrupt occurs when the previously triggered command sequence is finished and the new one can be started. The command sequence is marked as finished when the full sequence is executed or when the NAND Flash device goes into the busy state.

INT_STATUS.ECC_INT0_FLAG

The ECC module detects an uncorrectable error in the transmitted data.
The ECC module detects when the configured errors threshold level is exceeded.

INT_STATUS.MEM0_RDY_INT_FL

The memory device is ready – This interrupt occurs when the NAND Flash device finishes executing the programmed command sequence and is ready for the new one. Each NAND Flash device has a single interrupt flag. The difference between “command sequence finished” interrupt and “memory device is ready” interrupt is presented in Figure 31.30.

INT_STATUS.TRANS_ERR_FL

The error on the slave interface during access to the controller FIFO – This interrupt occurs if the access to the FIFO memory has the opposite direction to the current FIFO configuration: the FIFO is read when it is configured for write, or the FIFO is write when it is configured for read.

INT_STATUS.STAT_ERR_INT0_FL

Most recently finished operation on the memory device failed. This applies to PROGRAM PAGE and ERASE BLOCK operations. It is not valid following a READ-series operation.

INT_STATUS.PG_SZ_ERR_INT_FL

Data Size error flag
When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions.
Interrupt condition is met when the value written to the DATA_SIZE register is not correct.

INT_STATUS.DMA_INT_FL

DMA transfer ended flag

INT_STATUS.DATA_REG_INT_FL

Data in DATA_REG is available.

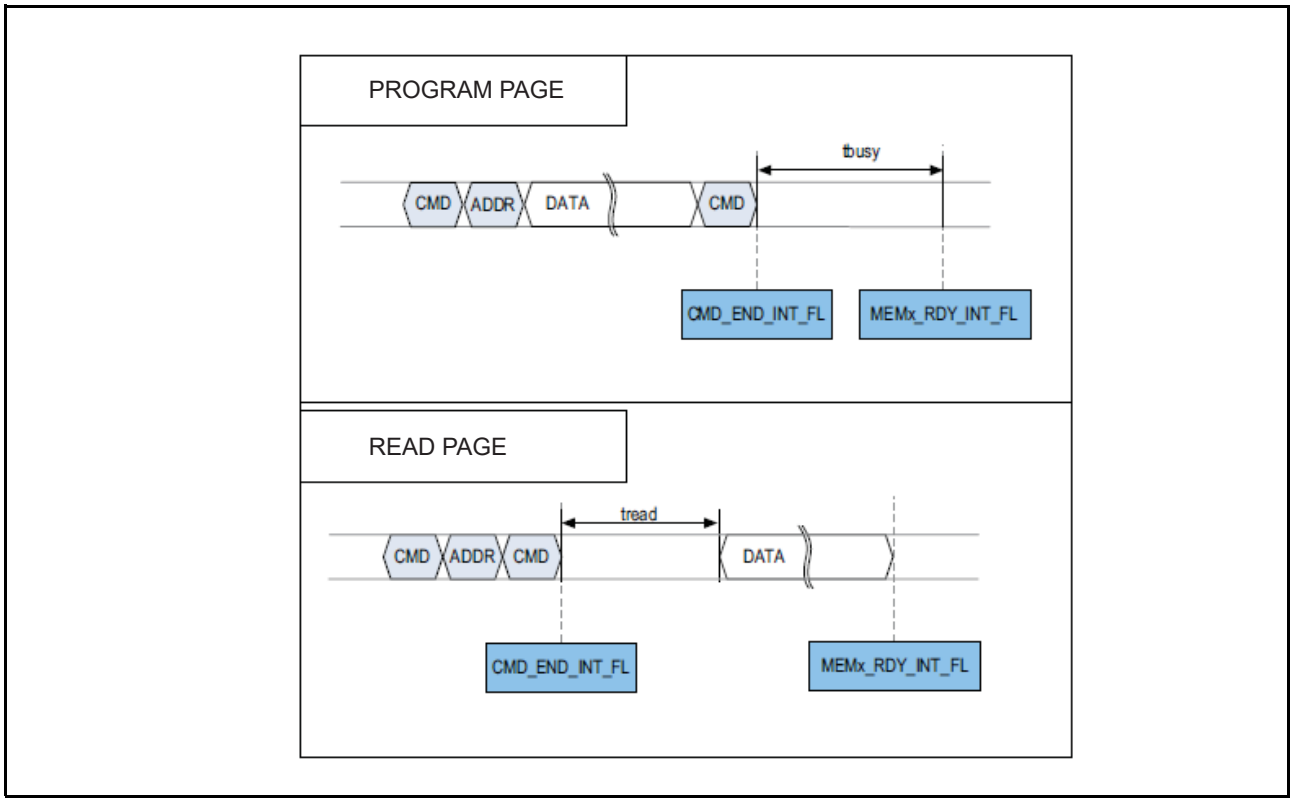

Figure 31.31 Command Sequence End and Memory-Ready Interrupts

31.3.7 Setup and Configuration

The CONTROL register is the main control register in the NAND Flash controller.
The following bits configure basic settings of the controller:

- INT_EN – Bit which enables Global Interrupt.
- ECC_EN – Bit which enables Hardware ECC.
- BLOCK_SIZE – Bits which configure block size.
- BBM_EN – Bit which enables remapping process.
- PROT_EN – Bit which enables Protect mechanism.
- ADDRx_AUTO_INCR - Addresses auto increment for row address register 0 or 1.
- SMALL_BLOCK_EN – Bit which enables Small Block Mode.
- MLUN_EN – Bit which enables Multi LUN mode.
- AUTO_READ_STAT_EN – Bit which activates automatic read status after the PROGRAM PAGE and ERASE BLOCK commands.
- READ_STATUS_EN – Bit which chooses whether the controller checks RnB lines or sends READ_STATUS commands.
- ECC_BLOCK_SIZE – Bits which define ECC Block Size.

The registers described below are configured according to the settings of other bits in the CONTROL register:

1. If INT_EN bit is set, the software must write the mask into the INT_MASK register, which masks the selected interrupts source in the NAND Flash controller.
2. If ECC_EN bit is set, the software must correctly configure the ECC module by writing the appropriate configuration into the ECC_CTRL. Additionally, the software configures the offset in the ECC_OFFSET register. In small block mode, the value in the ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device, right behind the data.
3. The write number of the data which will be transferred by the controller (DATA_SIZE).
   When ECC is enabled, there are some restrictions to the DATA_SIZE value.
4. If the BBM_EN bit is set, the software must initialize the remapping tables (DEVn_PTR and DEVn_SIZE registers).
5. Additionally, the software must configure time parameters which can be found in the TIMINGS_ASYN register. Additionally, the software must configure the TIME_SEQ_0 and TIME_SEQ_1 registers.

When the NAND Flash controller uses DMA to transfer data, the software must configure the DMA_ADDR, DMA_CTRL and DMA_CNT registers. The software can modify these registers before any transfer or during the initialization procedure.

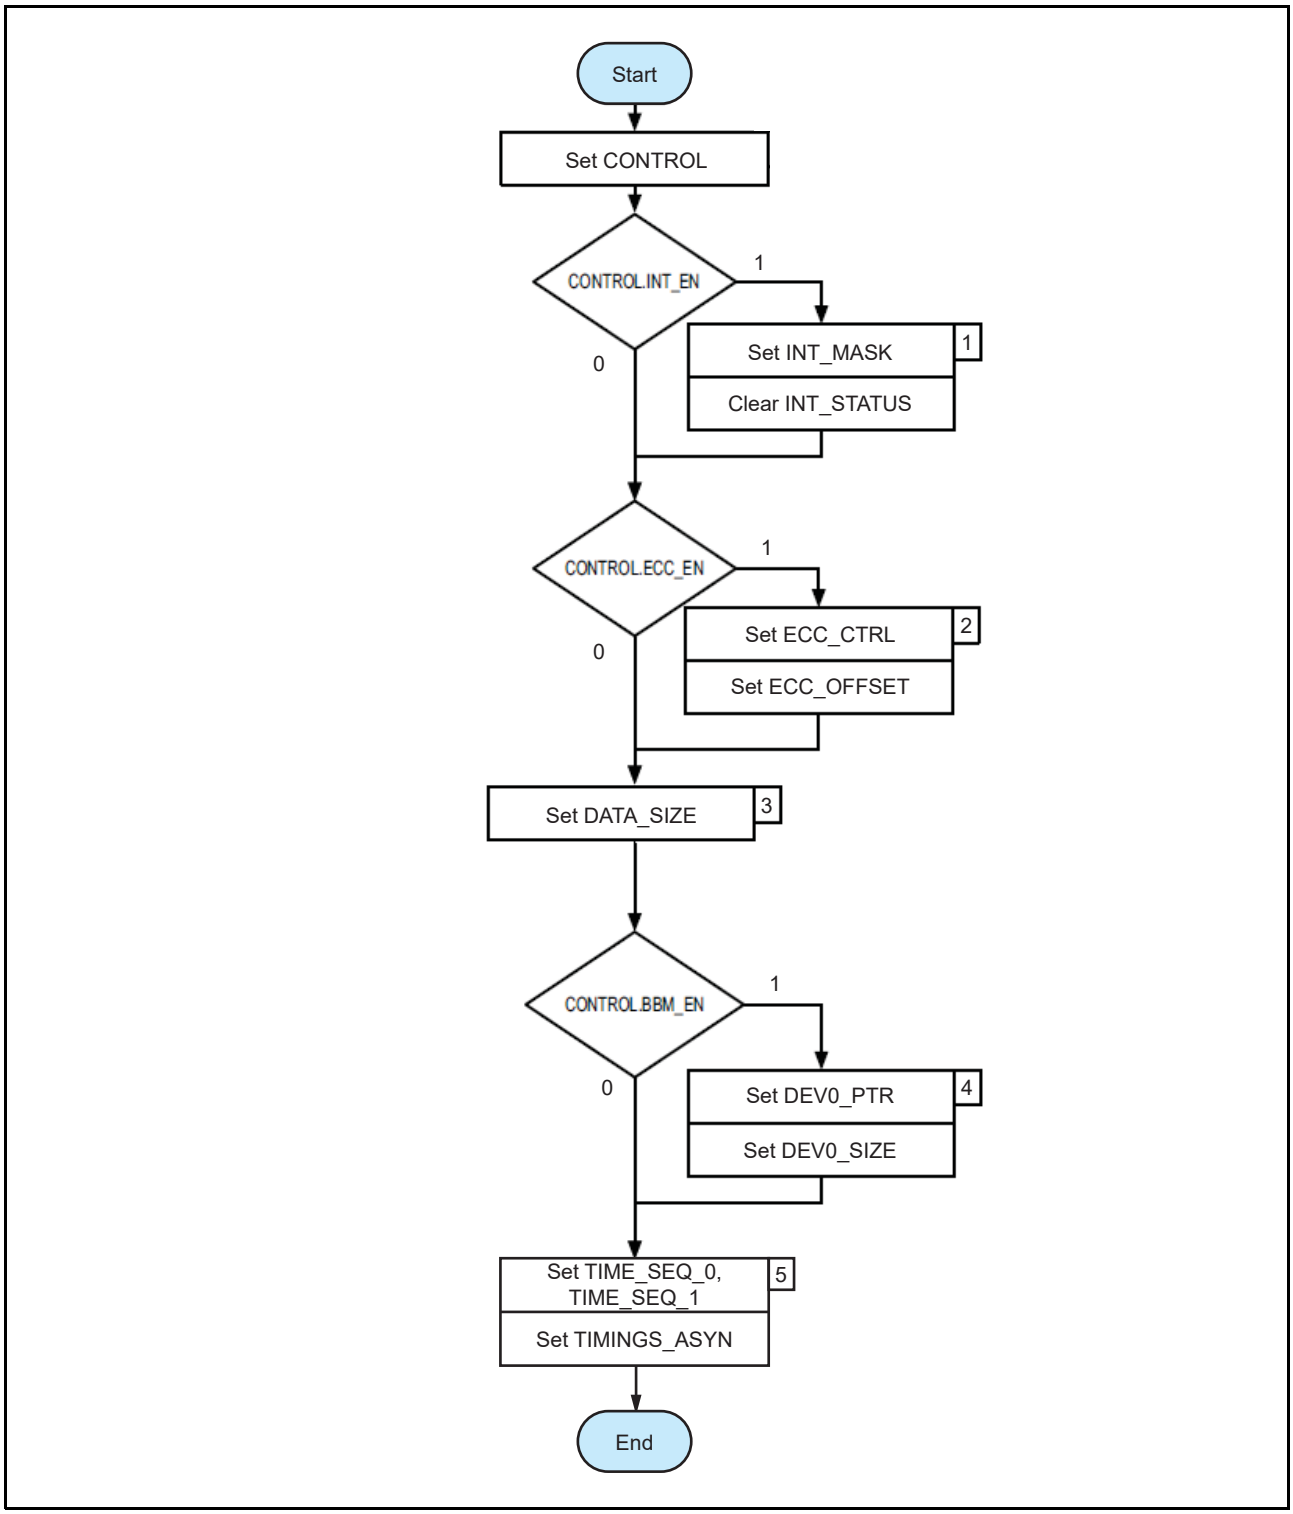

Figure 31.32 Configuration

(1) Send Data to NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). Write the number of data which you want to read (DATA_SIZE register).
3. To use the simplest program command, write H'0010 800C to the COMMAND register (PROGRAM PAGE command, FIFO selected, slave interface selected).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

When the memory is ready for further work, MEM0_ST is set.

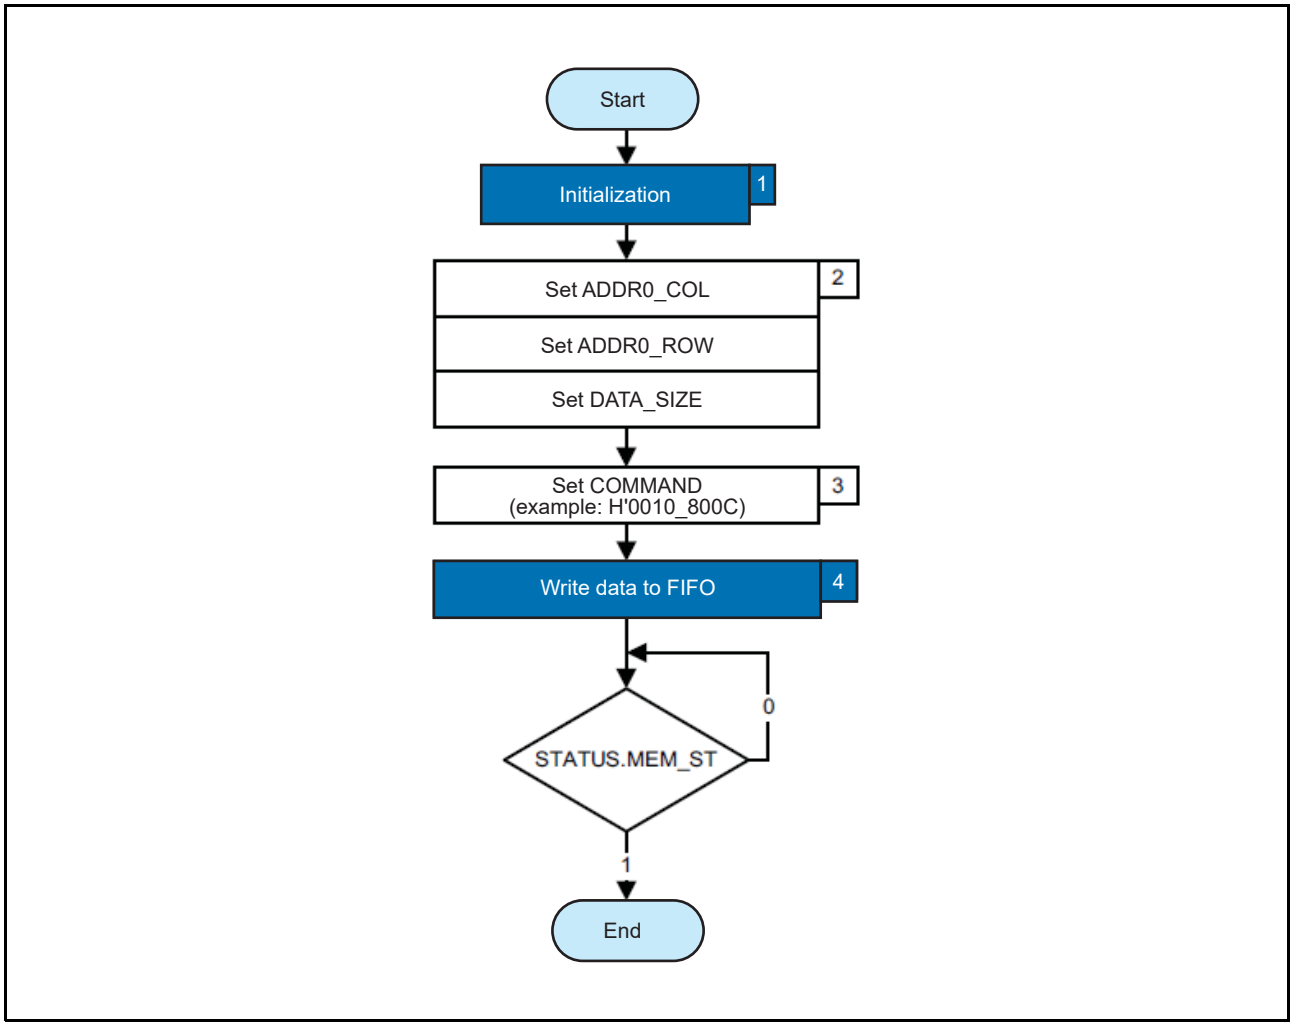

Figure 31.33 Write data to NAND Flash Memory via Slave Interface

(2) Read Data from NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW).
3. To use the simplest read command, write H'3000 002A to the COMMAND register (READ PAGE command, FIFO selected, slave interface selected).
4. The application program can read data immediately after sending the command but in this case reading will be preceded by a very few WAIT replies from the NAND flash controller.
   If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

When the memory is ready for further work, MEM0_ST is set.

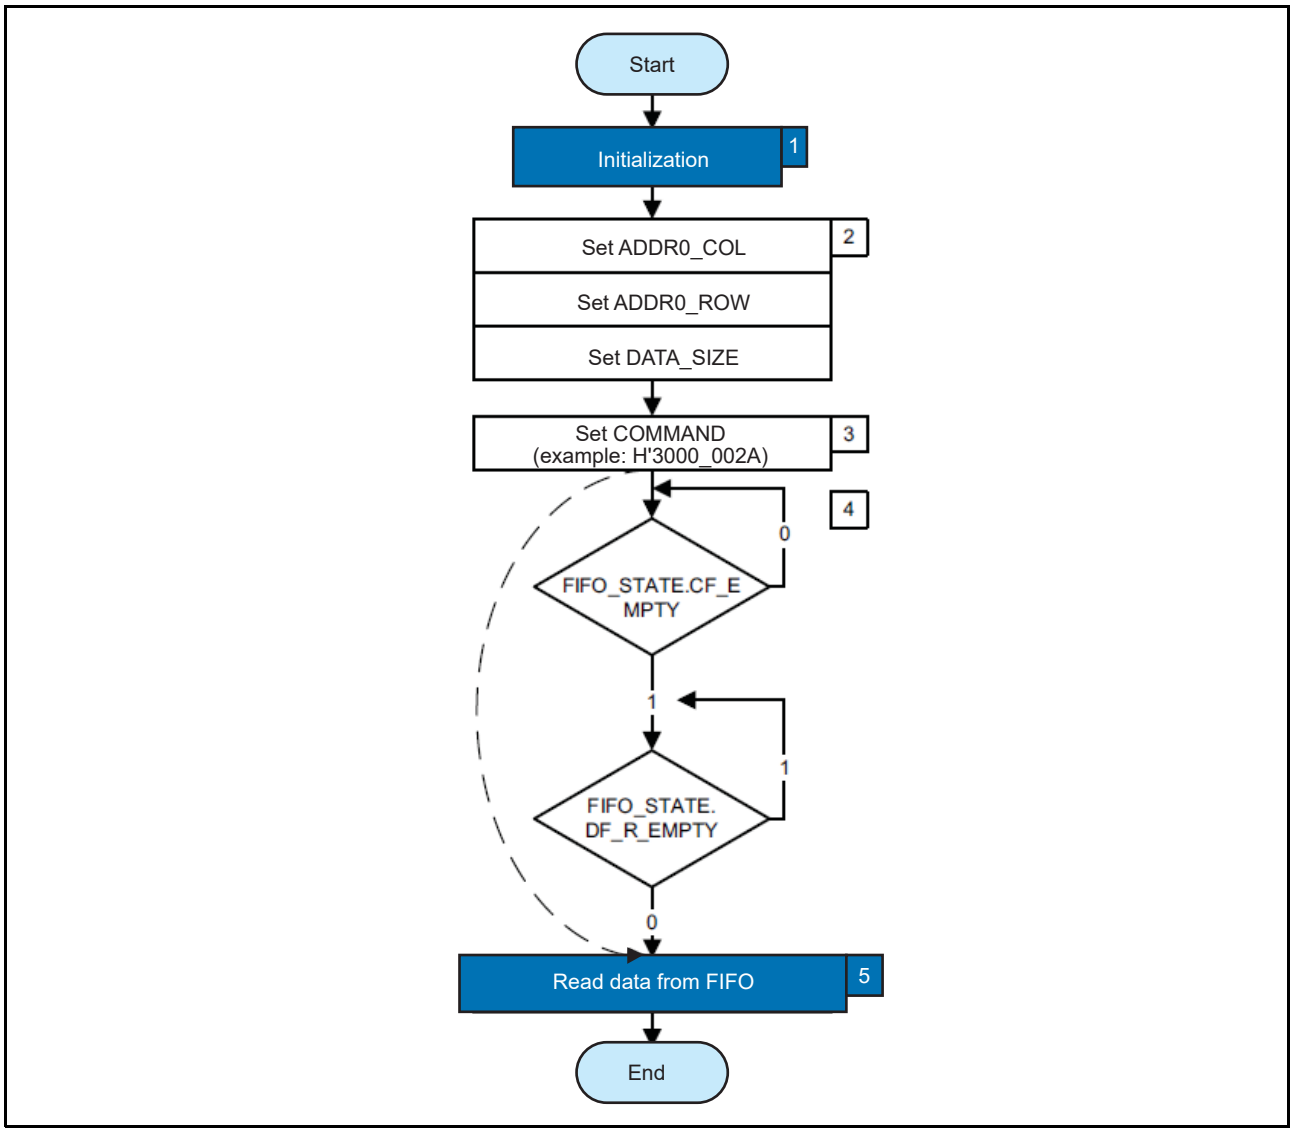

Figure 31.34 Read data from NAND Flash memory via Slave Interface

(3) Send Data to NAND Flash via Master Interface (using DMA)

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Set the INT_EN bit in the CONTROL register to enable global interrupts.
3. Select active interrupt in the INT_MASK register and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
4. Select the DMA work mode to configure the DMA module correctly:
   In registers managed mode, the address of the data is written in the system memory (DMA_ADDR_L registers). Write the number of the transferred data into the DMA_CNT register. Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. Bits ERR_FLAG and DMA_READY are read-only. The ERR_FLAG bit indicates an error on the internal bus while the DMA is transferring data; the DMA_READY bit indicates that the DMA is ready (transfer is completed).
5. Write the address of the data in the NAND Flash memory device into the address register 0.
6. To use the simplest program command, write H'0010 804C to the COMMAND register (PROGRAM PAGE command, FIFO selected, DMA selected).

When the memory is ready for further work, the appropriate MEM0_ST bit is set and interrupt is active. The recommended interrupt is MEM0_RDY_INT.

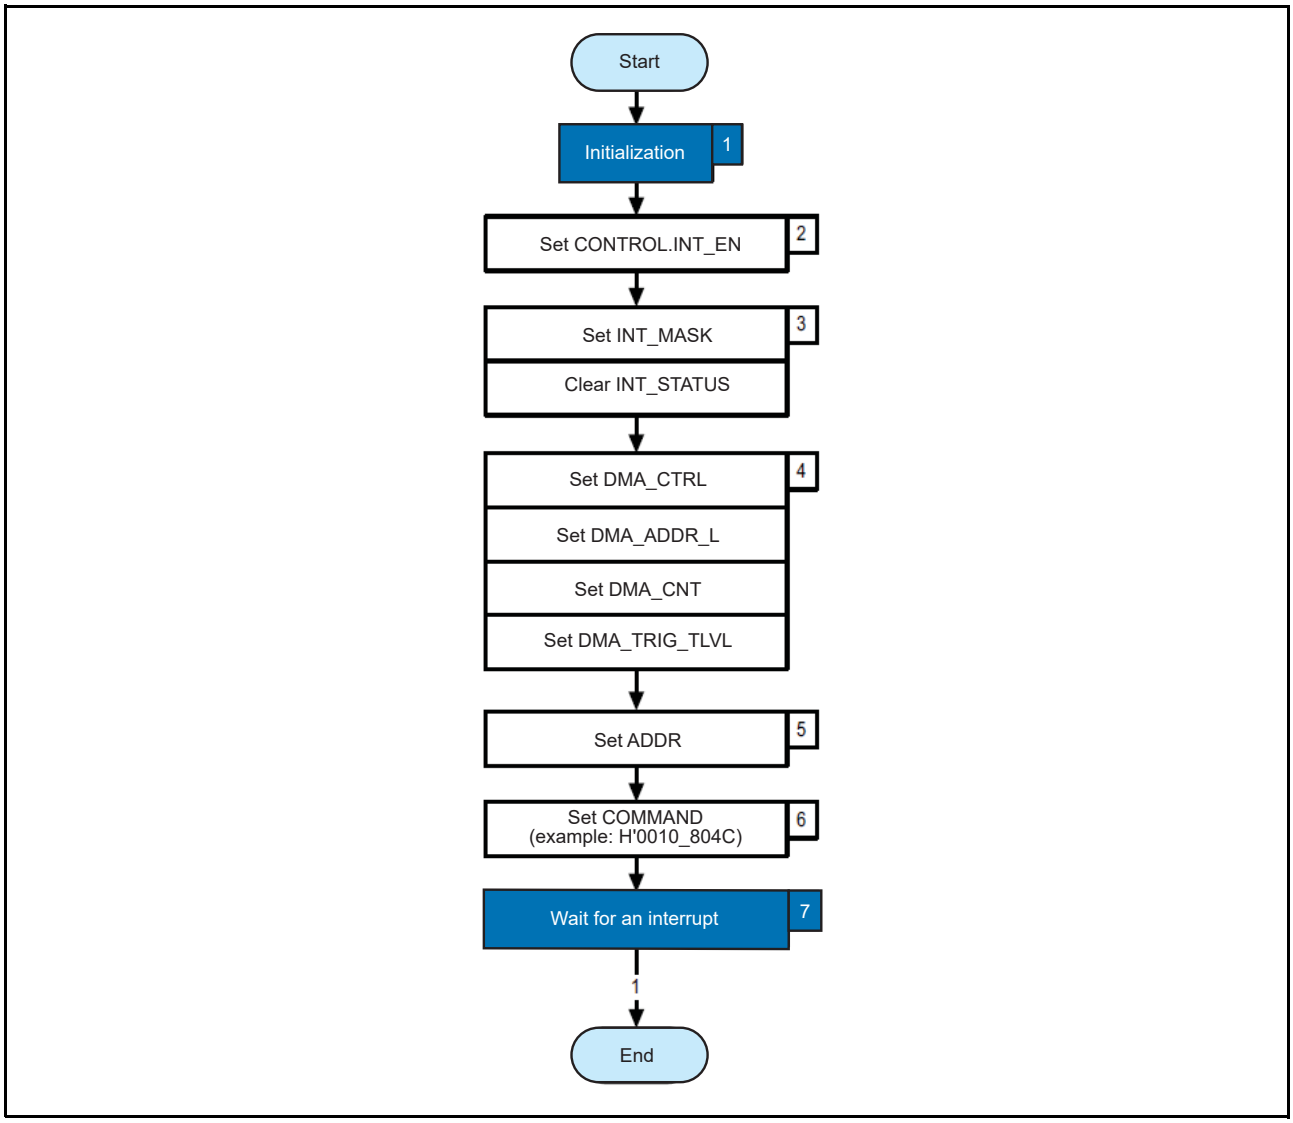

Figure 31.35 Send Data to NAND Flash Using DMA, Interrupt Enable

(4) Fast Writing and Reading of Several Pages from the Memory using DMA

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Set the INT_EN bit in the CONTROL register to enable global interrupts.
3. Select the active interrupt (CMD_END_INT_EN) in the INT_MASK register and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
4. In Scatter-Gather mode, it is necessary to write the descriptors into the system memory. Select the DMA work mode to correctly configure the DMA module. In Scatter-Gather mode, it is not necessary to configure the DMA_CNT register. For more details, see section 31.4.2 (2) (b), Scatter-Gather Mode.
5. Set DMA_START bit to start the DMA when the command sequence is sent to the NAND Flash memory. Bits ERR_FLAG and DMA_READY are read-only. The former indicates the error on the internal bus while DMA is transferring data, the latter indicates when the DMA is ready (transfer is completed).
6. Set the ADDR0_INCR bit to auto increment row address 0 register after each command. Write address of the data in the NAND Flash memory device into the 0 address register.
7. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
8. Write address of the first descriptor into the DMA_ADDR_L registers.
9. Write PROGRAM PAGE CACHE command to the NAND Flash memory device by writing H'0015 804C into the COMMAND register (DMA selected, FIFO selected). When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated.
10. When the number of the pages to be transferred does not equal one, go to step 7.
11. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
    Write address of the first descriptor into the DMA_ADDR_L register.
    The last command in the sequence of sending data is the PROGRAM PAGE (write H'0010804C) into the COMMAND register (DMA selected, FIFO selected).
12. Wait for interrupts and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
13. Write the new descriptors to the system memory.
14. If DMA should work in the same work mode and burst type do not modify DMA_BURST and DMA_MODE bits. Set DMA_START bit to start DMA when the command sequence is sent to the NAND Flash memory.
15. Write the READ PAGE command into the NAND Flash memory device by writing H'3000 0069 into the COMMAND register (FIFO selected, DMA selected).
16. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
17. Write the address of the first descriptor to the DMA_ADDR_L registers.
18. Write READ PAGE CACHE SEQUENTIAL command to the NAND Flash memory device by writing H'0000 316B into the COMMAND register (FIFO selected, DMA selected).
19. When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated. When the number of the pages to be transferred does not equal zero, go to step 16.
20. Write H'0000 0000 into the INT_STATUS register to clear all interrupts. Write the address of the first descriptor to the DMA_ADDR_L register. The last command in the sequence of reading data is READ PAGE CACHE LAST (write H'0000 3F6B into the COMMAND register).

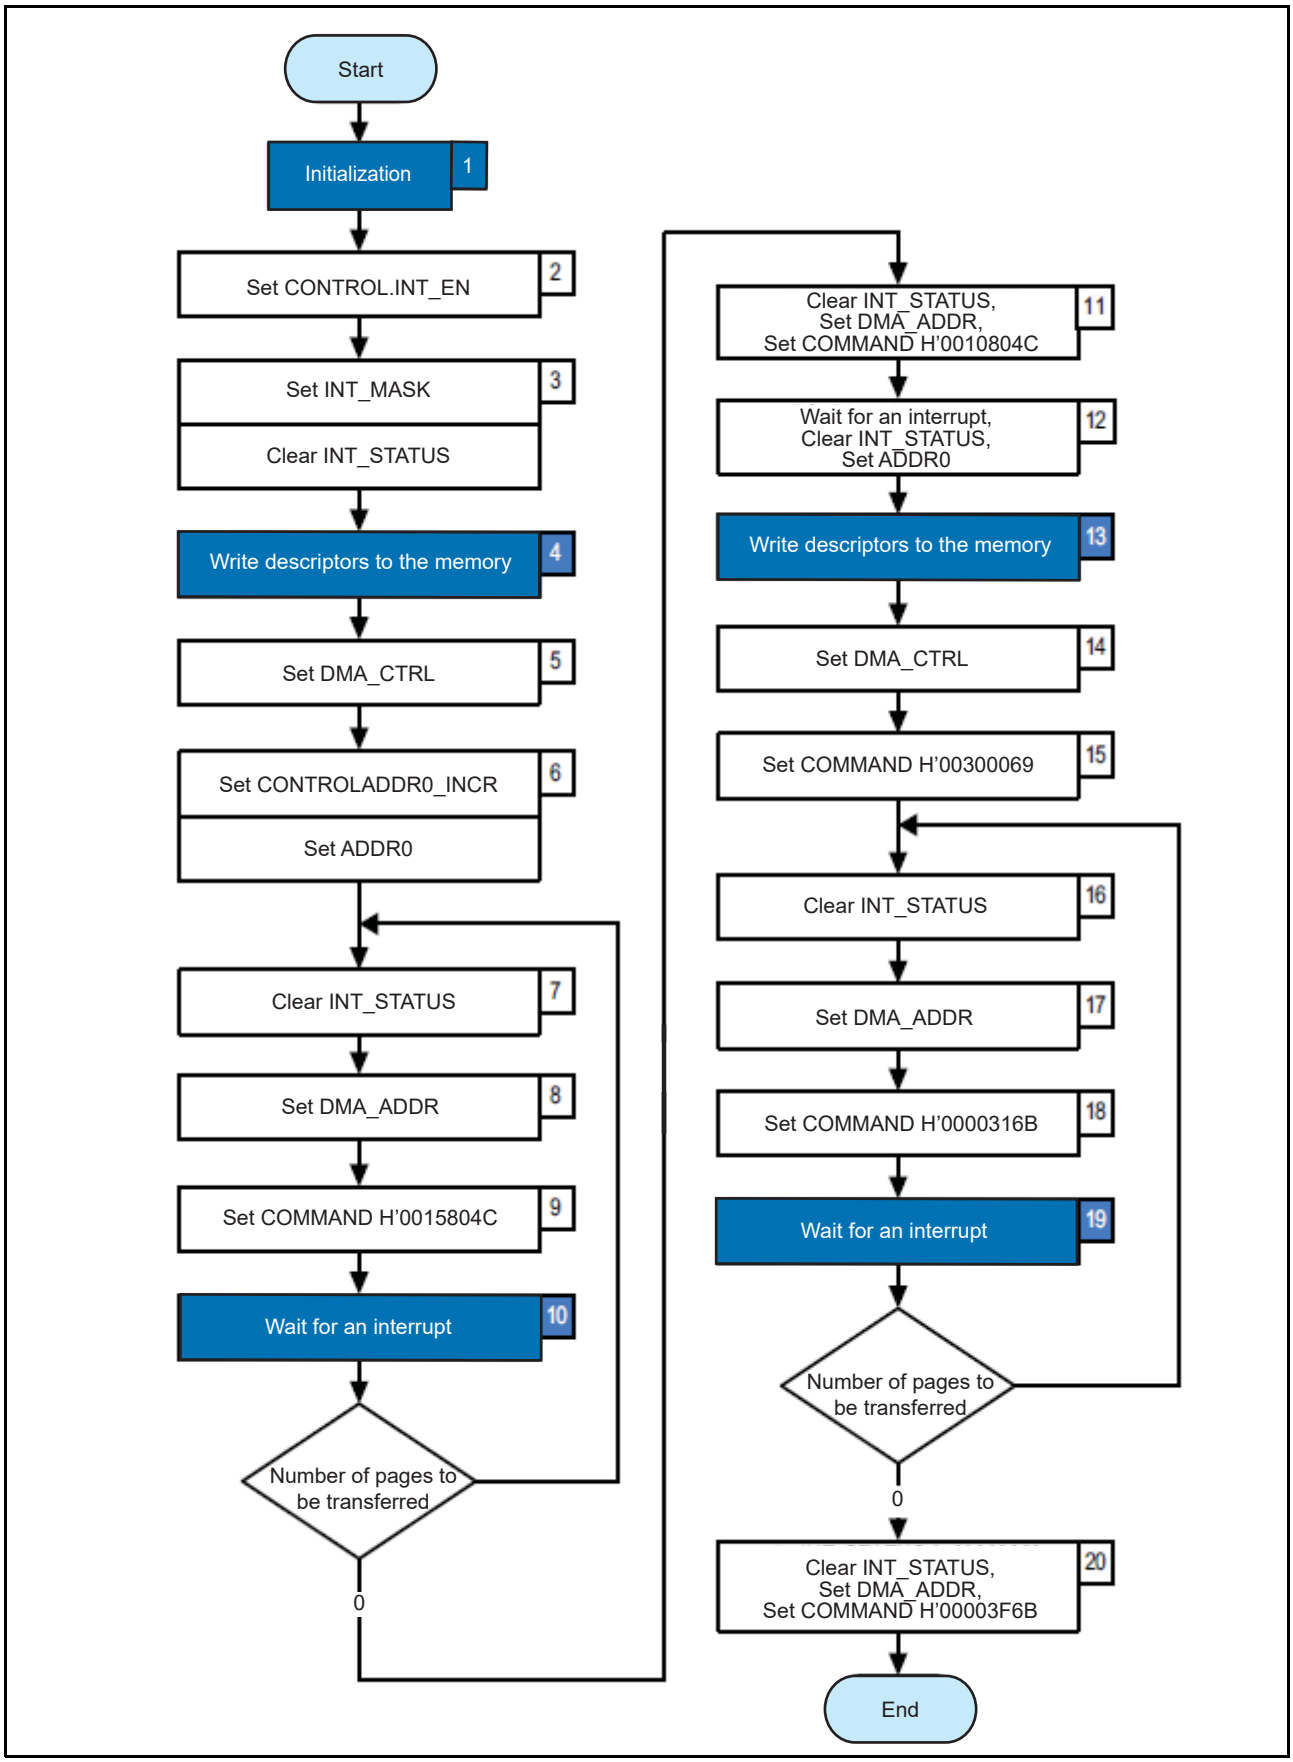

Figure 31.36 Fast Writing and Reading of Several Pages from the Memory Using DMA

(5) Writing to Partial Pages

The following procedure need to be used to write to partial pages with ECC engine enabled:

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). You need to write the partial page offset into the ADDR0_COL register. Write the number of data that you want to write (DATA_SIZE register) – in this case you need to set the partial sector size. Write the offset value of the ECC data into the ECC_OFFSET register.
3. To use the simplest program command, write H'0010 800C to the COMMAND register (PROGRAM PAGE command, FIFO selected, slave interface selected).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

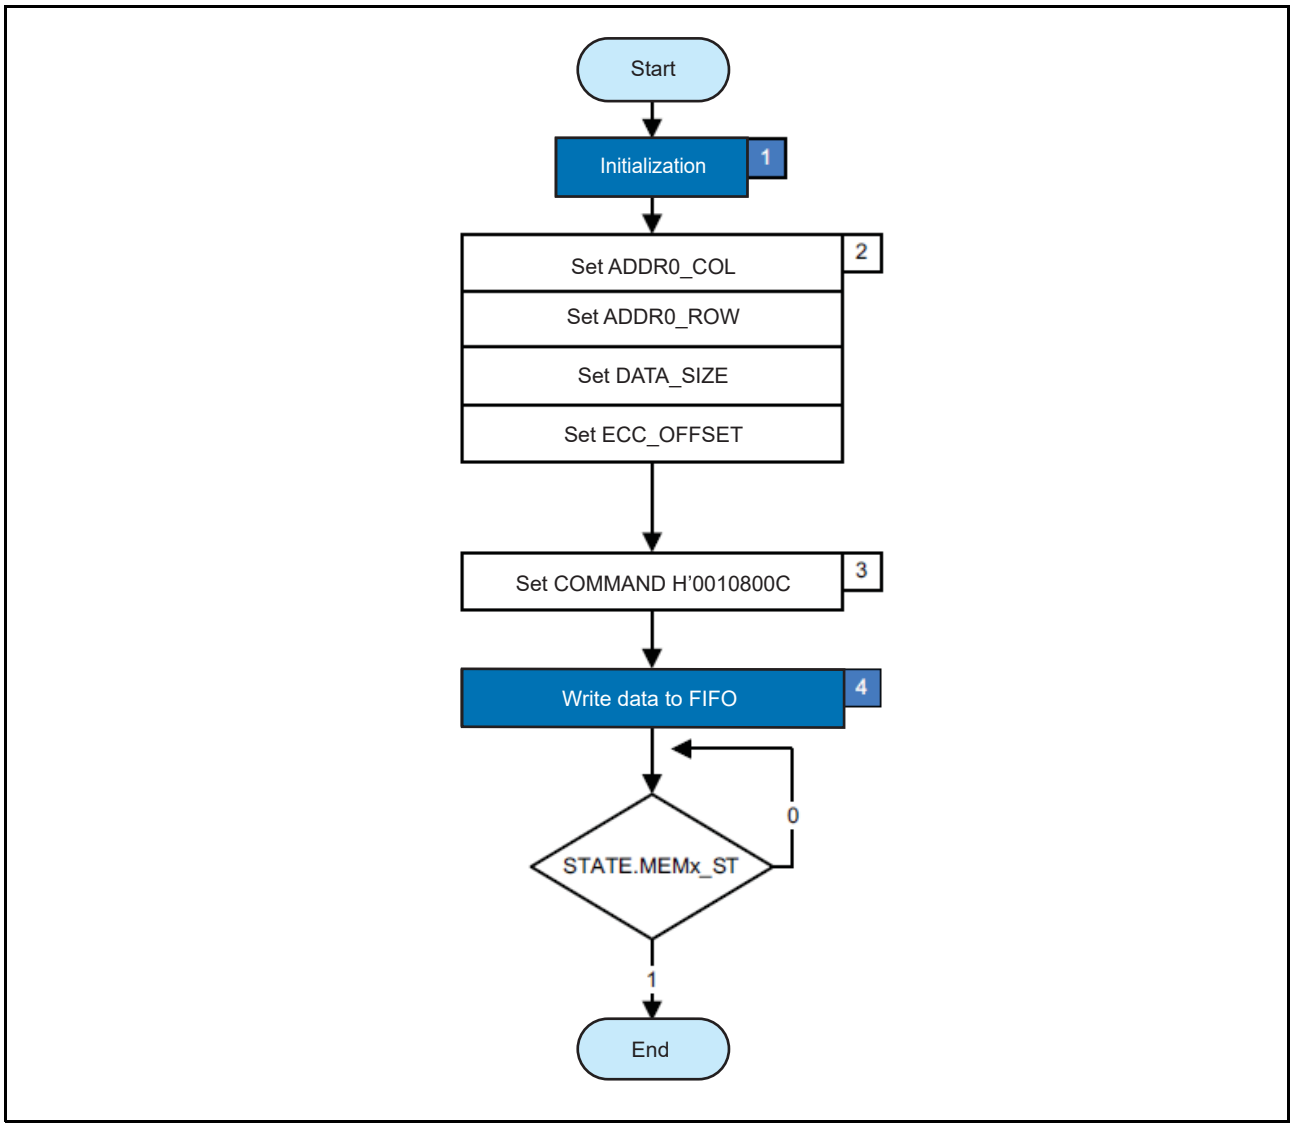

Figure 31.37 Writing to Partial Pages

(6) Reading Partial Pages

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). You need to write the partial page offset into the ADDR0_COL register. Write the number of data that you want to read (DATA_SIZE register) – in this case you need to set the partial page size.
3. To use the simplest read command, write H'3000 002A to the COMMAND register (READ PAGE command, FIFO selected, slave interface selected).
4. The application program can read data immediately after sending the command but in this case reading will be preceded by a very few WAIT replies from the NAND flash controller. If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

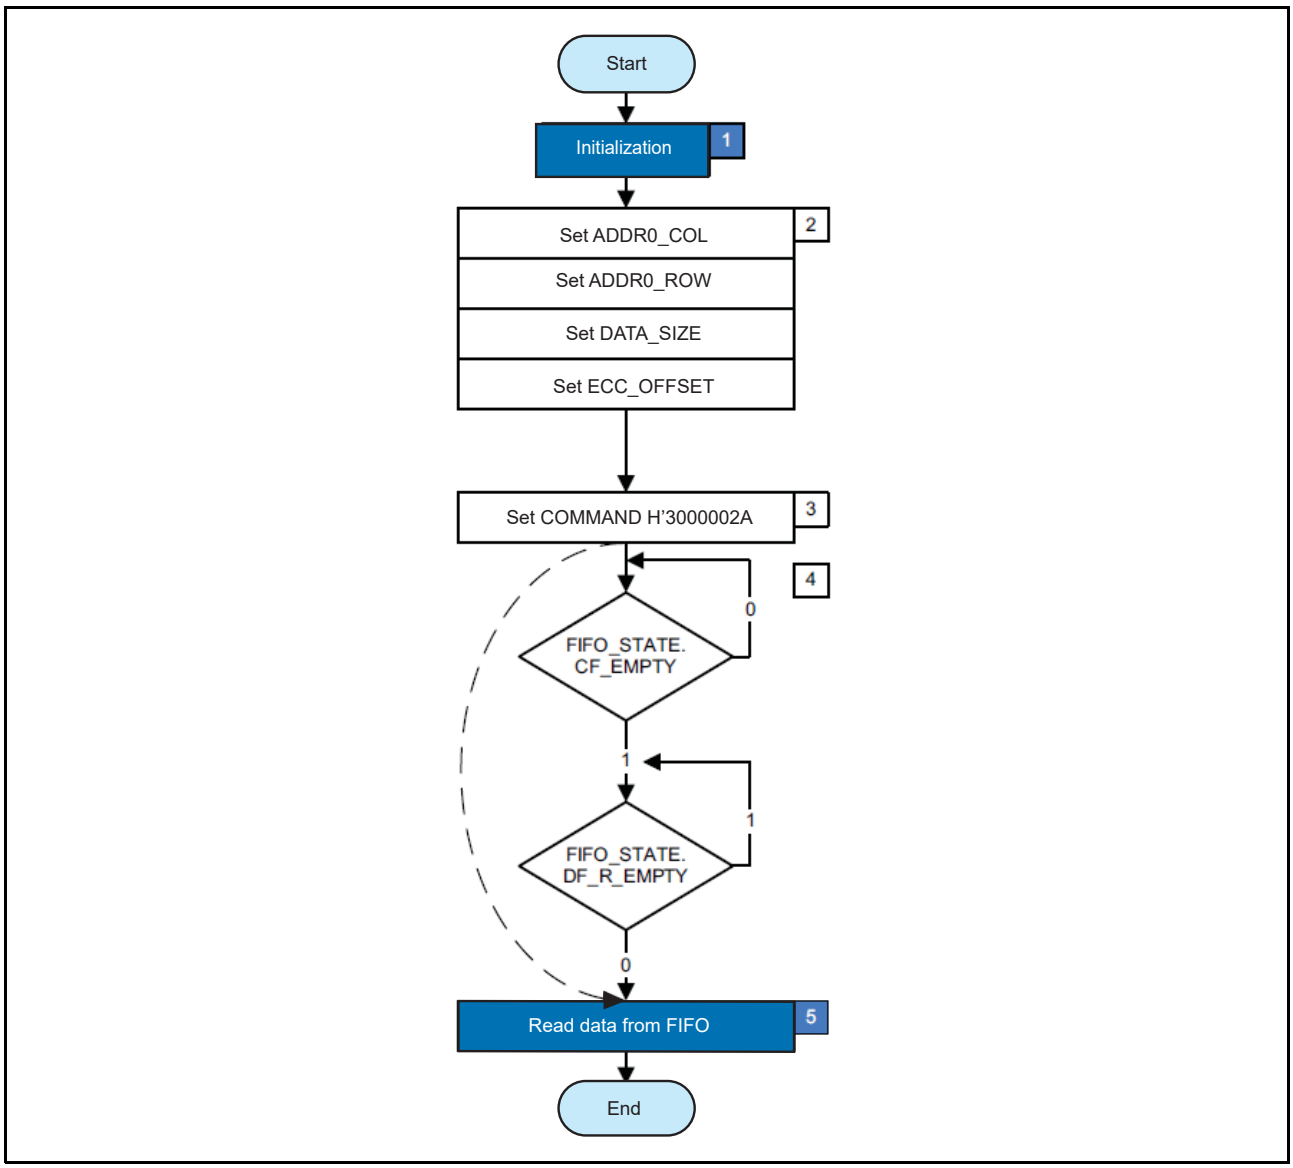

Figure 31.38 Reading Partial Pages

31.4 Functional Details

31.4.1 Block Diagram

The figure below shows the NAND Flash controller block diagram.

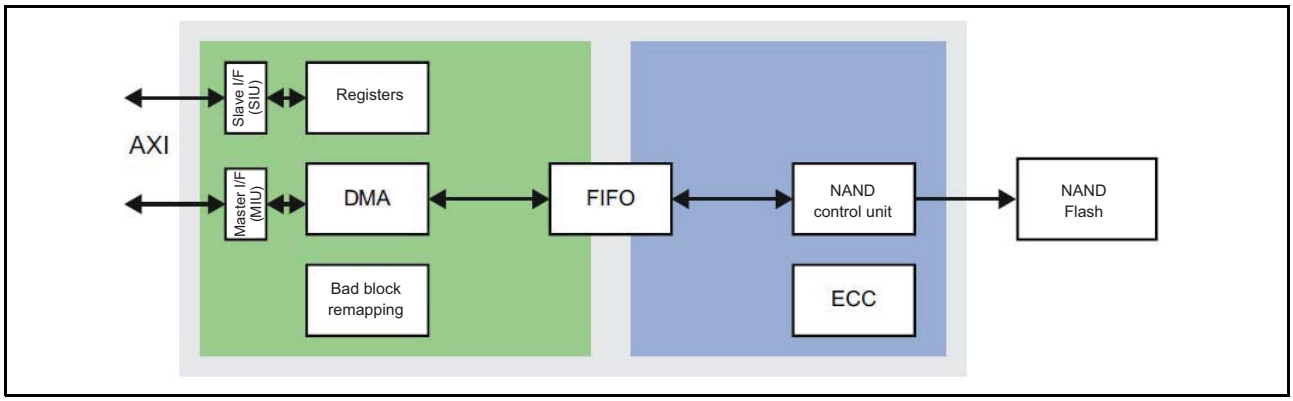

Figure 31.39 Block Diagram

The main blocks and their functions are as follows.

- FIFO provides the FIFO queue interface to other controller modules. Since the FIFO interface keeps control of the read and write pointers within the same module, one module can read and another write at the same time. One side of the queue is connected to the SIU or DMA module depending on the controller software configuration, and the other side of the queue is connected to the NAND control unit.
- DMA is responsible for the fast transfer of data between the external memory location and the controller. The unit can works in two modes: the Scatter-Gather mode and the internally triggered registers managed mode. DMA functions as the master.
- NAND control unit generates NAND Flash device access sequences.
- ECC is an error correction code calculator. A correction word is calculated for each 256B, 512B or 1024B ECC block of the NAND Flash memory page. During the read operation, this block can automatically correct bad bits without any interaction with the CPU. It has a status register, the bits of which signal errors occurring during a read, and then it informs when errors are corrected.
- Bad block remapping remaps blocks excluded from the poll of the usable blocks into the blocks that will be its substitute. Whole process is transparent for the software.

31.4.2 DMA

(1) Overview

The DMA in this module has the following properties:

- Two work modes:
  – The registers managed mode
  – The Scatter-Gather mode
- The DMA module preserves the configuration registers. These are copied into the DMA working registers.
- DMA trigger level enables DMA to send packet data.

(2) DMA Description

DMA supports two modes:

- The registers managed mode – the DMA does one transfer depending on the contents of DMA_ADDR, DMA_CNT, and DMA_CTRL registers.
- The Scatter-Gather mode – new DMA transfer algorithm.

The DMA mode for the current transfer is selected via the DMA_CTRL.DMA_MODE bit and cannot be changed during each consecutive data transfer. The application program can change the DMA mode when the transfer is completed and the DMA_CTRL.DMA_READY bit is set.

In order to begin the transfer, the DMA should be in an IDLE state (DMA_CTRL.DMA_READY = 1).

Setting the DMA_CTRL.DMA_START bit triggers the DMA after the commands are sent to the NAND Flash memory (writing CONTROL register). When the DMA_START bit is clear, sending commands to the NAND Flash memory will not trigger the DMA. This allows the DMA to be programmed to transfer more data than the page size of the NAND Flash memory. (example: the DMA is configured to 32 kB data transfer, the size of the page in NAND Flash memory is 4 kB. In order to send 32 kB of data into the NAND Flash memory, it is necessary to set the DMA_START bit in the register DMA_CTRL, then it is necessary to send the PROGRAM PAGE command to the NAND Flash memory, clear the DMA_START bit in the DMA_CTRL register, and send seven commands to the NAND Flash memory).
In this example, the DMA is set only once at the beginning.

The DMA trigger level enables the DMA to send packet data. It indicates when the DMA has to start transferring data. The application program must set trigger level depending on arbitration type, system and NAND Flash memory performance.
For example:

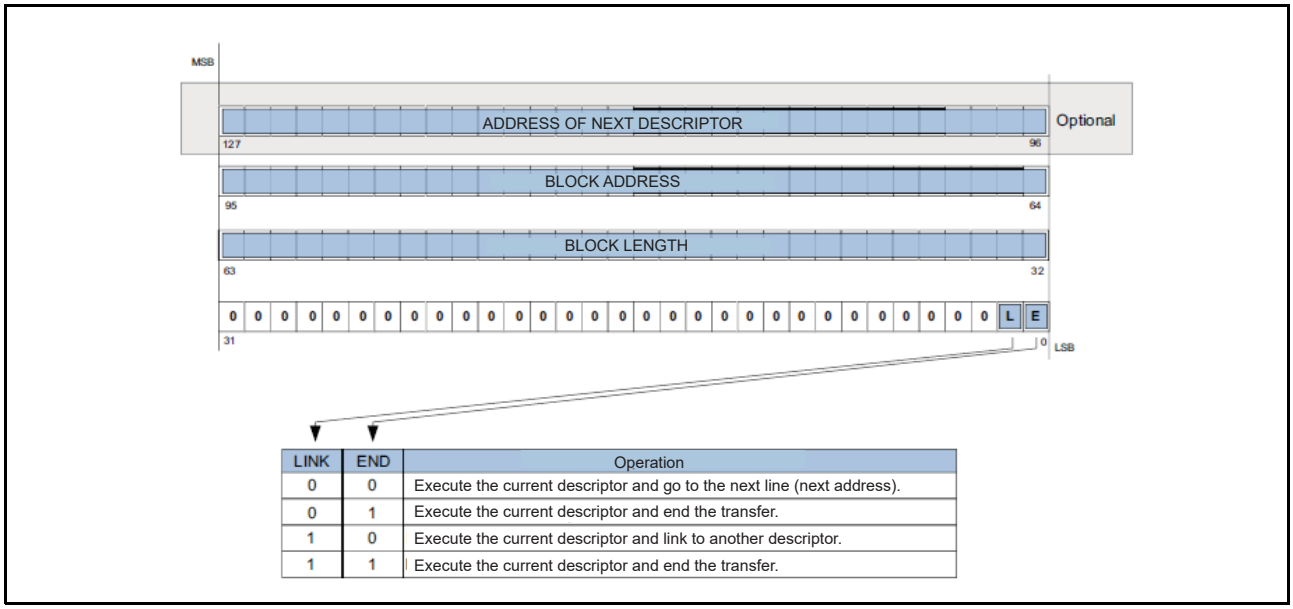
1. If the DMA trigger level equals 0, the DMA does not wait, but transfers data immediately because the trigger level is always exceeded.
2. For read from the NAND Flash memory: If the DMA trigger level equals H’40 (256 bytes), the DMA waits until data level reaches the previously programmed trigger level (256 bytes). Then the DMA will transfer data until FIFO gets empty status. Next the wait cycle for required data level is repeated as long as remain data size allow to reach programmed trigger level. The trigger level value should be chosen to ensure that only the continuous data block will be transferred and the FIFO will not be overflowed.
3. For write to NAND Flash memory: If the DMA trigger level equals H’40 (256 bytes), the DMA writes data to the FIFO until the FIFO is full. Then, the DMA waits until 256 bytes are written into the NAND Flash memory. Next, again the DMA transfers data until FIFO is full. The trigger level value should be chosen to ensure that only the continuous data block will be transferred.

(a) Registers Managed Mode

When the DMA works in this mode, it transfers only one continuous block (DMA_CNT is block length) to or from the system memory at address DMA_ADDR. Block can be multiple of DATA_SIZE value in the DATA_SIZE register. All the registers which modify this transfer are described in section 31.2.18, DMA base address register (DMA_ADDR_L), section 31.2.19, DMA counter initial value register (DMA_CNT) and section 31.2.20, DMA control register (DMA_CTRL).
The DMA_BURST bit in register DMA_CTRL defines the main transfer type used by the DMA to precede the requested transfer.

(b) Scatter-Gather Mode

The scatter-gather DMA controller implements high-speed DMA transfer from non-contiguous memory locations to a continuous address space, and vice versa.
The DMA in Scatter-Gather mode uses the Descriptors List to describe data transfers. The NAND Flash registers only points to the base address of the Descriptors List. The base address for this list is set in the DMA_ADDR register whether it is a read or write transfer. The base address, sizes of the data blocks, and flags are defined inside the descriptors.
The DMA_BURST bit in register DMA_CTRL defines the main transfer type used by the DMA.
When in Scatter-Gather mode, the DMA transfers data from data blocks. Each descriptor can define only one data block. The DMA adopts the scatter-gather DMA algorithm so that higher data transfer speed is available. The application program can program a list of data transfers between the system memory and NAND Flash to the Descriptor Table before executing Scatter-Gather mode.



LINK	END	Operation
0	0	Execute the current descriptor and go to the next line (next address).
0	1	Execute the current descriptor and end the transfer.
1	0	Execute the current descriptor and link to another descriptor.
1	1	Execute the current descriptor and end the transfer.

Figure 31.40 Descriptor Fields for Scatter-Gather DMA

The table below defines the Scatter-Gather DMA descriptor fields and their functions:

Table 31.47 Descriptor Fields for Scatter-Gather DMA

Bit	Symbol	Description		
[127:96]	ADDRESS	Next descriptor address when LINK = 1 and END = 0		
[95:64]	ADDRESS	Data block address		
[63:32]	LENGTH	Data page length (H'0000 0004 to H'FFFF FFFD) Specify a multiple of four as the number of bytes.		
[31:2]	—	Reserved		
[1]	LINK			
		LINK	END	Description
		0	0	Execute the current descriptor and go to the next descriptor on the list.
[0]	END	0	1	Execute the current descriptor and end the transfer.
		1	0	Execute the current descriptor and link to another descriptor.
		1	1	Execute the current descriptor and end the transfer.

Table 31.48 DMA Data Counter Length

LENGTH Value	Counter Length
H’0000 0000	Setting prohibited
H’0000 0001	Setting prohibited
H’0000 0002	Setting prohibited
H’0000 0003	Setting prohibited
H’0000 0004	4 bytes
H’0000 0005	Setting prohibited
H’0000 0006	Setting prohibited
H’0000 0007	Setting prohibited
H’0000 0008	8 bytes
….	….

The Descriptor Table is created in system memory by the application program. Each descriptor line (one executable unit) consists of the address, length and flags. The flags specify operation of the descriptor line. The size of each descriptor field is 16 bytes when LINK is 1 and END is 0, while the size is 12 bytes for other combinations.

The figure below shows the example of Scatter-Gather programming:

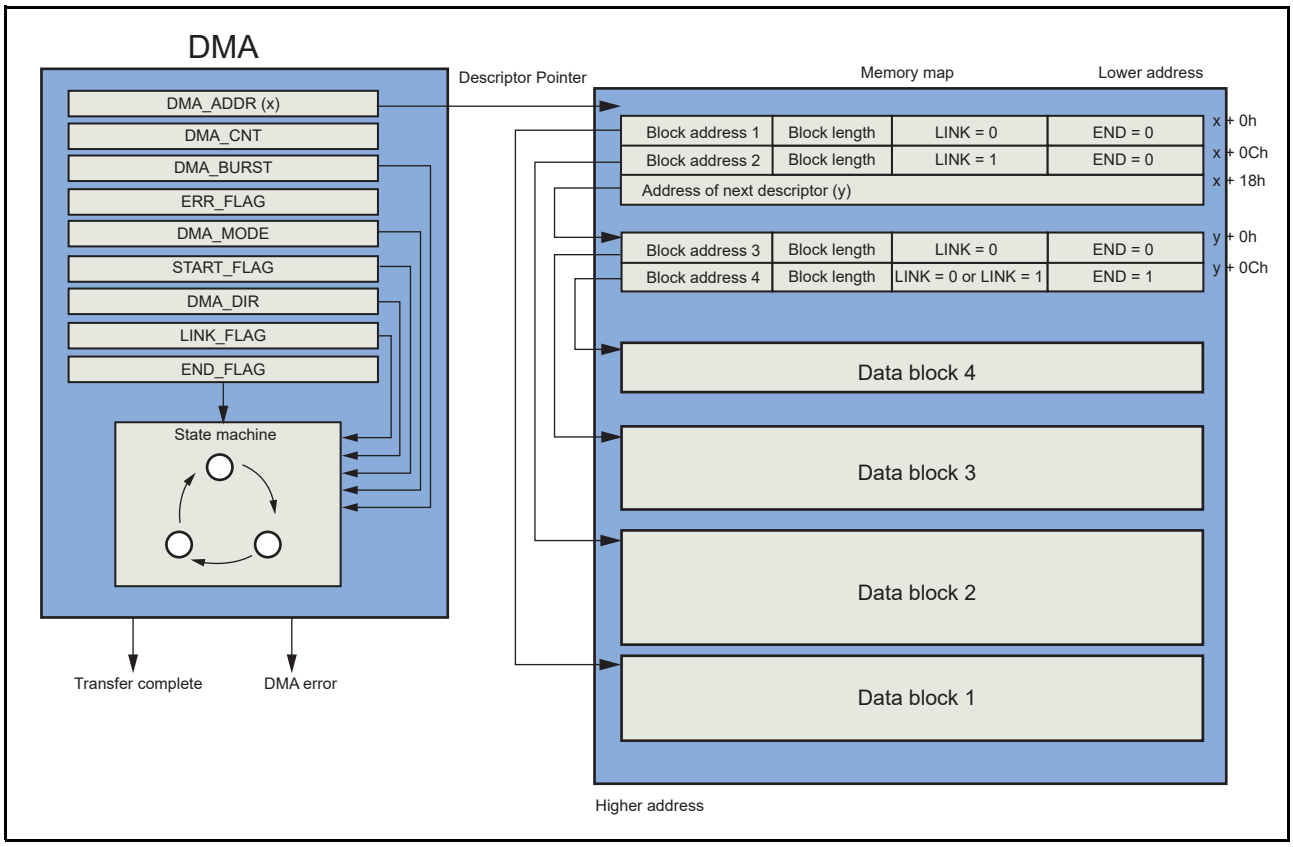


Figure 31.41 Example of Scatter-Gather DMA Data Transfer

31.4.3 ECC

(1) Overview

The built-in ECC of this module is based on one of the BCH algorithms and allows correction of multiple bit errors.
The ECC has the following features:

- The encoder and decoder work on the 256, 512, 1024 bytes data blocks.
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- The corrected data words are aligned to the 32 bits.
- The correction words are aligned to the 32 bits.
- Correction words are placed after the data.

(2) Block Diagram

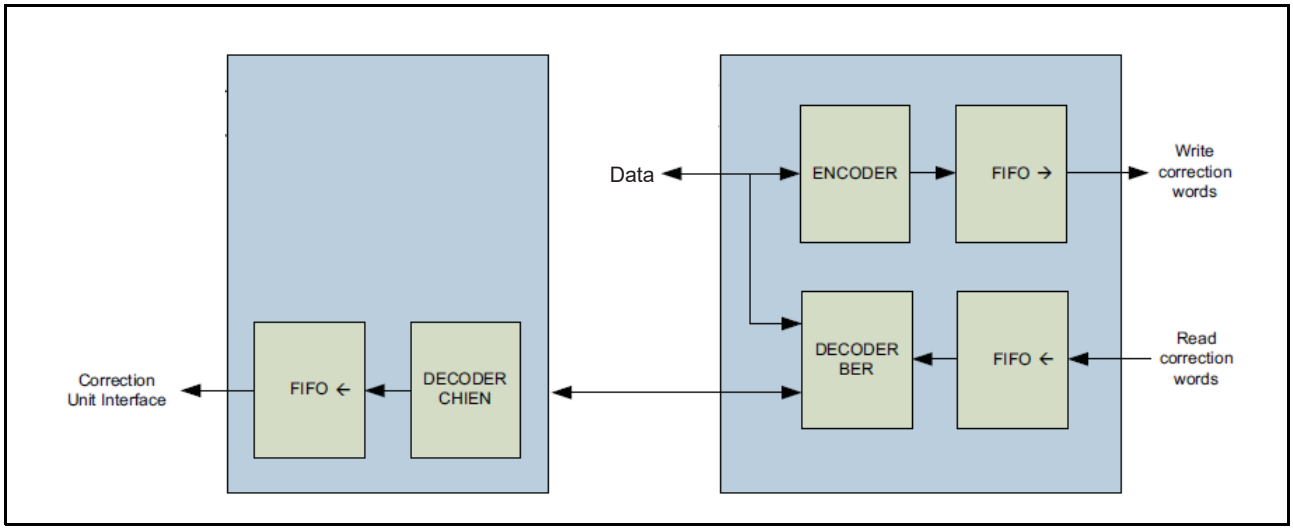

Figure 31.42 Block Diagram of ECC

31.4.4 BCH Algorithm Implementation

- Data block length: 256 (small block memory), 512, or 1024 bytes
- Programmable memory page length, multiple of the block length by any power of 2 (optional).
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- Separate encoder and decoder modules.
- Calculation of correction data performed during write to memory.
- Error detection performed during read data from memory.
- Internal pipeline allows the correction of errors in one data block simultaneously with detection of errors in the following data block.

Table 31.49 Size of Correction Bytes

Correction Capability	ECC Block Size	Size of Correction Bytes per one ECC Block
2 bits	256/512/1024 bytes	4 bytes
4 bits	256/512/1024 bytes	7 bytes
8 bits	256/512/1024 bytes	14 bytes
16 bits	256/512/1024 bytes	28 bytes
24 bits	256/512/1024 bytes	42 bytes
32 bits	256/512/1024 bytes	56 bytes

32. USB 2.0 Host Module

32.1 Overview

32.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

32.1.2 Features

This module has the following features:

Function	Description
Host function	• Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers • Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a • Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1
Other functions	• Battery charging (compliant with Battery Charging Specification Revision 1.2)*2 • Dual-role-device function (static switching between the USB host and USB peripheral functions)

Note 1. Some functions (specifications) are not supported.
Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected.

32.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.
Note, however, that this module supports only the functions marked with a circle "○" in the table below.

Function Name	Support
Per-Port Change Events	○
Shorter Periodic Frame List	○
Hardware Prefetching	—
Link Power Management (LPM)	○

Of the three features to support, the registers associated with “Per-Port Change Events” and “Shorter Periodic Frame List” are listed below. For more information on each register, refer to the appropriate register specification of the section 32.2, Register Descriptions.
With regard to “Link Power Management (LPM)”, it is described in section 32.1.2.2, Link Power Management (LPM) function.

-Per-Port Change Events

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 18	Per-Port Change Event Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit 15	Per-Port Change Events Enable	R/W	Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function.
USBSTS (offset: 124h)	bit 16	Port-1 Change Detect	R/W(1)	If a port-1 change event is detected, 1b is written to this bit.
USBINTR (offset: 128h)	bit 16	Port-1 Change Event Enable	R/W	Enable/Disable setting of the above “port-1 Change Detect” field. To reflect the port event on the above field for the port, set corresponding bit to 1b.

-Shorter Periodic Frame List

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 19	32-Frame Periodic List Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit[3:2]	Frame List Size	R/W	This bit determines the Frame List Size. To determine 32 frames, set this field 11b.

32.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).
When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.
*In using LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in section 32.2, Register Descriptions.

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: 108h)	bit 17	Link Power Management Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: 120h)	bit[27:24]	Host-Initiated Resume Duration	R/W	The minimum duration time of K-state drive in resume from LPM state.
PORTSC1 (offset: 164h)	bit[31:25]	Device Address [7:0]	R/W	The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token.
	bit[24:23]	Suspend Status [1:0]	R	The device response to LPM Token.
	bit 9	Suspend using L1	R/W	In using LPM function, set this bit 1b.
	bit 7	Suspend	R/W	When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = 000h”.
PORT_LPM_CTR1 (offset: 320h)	bit[7:4]	NYET_RETRY_CNT_P1[3:0]	R/W	The number of retry for NYET response of device in LPM transaction.
	bit 3	REMOTEWAKE_EN_P1	R/W	Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted
	bit 2	SLEEP_INT_EN_P1	R/W	In LPM transaction, setting to generate an interrupt or not when received a response other than ACK. 0b: not to generate an interrupt (default) 1b: to generate an interrupt
	bit 1	RETRY_ENABLE_NYET_P1	R/W	In LPM transaction, setting to the host behavior when received NYET response from the device. 0b: not to Retry (default) 1b: to Retry
	bit 0	HIRD_SEL_P1	R/W	Setting the duration time of the K-state drive, in resume of LPM state.

32.1.2.3 Dual Role Device function

You can switch the role between the host function and the peripheral function via this module register (UCOM).
For details about the UCOM register, see section 32.2.4.5, UCOM Register.

32.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module.
The detail of the UCOM register, refer to section 32.2.4.5, UCOM Register.

32.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.
The detail of the register, refer to section 32.2.4.4, (6), Suspend Control Register (offset: 308h).

[Relevant register]
Suspend Control Register (offset: 308h)

[Functional specification]

Function		Relevant bit	
[1]	Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register	bit 31	SUSPENDM_ENABLE
[2]	Function to forcibly assert USBPHY SUSPENDM	bit 0	GLOBAL_SUSPENDM_P1

32.1.2.6 Usage Notes

(1) In the case of disconnection immediately before a frame boundary from a device connected at full speed or low speed, subsequently recognizing the connection to the given device may not be possible.
(2) When an instruction to suspend the OHCI is executed after disconnection from a device connected at full speed or low speed, subsequently recognizing the connection to the given device may not be possible.

When a device is disconnected or an instruction to suspend the OHCI is executed after device disconnection, follow the procedure described in section 32.11.1, Actions after Device Disconnection.

32.1.3 Support of USB-Related Specifications

o: support
×: no support

USB-Related Specification or Function			Support
Host function	High Speed	Bulk IN/OUT transfer	○
		Control IN/OUT transfer	○
		Isochronous IN/OUT transfer	○
		Isochronous Highband transfer	○
		Interrupt IN/OUT transfer	○
	Full Speed	Bulk IN/OUT transfer	○
		Control IN/OUT transfer	○
		Isochronous IN/OUT transfer	○
		Interrupt IN/OUT transfer	○
	Low Speed	Control IN/OUT transfer	○
		Interrupt IN/OUTtransfer	○
	No. of hub connection stages	HS: 5 stages	○
		FS: 5 stages	○
	Support of EHCI V1.1	Hardware Prefetching	×
		Link Power Management	○
		Per-Port Change Events	○
		Shorter Periodic Frame List	○
Battery-charging function (hereafter called the "BC function")			○
Dual role device * Function to statically switch between the host and peripheral modes			○

32.1.4 Input/Output Pins

The following table describes the pin alignment.

Channel	Name	Pin	I/O	Function
0	USB D+ Data	DP0	I/O	USB built-in transceiver D+ I/O Connect this pin to the USB bus D+ pin.
	USB D- Data	DM0	I/O	USB built-in transceiver D- I/O Connect this pin to the USB bus D- pin.
	VBUS Input	VBUSIN0	Input	USB cable connection monitor pin Before connecting this pin, lower the voltage of VBUS of the USB bus to 3.3 V. This pin can be used to detect connection and disconnection of VBUS.
	VBUS Output	VBUSEN0	Output	VBUS power enable pin
	Overcurrent Input	OVRCUR0	Input	Overcurrent pin
	OTG Power IC Control	OTG_EXICEN0	Output	OTG power IC control pin
	OTG Power IC ID	OTG_ID0	Input	OTG power IC ID pin
	CC Input	CC1_Rd0, CC1_Ra0, CC2_Rd0, CC2_Ra0	Input	CC pin monitor for the Type-C pin Before connecting this pin, detect the status of the resistance value of the CC pin.
	Reference Input	RREF0	Input	Pin for connecting the reference resistance Connect this pin to USBVss via the resistance of 2.2 kΩ ± 1%.
	Transceiver Section Analog Pin Power	USBAPVcc0	Input	Power for the pin
	Transceiver Section Digital Pin Power	USBDPVcc0	Input	Power for the pin
1	USB D+ Data	DP1	I/O	USB built-in transceiver D+ I/O Connect this pin to the USB bus D+ pin.
	USB D- Data	DM1	I/O	USB built-in transceiver D- I/O Connect this pin to the USB bus D- pin.
	VBUS Input	VBUSIN1	Input	USB cable connection monitor pin Before connecting this pin, lower the voltage of VBUS of the USB bus to 3.3 V. This pin can be used to detect connection and disconnection of VBUS.
	VBUS Output	VBUSEN1	Output	VBUS power enable pin
	Overcurrent Input	OVRCUR1	Input	Overcurrent pin
	OTG Power IC Control	OTG_EXICEN1	Output	OTG power IC control pin
	OTG Power IC ID	OTG_ID1	Input	OTG power IC ID pin
	CC Input	CC1_Rd1, CC1_Ra1, CC2_Rd1, CC2_Ra1	Input	CC pin monitor for the Type-C pin. Before connecting this pin, detect the status of the resistance value of the CC pin.
	Reference Input	RREF1	Input	Pin for connecting the reference resistance. Connect this pin to USBVss via the resistance of 2.2 kΩ ± 1%.
	Transceiver Section Analog Pin Power	USBAPVcc1	Input	Power for the pin
	Transceiver Section Digital Pin Power	USBDPVcc1	Input	Power for the pin
Common	Quartz Oscillator for USB/External Clock	USB_X1	Input	Connect this pin to the quartz oscillator for the USB 2.0 host/function module. USB_X1 pin can be also used for inputting the external clock.
		USB_X2	Output	
	Transceiver Section pin Grand	USBVss	Input	Grand for pins

32.2 Register Descriptions

32.2.1 Register Attributes

Table 32.1 Register Attributes

Register Attribute	Description
R/W	Register bits can be read and written.
R/W(1)	Register bits can be read. A clear bit may be set by writing “1”; writing 0 to R/W(1) bits has no effect.
R/W(0)	Register bits can be read. A clear bit may be set by writing “0”; writing 1 to R/W(0) bits has no effect.
R	Register bits can only be read.
W	Register bits can only be written.
Reserved	Reserved bits are Read Only field.

32.2.2 Base Address

Table 32.2 Base Addresses for Each Channel of the USB Host Module

Channel	Base Address
0	E821 8000h
1	E821 A000h

32.2.3 Register Overview

Address Offset	Register Name	Abbreviated Name	Remarks
000h	HcRevision	HcRevision	OHCI Operation Registers
004h	HcControl	HcControl	
008h	HcCommandStatus	HcCommandStatus	
00Ch	HcInterruptStatus	HcInterruptStatus	
010h	HcInterruptEnable	HcInterruptEnable	
014h	HcInterruptDisable	HcInterruptDisable	
018h	HcHCCA	HcHCCA	
01Ch	HcPeriodCurrentED	HcPeriodCurrentED	
020h	HcControlHeadED	HcControlHeadED	
024h	HcControlCurrentED	HcControlCurrentED

848h	PHYIF CTRL	PHYIF_CTRL	Deep Standby Recovery Control Register

32.2.4 Description of Registers

32.2.4.1 OHCI Operational Register

(1) HcRevision Register (offset: 000h)

Abbreviated name of register: HcRevision

Address:	003h								002h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	001h								000h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Revision							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Table 32.3 HcRevision Register

Bit	Symbol	Description
31 to 8		Reserved The write value should always be 0.
7 to 0	Revision	This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, 10h is indicated.

(2) HcControl Register (offset: 004h)

Abbreviated name of register: HcControl

Address:	007h								006h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	005h								004h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved						RWC	Reserved	HCFS		BLE	CLE	IE	PLE	CBSR	
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.4 HcControl Register

Bit	Symbol	Description
31 to 10		Reserved The write value should always be 0.
9	RWC (Remote Wakeup Connected)	This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported
8		Reserved The write value should always be 0.

Table 32.4 HcControl Register

Bit	Symbol	Description
7, 6	HCFS (Host Controller Functional State)	This field indicates the operating state of the host controller. 00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary. This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume. Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)
5	BLE (BulkList Enable)	This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the bulk list, this bit must be 0b. 0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled
4	CLE (ControlList Enable)	This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the control list, this bit must be 0b. 0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.
3	IE (Isochronous Enable)	This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame. If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing. 1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started. 0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.
2	PLE (Periodic List Enable)	This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. The host controller module checks this bit before starting the periodic list processing. 0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.
1, 0	CBSR (Control Bulk Service Ratio)	This field defines the service ratio of the control transfer and bulk transfer. When the periodic list is processed, the service ratio defined in this field is used for transfer.

CBSR	No. of Control EDs Over Bulk EDs Served
00b	1 : 1
01b	2 : 1
10b	3 : 1
11b	4 : 1

(3) HcCommandStatus Register (offset: 008h)

Abbreviated name of register: HcCommandStatus

Address:	00Bh								00Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved						SOC	
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	009h								008h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W
Symbol:	Reserved								Reserved					BLF	CLF	HCR
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.5 HcCommandStatus Register

Bit	Symbol	Description
31 to 18		Reserved The write value should always be 0.
17, 16	SOC (Scheduling Overrun Count)	This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected.
15 to 3		Reserved The write value should always be 0.
2	BLF (BulkList Filled)	This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list.
1	CLF (ControlList Filled)	This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list.
0	HCR (Host Controller Reset)	This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b.

(4) HcInterruptStatus Register (offset: 00Ch)

Abbreviated name of register: HcInterruptStatus

Address:	00Fh								00Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	00Dh								00Ch							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved								Reserved	RHSC	FNO	UE	RD	SF	WDH	SO
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.6 HcInterruptStatus Register

Bit	Symbol	Description
31 to 7		Reserved The write value should always be 0.
6	RHSC (Root Hub Status Change)	Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed.
5	FNO (Frame Number Overflow)	Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred.
4	UE (Unrecoverable Error)	Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred.
3	RD (Resume Detected)	Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup).
2	SF (Start of Frame)	Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame.
1	WDH (Writeback DoneHead)	Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred.

Table 32.6 HcInterruptStatus Register

Bit	Symbol	Description
0	SO (Scheduling Overrun)	Interrupt bit that indicates that overrun of the USB schedule occurred. When USB scheduling overrun occurs, the host controller updates HccaFrameNumberl, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented. Writing this bit to 1b clears the interrupt. 0b: The scheduling overrun has not occurred. 1b: The scheduling overrun has occurred.

(5) HcInterruptEnable Register (offset: 010h)

Abbreviated name of register: HcInterruptEnable

Address:	013h								012h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	MIE	OCE	Reserved						Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	011h								010h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved								Reserved	RHSCE	FNOE	UEE	RDE	SFE	WDHE	SOE
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.7 HcInterruptEnable Register

Bit	Symbol	Description
31	MIE (Master Interrupt Enable)	This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled.
30	OCE	OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (OwnershipChange) interrupt is disabled. 1b: OC (OwnershipChange) interrupt is enabled.
29 to 7		Reserved The write value should always be 0.
6	RHSCE	RHSC (RootHub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (RootHub Status Change) interrupt is disabled. 1b: RHSC (RootHub Status Change) interrupt is enabled.
5	FNOE	FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled.
4	UEE	UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled.
3	RDE	RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled.
2	SFE	SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled.
1	WDHE	WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled.

Table 32.7 HcInterruptEnable Register

Bit	Symbol	Description
0	SOE	SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled.

(6) HcInterruptDisable Register (offset: 014h)

Abbreviated name of register: HcInterruptDisable

Address:	017h								016h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W(1)	R/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	MID	OCD	Reserved						Reserved

Address:	015h								014h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)
Symbol:	Reserved								Reserved	RHSCD	FNOD	UED	RDD	SFD	WDHD	SOD
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.8 HcInterruptDisable Register

Bit	Symbol	Description
31	MID (Master Interrupt Disable)	This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored.
30	OCD	OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
29 to 7		Reserved The write value should always be 0.
6	RHSCD	RHSC (RootHub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
5	FNOD	FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored.
4	UED	UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored.
3	RDD	RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored.
2	SFD	SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored.
1	WDHD	WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded form the interrupt source. Writing 0b to this bit is ignored.
0	SOD	SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored.

(7) HcHCCA Register (offset: 018h)

Abbreviated name of register: HcHCCA

Address:	01Bh								01Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	HcHCCA[31:24]								HcHCCA[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	019h								018h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Symbol:	HcHCCA[15:8]								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.9 HcHCCA Register

Bit	Symbol	Description
31 to 8	HcHCCA	This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field.
7 to 0		Reserved The write value should always be 0.

(8) HcPeriodicCurrentED Register (offset: 01Ch)

Abbreviated name of register: HcPeriodCurrentED

Address:	01Fh								01Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	PECD[31:24]								PECD[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	01Dh								01Ch							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	PECD[15:8]								PECD[7:4]				Reserved			
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.10 HcPeriodCurrentED Register

Bit	Symbol	Description
31 to 4	PECD (Period Current ED)	This pointer indicates the physical address of ED in the periodic list that is currently processed. The host controller updates this pointer when the list processing of the periodic ED finishes.
3 to 0	Reserved	Reserved The write value should always be 0.

(9) HcControlHeadED Register (offset: 020h)

Abbreviated name of register: HcControlHeadED

Address:	023h								022h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	CHED[31:24]								CHED[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	021h								020h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R
Symbol:	CHED[15:8]								CHED[7:4]				Reserved			
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.11 HcControlHeadED Register

Bit	Symbol	Description
31 to 4	CHED (Control Head ED)	This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer.
3 to 0		Reserved The write value should always be 0.

(10) HcControlCurrentED Register (offset: 024h)

Abbreviated name of register: HcControlCurrentED

Address:	027h								026h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	CCED[31:24]								CCED[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	025h								024h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.12 HcControlCurrentED Register

Bit	Symbol	Description
31 to 4	CCED (Control Current ED)	This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to 0h to indicate the end of the control list.
3 to 0		Reserved The write value should always be 0.

(11) HcBulkHeadED Register (offset: 028h)

Abbreviated name of register: HcBulkHeadED

Address:	02Bh								02Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.14 HcBulkCurrentED Register

Bit	Symbol	Description
31 to 4	BCED (Bulk Current ED)	This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulklCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to 0h to indicate the end of the bulk list.
3 to 0		Reserved The write value should always be 0.

(13) HcDoneHead Register (offset: 030h)

Abbreviated name of register: HcDoneHead

Address:	033h								032h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	DH[31:24]								DH[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	031h								030h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	DH[15:8]								DH[7:4]				Reserved			
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.15 HcDoneHead Register

Bit	Symbol	Description
31 to 4	DH (Done Head)	This field indicates the physical address of the HcDoneHead of the host controller. The physical address of the TD that lately finished and is added to the Done queue. After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD. At the same time, the host controller overwrites the contents of HcDoneHead with the TD address. After the host controller writes the contents of this register into HCCA, it sets 0b to this register. Then, the WritebackDoneHead bit of the HcInterruptStatus register is set to 1b.
3 to 0		Reserved The write value should always be 0.

(14) HcFmInterval Register (offset: 034h)

Register abbreviation: HcFmInterval

Address:	037h								036h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	FIT	FSMPS[30:24]							FSMPS[23:16]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset value:	0	0	1	0	1	1	1	0	1	1	0	1	1	1	1	1

Table 32.16 HcFmInterval Register

Bit	Symbol	Description
31	FIT (Frame Interval Toggle)	This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register.
30 to 16	FSMPS (FS Largest Data Packet)	This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. Note: The maximum setting value for this field is 2778h. Do not set any value that is larger than 2778h.
15, 14		Reserved The write value should always be 0.
13 to 0	FI (Frame Interval)	This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to ”2EDFh” so that 1 frame (= 1 ms) of USB standard is satisfied.

(15) HcFmRemaining Register (offset: 038h)

Register abbreviation: HcFmRemaining

Address:	041h								040h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	FRT	Reserved							Reserved

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved		FR[13:8]						FR[7:0]							
Reset value:	0	0	1	0	1	1	1	0	1	1	0	1	1	1	1	1

Table 32.17 HcFmRemaining Register

Bit	Symbol	Description
31	FRT (Frame Remaining Toggle)	This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to 0000h, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field.
30 to 14		Reserved The write value should always be 0.
13 to 0	FR (Frame Remaining)	This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes 0000h, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF.

(16) HcFmNumber Register (offset: 03Ch)

Register abbreviation: HcFmNumber

Address:	03Fh								03Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Symbol:	FN[15:8]								FN[7:0]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.18 HcFmNumber Register

Bit	Symbol	Description
31 to 16		Reserved The write value should always be 0.
15 to 0	FN (Frame Number)	This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to FFFFh, the value is rolled over to 0000h. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register.

(17) HcPeriodicStart Register (offset: 040h)

Register abbreviation: HcPeriodicStart

Address:	043h								042h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	041h								040h

Symbol:	Reserved		PS[13:8]						PS[7:0]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.19 HcPeriodicStart Register

Bit	Symbol	Description
31 to 14		Reserved The write value should always be 0.
13 to 0	PS (Periodic Start)	This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is 2A2Fh. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing.

(18) HcLSThreshold Register (offset: 044h)

Register abbreviation: HcLSThreshold

Address:	047h								046h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W :	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R
Symbol:	Reserved			NOCP	OCPM	DT	NPS	PSM	NDP							
Reset value:	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0	1

Table 32.21 HcRhDescriptorA Register

Bit	Symbol	Description
31 to 24	POTPGT (PowerOn To PowerGood Time)	This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms.
23 to 13		Reserved The write value should always be 0.
12	NOCP (No OverCurrent Protection)	This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see section 32.9.1, Host/Peripheral Common Setting Sequence.
11	OCPM (OverCurrent Protection Mode)	This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port.
10	DT (Device Type)	This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device.
9	NPS (No Power Switching)	This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running.
8	PSM (Power Switching Mode)	This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command.
7 to 0	NDP (Number Down stream Ports)	This field indicates the number of downstream ports supported by the root hub.

(20) HcRhDescriptorB Register (offset: 04Ch)

Register abbreviation: HcRhDescriptorB

Address:	04Fh								04Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R
Symbol:	Reserved								Reserved						DR	Reserved
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.22 HcRhDescriptorB Register

Bit	Symbol	Description
31 to 18		Reserved The write value should always be 0.
17	PPCM (PortPower Control Mask)	This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored.
16 to 2		Reserved The write value should always be 0.
1	DR (Device Removable)	This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable.
0		Reserved The write value should always be 0.

(21) HcRhStatus Register (offset: 050h)

Register abbreviation: HcRhStatus

Address:	053h								052h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W
Symbol:	CRWE	Reserved							Reserved						OCIC	LPSC
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	051H								050h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Symbol:	DRWE	Reserved							Reserved						OCI	LPS
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.23 HcRhStatus Register

Bit	Symbol	Description
31	CRWE (Clear RemoteWakeup Enable)	This bit is used to clear the DRWE bit. If this bit is set to 1b, DRWE (Device RemoteWakeup Enable) bit can be cleared. Writing 0b to this bit has no effect.
30 to 18		Reserved The write value should always be 0.
17	OCIC (OverCurrent Indicator Change)	This bit is used to report the change in the OCI bit. If there is any change in the OCI bit, the host controller sets this bit to 1b. If 1b is written to this bit while this bit is set to 1b, this bit can be cleared. Writing 0b to this bit has no effect. 0b: There is no change in the Overcurrent state. 1b: There is a change in the Overcurrent state.
16	LPSC	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status Change This bit is always read as 0b because the Local Power Status is not supported. [Write] Set Global Power If this bit is set to 1b, the power to the ports is turned on. The ports whose power is turned on are determined by the settings of the PSM (Power Switching Mode) bit and the PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	1b is set to the PPS bit.
	1	0	1b is set to the PPS bit.
		1	Setting ignored

Writing 0b to this bit has no effect.

15	DRWE	[Read] Device RemoteWakeup Enable This bit sets whether the RemoteWakeup event includes the CSC (Connect Status Change) bit. If this bit is set to 1b, the CSC bit of the HcRhPortStatus1 register becomes valid as the Resume event. If the CSC bit is changed to 1b, the state is changed from USB Suspend to USB Resume, and the Resume detection interrupt occurs. 0b: Connect Status Change is not the source of RemoteWakeup. 1b: Connect Status Change is the source of RemoteWakeup. [Write] Set RemoteWakeup Enable This bit is used to set the DRWE bit. Writing 0b to this bit has no effect.
14 to 2		Reserved The write value should always be 0.

Table 32.23 HcRhStatus Register

<table>
<tr><th>Bit</th><th>Symbol</th><th>Description</th></tr>
<tr><td>1</td><td>OCI
(Over Current Indicator)</td><td>This bit is used to report the overcurrent state in the global overcurrent detection mode (OCPM bit = 0b).
This bit always indicates 0b when overcurrent for each port is reported (when OPCM bit = 1b).
0b: The port state is normal.
1b: The port is in the overcurrent state.</td></tr>
<tr><td>0</td><td>LPS</td><td>The meaning of this bit differs depending on whether the operation is read or write.

[Read] Local Power Status
This bit is always read as 0b because the Local Power Status is not supported.

[Write] Clear Global Power
If this bit is set to 1b, the power to the ports is turned off.
The ports whose power is turned off are determined by the settings of the PSM (Power Switching Mode) bit and PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.
<table>

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.24 HcRhPortStatus1 Register

Bit	Symbol	Description
31 to 21		Reserved The write value should always be 0.
20	PRSC (Port Reset Status Change)	This bit indicates that port reset (bus reset) has finished. The host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished.
19	OCIC (Port OverCurrent Indicator Change)	This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed).
18	PSSC (Port Suspend Status Change)	This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished.
17	PESC (Port Enable Status Change)	This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed.
16	CSC (Connect Status Change)	This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed.
15 to 10		Reserved The write value should always be 0.

Table 32.24 HcRhPortStatus1 Register

Bit	Symbol	Description
9	LSDA	The meaning of this bit differs depending on whether the operation is read or write. [Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected. [Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.
8	PPS	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on. [Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.
7 to 5		Reserved The write value should always be 0.
4	PRS	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset [Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.
3	POCI	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status. [Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.

Table 32.24 HcRhPortStatus1 Register

Bit	Symbol	Description
2	PSS	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Suspend Status This bit indicates that the port status is in Suspend or Resume sequence. 0b: The port is not in Suspend status. 1b: The port is in Suspend status. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is cleared under the following conditions: - When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set - When the port reset finished, and the PRSC (Port Reset Status Change) bit is set - When the host controller is in the USB Resume state [Write] Set Port Suspend This bit is used to change the port status to Suspend. Writing 1b to this bit changes the status to Suspend. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to the ports to which no device is connected that the Suspend command was issued.
1	PES	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Enable Status This bit indicates whether the port status is Enable or Disable. If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is set "when port reset finished and the PRSC bit is set" or "when the port status becomes Suspend and the PRSC bit is set". 0b: The port status is Disable. 1b: The port status is Enable. [Write] Set Port Enable This bit is used to set the PES bit. Writing 1b to this bit changes the port status to Enable. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.
0	CCS	The meaning of this bit differs depending on whether the operation is read or write. [Read] Current Connect Status The current connection status of the downstream port is applied to this bit. 0b: No device is connected. 1b: A device is connected. [Write] Clear Port Enable This bit is used to clear the PES (Port Enable Status) bit. Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.

32.2.4.2 EHCI Controller Capability Register

(1) HCIVERSION/CAPLENGTH Register (offset: 102h/100h)

Register abbreviation: CAPL_VERSION

Address:	103h								102h

Table 32.25 CAPL_VERSION Register

Bit	Symbol	Description
31 to 16	Interface Version Number	This field indicates the EHCI version supported by the host controller. 0110h is indicated because this host controller supports EHCI Rev1.1.
15 to 8		Reserved The write value should always be 0.
7 to 0	Capability Registers Length	This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. 20h is indicated because the EHCI Operation register of this module starts from 20h.

(2) HCSPARAMS Register (offset: 104h)

Register abbreviation: HCSPARAMS

Address:	107h								106h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Debug Port Number [3:0]				Reserved			P_INDICATOR
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	105h								104h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset value:	0	0	0	1	0	0	0	1	1	0	0	1	0	0	0	1

Table 32.26 HCSPARAMS Register

Bit	Symbol	Description
31 to 24		Reserved The write value should always be 0.
23 to 20	Debug Port Number	This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port.
19 to 17		Reserved The write value should always be 0.
16	P_INDICATOR (Port Indicators)	This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control.
15 to 12	N_CC (Number of Companion Controller)	This field indicates the number of OHCI host controllers implemented in this module. 1h is indicated because this module has one OHCI host controller.
11 to 8	N_PCC (Number of Ports per Companion Controller)	This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field.
7	Port Routing Rules	This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method.
6, 5		Reserved The write value should always be 0.
4	PPC (Port Power Control)	This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power.
3 to 0	N_PORTS	This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port

(3) HCCPARAMS Register (offset: 108h)

Register abbreviation: HCCPARAMS

Address:	10Bh								10Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved				32-Frame Periodic List Capability	Per-Port Change Event Capability	Link Power Management Capability	Hardware Prefetch Capability
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0
Address:	109h								108h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	EECP								Isochronous Scheduling Threshold				Reserved	Asynchronous Schedule Park Capability	Programmable Frame List Flag	64-bit Addressing Capability
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

Table 32.27 HCCPARAMS Register

Bit	Symbol	Description
31 to 20		Reserved The write value should always be 0.
19	32-Frame Periodic List Capability	This bit indicates 1b because this module supports 32 Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32 Frame Periodic List.
18	Per-Port Change Event Capability	This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved
17	Link Power Management Capability	This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved.
16	Hardware Prefetch Capability	This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1.
15 to 8	EECP	This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates 00h because this module does not use EHCI Extend Capabilities Registers.
7 to 4	Isochronous Scheduling Threshold	This field indicates 0h because this module does not support caches with isochronous data structure for the entire frame.
3		Reserved The write value should always be 0.
2	Asynchronous Schedule Park Capability	This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function.
1	Programmable Frame List Flag	This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable.
0	64-bit addressing Capability	This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported.

(4) HCSP-PORTROUTE Register (offset: 10Ch)

Register abbreviation: HCSP_PORTROUTE

Address:	10Fh								10Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset value:	0	0	0	0	1	0	1	1	0	0	0	0	0	0	0	0

Table 32.29 USBCMD Register

Bit	Symbol	Description
31 to 28		Reserved The write value should always be 0.
27 to 24	Host-Initiated Resume Duration	This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state. The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token. The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, 0h means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, 1h means 125 µs, and 4h means 1175 µs.
23 to 16	Interrupt Threshold Control	This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed. Value / Maximum Interrupt Interval 00h: Reserved 01h: 1 micro-frame 02h: 2 micro-frames 04h: 4 micro-frames 08h: 8 micro-frames (default, equals to 1 ms) 10h: 16 micro-frames (2 ms) 20h: 32 micro-frames (4 ms) 40h: 64 micro-frames (8 ms) Do not set 00h to this field while the Halted bit is 0b.
15	Per-Port Change Events Enable	This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register. 0b: The event report function of the ports is disabled. 1b: The event report function of the ports is enabled.
14 to 12		Reserved The write value should always be 0.
11	Asynchronous Schedule Park Mode Enable	This bit enables or disables the Asynchronous Schedule Park mode. 0b: The Park mode is disabled. 1b: The Park mode is enabled.
10		Reserved The write value should always be 0.

Table 32.29 USBCMD Register

Bit	Symbol	Description
9, 8	Asynchronous Schedule Park Mode Count	This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is 1h to 3h. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set 0h to this field.
7		Reserved The write value should always be 0.
6	Interrupt on Async Advance Doorbell	This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit.
5	Asynchronous Schedule Enable	This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing.
4	Periodic Schedule Enable	This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing.
3, 2	Frame List Size	This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. Value — the number of frames in Frame List 00b — 1024 frames (default) 01b — 512 frames 10b — 256 frames 11b — 32 frames
1	HCRESET (Host Controller Reset)	This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit.
0	RS (Run/Stop)	This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit.

(2) USBSTS Register (offset: 124h)

Register abbreviation: USBSTS

Address:	127h								126h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)
Symbol:	Reserved								Reserved							Port-1 Change Detect
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	125h								124h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)
Symbol:	Asynchronous Schedule Status	Periodic Schedule Status	Reclamation	HCHalted	Reserved				Reserved		Interrupt on Async Advance	Host System Error	Frame List Rollover	Port Change Detect	USBERRINT	USBINT
Reset value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.30 USBSTS Register

Bit	Symbol	Description
31 to 17		Reserved The write value should always be 0.
16	Port-1Change Detect	If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b.
15	Asynchronous Schedule Status	This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b).
14	Periodic Schedule Status	This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b).
13	Reclamation	This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode.
12	HCHalted	If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped.
11 to 6		Reserved The write value should always be 0.
5	Interrupt on Async Advance	This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected.

Table 32.30 USBSTS Register

Bit	Symbol	Description
4	Host System Error	This bit is set to 1b if a serious error occurs in the host controller. If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: No system error occurred. 1b: A system error occurred.
3	Frame List Rollover	If a frame list rollover occurs, the host controller sets this bit to 1b. Specifically, when the Frame Index field of the FRINDEX register is returned to 000h from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles. Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect. 0b: The frame list is not returned to 000h. 1b: The frame list is returned to 000h (rollover occurred).
2	Port Change Detect	This bit indicates that the port status has changed. Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b: - Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1. - A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1. - The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1. - J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
1	USBERRINT (USB Error Interrupt)	This bit indicates that a USB transaction finished with an error. When a USB transaction finishes with an error, the host controller sets this bit to 1b. If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: USB transaction is normal. 1b: USB transaction finished with an error.
0	USBINT (USB Interrupt)	This bit indicates that a USB transfer has finished. The host controller sets this bit to 1b if one of the following conditions is satisfied: - A USB transfer has finished. - A short packet is received. Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: A USB transfer has not finished. 1b: A USB transfer has finished.

(3) USBINTR Register (offset: 128h)

Register abbreviation: USBINTR

Address:	12Bh								12Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Symbol:	Reserved								Reserved							Port-1 Change Event Enable
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	129h								128h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved								Reserved		Interrupt on Async Advance Enable	Host System Error Enable	Frame List Rollover Enable	Port Change Detect Enable	USB Error Interrupt Enable	USB Interrupt Enable
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.31 USBINTR Register

Bit	Symbol	Description
31 to 17		Reserved The write value should always be 0.
16	Port-1 Change EventEnable	If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt.
15 to 6		Reserved The write value should always be 0.
5	Interrupt on Async Advance Enable	This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit).
4	Host System Error Enable	This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit).
3	Frame List Rollover Enable	This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit).
2	Port Change Detect Enable	This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit).
1	USB Error Interrupt Enable	This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit).
0	USB Interrupt Enable	This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit).

(4) FRINDEX Register (offset: 12Ch)

Register abbreviation: FRINDEX

Address:	12Fh								12Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.32 FRINDEX Register

Bit	Symbol	Description
31 to 14		Reserved The write value should always be 0.
13 to 0	Frame Index [13:0]	This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame. Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register.

Frame List Size	Number of Frames	N
00b	1024	12
01b	512	11
10b	256	10
11b	32	12

Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b).
The setting value of this field is applied to the SOF frame number of the SOF token.

(5) CTRLDSSEGMENT Register (offset: 130h)

Register abbreviation: CTRLDSSEGMENT

Address:	133h								132h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.34 PERIODICLISTBASE Register

Bit	Symbol	Description
31 to 12	Base Address	This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation.
11 to 0		Reserved The write value should always be 0.

(7) ASYNCLISTADDR Register (offset: 138h)

Register abbreviation: ASYNCLISTADDR

Address:	13Bh								13Ah

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	165h								164h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W(1)	R	R/W(1)	R/W	R/W(1)	R
Symbol:	Reserved		Port Owner	PP	Line Status		Suspend using L1	Port Reset	Suspend	Force Port Resume	Over current Active Change	Over-current Active	Port Enabled/ Disabled Change	Port Enabled/ Disabled	Connect Status Change	Current Connect Status
Reset value:	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.37 PORTSC1 Register

Bit	Symbol	Description
31 to 25	Device Address	This field indicates the USB device address (7 bits) of the device connected to the down port. This address is used when the LPM Token is sent. If the value of this filed is 00h, it means that no device that needs to use this field has been connected.
24, 23	Suspend Status	This field indicates the response from the connected device to the LPM Token (L1 transition request). 00b: The device succeeded transition to the L1 state (ACK received from the device). 01b: The device has not changed to the L1 state (NYET received from the device). 10b: The device does not support the L1 state transition (STALL received from the device). 11b: Other response (for example, Timeout error) Change this field only when the Suspend bit is 0b.
22	WKOC_E (Wake on Overcurrent Enable)	By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
21	WKDSCNNT_E (Wake on Disconnect Enable)	By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
20	WKCNNT_E (Wake on Connect Enable)	By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
19 to 16	Port Test Control	This field is controlled by the test mode. If the value of this field is other than 0000b, it indicates that this module is running in the test mode.

Value	Test mode
0000b	Test mode not enabled
0001b	Test J_STATE
0010b	Test K_STATE
0011b	Test SE0_NAK
0100b	Test Packet
0101b	Test FORCE_ENABLE
Other	Reserved

15, 14		Reserved The write value should always be 0.

Table 32.37 PORTSC1 Register

<table>
<tr><th>Bit</th><th>Symbol</th><th>Description</th></tr>
<tr><td>13</td><td>Port Owner</td><td>This bit indicates which of OHCI or EHCI has the port ownership.
0b: EHCI has the port ownership.
1b: OHCI has the port ownership.
When bit 0 (Configure Flag bit) of the CONFIGFLA register is changed from 0b to 1b, this bit becomes 0b. If bit 0 (Configure Flag bit) of the CONFIGFLA register is 0b, this bit becomes 1b.
If the connected device is not a High Speed device, this bit is set to 1b to transfer the port ownership to OHCI.</td></tr>
<tr><td>12</td><td>PP
(Port Power)</td><td>This bit controls power supply to the port.
If this bit is 0b, power is not supplied to the port. Therefore, the port does not function, and does not recognize connection and disconnection.
If overcurrent is detected while this bit is set to 1b, the host controller clears this bit to 0b, and the power supplied to the port is stopped.
Note: As described later, if the PPC bit is 0b, this bit is fixed to 1b, so the power supplied to the port is not stopped.

The function of this bit differs depending on the value of bit 4 (PPC [Port Power Control] bit) of the HCSPARAMS register.
<table>
<tr><th>PPC</th><th>PP</th><th>Operation</th><th></th></tr>
<tr><td>0b</td><td>1b</td><td>R</td><td>This bit is fixed to 1b, and the power is always supplied to the port.</td></tr>
<tr><td>1b</td><td>0b/1b</td><td>R/W</td><td>Whether or not power is supplied to the port depends on the setting of this bit.</td></tr>
<tr><td></td><td></td><td></td><td>0b Power is not supplied to the port.</td></tr>
<tr><td></td><td></td><td></td><td>1b Power is supplied to the port.</td></tr>
</table></td></tr>
<tr><td>11, 10</td><td>Line Status</td><td>This field indicates the logical level of D+/D- lines of the current USB bus. (bit 11: DP / bit 10: DM)
This field is used to detect an LS device before starting a sequence for port reset and port enable.
Therefore, this bit is valid only when bit 3 (Port Enable/Disable bit) is 0b and bit 0 (Current Connect Status bit) is 1b.
<table>
<tr><th>bit 11</th><th>bit 10</th><th>USB bus status</th><th>Description</th></tr>
<tr><td>0b</td><td>0b</td><td>SE0</td><td>The device is not an LS device.</td></tr>
<tr><td></td><td></td><td></td><td>EHCI port reset is executing.</td></tr>
<tr><td>1b</td><td>0b</td><td>J-state</td><td>The device is not an LS device.</td></tr>
<tr><td></td><td></td><td></td><td>EHCI port reset is executing.</td></tr>
<tr><td>0b</td><td>1b</td><td>K-state</td><td>An LS device was connected.</td></tr>
<tr><td></td><td></td><td></td><td>The port ownership is transferred from EHCI to OHCI.</td></tr>
<tr><td>1b</td><td>1b</td><td>Undefined</td><td>The device is not an LS device.</td></tr>
<tr><td></td><td></td><td></td><td>EHCI port reset is executing.</td></tr>
</table></td></tr>
<tr><td>9</td><td>Suspend using L1</td><td>Suspend using L1 (LPM) control bit.
If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state.
Writing to this bit is possible only when the Suspend bit (bit 7) is 0b.
0b: Suspend using L2
1b: Suspend using L1 (LPM)
If this bit is 1b and the Device Address field is other than 0000h, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state.
If this bit is 0b, the host controller operates as L2 Suspend.</td></tr>
</table>

Table 32.37 PORTSC1 Register

<table>
<tr><th>Bit</th><th>Symbol</th><th>Description</th></tr>
<tr><td>8</td><td>Port Reset</td><td>This bit indicates the reset status of the port.
0b: The port is not being reset.
1b: The port is being reset.
If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete.
If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b.
If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b.
Note: Even if 1b is written to this bit, the bus reset sequence does not start.
- PP (Port Power) bit = 0b
- Port Owner bit = 1b
- Current Connect Status bit = 0b</td></tr>
<tr><td>7</td><td>Suspend</td><td>This bit indicates the Suspend control and status of the port.
This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status.
<table>
<tr><th>Port Enabled</th><th>Suspend</th><th>Port Status</th></tr>
<tr><td>0b</td><td>—</td><td>Disable</td></tr>
<tr><td>1b</td><td>0b</td><td>Enable</td></tr>
<tr><td></td><td>1b</td><td>Suspend</td></tr>
</table>
To change the port state to L1 or L2 Suspend, set this bit to 1b.
Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit.
In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes.
Writing 0b to this bit has no effect.
This bit can be set to 1b only when all the following conditions are satisfied: ”PP (Port Power) bit = 1b”, “Port Owner bit = 0b”, and “Current Connect Status bit = 1b”. If any of the following conditions is satisfied, the host controller clears this bit:
- "Resume is complete" is detected.
- The PR bit is set to 1b when PR (Port Reset) bit is 0b.
- The port owner is 1b (OHCI).
- The PP (Port Power) bit is set to 0b.
- The Port Enabled/Disabled bit is set to 0b.</td></tr>
<tr><td>6</td><td>Force Port Resume</td><td>This bit indicates that the Resume state of the port is detected.
0b: Resume signal is not detected or output.
1b: Resume (K-state) is detected or output.
When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b.
If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus.
For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b.
On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register.
If the Port Power (PP) bit is 0b, this bit becomes 0b.</td></tr>
<tr><td>5</td><td>Over-current Change</td><td>This bit indicates that bit 4 (Over-current Active bit) has changed.
Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
0b: Over-current Active bit has not changed.
1b: Over-current Active bit has changed.</td></tr>
</table>

Table 32.37 PORTSC1 Register

Bit	Symbol	Description
4	Over-current Active	This bit indicates the overcurrent status of the port. If the host controller detects overcurrent, it disables the port, and set this bit to 1b. After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b. 0b: The port is not in overcurrent state. 1b: The port is in overcurrent state.
3	Port Enable/Disable Change	This bit indicates that the host controller detected frame babble. If the Host Controller detects frame babble, it disables the port and sets this bit to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: Frame babble has not occurred. 1b: Frame babble is detected.
2	Port Enabled/ Disabled	This bit indicates the Enable/Disable status of the port. The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b. If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit. If the port is disabled, data transfer to the downstream port is blocked except for port reset. If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The port is disabled. 1b: The port is enabled.
1	Connect Status Change	This bit indicates that bit 0 (Current Connect Status bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The Current Connect Status bit has no change. 1b: The Current Connect Status bit has changed.
0	Current Connect Status	This bit indicates the connection status of the port. If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected. On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b. If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b. 0b: No device is connected to the port. 1b: A device is connected to the port.

32.2.4.4 AHB Bridge Register

(1) INT_ENABLE Register (offset: 200h)

Abbreviated name of register: INT_ENABLE

Address:	203h								202h

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.40 AHB_BUS_CTR Register

Bit	Symbol	Description
31 to 16		Reserved The write value should always be 0.
15 to 12	PROT_TYPE	This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data
11 to 9		Reserved The write value should always be 0.
8	PROT_MODE	This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed.
7, 6		Reserved The write value should always be 0.
5, 4	ALIGN_ ADDRESS	This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed16 byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.)
3, 2		Reserved The write value should always be 0.
1 to 0	MAX_BURST _LEN	This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: INCR16 01b: INCR8 10b: INCR4 11b: SINGLE

(4) USBCTR Register (offset: 20Ch)

Abbreviated name of register: USBCTR

Address:	20Fh								20Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Symbol:	Reserved								Reserved					DIRPD	PLL_RST	USBH_RST
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Table 32.41 USBCTR Register

Bit	Symbol	Description
31 to 3		Reserved The write value should always be 0.
2	DIRPD	USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode [Note] When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1 when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition.
1	PLL_RST	This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset.
0	USBH_RST	Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. [Note] Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [Bφ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module.

(5) Register Enable/Clock Gating Control Register (offset: 304h)

Abbreviated name of register: REGEN_CG_CTRL

Address:	307h								306h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	NONUSE_CLK_MSK	Reserved	HOST_CLK_MSK	PERI_CLK_MSK	Reserved			RPB_WEN	Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	305h								304h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.42 REGEN_CG_CTRL Register

Bit	Symbol	Description
31	NONUSE_CLK_MSK	This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see section 32.3.1.2, Specifications of NONUSE_CLK_MSK operation.
30		Reserved The write value should always be 0.
29	HOST_CLK_MSK	This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see section 32.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations.
28	PERI_CLK_MSK	This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see section 32.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations.
27 to 25		Reserved The write value should always be 0.
24	RPB_WEN	This is used to enable writing to the U2HC_EXT2 register (offset 360h). 0b: Writing to U2HC_EXT2 is disabled. 1b: Writing to U2HC_EXT2 is enabled.
23 to 0		Reserved The write value should always be 0.

(6) Suspend Control Register (offset: 308h)

Abbreviated name of register: SPD_CTRL

Address:	30Bh								30Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R
Symbol:	SUSPENDM_ENABLE	SLEEPM_ENABLE	Reserved						WKCNNT_ENABLE	Reserved						
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	309h								308h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Symbol:	Reserved								Reserved							GLOBAL_SUSPENDM_P1
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.43 SPD_CTRL Register

Bit	Symbol	Description
31	SUSPENDM_ ENABLE	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status. [This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus1 register OHCI: bit [7:6] (HCFS field) of the HcControl register
30	SLEEPM_ ENABLE	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b. [This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register
29 to 24		Reserved The write value should always be 0.
23	WKCNNT_ ENABLE	The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b. [Note] To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.
22 to 1		Reserved The write value should always be 0.

Table 32.43 SPD_CTRL Register

Bit	Symbol	Description
0	GLOBAL_ SUSPENDM_P1	The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register. This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped). If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller. Note: • Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after "stopping the EHCI/OHCI list processing" and "placing the port in the Disable status". • If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b.

(7) Suspend/Resume Timer Setting Register (offset: 30Ch)

Abbreviated name of register: SPD_RSM_TIMSET

Address:	30Fh								30Eh							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	TIMER_CONNECT[15:8]								TIMER_CONNECT[7:0]							
Reset value:	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0	0
Address:	30Dh								30Ch							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	TIMER_RESUME[15:8]								TIMER_RESUME[7:0]							
Reset value:	0	0	0	0	0	0	1	1	1	1	1	0	1	0	0	0

Table 32.44 SPD_RSM_TIMSET Register

Bit	Symbol	Description
31 to 16	TIMER_CONNECT [15:0]	This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 2.5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least FAh
15 to 0	TIMER_RESUME [15:0]	This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least 1F4h

(8) Overcurrent Detection/Sleep Timer Setting Register (offset: 310h)

Abbreviated name of register: OC_SLP_TIMSET

Address:	313h								312h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved			TIMER_SLEEP[8:4]					TIMER_SLEEP[3:0]				TIMER_OC[19:16]			
Reset value:	0	0	0	0	1	1	0	0	1	0	0	0	0	0	1	1
Address:	311h								310h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	TIMER_OC[15:8]								TIMER_OC[7:0]							
Reset value:	0	0	0	0	1	1	0	1	0	1	0	0	0	0	0	0

Table 32.45 OC_SLP_TIMSET Register

Bit	Symbol	Description
31 to 29		Reserved The write value should always be 0.
28 to 20	TIMER_SLEEP [8:0]	This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes 1 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: 064h
19 to 0	TIMER_OC [19:0]	This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs). (Setting guideline) For 100 MHz and 1 ms: At least 1_86A0h

(9) SBRN_FLADJ_PORTWAKECAP Register (offset: 314h)

Abbreviated name of register: SBRN_FLADJ_PW

Address:	317h								316h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	PORTWAKECAP[15:8]								PORTWAKECAP[7:0]							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
Address:	315h								314h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Symbol:	FLADJ[7:0]								SBRN[7:0]							
Reset value:	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0

Table 32.46 SBRN_FLADJ_PW Register

Bit	Symbol	Description
31 to 16	PORTWAKECAP [15:0]	This field is used to mask the ports (of the connected device) that are used for Wakeup event. Operation on this field has no effect on the operation of the HOST module.
15 to 8	FLADJ[7:0]	This field adjusts the length of one micro frame by 16HS bit time unit. The initial value indicates 20h (60000d HS bit time).
7 to 0	SBRN[7:0]	This field indicates the Serial Bus Release Number. The fixed value “20h” is indicated.

(10) PORT_LPM_CTR1 Register (offset: 320h)

Abbreviated name of register: PORT_LPM_CTRL1

Address:	323h								322h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	321h								320h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Symbol:	Reserved								NYET_RETRY_CNT_P1[3:0]				REMOTE WAKE_ EN_P1	SLEEP_ INT_EN_ P1	RETRY_ ENABLE_ NYET_P1	HIRD_ SEL_P1
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.47 PORT_LPM_CTRL1 Register

Bit	Symbol	Description
31 to 8		Reserved The write value should always be 0.
7 to 4	NYET_RETRY_ CNT_P1[3:0]	This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries)
3	REMOTEWAKE_ EN_P1	This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported.
2	SLEEP_INT_ EN_P1	This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs.
1	RETRY_ENABLE_ NYET_P1	This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made.

Table 32.47 PORT_LPM_CTRL1 Register

Bit	Symbol	Description
0	HIRD_SEL_P1	This bit sets the time for K drive for when recovered from the Sleep state. Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as follows.

USBCMD Register bit [27:24]	HIRD_SEL_P1 (Setting value of this bit) 0b	1
0000b	75 µs	50 µs
0001b	100 µs	125 µs
0010b	150 µs	200 µs
0011b	250 µs	275 µs
0100b	350 µs	350 µs
0101b	450 µs	425 µs
0110b	950 µs	500 µs
0111b	1950 µs	575 µs
1000b	2950 µs	650 µs
1001b	3950 µs	725 µs
1010b	4950 µs	800 µs
1011b	5950 µs	875 µs
1100b	6950 µs	950 µs
1101b	7950 µs	1025 µs
1110b	8950 µs	1100 µs
1111b	9950 µs	1175 µs

(11) USB 2 Host Controller Extended Function 2 Register (offset:360h)

Abbreviated name of register: U2HC_EXT2

Note: • Writing to this register is only possible while the setting of the RPB_WEN bit is 1b.
• Set bit 9 to 1b when making the initial settings for this module.

Address:	363h								362h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Symbol	Description
31 to 14		Reserved The write value should always be 0.
13, 12		Reserved The write value should always be 1.
11, 10		Reserved The write value should always be 0.
9	DUR_CTRL	Set this bit to 1b when making the initial settings for this module. For the procedure for the setting, see section 32.9.2, Initialization Sequence.
8, 7		Reserved The write value should always be 1.
6, 5		Reserved The write value should always be 0.
4		Reserved The write value should always be 1.
3 to 1		Reserved The write value should always be 0.
0		Reserved The write value should always be 1.

32.2.4.5 UCOM Register

(1) Common Control Register (offset: 800h)

Abbreviated name of register: COMMCTRL

Address:	803h								802h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	OTG_PERI	Reserved							Reserved

R/W :	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.49 COMMCTRL Register

Bit	Symbol	Description
31	OTG_PERI	This bit specifies whether this module is set to the host mode or peripheral mode. 0b: Host mode 1b: Peripheral mode
30 to 0		Reserved The write value should always be 0.

(2) OTG-BC Interrupt Status Register (offset: 804h)

Abbreviated name of register: OBINTSTA

Address:	807h								806h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)
Symbol:	Reserved								Reserved						DPMON CHG_STA	DMMON CHG_STA
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	805h								804h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R/W(1)	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)
Symbol:	Reserved									CHGDET CHG1_STA	Reserved	PDDET CHG1_STA	VBSTAINT_STA	VBSTACHG_STA	OCINT_STA	IDCHG_STA
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Table 32.50 OBINTSTA Register

Bit	Symbol	Description
31 to 18		Reserved The write value should always be 0.
17	DPMONCHG_STA	This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed.
16	DMMONCHG_STA	This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed.
15 to 7		Reserved The write value should always be 0.
6	CHGDETCHG1_STA	This bit is set if the setting of the CHGDETSTS bit in the BCCTRL1 register has been changed. 0b: The setting of the CHGDETSTS bit in the BCCTRL1 register has not been changed. 1b: The setting of the CHGDETSTS bit in the BCCTRL1 register has been changed.
5		Reserved The write value should always be 0.
4	PDDETCHG1_STA	This bit is set if the setting of the PDDETSTS bit in the BCCTRL1 register has been changed. 0b: The setting of the PDDETSTS bit in the BCCTRL1 register has not been changed. 1b: The setting of the PDDETSTS bit in the BCCTRL1 register has been changed.
3	VBSTAINT_STA	This bit is set if the value of the VBSTA bit of the VBCTRL register is equal to the value set to the VBLVL bit of the VBCTRL register. However, after this bit is set when the VBSTA bit and the VBLVL bit become equal, this bit might be cleared afterward. In such a case, if the value of the VBSTA bit has not changed, this bit is not be set, even if the value of the VBSTA bit is equal to the value of the VBLVL bit. Then, if the value of the VBSTA bit changes and becomes equal to the VBLVL bit again, this bit is set again. 0b: The VBSTA bit of the VBCTRL register is not equal to the value set to the VBLVL bit of the VBCTRL register. 1b: The VBSTA bit of the VBCTRL register becomes equal to the value set to the VBLVL bit of the VBCTRL register.
2	VBSTACHG_STA	This bit is set if the state of the VBSTA bit of the VBCTRL register has changed. 0b: The VBSTA bit of the VBCTRL register has not changed. 1b: The VBSTA bit of the VBCTRL register has changed.
1	OCINT_STA	This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b).
0	IDCHG_STA	This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. Note: The initial value is 1. Before using this bit, clear the status.

(3) OTG-BC Interrupt Enable Register (offset: 808h)

Abbreviated name of register: OBINTEN

Address:	80Bh								80Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Symbol:	Reserved								Reserved			VGPUO	Reserved			VBOUT
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.52 VBCTRL Register

Bit	Symbol	Description
31, 30		Reserved The write value should always be 0.
29	VBSTA	This bit indicates the voltage level of VBUS. Input level from the VBUSIN pin is indicated as it is.
28 to 22		Reserved The write value should always be 0.
21	VBLVL	This bit is used to detect (by an interrupt) that VBUS reaches a specific level. When the value of the VBUSIN pin becomes equal to the value set to this field, the VBSTAINT_STA bit of the OBINTSTA register is set. If the bit is not masked, an interrupt (caused by the VBSTAINT_STA bit of the OBINTSTA register) occurs.
20 to 17		Reserved The write value should always be 0.
16		Reserved The write value should always be 1.
15 to 5		Reserved The write value should always be 0.
4	VGPUO	The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC.
3 to 1		Reserved The write value should always be 0.
0	VBOUT	This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0.

(5) Line Control Port 1 Register (offset: 810h)

Abbreviated name of register: LINECTRL1

Address:	813h								812h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Symbol:	Reserved								Reserved				DP_MON	DM_MON	Reserved	ID_MON
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.53 LINECTRL1 Register

Bit	Symbol	Description
31 to 22		Reserved The write value should always be 0.
21, 20	DSDP[1:0]	These bits are set on transitions to and returning from the deep standby state in the DCP mode. Set the bits by following the procedure described in section 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal or section 32.6.1.2, When the host controller is to be used in the DCP mode. If you do not so, operation is not guaranteed.
19	DPRPD_EN	This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resister. 0b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is enabled.
18	DP_RPD	This bit controls USB bus (DP) 15 kΩ Pulldown resister when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resister is OFF. 1b: DP-side 15 kΩ Pulldown resister is ON.
17	DMRPD_EN	This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resister. 0b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is enabled.
16	DM_RPD	This bit controls USB bus (DM) 15 kΩ Pulldown resister when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resister is OFF. 1b: DM-side 15 kΩ Pulldown register is ON.
15 to 4		Reserved The write value should always be 0.
3	DPMON	This bit indicates the value of USB bus DP.
2	DMMON	This bit indicates the value of USB bus DM.
1		Reserved The write value should always be 0.
0	IDMON	This bit indicates the value of the OTG_ID pin.

(6) BC Control Port 1 Register (offset: 820h)

Abbreviated name of register: BCCTRL1

Address:	823h								822h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved

Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.54 BCCTRL1 Register

Bit	Symbol	Description
31 to 26		Reserved The write value should always be 0.
25, 24		Reserved The write value should always be 1.
23 to 10		Reserved The write value should always be 0.
9	PDDETSTS	This bit indicates the USBPHY Portable Device Detect signal state.
8	CHGDETSTS	This bit indicates the USBPHY Charging Downstream Port Detect signal state.
7, 6		Reserved The write value should always be 0.
5	DCPMODE	If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b.
4	VDMSRCE	This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven.
3	IDPSINKE	This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled.
2	VDPSRCE	This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven.
1	IDMSINKE	This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled.
0	IDPSRCE	This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven.

(7) CC STATUS Register (offset: 840h)

Abbreviated name of register: CC_STATUS

Address:	843h								842h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Symbol:	CC_INT_SEL	Reserved	CC_LVL_CLR	CC_LVL[3]	CC_LVL[2]	CC_LVL[1]	CC_LVL[0]	CC_LVL_EN	Reserved							
Reset value:	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0	0
Address:	841h								840h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R
Symbol:	Reserved								Reserved	Reserved	CC_PERI_STA	CC_LVL_STA	CC1_RD	CC1_RA	CC2_RD	CC2_RA
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.55 CC_STATUS Register

Bit	Symbol	Description
31	CC_INT_SEL	This bit specifies the condition for the CC_INT interrupt. 0: The CC_INT interrupt occurs whenever a peripheral device is connected.*1 1: Whether a CC_INT interrupt occurs and its level depend on the settings of the CC_LVL and CC_LVL_EN bits.
30		Reserved The write value should always be 0.
29	CC_LVL_CLR	CC_LVL_STA flag clear 0: Do not clear CC_LVL_STA. 1: Clear CC_LVL_STA.*2
28	CC_LVL[3]	If “CC_INT_SEL = 1” is set, this bit specifies the level of interrupt occurrence. Specify the CC1_Rd level.
27	CC_LVL[2]	If “CC_INT_SEL = 1” is set, this bit specifies the level of interrupt occurrence. Specify the CC1_Ra level.
26	CC_LVL[1]	If “CC_INT_SEL = 1” is set, this bit specifies the level of interrupt occurrence. Specify the CC2_Rd level.
25	CC_LVL[0]	If “CC_INT_SEL = 1” is set, this bit specifies the level of interrupt occurrence. Specify the CC2_Ra level.
24	CC_LVL_EN	CC_LVL enable setting 0: If “CC_INT_SEL = 1” is set, and input state of the CCn_Rd and CCn_Ra (n = 1, 2) pins is equal to the CC_LVL[3:0] value, an interrupt does not occur. 1: If “CC_INT_SEL = 1” is set, and input state of the CCn_Rd and CCn_Ra pins is equal to the CC_LVL[3:0] value, an interrupt occurs.
23 to 7		Reserved The write value should always be 0.
6		Reserved The read value is not stable. The write value should always be 0.
5	CC_PERI_STA	This bit indicates whether a peripheral device is connected.*3 0: A peripheral device is not connected. 1: A peripheral device is connected.*1
4	CC_LVL_STA	This bit indicates the relationship between the setting value of the CC_LVL bit and the pin status. 0: The status of the CCn_Rd and CCn_Ra pins is not equal to the setting value of CC_LVL[3:0]. 1: The status of the CCn_Rd and CCn_Ra pins is equal to the setting value of CC_LVL[3:0].*4
3	CC1_RD	This bit indicates the CC1_Rd pin status.
2	CC1_RA	This bit indicates the CC1_Ra pin status.
1	CC2_RD	This bit indicates the CC2_Rd pin status.
0	CC2_RA	This bit indicates the CC2_Ra pin status.

Note 1. When the settings of the CC1_Rd, CC1_Ra, CC2_Rd, and CC2_Ra bits are as in Table 32.56, the connection of peripheral devices is detected.
For details about the values to be input to the CCn_Rd and CCn_Ra pins, see section 32.10.1, Notes on Using the CCn_Ra and CCn_Rd Pins.

Note 2. This bit is not automatically cleared from 1 to 0, so write 0 to this bit after CC_LVL_STA clear.
Note 3. Regardless of the CC_INT_SEL setting, if the input of the CCn_Rd and CCn_Ra pins is equal to Table 32.56, 1 is set.
Note 4. Regardless of the CC_INT_SEL setting, if the value set for CC_LVL is equal to the status of the CCn_Rd and CCn_Ra pins, 1 is set.

Table 32.56 Conditions for Detecting the Connection of a Peripheral Device

CC1_Rd	CC1_Ra	CC2_Rd	CC2_Ra
0	1	1	1
1	1	0	1
0	1	0	0
0	0	0	1

(8) PHYCLK CTRL Register (offset: 844h)

Abbreviated name of register: PHYCLK_CTRL

Address:	847h								846h							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Address:	845h								844h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Symbol:	Reserved								Reserved							UCLK SEL
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.57 PHYCLK_CTRL Register

Bit	Symbol	Description
31 to1		Reserved The write value should always be 0.
0	UCLKSEL	This bit selects the clock supplied to USBPHY. 0: EXTAL clock is selected. 1: USB_X1 clock is selected.

(9) PHYIF CTRL Register (offset: 848h)

Abbreviated name of register: PHYIF_CTRL

Address:	84Bh								84Ah							
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Symbol:	Reserved								Reserved							
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Address:	849h								848h							
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Symbol:	Reserved								Reserved							FIXPHY
Reset value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.58 PHYIF_CTRL Register

Bit	Symbol	Description
31 to 1		Reserved The write value should always be 0.
0	FIXPHY	This bit is to be set when the USB module is not in use or on recovery from the deep standby state. Set the bit by following the descriptions in section 33.9.16.1, Setting at transition to deep standby and section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used. If you do not so, operation is not guaranteed.

32.3 Clock Signals

32.3.1 Clock Gating Specifications

32.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.
Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the "circuits that do not require clock supply temporarily."
The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]
Register Enable/Clock Gating Control Register (offset:304h)

[Functional specification]

bit	Symbol	Functional specification
31	NONUSE_CLK_MSK	Gating clocks for unused host controller or peripheral controller.
29	HOST_CLK_MSK	Gating clocks for host controller.
28	PERI_CLK_MSK	Gating clocks for peripheral controller.

32.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.
This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: 800h).

			Host/Peripheral Switching Setting	Gating Target	
Clock Gating Register Setting			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
1	0	0	0		○
			1	○	

[Note on using the NONUSE_CLK_MSK bit]
If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.
If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

32.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.
The following table shows the operating specifications of this function.

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
0	1	0	—	○	
	0	1	—		○
	1	1	0	○	○

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

32.4 Interrupt Sources

32.4.1 Interrupt Signals

This module has the six interrupt signals listed below. The logical OR of these six interrupt signals is sent to the interrupt controller as USBHIn (n = 0, 1). For details about the occurrence source of USBHIn (n = 0, 1) interrupt, check the corresponding status register.
Use all these interrupt signals as level interrupt signals.

Interrupt Source Name	Interrupt Type	Pulse/ Level	Active Level
U2H_INT	BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register.	Level	H
U2H_OHCI_INT	OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register.	Level	H
U2H_EHCI_INT	EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_WAKEON_INT	EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_OBINT	OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register.	Level	H
CC_INT	CC pin interrupt signal	Level	H

32.4.2 Interrupt Sources and Control

32.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]
Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:200h) bit[0] (AHB_INTEN)

[Interrupt source]
A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]
To clear the interrupt, write 1b to the relevant bit in the register below.
AHB Bridge Register INT_STATUS Register (offset:204h) bit[0] (AHB_INT)

32.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:010h) bit[31], bit[6:0]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

		Registers That Require Interrupt Enable Setting							
		USBH_INTAEN	HcInterruptEnable						
			bit [31]	bit [6]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
Interrupt Source			MIE	RHSCE	FNOE	ROE	SFE	WDHE	SOE
1	Device connection is detected.	○	○	○					
2	Device disconnection is detected.	○	○	○					
3	Port power is OFF (excluding overcurrent detection).	○	○	○					
4	Babble error is detected during a USB transfer.	○	○	○					
5	Resume is complete.	○	○	○					
6	Overcurrent is detected.	○	○	○					
7	Bus reset is complete.	○	○	○					
8	When the HcRhDescritorB Register DR bit is 1b, OHCI becomes “USB Operational” (HCFS[1:0] bit = 10b) or “USB Suspend” (HCFS[1:0] bit = 11b).	○	○	○					
9	When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register.	○	○	○					
10	When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register.	○	○	○					
11	When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register.	○	○	○					
12	When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register.	○	○	○					
13	When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register.	○	○	○					
14	When no device is connected (CCS bit = 1b), the port power is turned off.	○	○	○					
15	The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed.	○	○		○				
16	RemoteWakeup signal (Resume signal) is detected from a device.	○	○			○			
17	HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.)	○	○				○		
18	A transfer finishes (including an error), and the host module updated HccaDoneHead.	○	○					○	
19	USB schedule overrun occurred for the frame.	○	○						○

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:00Ch) bit[6:0]

32.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:128h) bit[17:16], bit[5:0]*

* Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:120h) bit[15], bit[6]

[Interrupt source]

		Registers That Require Interrupt Enable Setting								
			USBCMD		USBINTR					
			bit [15]	bit [6]	bit [17]	bit [16]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
	Interrupt Source	USBH_INTBEN	Per-Port Change Event	Doorbell	Port-1 Change Event		Async Advance	Frame List Rollover	Port Change	USB ERRINT	USB INT
1	Device connection is detected.	○							○		
2	Device disconnection is detected.	○							○		
3	Overcurrent is detected.	○							○		
4	RemoteWakeup signal (Resume Signal) is detected from a device.	○							○		
5	Babble status of the USB bus is detected.	○							○		
6	USB transfer with "qTD IOC = 1b" normally finishes.	○									○
7	Short packet is received.	○									○
8	USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.)	○								○	
9	The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b.	○		○			○				
10	The FRINDEX Register FrameIndex bit returned from the maximum value to 000h (rollover detected).	○						○			
11	The Port Change Detect event (interrupt source 1 to 5) was detected.	○	○			○					

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:124h) bit[17:16], bit[5:0]

32.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]
Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:200h) bit[4] (WAKEON_INTEN)
EHCI Operational Register PORTSC[1:2] Register (offset:164h/168h) bit[22:20]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

		Registers That Require Interrupt Enable Setting			
			PORTSC		
Interrupt Source		WAKEON_INTEN	bit [22] WKOC_E	bit [21] WKDSCNNT_E	bit [20] WKCNNT_E
1	Device connection is detected.	○			○
2	Device disconnection is detected.	○		○	
3	Overcurrent is detected.	○	○		
4	RemoteWakeup signal (Resume Signal) is detected from a device.	○			

[Clearing the interrupt]
To clear the interrupt, write 1b to the relevant bit in the register below.
AHB Bridge Register INT_STATUS Register (offset:204h) bit[4] (WAKEON_INT)

32.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:808h) bit[27:24], bit[18:16], bit[12:8], bit[3:0]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [17]	bit [16]
	Interrupt Source	UCOM_INTEN	DPMONCHG_EN	DMMONCHG_EN
1	The DP pin has changed.	○	○	
2	The DM pin has changed.	○		○

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [6]	bit [4]
	Interrupt Source	UCOM_INTEN	CHGDETCHG1_EN	PDDETCHG1_EN
1	The portable device detection signal has changed.	○		○
2	The charging port detection signal has changed.	○	○	

		Registers That Require Interrupt Enable Setting				
			OTG-BC Interrupt Enable			
			bit [3]	bit [2]	bit [1]	bit [0]
	Interrupt Source	UCOM_INTEN	VBSTAINT_EN	VBSTACHG_EN	OCINT_EN	IDCHG_EN
1	It is detected that the value of the VBUSIN pin becomes equal to the value set to bit [21] (VBLVL) of the VBUS Control Register.	○	○			
2	The VBUSIN pin has changed.	○		○		
3	Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.)	○			○	
4	The OTG_ID pin has changed.	○				○

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:804h) bit[27:24], bit[18:16], bit[12:8], bit[3:0]

32.4.2.6 CC_INT assertion source and control

[Register interrupt enable control and interrupt source]

By the setting of bit [31] of the CC_STATUS register, you can change the interrupt source.

When bit [31] = 0: If the conditions in Table 32.56, Conditions for Detecting the Connection of a Peripheral Device are satisfied, an interrupt occurs.

When bit [31] = 1: According to the setting value of bit [28:24], an interrupt occurs.

Note: An unintended interrupt (CC_INT) might occur because of chattering of the CCn_Rd and CCn_Ra (n = 1, 2) pins. If an interrupt occurs, read the input status of the CCn_Rd and CCn_Ra pins, and confirm that they are preferable values. Then, start the interrupt processing.

[Interrupt clear]

When bit [31] = 0: If the input values of the CCn_Rd and CCn_Ra pins do not satisfy the conditions in Table 32.56, Conditions for Detecting the Connection of a Peripheral Device, an interrupt is cleared.

When bit [31] = 1: An interrupt is cleared by setting bit [29] to 1.

32.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

32.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

32.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at section 32.1.2.5, Suspend extension function, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.
See section 32.2.4.4, (6), Suspend Control Register (offset: 308h) and control the relevant registers appropriately.

32.5.2 Controlling the Clock-Gating Function

See section 32.2.4.4, (5), Register Enable/Clock Gating Control Register (offset: 304h) and section 32.3.1, Clock Gating Specifications", then control the relevant registers appropriately.

32.6 Battery Charging

32.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.
Charging ports can be generally classified by function as described below.

Table 32.59 Function of Charging Port

Type	Function
CDP (Charging Downstream Port)	Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host).
DCP (Dedicated Charging Port)	Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host.
SDP (Standard Downstream Port)	Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host.

Examples of control when the host controller is to be used as a charging port are described on the following pages.

32.6.1.1 When the host controller is to be used in the CDP mode

An example of the flow of control when the host controller is to be used in the CDP mode is shown below.

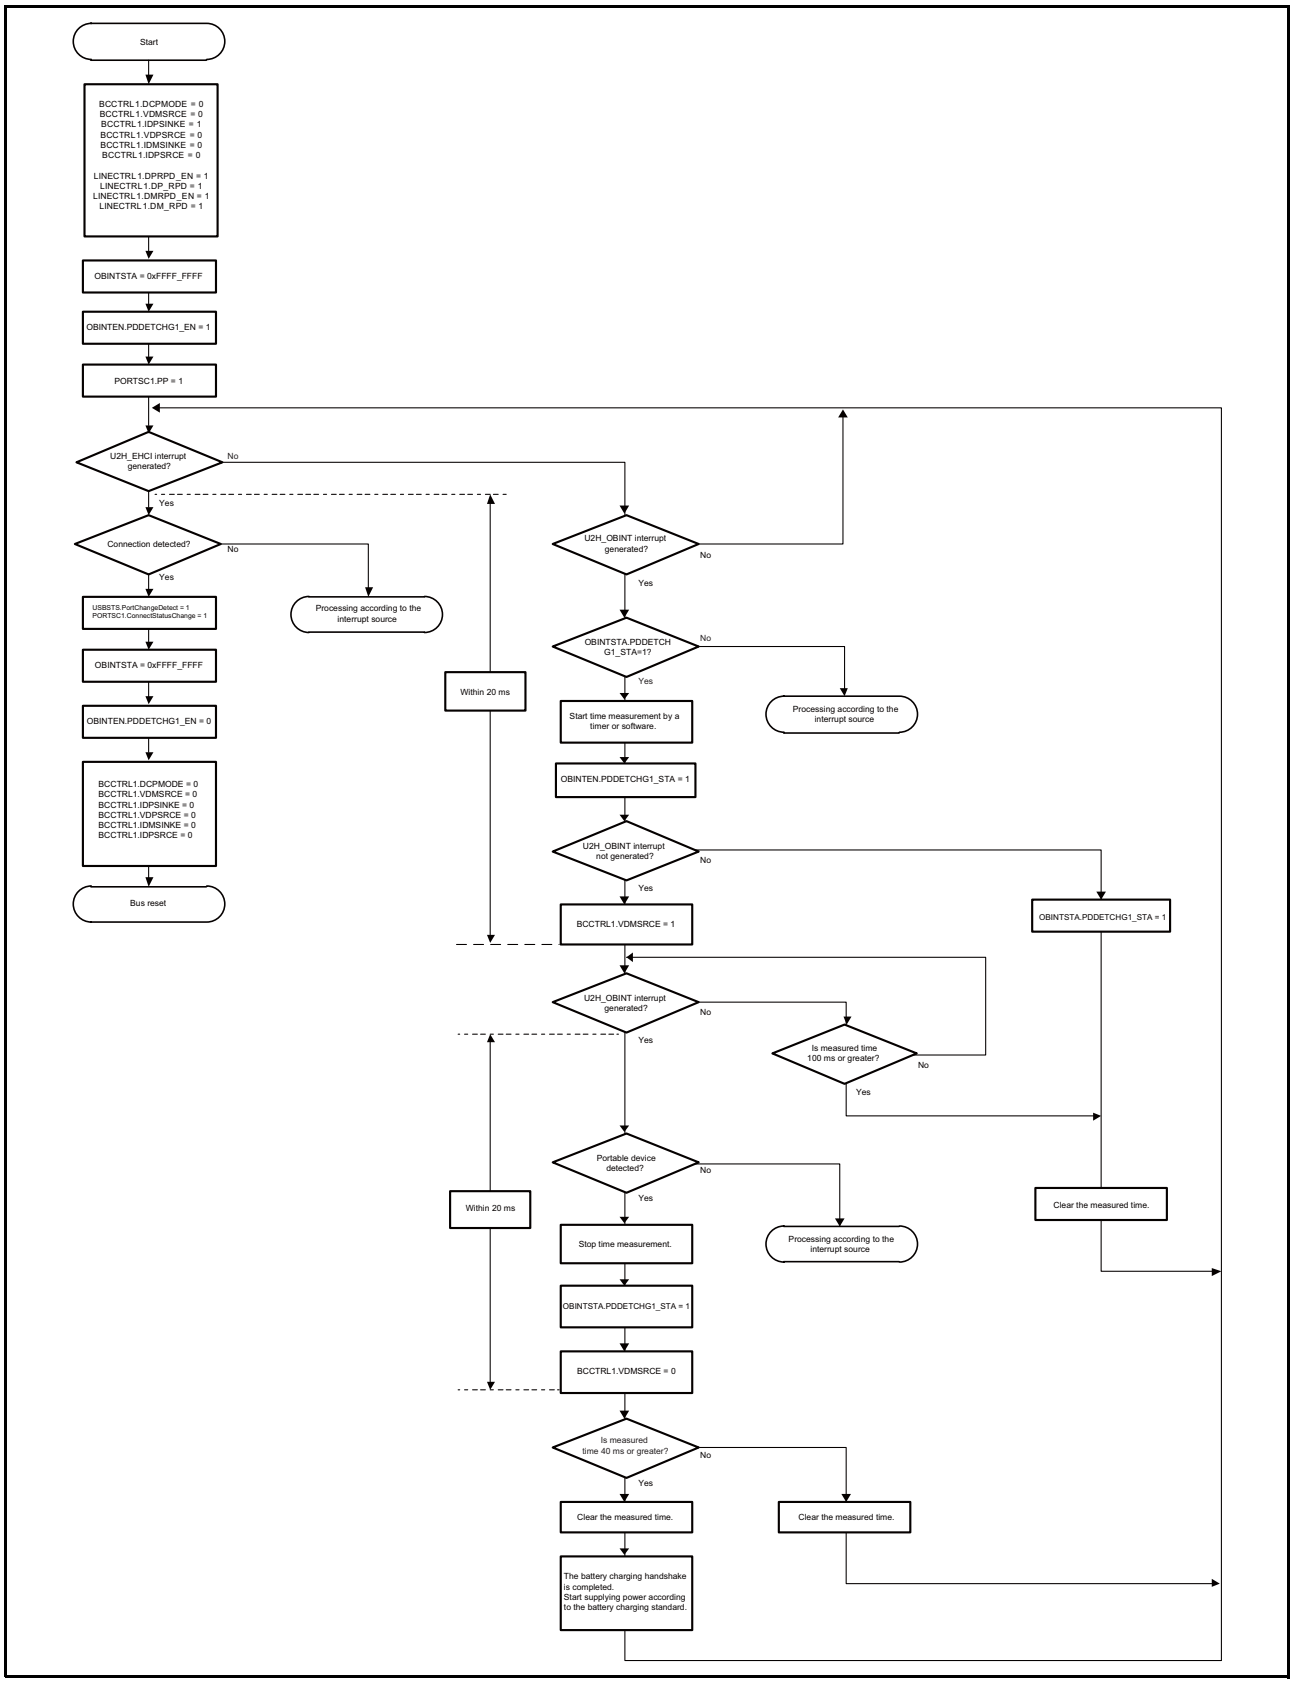

Figure 32.1 Example of the Control Flow in CDP Mode

32.6.1.2 When the host controller is to be used in the DCP mode

When the host controller is to be used in the DCP mode, make the following settings.
BCCTRL1 = 0x0300_0020
LINECTRL1 = 0x002A_0000

32.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.
An example of the flow of control when the peripheral controller is in use as a portable device is shown on the next page.

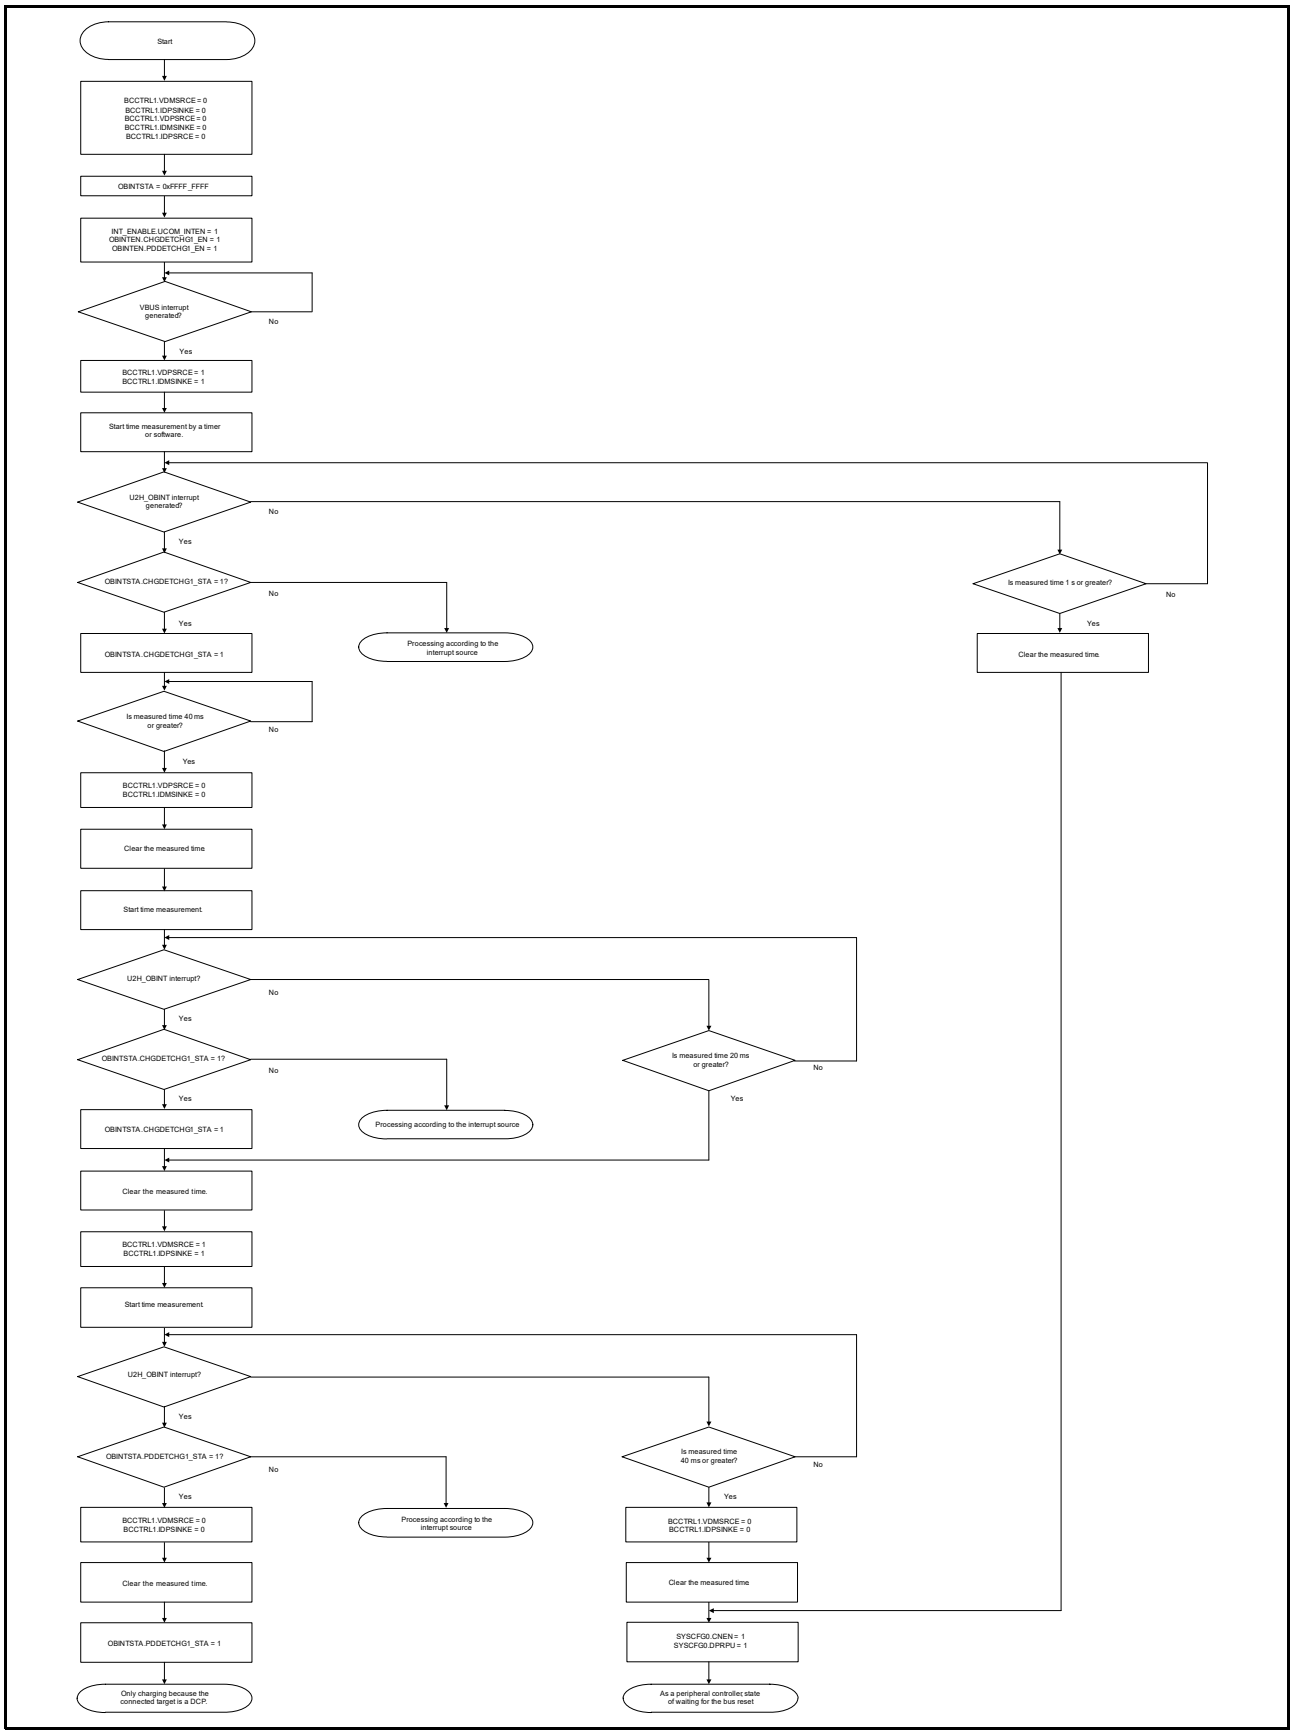

Figure 32.2 Example of the Control Flow for Portable Devices

32.7 Bus Master

32.7.1 Functional specifications of the bus master

32.7.1.1 Supported bus master functions

Function as the BUS MASTER	Status
Residual burst after an error response is received	The transfer is not stopped.
1 Kbyte boundary processing	The fixed length burst (INCRx) across 1 Kbyte boundary is not performed.

32.7.1.2 Issuing requests for different types of bus transfer

MHTRANS[1:0]	MHSIZE[2:0]	MHWRITE	MHBURST[2:0]	Reply	Remarks
IDLE (00b)	—	—	—	—	—
BUSY (01b)	—	—	—	—	Not issued.
NONSEQ (10b)	32-bit (010b)	WRITE	SINGLE INCR4 INCR8 INCR16	OKAY/ ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ			
	8-bit (000b) 16-bit (001b)	WRITE	SINGLE	OKAY/ ERROR	8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt.
	other than the above	—	—	—	Not issued.
SEQ (11b)	32-bit (010b)	WRITE	INCR4 INCR8 INCR16	OKAY/ ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ		OKAY/ ERROR	
	other than the above	—	—	—	Not issued.

32.7.1.3 Supported responses

Response type	Response	Remarks
OKAY	Enable	Supported.
ERROR	Enable	A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed.

32.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: 208h).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

32.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: 208h). The maximum burst length is common to reading and writing.

32.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: 208h).

32.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

ALIGN_ADDRESS Setting	Fixed length Start Address of INCR Burst		
	INCR4	INCR8	INCR16
00b (Aligned at the 1-Kbyte boundary)	MHADDR[9:0] = 000h	MHADDR[9:0] = 000h	MHADDR[9:0] = 000h
	004h	004h	004h
	008h	008h	008h
	00Ch	00Ch	00Ch
	010h	010h	010h
	:	:	:
	3D0h	3C8h	3B8h
	3D4h	3CCh	3BCh
	3D8h	3D0h	3C0h
	3DCh	3D4h	
	3E0h	3D8h	
	3E4h	3DCh	
	3E8h	3E0h	
	3ECh		
	3F0h		
01b (Aligned at the 16-byte boundary)	MHADDR[3:0] = 0h	-- (Not issued)	-- (Not issued)
10b (Aligned at the 32-byte boundary)	MHADDR[4:0] = 00h	MHADDR[4:0] = 00h	-- (Not issued)
	04h		
	08h		
	0Ch		
	10h		
11b (Aligned at the 64-byte boundary)	MHADDR[5:0] = 00h	MHADDR[5:0] = 00h	MHADDR[5:0] = 00h
	04h	04h	
	08h	08h	
	0Ch	0Ch	
	10h	10h	
	14h	14h	
	18h	18h	
	1Ch	1Ch	
	20h	20h	
	24h		
	28h		
	2Ch		
	30h		

32.8 Overcurrent Control and VBUS Control

32.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

This module pin	Input/Output	Level	Description
OVRCURI	Input	L	Overcurrent status was detected.
		H	Overcurrent status was not detected.
VBUSEN	Output	L	Port Power (VBUS) OFF
		H	Port Power (VBUS) ON

32.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.
The period over which assertion of the OVRCUR pin is required ("vercurrent detection time") can be set in the following register.

Register	Overcurrent detection/sleep timer setting register (offset: 310h)
Bits	TIMER_OC[19:0]
Initial value	3_0D40h

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (Bφ) cycle.
Therefore, set the value of the above register at initial configuration, considering "the internal bus clock (Bφ) frequency to be used" and "the overcurrent detection time you want to specify".

32.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the PMODEPFS register on the general input/output port.
The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

Situation		Register		bit
EHCI control		PORTSC1 (offset: 164h)		bit 12 (PP)
OHCI control	Global control*1	ON setting	HcRhStatus Register (offset: 050h)	bit 16 (Set Global Power)
		OFF setting		bit 0 (Clear Port Status)
	Selective control*2	ON setting	HcRhPortStatus1 Register (offset: 054h)	bit 8 (Set Port Power)
		OFF setting		bit 9 (Clear Port Power)

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b and HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 0b

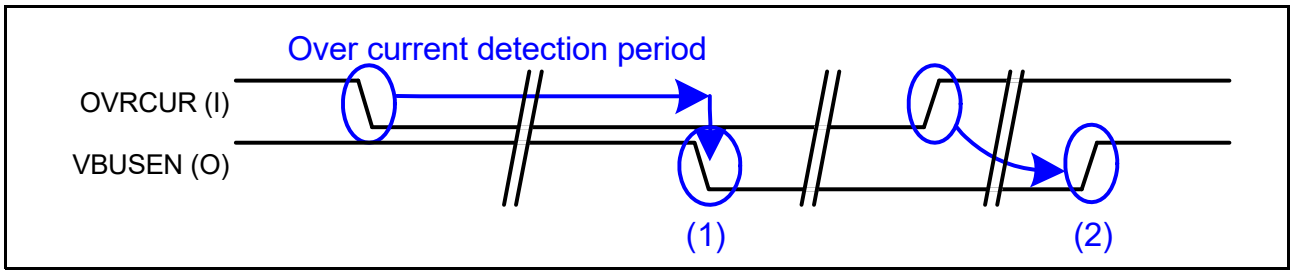
Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b and HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.
Specify the settings as necessary (for example, your system needs that VBUS is always ON).

EHCI Operational	OHCI Operational				
HCSPARAMS (offset: 104h)	HcRhDescriptorA (offset: 048h)			HcRhDescriptorB (offset: 04Ch)	Pin Operation
PPC (bit 4)	NOCP (bit 12)	NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the OVRCUR pin is asserted (0b)
0	—	—	—	—	Fixed to 1b
—	1	—	—	—	Fixed to 1b
—	—	1	—	—	Fixed to 1b
1	0	0	0	—	0b
			1	0	
				1	

32.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.
Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see section 32.8.3, Port Power (VBUS) control specifications) have not been made.



1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).

2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in section 32.8.3, Port Power (VBUS) control specifications to turn on the Port Power (Vbus).

Note: Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

32.9 Procedure for Setting this Module

32.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

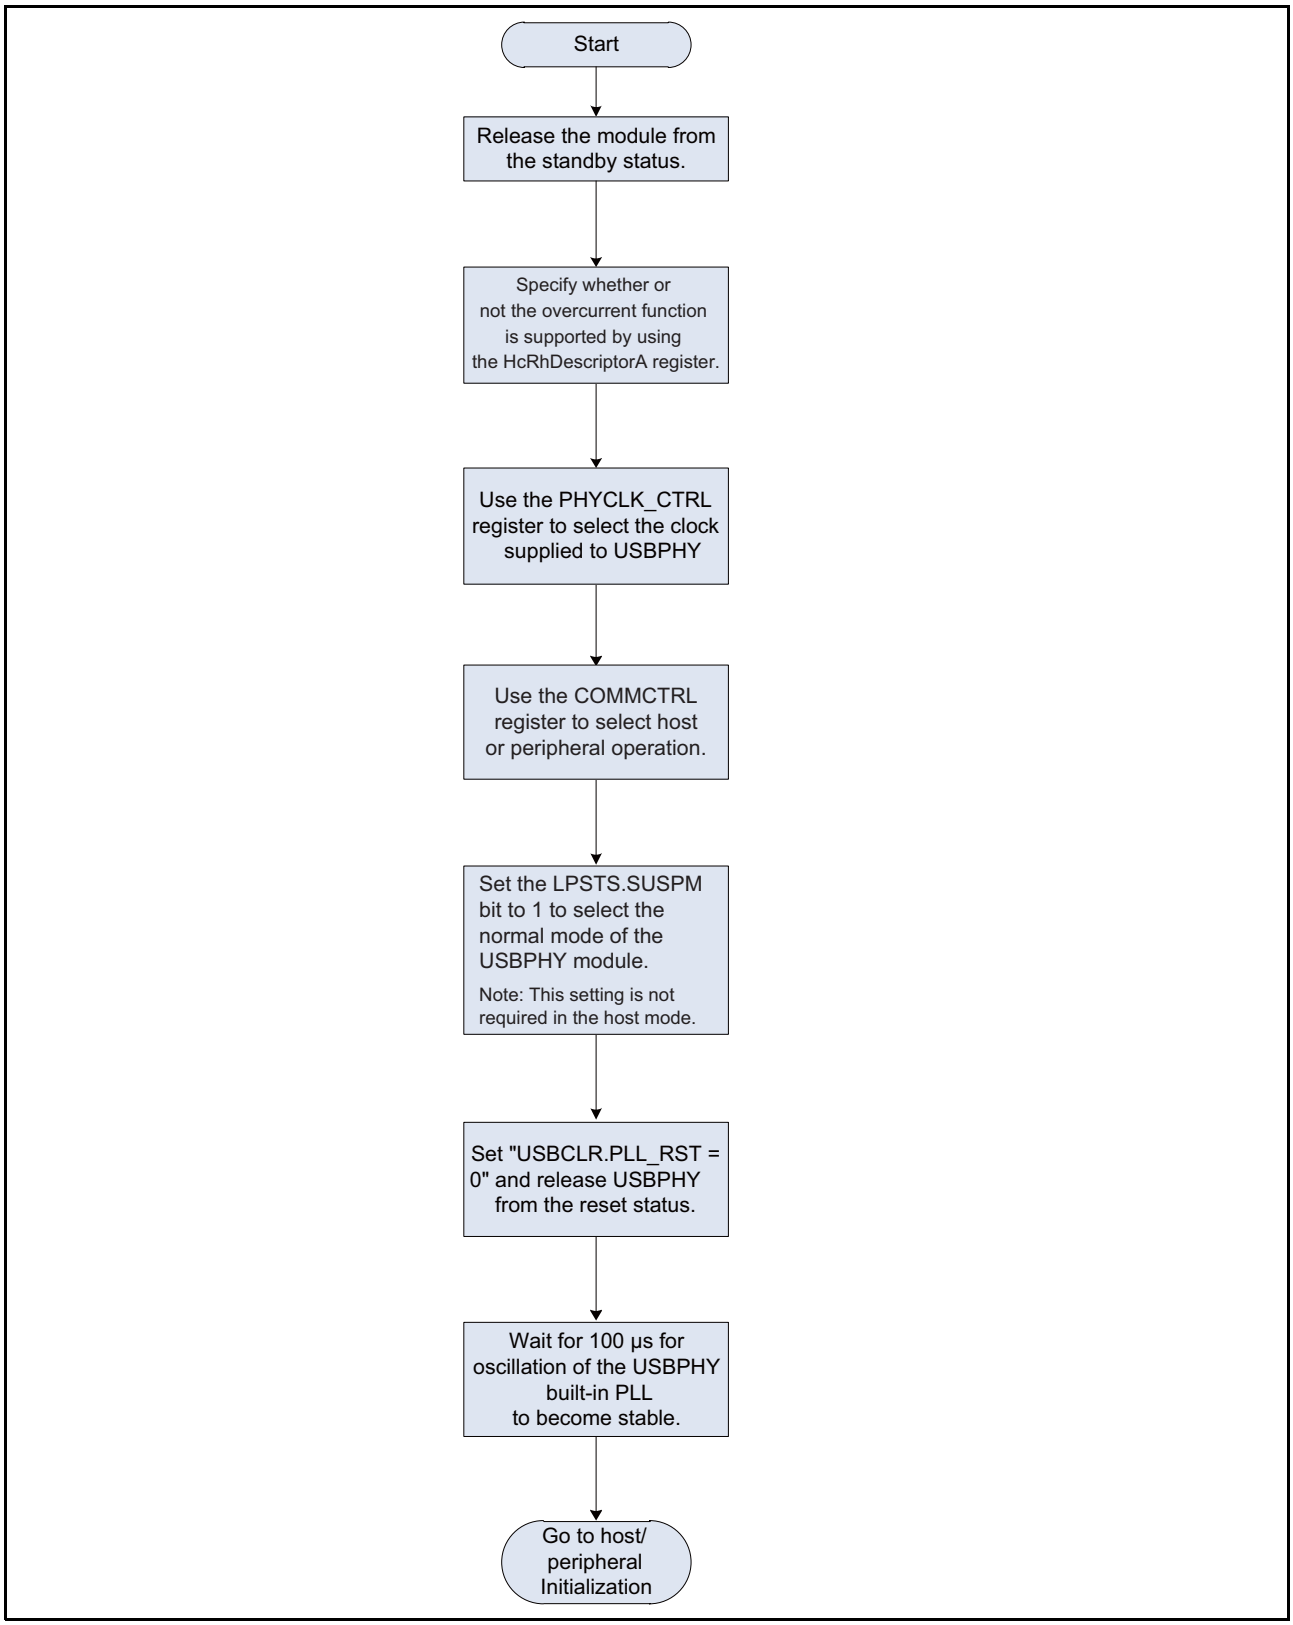


Figure 32.3 Sequence Common to Both Host and Peripheral Modes

32.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

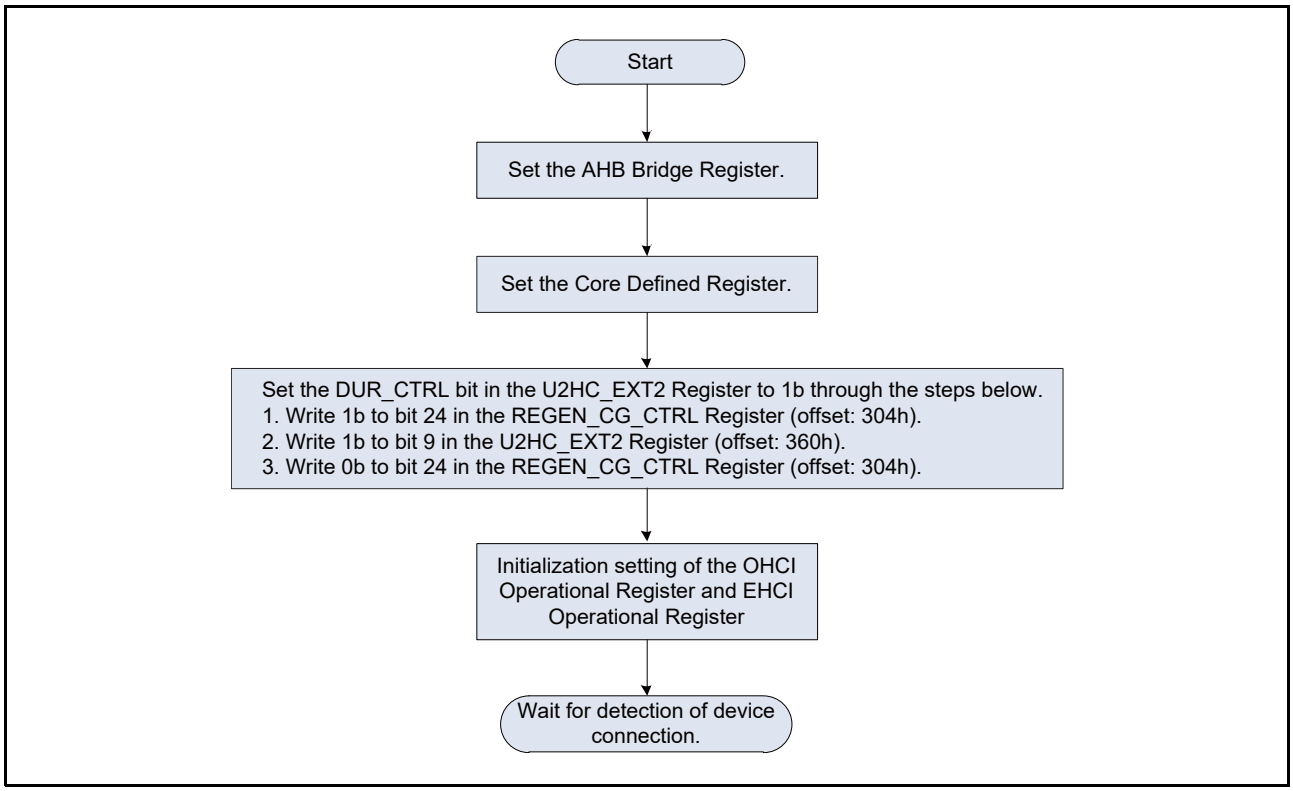

Figure 32.4 Initialization Sequence

32.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: 120h) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: 008h) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

32.10 CCn_Rd and CCn_Ra Pins

32.10.1 Notes on Using the CCn_Ra and CCn_Rd Pins

When the CCn_Ra and CCn_Rd (n = 1 or 2) pins are to be used, include a pull-up resistor Rp and pull-down resistor Rd in conformance with the USB specification, and an external circuit for use in checking the state of the resistance (voltage state) on the CC pins of the Type-C connector. After that, input the result of checking through the CCn_Ra and CCn_Rd pins.
The threshold values for use in checking are given in Table 32.60.

Table 32.60 Threshold Values for Use in Checking for Inputs on CCn_Ra and CCn_Rd

Condition for Supply of USB Type-C VBUS	Threshold Value for CCn_Rd*	Threshold Value for CCn_Ra*
Default USB power (500 mA at 5 V)	1.6 V	0.2 V
1.5 A at 5 V	1.6 V	0.4 V
3.0 A at 5 V	2.6 V	0.8 V

Note: * When the voltage is no less than the threshold, apply a high-level signal to the CCn_Ra and CCn_Rd pins. When the voltage is below the threshold, apply a low-level signal to the CCn_Ra and CCn_Rd pins.

32.11 Points for Caution

32.11.1 Actions after Device Disconnection

When a connected device is disconnected or an instruction to suspend the OHCI is executed after device disconnection, confirm the settings of the NPS (bit 9) and PSM (bit 8) bits in the HcRhDescriptorA register and the setting of the PPCM[1] (bit 17) bit in the HcRhDescriptorB register, and follow the flow that corresponds to the register setting in the list below.

Table 32.61 Register Setting and Corresponding Flows

Register Setting			Corresponding Flows	
HcRhDescriptorA		HcRhDescriptorB	Within 4 ms of device disconnection or OHCI suspension	
NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the flow can be completed	When the flow cannot be completed
0	1	1	Flow 1	Flow 5
0	1	0	Flow 2	Flow 6
0	0	—	Flow 2	Flow 6
1	1	1	Flow 3	Flow 7
1	1	0	Flow 4	Flow 8
1	0	—	Flow 4	Flow 8

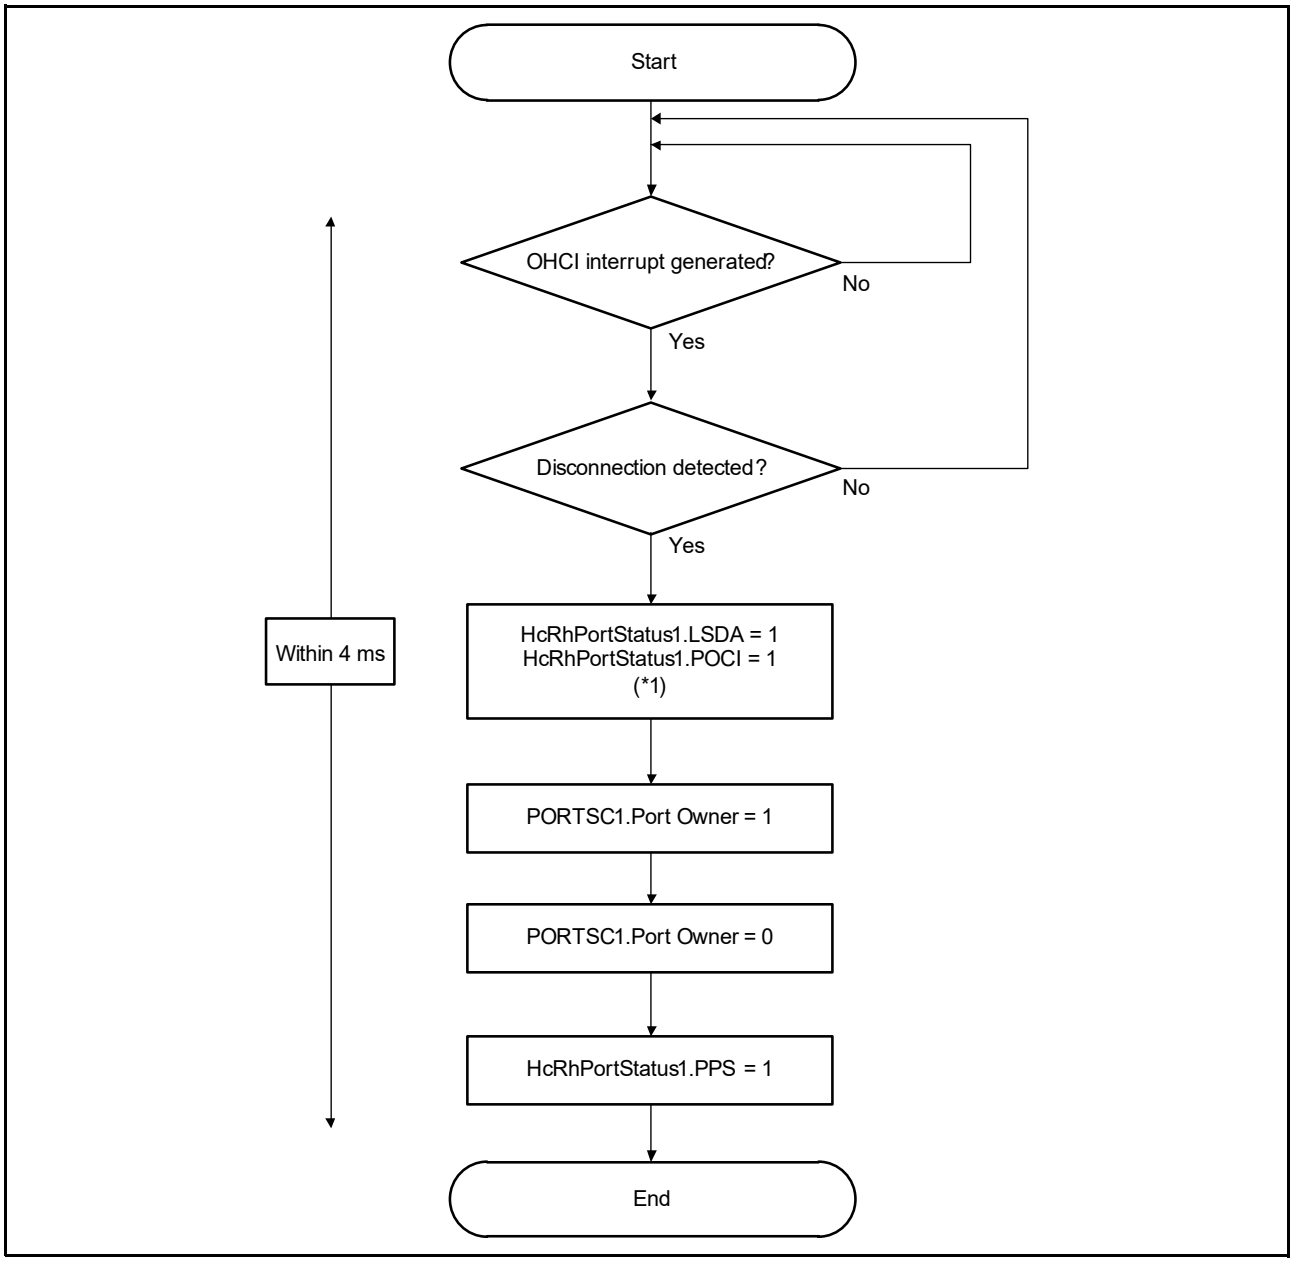

Figure 32.5 Flow 1

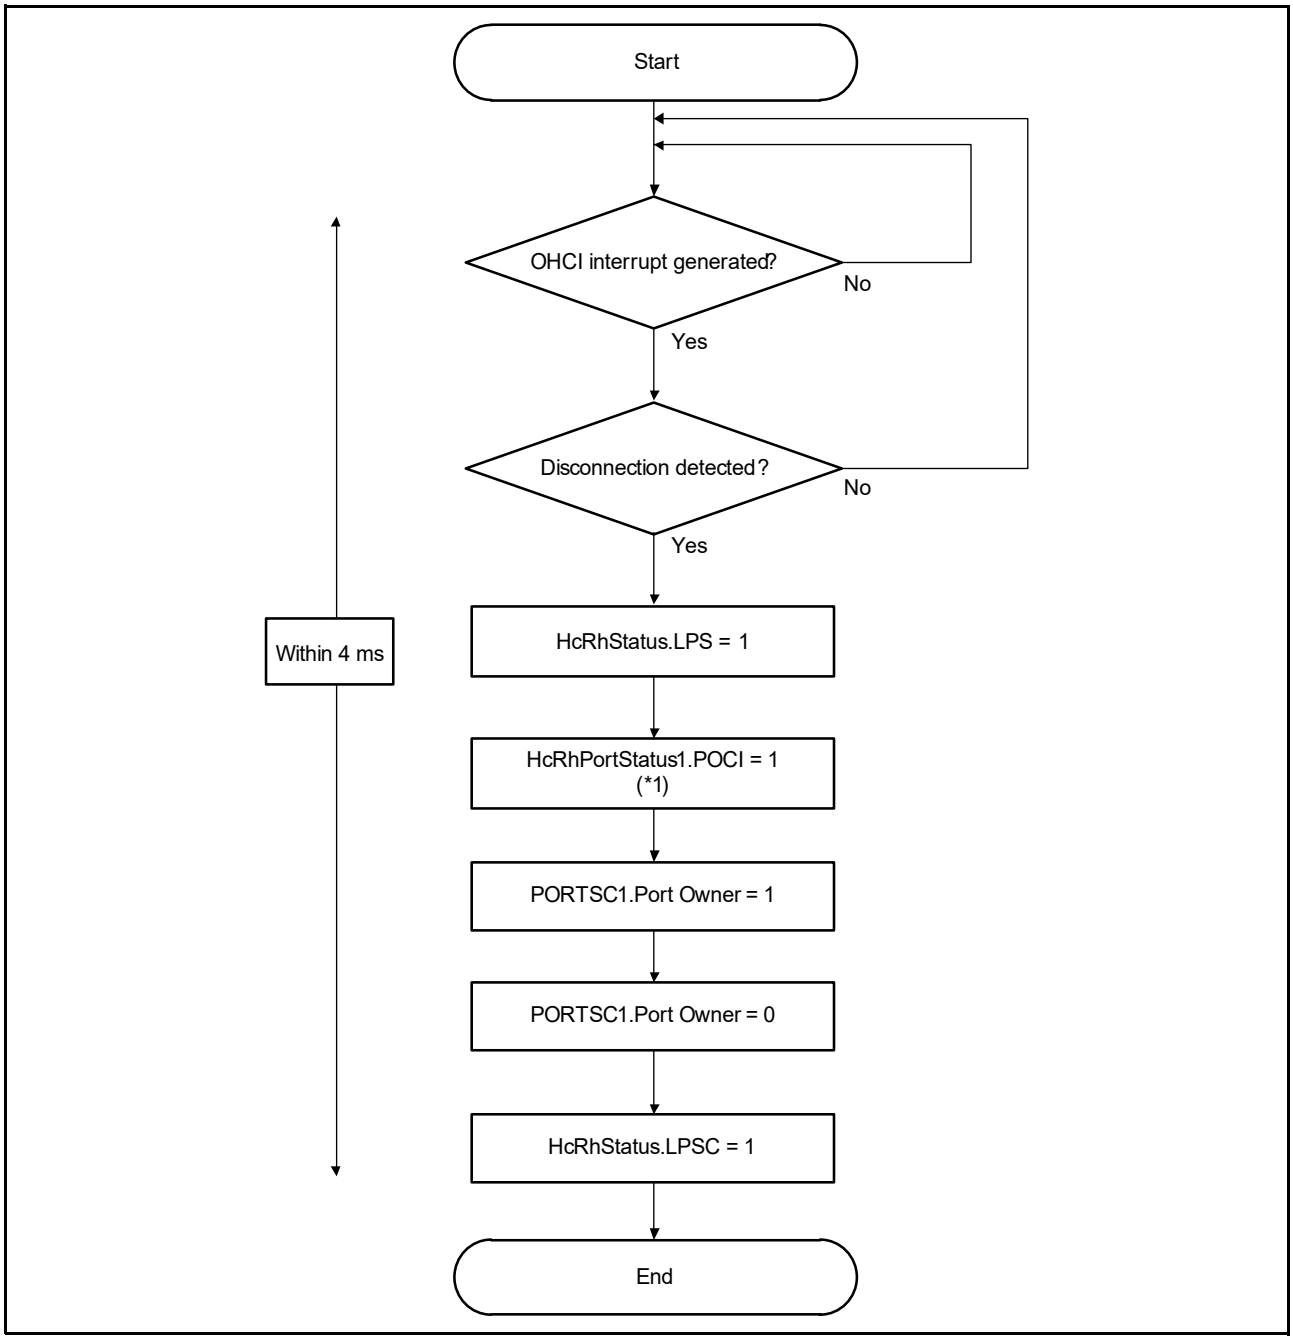

Figure 32.6 Flow 2

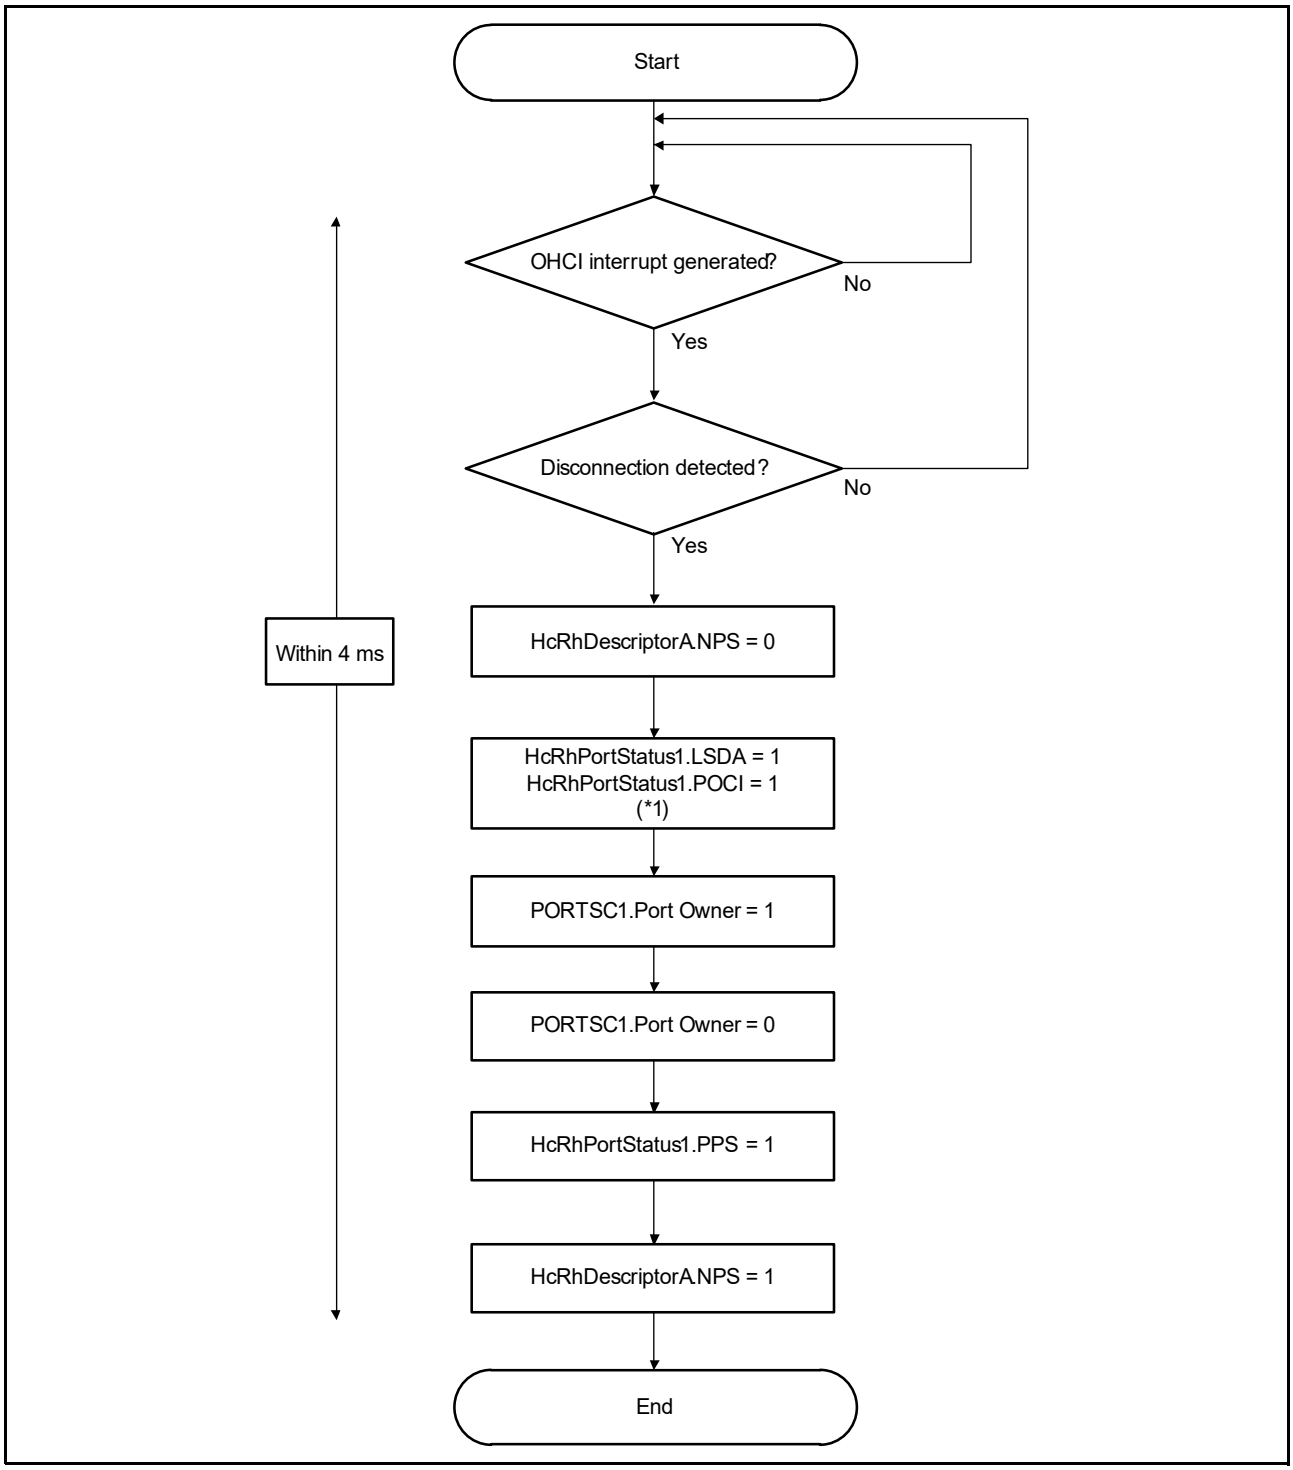

Figure 32.7 Flow 3

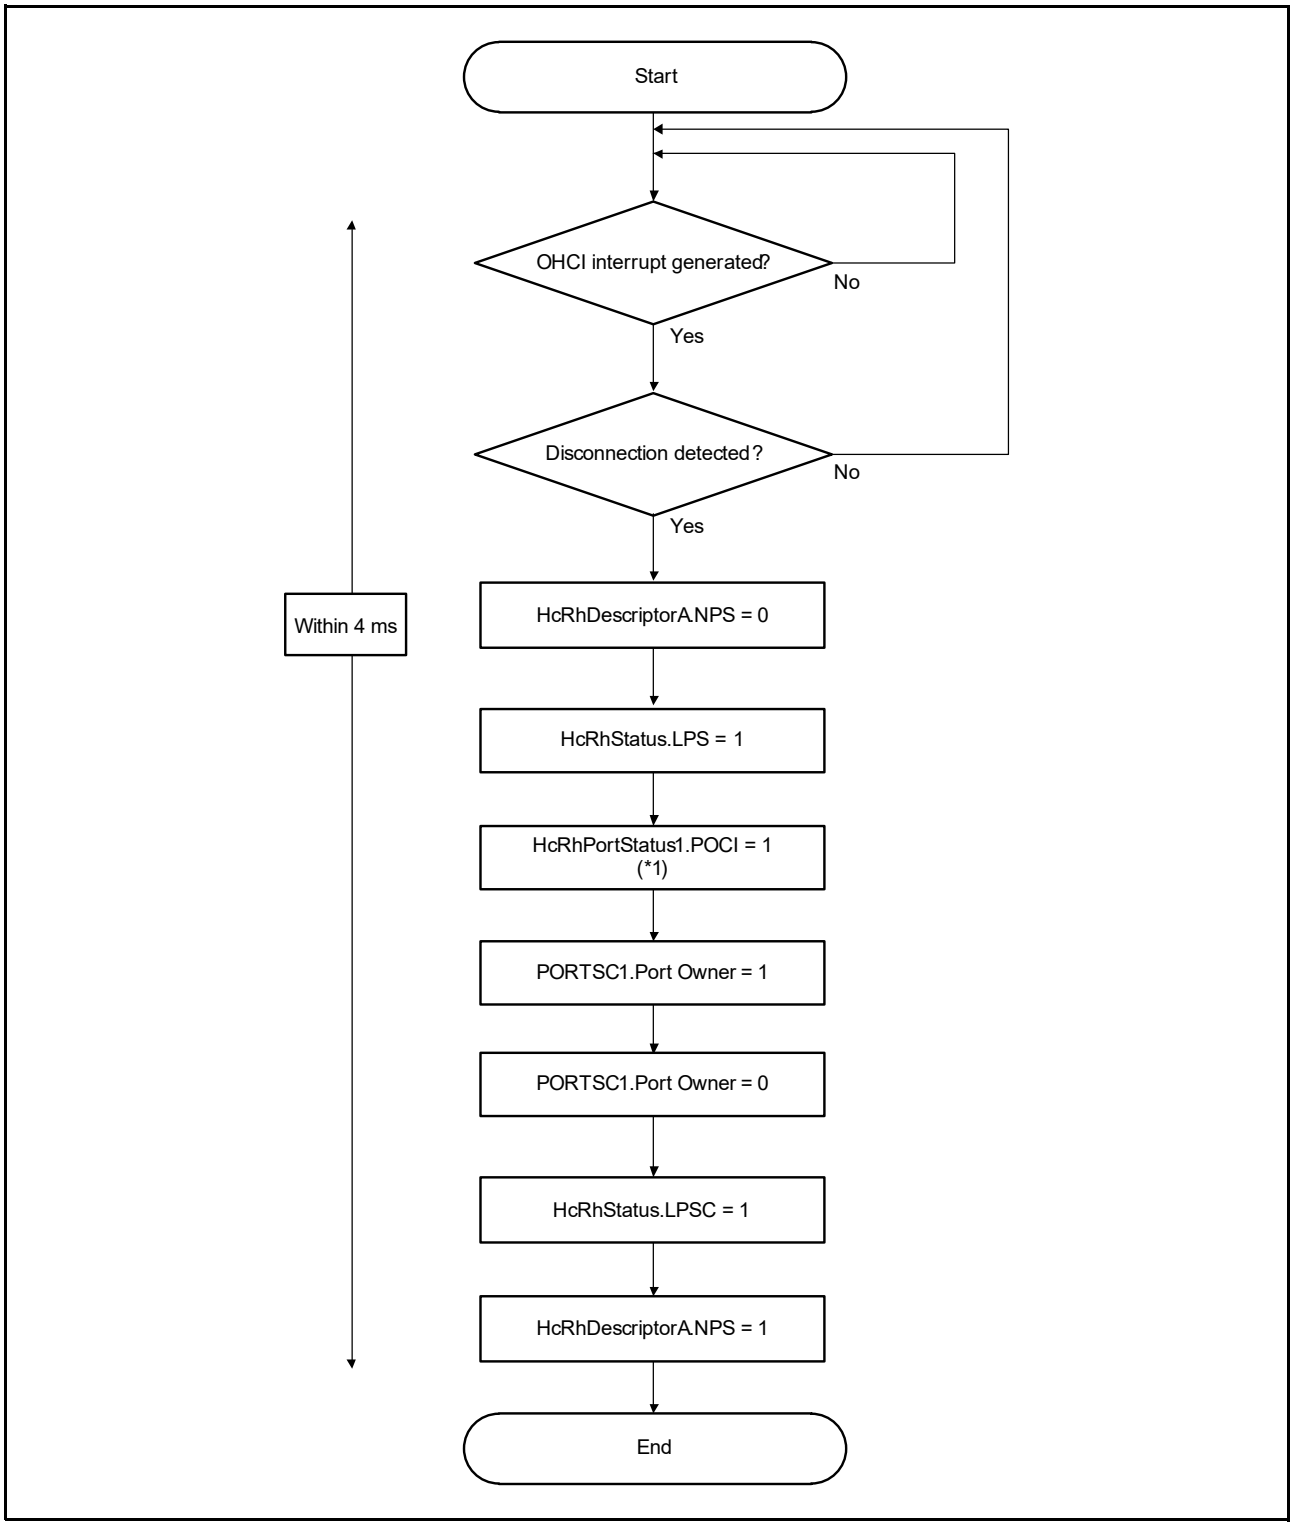

Figure 32.8 Flow 4

Point for caution on flows 1 to 4

Note 1. Making this setting leads to setting of the HcInterruptStatus.RHSC bit to 1, which causes the generation of an OHCI interrupt.
Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.
At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.
CCS = 0, PES = 0, CSC = 1, and PESC = 0

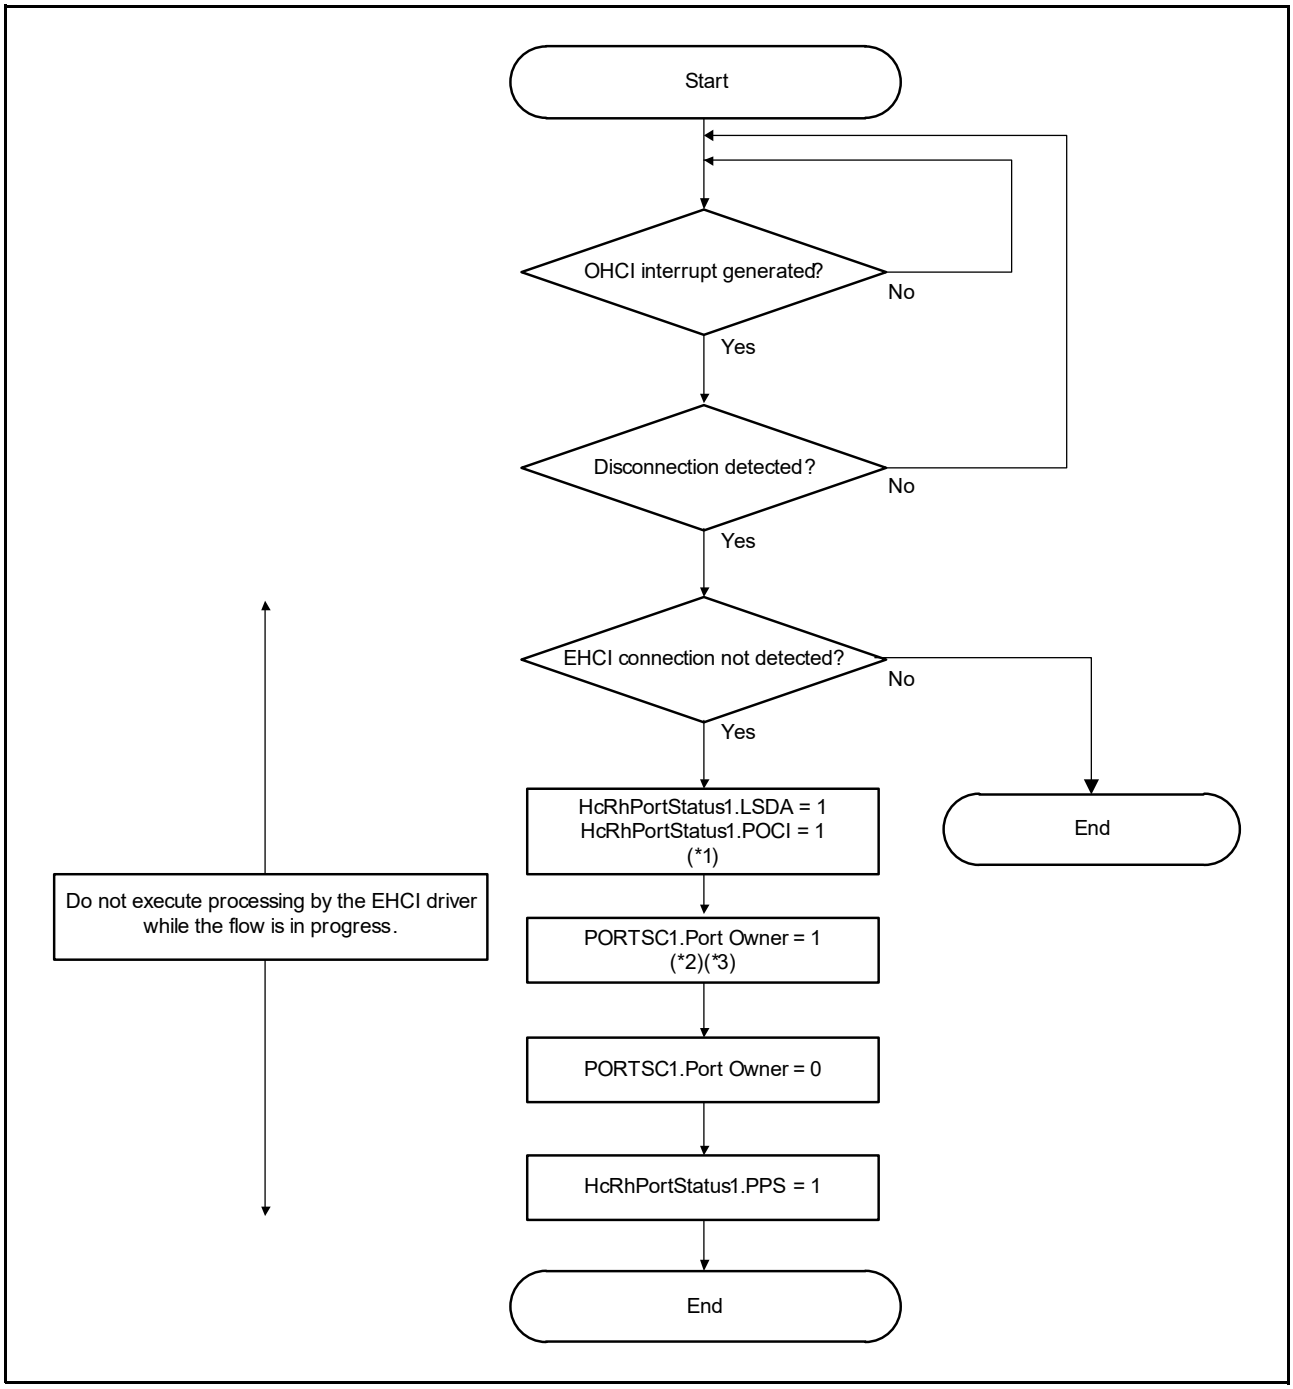

Figure 32.9 Flow 5

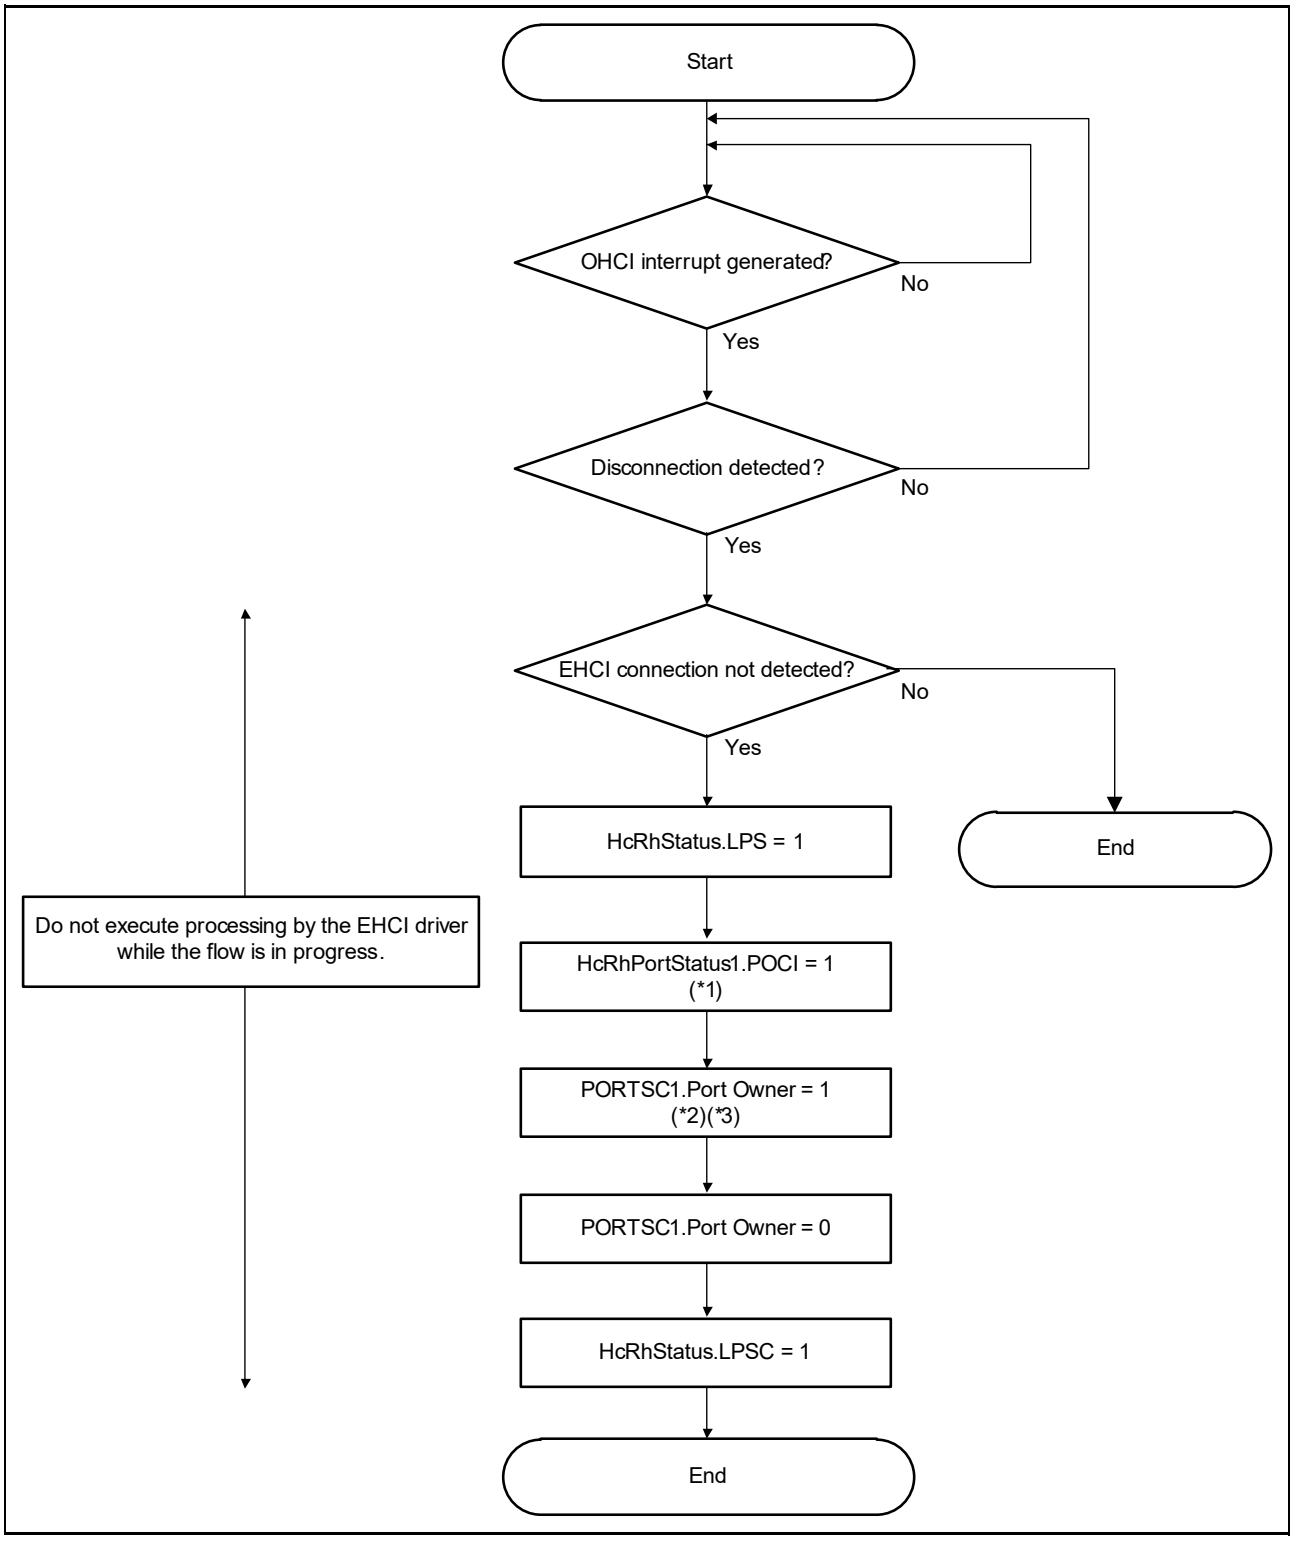

Figure 32.10 Flow 6

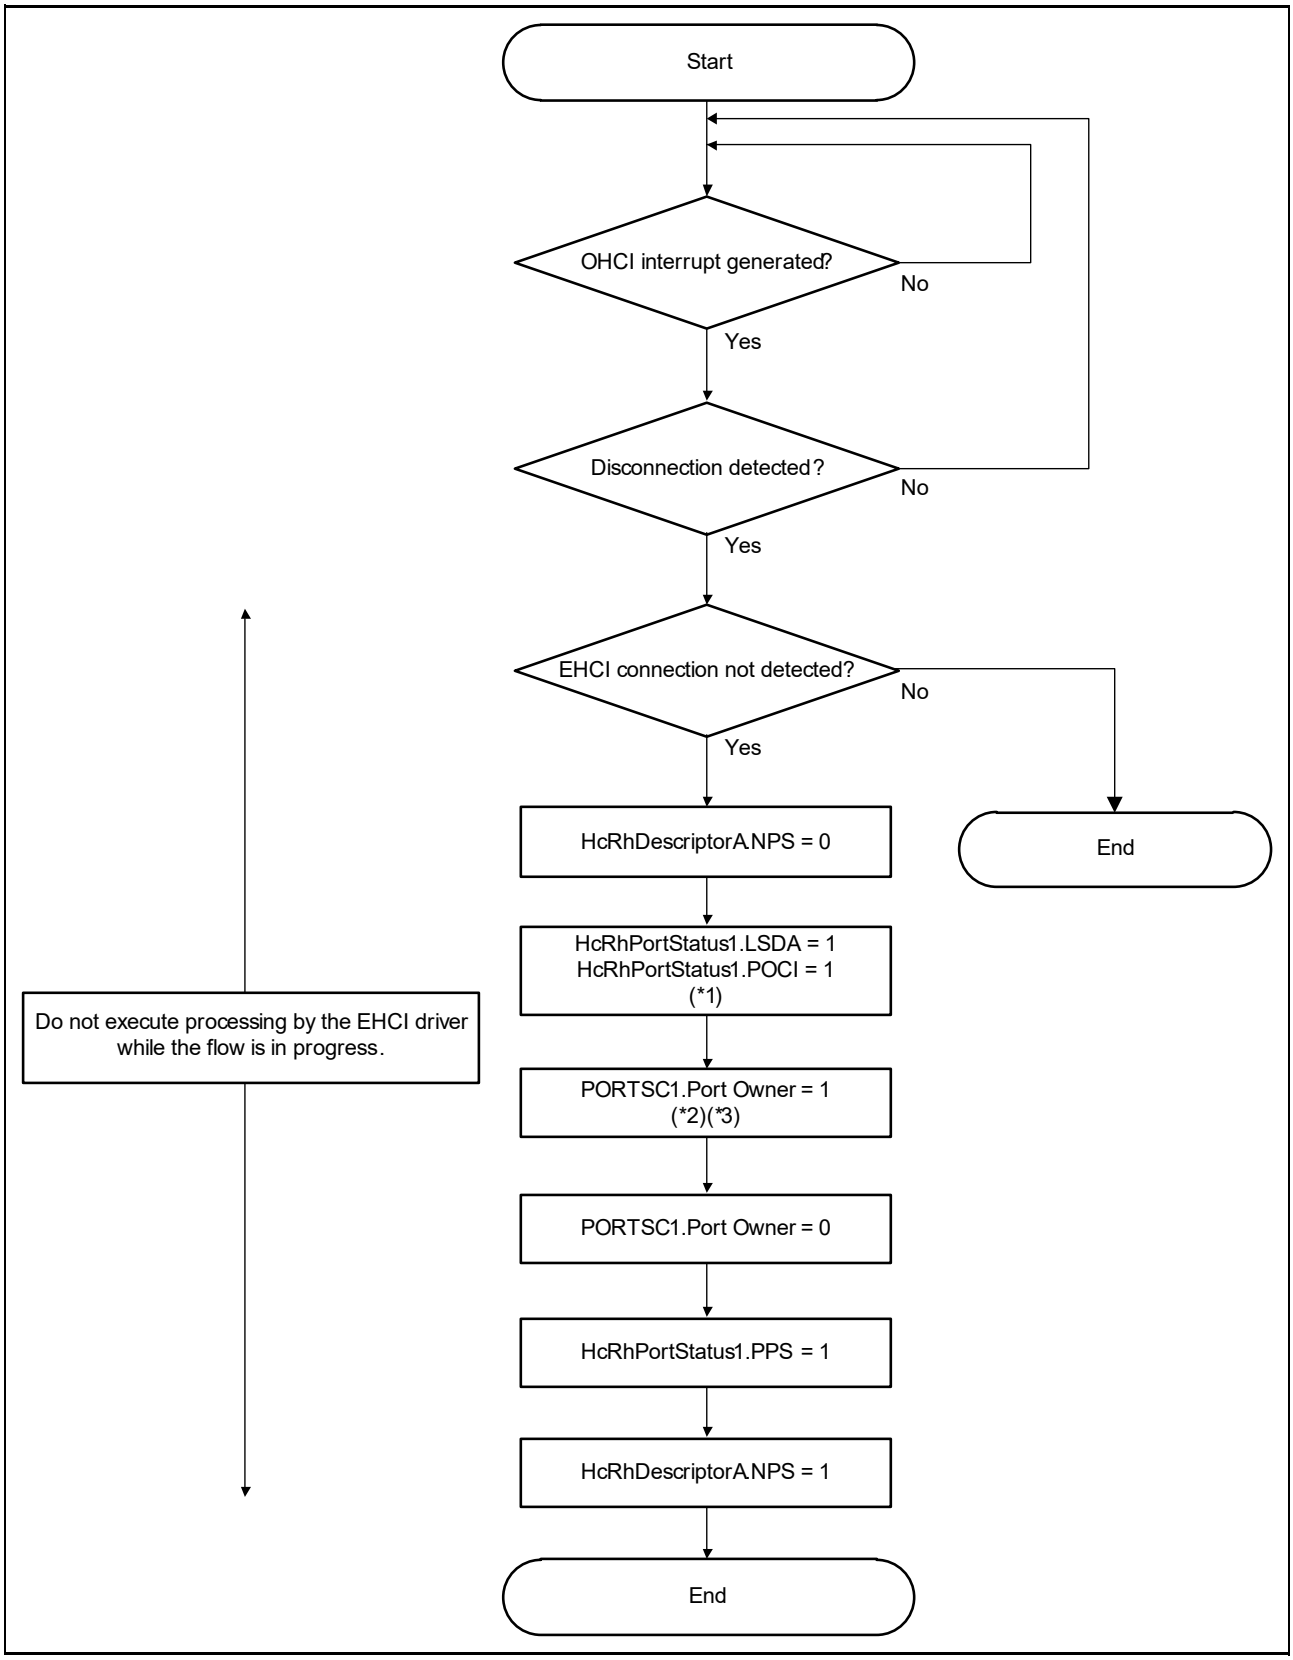

Figure 32.11 Flow 7

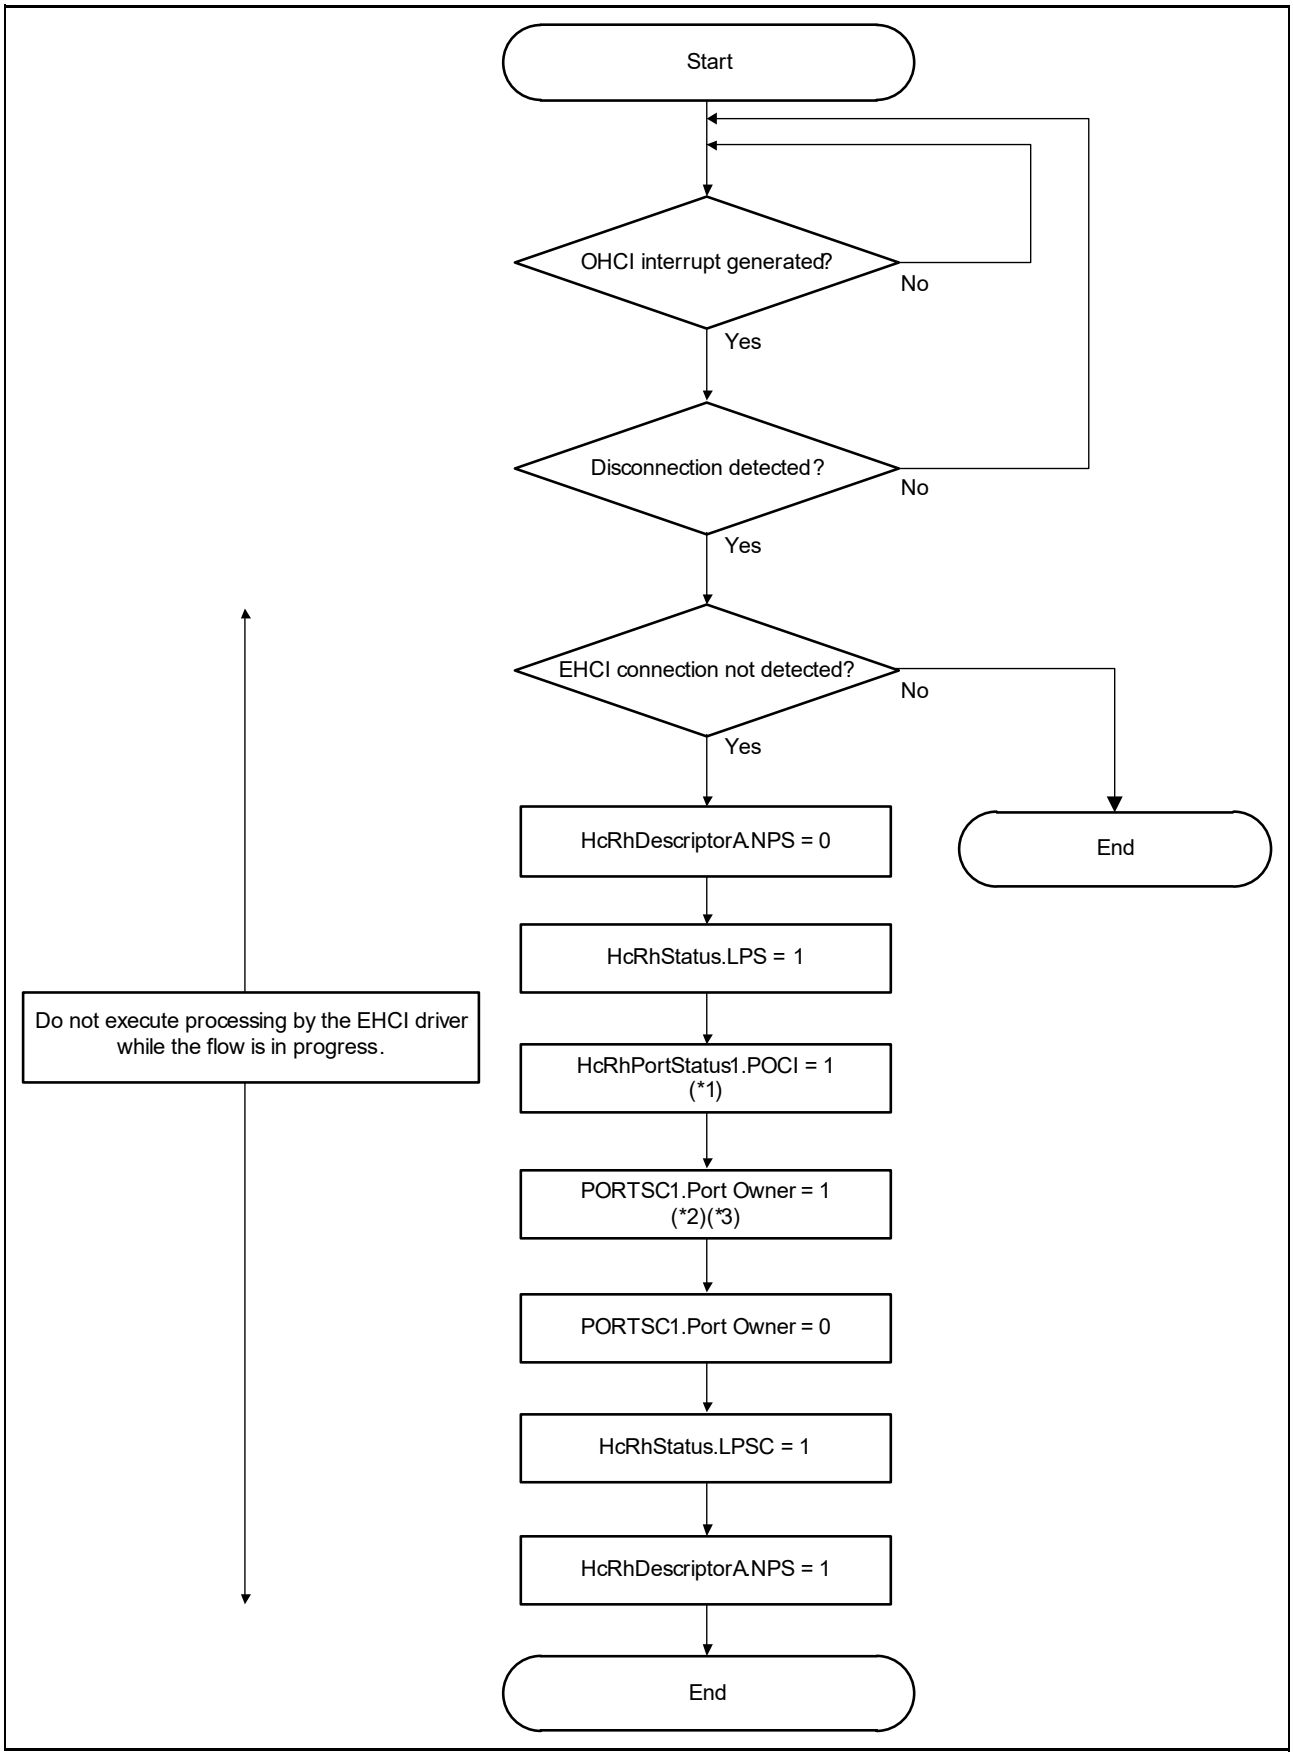

Figure 32.12 Flow 8

Points for caution on flows 5 to 8

Note 1. Making this setting leads to setting of the HcInterruptStatus.RHSC bit to 1, which causes the generation of an OHCI interrupt.
Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.
At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.
CCS = 0, PES = 0, CSC = 1, and PESC = 0

Note 2. No time constraint applies to these flows and a peripheral device can be reconnected while the flow is in progress.
However, contention between the detection of reconnection and this setting may lead to the HcInterruptStatus.RHSC bit being set to 1, which causes the generation of an OHCI interrupt. Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.
At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.
CCS = 0, PES = 0, CSC = 1, and PESC = 0

Note 3. After reconnection of the peripheral device is detected, changing the port owner to the OHCI leads to setting of the USBSTS.PortChangeDetect bit to 1, which causes the generation of an EHCI interrupt. Note that processing by the EHCI driver must not proceed until this flow is completed.

33. USB 2.0 Function Module

33.1 Overview

33.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.
The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see section 32, USB 2.0 Host Module.

This module is a universal serial bus (USB) controller that has peripheral functions.
This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 16 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

33.1.2 Features

33.1.2.1 Peripheral controller supporting high-speed USB

- On-chip peripheral USB controller

33.1.2.2 Support of all types of USB transfer

- Supporting all types of USB transfer, including isochronous transfer
- Control transfer
- Bulk transfer
- Interrupt transfer (high-bandwidth transfers not supported)
- Isochronous transfer (high-bandwidth transfers not supported)

33.1.2.3 Bus interface

- Includes a two-channel DMA interface

33.1.2.4 Pipe configuration

- 8 Kbytes of buffer memory for USB communications for each channel
- Up to 16 pipes (including the default control pipe) selectable for each channel
- Programmable pipe configuration
- Any endpoint number assignable to pipes other than pipe 0

Table 33.1 Pipe Settings

PIPE	Transfer Type	Double buffer	Continuous transfer mode	Buffer size
PIPE0	Control	—	—	Fixed to 64 bytes/ 256 bytes (CNTMD = 1)
PIPE1	Iso/Bulk	√	√ (Bulk only)	Up to 2 Kbytes
PIPE2	Iso/Bulk	√	√ (Bulk only)	Up to 2 Kbytes
PIPE3	Bulk	√	√	Up to 2 Kbytes
PIPE4	Bulk	√	√	Up to 2 Kbytes
PIPE5	Bulk	√	√	Up to 2 Kbytes
PIPE6	Int	—	—	Fixed to 64 bytes
PIPE7	Int	—	—	Fixed to 64 bytes
PIPE8	Int	—	—	Fixed to 64 bytes
PIPE9	Int/Bulk	√ (Bulk only)	√ (Bulk only)	Up to 2 Kbytes
PIPE10	Int/Bulk	√ (Bulk only)	√ (Bulk only)	Up to 2 Kbytes
PIPE11	Bulk	√	√	Up to 2 Kbytes
PIPE12	Bulk	√	√	Up to 2 Kbytes
PIPE13	Bulk	√	√	Up to 2 Kbytes
PIPE14	Bulk	√	√	Up to 2 Kbytes
PIPE15	Bulk	√	√	Up to 2 Kbytes

33.1.2.5 Features of peripheral functions

- Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)
- Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Automatic response to SET_ADDRESS request
- NAK response interrupt (NRDY)
- SOF interpolation

33.1.2.6 Features of DMA transfer

DMA transaction mode:	Fetching in both register and link modes are supported.
Interrupt:	Level is supported.
Transfer size:	A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.
Skip (scatter/gather) function:	The access size and skip size can be specified separately for the transfer source and destination.
Suspend function:	A running DMA transaction can be suspended temporarily.
Interval function:	The interval of DMA transfers can be specified to control the bus occupancy.

33.1.2.7 Other functions

- Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)
- Transfer ending function using a transaction counter
- SOF pulse output function
- BRDY interrupt event notification timing change function (BFRE)
- Function (SHTNAK) to set NAK in the response PID when transfer ends
- Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

33.1.3 Overview of Functions

33.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

(a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

(b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

33.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.
You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

33.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:
(1) One pipe dedicated to control transfer
(2) Three pipes dedicated to interrupt transfer
(3) Eight pipes dedicated to bulk transfer
(4) Two pipes selectively used for bulk or isochronous transfer
(5) Two pipes selectively used for bulk or interrupt transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

33.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

33.1.4 Restriction matter and Notes

33.1.4.1 Restriction matter

(1) Restrictions on the USB specifications

It's no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

(2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and can not use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and can not use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function can not use.

33.1.4.2 Notes

(1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

(a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

(b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.
According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

33.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset
"Power on Reset" indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
"-" indicates that a user's setting is retained without this module operation having been performed.
“X” indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.
R: Reading only
W: Writing only
R/W: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

<Example of description>

(1) Bit Number	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit Symbol		A bit	B bit	C bit												
(2) Power on Reset	X	0	0	0												
USB Bus Reset	X	0	—	—												

bit	Name	Function	R/W
15	—	Nothing is assigned. Fix this bit to 0.	
14	A bit AAA enable	0: Disables operation 1: Enables operation	R/W
13	B bit BBB operation	0: Outputs low-level signal 1: Outputs high-level signal	R
12	C bit CCC control	0: +++++++ 1: +++++++	R(0)/W(1)
	(5)	(6)	(4)

33.2.1 Base Address

Table 33.2 Base addresses for each channel of the USB function module

Channel number	Base address
0	E821 9000h
1	E821 B000h

33.2.2 List of Registers

Table 33.3 lists the registers of this module.

Table 33.3 List of Registers

Address	Symbol	Name	Access unit
000	SYSCFG0	System Configuration Control Register 0	16-bit
002	SYSCFG1	System Configuration Control Register 1	16-bit

33.2.3 System Configuration Control Registers

33.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: 000H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	CNEN	HSE	—	DRPD	DPRPU	—	—	—	USBE
0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 9	—	Nothing is assigned to these bits. Fix these bits to 0.	
8	CNEN	This bit prohibits or enables single-ended receiver operation. 0: Single-ended receiver operation prohibited 1: Single-ended receiver operation enabled	R/W
7	HSE	This bit prohibits or enables High-Speed operation. 0: High-Speed operation prohibited (Full-Speed) 1: High-Speed operation enable(The controller detects the communication speed.)	R/W
6	—	Nothing is assigned to this bit. Fix this bit to 0.	
5	DRPD	D+/D- line resistor control Set this bit to 0 to use this module. For details, see Control of USB Data Bus Resistors.	R/W
4	DPRPU	D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see Control of USB Data Bus Resistors. 0: Pull Up prohibited 1: Pull Up enabled	R/W
3 to 1	—	Nothing is assigned to these bits. Fix these bits to 0.	
0	USBE	USB block operation prohibited This bit prohibits or enables USB block operation. 0: USB block operation prohibited 1: USB block operation enabled	R/W

Note: Data can be written to and read from this register even while the UTMI+PHY clock is stopped.
However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

(1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.
Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

When the HSE bit is 0, this module performs a full-speed operation.
When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(3) D+/D- line resistor control (DRPD or DPRPU) bit

Table 33.4 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 33.4 Control of USB Data Bus Resistors

Setting		Control of USB Data Bus Resistors		
DRPD	DPRPU	D- Line	D+ Line	Remarks
0	0	Open	Open	
0	1	Open	Pull-Up	Specify the settings as shown in the left.
1	0	Pull-Down	Pull-Down	Initial state (When power on reset is canceled)
1	1	Pull-Down	Pull-Up	Setting prohibited

(a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.
When this bit is changed from 1 to 0, this module initializes the bits shown in Table 33.5.

Table 33.5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

Register Name	Bit Name
SYSSTS0	LNST
DVSTCTR0	RHST
INTSTS0	DVSQ
USBADDR	USBADDR
USBREQ	bRequest bmRequestType
USBVAL	wValue
USBINDX	wIndex
USBLENG	wLength

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

33.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: 002H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	—	BWAIT					
0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 12	—	Nothing is assigned to these bits. Fix these bits to 0.	
11 to 8	—	Nothing is assigned to these bits. Fix these bits to 0.	
7, 6	—	Nothing is assigned to these bits. Fix these bits to 0.	
5 to 0	BWAIT	CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (default) : 111111: 63 wait cycles (65 access cycles)	R/W

(1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.
The following restriction is placed on the cycle of the access to the registers at address 04H or after of this module:
Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (Bφ) frequency. The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:
MBW = 10 (32-bit access width): max 60 MBytes/sec
MBW = 01 (16-bit access width): max 30 MBytes/sec
MBW = 00 (8-bit access width): max 15 MBytes/sec

33.2.4 System Configuration Status

33.2.4.1 System Configuration Status Register (SYSSTS0) <Address: 004H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	LNST	
—	—	0	0	0	0	0	0	0	0	0	0	0	—	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 2	—	Nothing is assigned to these bits. Fix these bits to 0.	
1, 0	LNST	USB Line status monitor The USB line status is displayed. Note: See the detailed description.	R

(1) Line status monitor (LNST) bits

Table 33.6 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 33.6 Line Status of USB Data Bus

LNST [1]	LNST [0]	Full-Speed operation	High-Speed operation	Chirp operation
0	0	SE0	Squelch	Squelch
0	1	J State	Unsquelch	Chirp J
1	0	K State	Invalid	Chirp K
1	1	SE1	Invalid	Invalid

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

33.2.5 USB Signal Control Registers

33.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: 008H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BRST 1	—	—	—	—	—	—	WKUP	—	—	—	—	—	RHST		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	BRST1	This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed.	R/W
14 to 9	—	Nothing is assigned to these bits. Fix these bits to 0.	—
8	WKUP	Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output.	R/W(1)
7 to 3	—	Nothing is assigned to these bits. Fix these bits to 0.	
2 to 0	RHST	Reset handshake This bit indicates the reset handshake status. Note: See the detailed description.	R

(1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.
This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.
The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.
When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. Table 33.7 lists the results of reset handshake.

Table 33.7 Reset Handshake Status

Bus State	Value of RHST Bit
Powered or disconnected state	000
Reset handshake in process	100
Full-speed connection	010
High-speed connection	011

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

33.2.6 Test Mode Register

33.2.6.1 USB Test Mode Register [TESTMODE] <Address: 00CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	BRST 2	—	—	BRST 3	—	—	—	—	—	—	—	UTST			
0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	—	Nothing is assigned to this bit. Fix this bit to 0.	
14	BRST2	This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed.	R/W
13, 12	—	Nothing is assigned to these bits. Fix these bits to 0.	
11	BRST3	This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed.	R/W
10 to 4	—	Nothing is assigned to these bits. Fix these bits to 0.	
3 to 0	UTST	Test mode See the detailed description.	R/W

(1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.
Table 33.8 lists the test modes of this module.

Table 33.8 List of test mode operation

Test mode	Value of UTST Bits
Normal operation	0000
Test_J	0001

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication.
When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.
To perform a normal USB communication after setting a test mode, perform Power on reset.

33.2.7 FIFO Port Registers

33.2.7.1 CFIFO Port Register [CFIFO] <Address: 014H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FIFOPORT (Low)															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

33.2.7.2 CFIFO Port Register [CFIFO] <Address: 016H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FIFOPORT (High)															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	FIFOPORT	FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer.	R/W

(1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

(2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).
The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in Table 33.9 to Table 33.11.

Table 33.9 Endian Operation in 32-Bit Access (When MBW = 10)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	N + 3 address	N + 2 address	N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	N + 2 address	N + 3 address

Table 33.10 Endian Operation in 16-Bit Access (When MBW = 01)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1		•even-numbered address	odd-numbered address
1	even-numbered address	odd-numbered address	Writing: invalid Reading: prohibited*1	

Table 33.11 Endian Operation in 8-Bit Access (When MBW = 00)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1			Writing: valid Reading: valid
1	Writing: valid Reading: valid	Writing: invalid Reading: prohibited*1		

Note: Reading words or bytes from an invalid register is prohibited.

33.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: 020H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RCNT	REW	—	—	MBW		—	BIGEND	—	—	ISEL	—	CURPIPE			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	RCNT	Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.	R/W
14	REW	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.	R(0)/W
13, 12	—	Nothing is assigned to these bits. Fix these bits to 0.	
11, 10	MBW	CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited	R/W
9	—	Nothing is assigned to this bit. Fix this bit to 0.	
8	BIGEND	FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0: Little endian 1: Big endian	R/W
7, 6	—	Nothing is assigned to these bits. Fix these bits to 0.	
5	ISEL	FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0: Selects reading of buffer memory. 1: Selects writing of buffer memory.	R/W
4	—	Nothing is assigned to this bit. Fix this bit to 0.	
3 to 0	CURPIPE	FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000: DCP 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15	R/W

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).
Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.
If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.
If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.
Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.
For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.
When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.
Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.
For details see section 33.2.7.2 (1), FIFO port control bits (for FIFOPORT).

(5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.
If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.
Set this bit simultaneously with setting of the CURPIPE bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.
If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.
If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

33.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address: 028H>
D1FIFO Port Select Register [D1FIFOSEL] <Address: 02CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RCNT	REW	DCLRM	DREQE	MBW		—	—	—	—	—	—	CURPIPE			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	RCNT	Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.	R/W
14	REW	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.	R(0)/W
13	DCLRM	Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0: Automatic FIFO buffer clear prohibited 1: Automatic FIFO buffer clear enabled	R/W
12	DREQE	UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0: Output prohibited 1: Output enabled	R/W
11, 10	MBW	DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited	R/W
9 to 4	—	Nothing is assigned to these bits. Fix these bits to 0.	
3 to 0	CURPIPE	FIFO port access pipe specification 0000: No specification 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15	R/W

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).
Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.
If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the "BCLR = 1" processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.
Always clears this bit when you use this module with the BRDYM bit set.

(4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.
When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits.
When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port.
For details, see 33.2.7.3, (3), CFIFO port access bit width (MBW) bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.
If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.
Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers.
If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

33.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: 022H>
D0FIFO Port Control Register [D0FIFOCTR] <Address: 02AH>
D1FIFO Port Control Register [D1FIFOCTR] <Address: 02EH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BVAL	BCLR	FRDY	—	DTLN											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	BVAL	Buffer memory valid flag Specify 1 for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0: Invalid 1: Writing complete	R/W(1)
14	BCLR	CPU buffer clear Specify 1 for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0: Invalid 1: CPU buffer memory clear	R(0)/W(1)
13	FRDY	FIFO port ready This bit indicates whether the FIFO port can be accessed. 0: The FIFO port cannot be accessed. 1: The FIFO port can be accessed.	R
12	—	Nothing is assigned to this bit. Fix this bit to 0.	
11 to 0	DTLN	Receive data length These bits indicate the length of receive data.	R

(1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

(1) To send short packets, set this bit when data writing ends.
(2) To send zero length packets, set this bit before writing data to the FIFO buffer.
(3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.
When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.
Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.
Do not set this bit when the specified pipe is in the receiving direction.

(2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.
Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and the both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to "NAK".
When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.
In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

(1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.
(2) A short packet has been received and data reading has ended while the BFRE bit is 1.

(4) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

(1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.
(2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.
When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

33.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

33.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: 030H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	VBSE	VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
14	RSME	Frame number update interrupt enable Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
13	SOFE	This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
12	DVSE	Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
11	CTRE	Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
10	BEMPE	Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
9	NRDYE	Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
8	BRDYE	Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W
7 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

33.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: 036H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPEBRDYE															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPEBRDYE	Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: 038H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPENRDYE															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPENRDYE	Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled	R/W

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: 03AH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPEBEMPE															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPEBEMPE	Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0: Interrupt output prohibited 1: Interrupt output enabled	R/W

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.9 SOF Control Register

33.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: 03CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Function	R/W
15	VBINT	Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0: No VBUS interrupt is generated. 1: A VBUS interrupt is generated.	R/W(0)
14	RESM	Resume interrupt status This bit indicates the resume detection interrupt status. 0: No resume interrupt is generated. 1: A resume interrupt is generated.	R/W(0)
13	SOFR	Frame number update interrupt status This bit indicates the frame number update interrupt status. 0: No SOF interrupt is generated. 1: A SOF interrupt is generated.	R/W(0)
12	DVST	Device state transition interrupt status This bit indicates the device state transition interrupt. 0: No device state transition interrupt is generated. 1: A device state transition interrupt is generated.	R/W(0)
11	CTRT	Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0: No control transfer stage transition interrupt is generated. 1: A control transfer stage transition interrupt is generated.	R/W(0)
10	BEMP	BEMP interrupt status This bit indicates the BEMP interrupt status. 0: No BEMP interrupt is generated. 1: A BEMP interrupt is generated.	R
9	NRDY	NRDY interrupt status This bit indicates the NRDY interrupt status. 0: No NRDY interrupt is generated. 1: An NRDY interrupt is generated.	R
8	BRDY	BRDY interrupt status This bit indicates the BRDY interrupt status. 0: No BRDY interrupt is generated. 1: A BRDY interrupt is generated.	R
7	VBSTS	VBUS input status This bit indicates the VBUS pin input status. 0: The VBUS pin is at the low level. 1: The VBUS pin is at the high level.	R
6 to 4	DVSQ	Device state These bits indicate the device state. 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state	R
3	VALID	USB request reception This bit indicates whether USB request reception is detected. 0: Not detected 1: A setup packet is received.	R/W(0)

Bit	Name	Function	R/W
2 to 0	CTSQ	Control transfer stage These bits indicate the control transfer stage. 000: Idle or setup stage 001: Control reading data stage 010: Control reading status stage 011: Control writing data stage 100: Control writing status stage 101: Control writing (No Data) status stage 110: Control transfer sequence error 111: Reserved	R

Note: * When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

Note: * This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XX) and detects a falling edge of the signal at the DP pin.

(3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:
This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)
This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.
When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).
For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.
This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.
Cannot clear this bit even by writing 0.

(7) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).
For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.
This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.
Software cannot clear this bit even by writing 0.

(8) Buffer ready interrupt status (BRDY) bit

This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).
For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.
This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.
Software cannot clear this bit even by writing 0.

33.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: 046H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPEBRDY															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPEBRDY	Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.	R/W(0)

Note: * Bit numbers correspond to pipe numbers.
* To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.
* When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.
Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

(a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.
Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction
   (a) When the DIR bit changes from 0 to 1
   (b) When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
   In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.
   (c) When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
   If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.
   (d) When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.
   (e) When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction
   (a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
   No request trigger is generated for the transaction that involves a data PID mismatch.
   In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
   If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
   When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
   In that case, the request trigger is generated even if the FIFO buffer has a free space.
   (b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
   If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.
Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

(b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:
1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.
If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

(c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

(a) For the pipe in the sending direction
This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction
This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

33.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: 048H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPENRDY															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPENRDY	Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.	R/W(0)

<<Remarks>>

* Bit numbers correspond to pipe numbers.
* To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.
This module issues an internal NRDY interrupt request for individual pipes under the conditions described below.
This module does not issue any interrupt request at the status stage of a control transfer.

(a) For the pipe in the sending direction

(1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero-length packet, and sets the OVRN bit.

(b) For the pipe in the receiving direction

(1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

(2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

(3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

33.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: 04AH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PIPEBEMP															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	PIPEBEMP	Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.	R/W(0)

<<Remarks>>

* Bit numbers correspond to pipe numbers.
* To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:
   (a) When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends
   (b) When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit
   (c) During an IN transfer (sending zero-length packets) at the status stage of a control transfer

2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:
   (a) When a CRC or bit stuff error has been detected in the received data
   (b) When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.
Writing 1 to this bit causes no effect.

33.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

33.2.11.1 Frame Number Register [FRMNUM] <Address: 04CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OVRN	CRCE	—	—	—	FRNM										
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	OVRN	Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.	R/W(0)
14	CRCE	CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.	R/W(0)
13 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10 to 0	FRNM	Frame number These bits indicate the latest frame number.	R

Note: * The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.
When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see section 33.2.10.3, (1), Pipe NRDY interrupt status (PIPENRDY) bit.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write 0x40.

When the peripheral controller function is selected
This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.
Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write 0x80.
When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see section 33.2.10.3, (1), Pipe NRDY interrupt status (PIPENRDY) bit.

(3) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.
When reading these bits, read them twice and check for consistency.

33.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: 04EH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DVCHG	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	DVCHG	0: Writing to the USBADDR register is disabled 1: Writing to the USBADDR register is enabled This bit is used in resumption in response to reception of the resume signal. Set this bit and the USBADDR register according to 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal. Operation cannot be guaranteed if the procedure in the flowchart is not observed.	R/W
14 to 3	—	Nothing is assigned to these bits. Fix these bits to 0.	
2 to 0	UFRNM	Micro frame These bits indicate the micro frame number.	R

(1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes 0x00 to these bits.

When reading these bits, read them twice and check for consistency.

33.2.12 USB Address

33.2.12.1 USB Address Register [USBADDR] <Address: 050H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	STSRECOV0			—	USBADDR						
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0

Bit	Name	Function	R/W
15 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10 to 8	STSRECOV0	Status Recovery Bits	R/W

b10	b9	b8	Description
0	0	1	FS default state
0	1	0	FS address state
0	1	1	FS configured state
1	0	1	HS default state
1	1	0	HS address state
1	1	1	HS configured state
1	0	0	Suspend state

Set these bits according to section 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal.
Operation cannot be guaranteed if the procedure in the flowchart is not observed.

Bit	Name	Function	R/W
7	—	Nothing is assigned to this bit. Fix this bit to 0.	
6 to 0	USBADDR	USB address These bits indicate the USB address allocated by the host.	R

(1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.
When this module detects a USB bus reset, this module writes 0x00 to these bits.

33.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.
These registers store the values set in the received USB requests.

33.2.13.1 USB Request Type Register [USBREQ] <Address: 054H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
bRequest								bmRequestType							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Name	Function	R/W
15 to 8	bRequest	Request Value of USBRequestbRequest	R
7 to 0	bmRequestType	Request type Value of USBRequestbmRequestType	R

(1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

33.2.13.2 USB Request Value Register [USBVAL] <Address: 056H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
wValue															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Name	Function	R/W
15 to 0	wValue	Value Value of the wValue field in a USB request	R

(1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.
These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

33.2.13.3 USB Request Index Register [USBINDX] <Address: 058H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
wIndex															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Name	Function	R/W
15 to 0	wIndex	Index Value of the wIndex field in a USB request	R

(1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.
These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction.
Writing to these bits is ignored.

33.2.13.4 USB Request Length Register [USBLENG] <Address: 05AH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
wLength															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Name	Function	R/W
15 to 0	wLength	Length Value of the wLength field in a USB request	R

(1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.
These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction.
Writing to these bits is ignored.

33.2.14 DCP Configuration

When performing a data communication by a control transfer, use the default control pipe (DCP).

33.2.14.1 DCP Configuration Register [DCPCFG] <Address: 05CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	—	—	—	—	—
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 9	—	Nothing is assigned to these bits. Fix these bits to 0.	
8	CNTMD	Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode	R/W
7	SHTNAK	Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends 1: Disables the pipe when the transfer ends	R/W
6 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

33.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: 05EH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	MXPS						
0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 7	—	Nothing is assigned to these bits. Fix these bits to 0.	
6 to 0	MXPS	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP.	R/W

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.
The default is 0x40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.
Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits.
If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

33.2.14.3 DCP Control Register [DCPCTR] <Address: 060H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BSTS	—	—	—	—	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID	
0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0

Bit	Name	Function	R/W
15	BSTS	Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0: Buffer access is not possible. 1: Buffer access is possible.	R
14 to 9	—	Nothing is assigned to these bits. Fix these bits to 0.	
8	SQCLR	Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA0 specified	R(0)/W(1)
7	SQSET	Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA1 specified	R(0)/W(1)
6	SQMON	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: DATA0 1: DATA1	R
5	PBUSY	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.	R
4 to 3	—	Nothing is assigned to these bits. Fix these bits to 0.	
2	CCPL	Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0: Does not permit the control transfer to end. 1: Permits the control transfer to end.	R/W
1, 0	PID	Response PID These bits control responses from this module in control transfer. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response	R/W

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.
If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.
Do not set the SQCLR and SQSET bits at the same time.
Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.
If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module.
When a transaction ends normally, this module toggles this bit.
This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.
When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).
This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.
Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.
In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.
When a new SETUP packet is received, this module changes this bit from 1 to 0.
When the VALID bit is 1, software cannot set this bit.

(7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

33.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

33.2.15.1 Pipe Window Select Register [PIPESEL] <Address: 064H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 4	—	Nothing is assigned to these bits. Fix these bits to 0.	
3 to 0	PIPESEL	Pipe window select These bits specify a pipe for registers at addresses 68H to 6EH. 0000: No selection 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15	R/W

* When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses 68H to 6EH is ignored.

(1) Pipe window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses 68H to 6EH. After a pipe is selected by these bits, the values set in the areas at addresses 68H to 6EH are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H68 to H6E. Then, writing to the areas at addresses H68 to H6E is ignored.

33.2.15.2 Pipe Configuration Register [PIPECFG] <Address: 068H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TYPE		—	—	—	BFRE	DBLB	CNTMD	SHTNAK	—	—	DIR	EPNUM			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15, 14	TYPE	Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00: The pipe cannot be used. 01: Bulk transfer 10: Interrupt transfer 11: Isochronous transfer	R/W
13 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10	BFRE	BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0: A BRDY interrupt is notified when data is sent or received. 1: A BRDY interrupt is notified when reading of data is completed.	R/W
9	DBLB	Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0: Single buffer 1: Double buffer	R/W
8	CNTMD	Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode	R/W
7	SHTNAK	Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends. 1: Disables the pipe when the transfer ends.	R/W
6, 5	—	Nothing is assigned to these bits. Fix these bits to 0.	
4	DIR	Transfer direction This bit specifies the transfer direction of the specified pipe. 0: Receiving direction 1: Sending direction	R/W
3 to 0	EPNUM	Endpoint number These bits specify the endpoint number of the specified pipe.	R/W

(1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.
Table 33.12 lists pipes and the transfer types specifiable in these bits.

Table 33.12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

Selected Pipe	TYPE Bits	USB Transfer Type
PIPE1 or PIPE2	01 or 11	Bulk or isochronous transfer
PIPE3 to PIPE5	01	Bulk transfer
PIPE6 to PIPE8	10	Interrupt transfer
PIPE9	01 or 10	Bulk or interrupt transfer
PIPE10	01 or 10	Bulk or interrupt transfer
PIPE10 to PIPE15	01	Bulk transfer

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5 or PIPE9 to PIPE15.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.
If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.
For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.
The size of the FIFO buffer this module allocates to the selected pipe is as follows:
(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15, and the transfer type of the selected pipe is bulk transfer.
This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in Table 33.14.

Table 33.13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

CNTMD Bit Setting Value	How to Determine Whether Reading or Sending is Enabled
0	Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): This module receives one packet
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): Either of the following conditions (1) and (2) is met: (1) Data for the maximum packet size is written to the FIFO buffer. (2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.
1	Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): (1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) * 64). (2) This module receives a short packet other than a zero-length packet. (3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. (4) Packets are received as many times as the value of the transaction counter set for the selected pipe.
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): One of the following conditions (1) to (3) is met: (1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. (2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. (3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.
If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Pipe disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15 and is in the receiving direction.
When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).
(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Endpoint number (EPNUM) bits

These bits are used to specify the endpoint number of the endpoint of a selected pipe.
Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

33.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: 06AH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	BUFSIZE							BUFNMB							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	—	Nothing is assigned to this bit. Fix this bit to 0.	
14 to 10	BUFSIZE	Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. 0x00: 64 bytes 0x01: 128 bytes ... (0x1F: 2 Kbytes)	R/W
9, 8	—	Nothing is assigned to these bits. Fix these bits to 0.	
7 to 0	BUFNMB	Buffer number These bits specify the FIFO buffer number of the specified pipe. (0x4 to 0x7F)	R/W

Note: * Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

Note: * If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe.
Specify the FIFO buffer size in units of blocks. One block has 64 bytes.
When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.
The size of the FIFO buffer this module allocates to the selected pipe is as follows:
(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:
(1) Any value from 0x0 to 0x1F when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15.
(2) 0x0 only when the selected pipe is PIPE6 to PIPE8.
In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe.
This module allocates the following blocks of FIFO buffer to the selected pipe:
Block with block number "BUFNMB" to the block with block number "BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1"

The value of these bits must be 0x04 to 0x7F. Note, however, that the following rules must be observed:
Value "0x00" is exclusively used for DCP.
Value "0x04" is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 0x04 in the BUFNMB bits for PIPE6.
Value "0x05" is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 0x05 in the BUFNMB

bits for PIPE7.
Value "0x06" is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 0x06 in the BUFNMB bits for PIPE8.
Value "0x07" is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets 0x07 in the BUFNMB bits for PIPE9.

33.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: 06CH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	MXPS										
0	0	0	0	0	0	0	0	0	0 (1)	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10 to 0	MXPS	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from 0x1 to 0x40 (bytes) can be set.	R/W

Note: * The initial value of the MXPS bits is 0x00 when no pipe is specified in the PIPESEL bits in the PIPESEL register or 0x40 when a pipe is specified in the PIPESEL bits.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.
The initial value of these bits is 0x40 (64 bytes).

For PIPE1 and PIPE2, a value from 0x1 (1 byte) to 0x400 (1024 bytes) can be specified.
For PIPE3 to PIPE5, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified. (Bits [2:0] are excluded.)
For PIPE6 to PIPE8, a value from 0x1 (1 byte) to 0x40 (64 bytes) can be specified.
For PIPE9, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified.
For PIPE10 to PIPE15, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified. (Bits [2:0] are excluded.)

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.
When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

33.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: 06EH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 13	—	Nothing is assigned to these bits. Fix these bits to 0.	
12	IFIS	Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0: Does not perform a buffer flush. 1: Performs a buffer flush.	R/W
11 to 3	—	Nothing is assigned to these bits. Fix these bits to 0.	
2 to 0	IITV	These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.	R/W

(1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.
In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.
This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.
Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.
If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.
For PIPE3 to PIPE5 and PIPE10 to PIPE15, these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5 and PIPE10 to PIPE15.
You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

(a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.
This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.
When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	OUT	DATA0
Setting of PID bits	NAK	NAK	BUF			BUF		
Whether token reception is expected (0: reception expected -: non-reception expected)	-	-	0			0		
Start of interval counting			↑					

Figure 33.1 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

(b) When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

	SOF	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0
Setting of PID bits	NAK	BUF	BUF			BUF	BUF			BUF	BUF		
Whether token reception is expected (0: reception expected -: non-reception expected)	-	-	0			-	0			-	0		
Start of interval counting			↑										

Figure 33.2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

(b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.
This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.
This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:
(1) This module is reset (then, also the IITV bits are cleared).
(2) The ACLRM bit is set.
(3) This module detects a USB bus reset.

33.2.16 Pipe Control Registers (PIPExCTR)

33.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: 070H>
PIPE2 Control Register [PIPE2CTR] <Address: 072H>
PIPE3 Control Register [PIPE3CTR] <Address: 074H>
PIPE4 Control Register [PIPE4CTR] <Address: 076H>

—	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0

Bit	Name	Function	R/W
15	BSTS	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible.	R
14	INBUFM	Transmit buffer monitor When the specified pipe is in the sending direction, this bit indicates the FIFO buffer status of the specified pipe. 0: The FIFO buffer does not contain data that can be sent. 1: The FIFO buffer contains data that can be sent.	R
13 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10	ATREPM	Automatic response mode This bit prohibits or enables automatic response of the specified pipe. 0: Automatic response prohibited 1: Automatic response enabled. (A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.)	R/W
9	ACLRM	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Prohibited 1: Enabled (all buffers are initialized)	R/W
8	SQCLR	Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Writing disabled 1: DATA0 specified	R(0)/W(1)
7	SQSET	Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0: Writing disabled 1: DATA1 specified	R(0)/W(1)
6	SQMON	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1	R

Bit	Name	Function	R/W
5	PBUSY	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.	R
4 to 2	—	Nothing is assigned to these bits. Fix these bits to 0.	
1, 0	PID	Response PID These bits specify the response method for the next transaction in the specified pipe. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response	R/W

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 33.14 BSTS Bit Operations

DIR bit Setting Value	BFRE bit Setting Value	DCLRM bit Setting Value	Meaning of the BSTS Bit
0	0	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
		1	Setting prohibited
	1	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished.
		1	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
1	0	0	This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

(2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.
When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)

When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA-PID).
This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)

When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.
If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.
Table 33.15 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.
Table 33.16 shows the cases that require this processing.

Table 33.15 Buffer Contents This Core Clears When the ACLRM Bit is Set

No.	Contents to be Cleared by Setting the ACLRM Bit
(1)	Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared)
(2)	If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared.

Table 33.16 Cases Requiring the ACLRM Bit to be Set

No.	Cases when Data Clear is Required
(1)	The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared.
(2)	The interval count value needs to be reset.
(3)	The value of the BFRE bit is changed.
(4)	The value of the DBLB bit is changed.
(5)	Forced termination of the transaction count function is performed.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.
If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.
Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.
If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggles this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.
Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.
The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF.
For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see Table 33.17.
If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits.
To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.
To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits.
To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 33.17 Core Operations Depending on the PID Setting

PID bit Setting Value	Transfer Type (TYPE Bit Setting Value)	Transfer Direction (DIR Bit Setting Value)	Operation of This Core
00 (NAK)	Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a NAK response for a token from the USB host.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	Does not respond to a token from the USB host.
		Sending direction ("DIR = 1")	Sends a zero-length packet for a token from the USB host.
01 (BUF)	Bulk ("TYPE = 01")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Interrupt ("TYPE = 10")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data.
		Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet.
10 (STALL) or 11 (STALL)	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a STALL response for a token from the USB host.
	Isochronous ("TYPE = 11")	Independent of the setting value	Does not respond to a token from the USB host.

33.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: 07AH>
PIPE7 Control Register [PIPE7CTR] <Address: 07CH>

4 to 2	—	Nothing is assigned to these bits. Fix these bits to 0.	
1, 0	PID	Response PID These bits specifies the response method for the next transaction in the specified pipe 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response	R/W

(1) Buffer status (BSTS) bit

See section 33.2.16.1, (2), Transmit buffer monitor (INBUFM) bit.

(2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.
Table 33.18 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.
Table 33.19 shows the cases that require this processing.

Table 33.18 Buffer Contents This Core Clears when the ACLRM Bit is Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	All contents of the FIFO buffer allocated to the selected pipe

Table 33.19 Cases Requiring the ACLRM Bit to be Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	When clearing contents of the FIFO buffer allocated to the selected pipe
(2)	When resetting the interval counter
(3)	When the value of the BFRE bit is changed
(4)	When the transaction count function is terminated forcibly

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.
If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit clear (SQCLR) bit

See section 33.2.16.1, (5), Sequence toggle bit clear (SQCLR) bit.

(4) Sequence toggle bit set (SQSET) bit

See section 33.2.16.1, (6), Sequence toggle bit set (SQSET) bit.

(5) Sequence toggle bit monitor (SQMON) bit

See section 33.2.16.1, (7), Sequence toggle bit monitor (SQMON) bit.

(6) Pipe busy (PBUSY) bit

See section 33.2.16.1, (8), Pipe busy (PBUSY) bit.

(7) Response PID (PID) bits

See section 33.2.16.1, (9), Response PID (PID) bits.

33.2.17 Transaction Counters (PIPExTRE)

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 10	Nothing is assigned to these bits. Fix these bits to 0.		
9	TRENB Transaction counter enable	This bit enables or disables the transaction counter. 0: Disables the transaction counter. 1: Enables the transaction counter.	R/W
8	TRCLR Transaction counter clear	This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit. 0: Invalid 1: Clears the current transaction counter.	R(0)/W(1)
7 to 0	Nothing is assigned to these bits. Fix these bits to 0.		

Note: * Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK.
If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

For the pipe in the sending direction, write 0 to this bit (TRENB bit).
When not using the transaction count function, write 0 to this bit.
When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

33.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: 092H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRNCNT															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 0	TRNCNT	When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0. Indicates the number of the currently counted transaction if TRENB is 1.	R/W

(1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in section 33.2.17.1 Transaction counter enable (TRENB) bit.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

(a) The TRENB bit is 1.

(b) A short packet has been received.

(3) The following condition is met:
(a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits).
When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.
If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.
If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

33.2.18 Low Power Control Register

33.2.18.1 Low Power Control Register [LPCTRL] <Address: 100H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	HWUPM	—	—	—	—	—	—	—
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 8	Reserved	Nothing is assigned to these bits. Fix these bits to 0.	
7	HWUPM	0: Resumes the PHY from the low-power mode while the internal bus clock (Bφ) is operating. 1: Enables resume from the low-power mode while the internal bus clock (Bφ) is stopped.	R/W
6 to 0		Nothing is assigned to these bits. Fix these bits to 0.	

(1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (Bφ) is stopped.

0: Disables resumption while the internal bus clock (Bφ) is stopped.
1: Enables resumption while the internal bus clock (Bφ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (Bφ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (Bφ) is stopped, set both this bit and the L1EXTMD bit.

33.2.19 Low Power Status Register

33.2.19.1 Low Power Status Register [LPSTS] <Address: 102H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	—	Nothing is assigned to this bit. Fix this bit to 0.	
14	SUSPM	USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0: USBPHY suspend mode 1: USBPHY normal mode	R/W
13 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

(1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in Table 33.20.

Table 33.20 Registers That Allow Writing when the SUSPM Bit is 0

Address	Register Name
000H	SYSCFG0
002H	BUSWAIT
100H	LPCTRL
102H	SUSPMODE

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).
When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

33.2.20 PHY Function Control Register

33.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: 104H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	SusMon	—	—	—	—	—	—	—	—	—	—	—	—	—	—
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	—	Nothing is assigned to this bit. Fix this bit to 0.	
14	SusMon	This bit allows reading of the status of the Suspend M signal.	R
13 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

(1) SusMon

SuspendM monitor bit (read only)

The status of the Suspend M signal can be read.

33.2.21 PHY_OTG Control Register (PHYOTGCTR)

33.2.21.1 PHY_OTG Control Register [PHYOTGCTR] <Address: 10AH>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	DmPuDwn	DpPuDwn	—	—	—	—	—	—	—	—	—
0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 11	—	Nothing is assigned to these bits. Fix these bits to 0.	
10	DmPuDwn	Dm Pulldown monitor bit	R
9	DpPuDwn	Dp Pulldown monitor bit	R
8 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

(1) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.

1: 15-kΩ Pulldown resistor control on the DM side is enabled.

(2) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.

1: 15-kΩ Pulldown resistor control on the DP side is enabled.

33.2.22 Peripheral L1 Control Register 1 (PL1CTRL)

33.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: 144H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	L1EXTMD	—	—	HIRDTHR[3:0]				DVSQ[3:0]				L1NEGOMD	L1RESPMD[1:0]		L1RESPEN
0	0	0	0	0				0	0	0	0	0	0	0	0
—	—	—	—	—				—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15	—	Nothing is assigned to this bit. Fix this bit to 0.	
14	L1EXTMD	USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0: Does not set the Suspend M bit when the Host K signal is received. 1: Sets the Suspend M bit when the Host K signal is received	R/W
13, 12	—	Nothing is assigned to these bits. Fix these bits to 0.	
11 to 8	HIRDTHR[3:0]	L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register.	R/W
7	DVSQ[3]	DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 4'b 0000: Powered state 4'b 0001: Default state 4'b 0010: Address state 4'b 0011: Configured state 4'b 01xx: Suspended state 4'b 10xx: L1 state	R
6 to 4	DVSQ[2:0]	These bits mirror the DVSQ[2:0] bits in INTSTS0.	R
3	L1NEGOMD	L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 2'b11.	R/W
2, 1	L1RESPMD[1:0]	L1 response mode These bits specify how to respond to an LPM token. 2'b 00: NYET 2'b 01: ACK 2'b 10: STALL 2'b 11: Response according to the value of the L1NEGOMD bit	R/W
0	L1RESPEN	L1 response enable This bit enables an L1 response. 0: Does not support LPM. 1: Supports LPM.	R/W

(1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

Note 1. The Host K period lasts a minimum of 50 µs. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
Note 2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
Note 3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.
The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.
4’b 0000: Powered state
4’b 0001: Default state
4’b 0010: Address state
4’b 0011: Configured state
4’b 01xx: Suspended state
4’b 10xx: L1 state

(4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.
0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.
1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 2'b11.

(6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.
2’b00: NYET
2’b01: ACK
2’b10: STALL
2’b11: Response according to the value of L1NEGOMD bit

(7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

33.2.23 Peripheral L1 Control Register 2

33.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: 146H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	RWE MON	HIRDMON[3:0]				—	—	—	—	—	—	—	—

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
15 to 13	—	Nothing is assigned to these bits. Fix these bits to 0.	
12	RWEMON	This bit reflects the value of the RWE bit in the LPM token received last.	R/W
11 to 8	HIRDMON [3:0]	These bits reflect the value of the HIRD field in the LPM token received last.	R/W
7 to 0	—	Nothing is assigned to these bits. Fix these bits to 0.	

(1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.
This bit reflects the value of the RWE bit in the LPM token received last.

(2) HIRD value monitor (HIRDMON) bits

These bits are referenced to monitor the value of the HIRD field in a received LPM token.
These bits reflect the value of the HIRD field in the LPM token received last.

33.3 Next Register Set

33.3.1 Next Source Address Register n

33.3.1.1 Next0 Source Address Register ch0 [N0SA_0] <Address: 400H>
Next1 Source Address Register ch0 [N1SA_0] <Address: 40CH>
Next0 Source Address Register ch1 [N0SA_1] <Address: 440H>

CRSA															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	CRSA	Current Source Address Register This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1, the value of this register is undefined.) The initial value of this register is loaded from the following register: In register mode: A transfer source address is loaded from the Next0/1 Register Set. In link mode: A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.) The value of this register is incremented when a read transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)	R

33.4.2 Current Destination Address Register

33.4.2.1 Current Destination Address Register ch0 [CRDA_0] <Address: 41CH>
Current Destination Address Register ch1 [CRDA_1] <Address: 45CH>

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 24	DNUM	Data Number These bits indicate the amount of valid data in the buffer. The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte) Incrementing condition: - A DMA read transfer ends. Decrementing condition: - A DMA write transfer ends. Clearing conditions: - A condition for clearing the EN bit is met. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
23 to 19	—	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.	
18	SWPRQ	Sweep Request This bit indicates the state of sweep request. This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register). 1: The sweep request signal has been asserted. 0: The sweep request signal has not been asserted. Setting condition: - The SETSSWPRQ bit in the CHCTRL_n register is asserted. Clearing conditions: - The buffer becomes empty because of sweep. - "1" is written to the CLRHSWPRQM bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
17	DMARQM	DMAREQ Mask This bit indicates the state of temporary masking of the DMA transfer request from the USB control. 1: The request is temporarily masked. 0: The request is released from temporary masking. Setting condition: - The SETDMARQM bit in the CHCTRL_n register is set. Clearing conditions: - "1" is written to the CLRDMARQM bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R

Bit	Name	Function	R/W
16	INTM	Interrupt Mask This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt. 1: The output is temporarily masked. 0: The output is released from temporary masking. Setting condition: - "1" is written to the SETINTM bit in the CHCTRL_n register. Clearing conditions: - "1" is written to the CLRINTM bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
15 to 12	—	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.	
11	MODE	DMA Mode This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode	R
10	DER	Descriptor Error This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register). 0: No descriptor error has occurred. 1: A descriptor error has occurred. Setting condition: - In link mode, when the DRRP bit in the CHCFG_n register is 0, the LV bit value read from the descriptor is 0. Clearing conditions: - "1" is written to the CLRDER bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
9	DW	Descriptor WriteBack This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1. 0: Status other than write-back to the header in link mode 1: (When the ER bit in the CHSTAT_n register is 0) Data is being written back to the header in link mode. (When the ER bit in the CHSTAT_n register is 1) A bus error has occurred during write-back to the header in link mode. Setting condition: - Write-back to the header is started in link mode. Clearing conditions: - Write-back to the header in link mode ends with an OK response. - "1" is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.	R
8	DL	Descriptor Load This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1. 0: Status other than descriptor reading 1: (When the ER bit is 0) Descriptor reading is in process in link mode. (When the ER bit is 1) A bus error has occurred during descriptor reading in link mode. Setting condition: - Descriptor reading is started in link mode. Clearing conditions: - Descriptor reading in link mode ends with an OK response. - "1" is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.	R

Bit	Name	Function	R/W
7	SR	Selected Register Set In register mode, this bit indicates the register set that is selected. 0: Next0 Register Set 1: Next1 Register Set Setting condition: - The RSEL bit in the CHCFG_n register is set. Clearing condition: - The RSEL bit in the CHCFG_n register is cleared.	R
6	TC	Terminal Count This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: - In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends. - In link mode, when the WBD bit in the header of the descriptor is 1, transfer of the total number of transfer bytes specified in the CRTB bits ends. - In link mode, when the WBD bit in the header of the descriptor is 0, write-back to the descriptor ends. Clearing conditions: - "1" is written to the CLRTC bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
5	END	USBFDMAmn Interrupted This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: - The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0. - In link mode, when the descriptor is read, the LV bit in the header is 0, and the DRRP and DIM bits in the CHCFG_n register are 0. Clearing conditions: - "1" is written to the CLREND bit in the CHCTRL_n register. - "1" is written to the SWRST bit in the CHCTRL_n register.	R
4	ER	Error This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer. 0: No error response has been received. 1: An error response has been received. Setting condition: - An error response is received in a bus cycle. Clearing condition: - "1" is written to the SWRST bit in the CHCTRL_n register.	R
3	SUS	Suspend This bit indicates whether the channel is suspended. For details, see section 33.9.13.8, (2), Suspension 0: Channel_n is not suspended. 1: Channel_n is suspended. Setting condition: - "1" is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended. Clearing conditions: - "1" is written to the CLRSUS bit in the CHCTRL_n register. - "1" is written to the CLREN bit in the CHCTRL_n register. - A condition for clearing the EN bit in the CHSTAT_n register.	R

Bit	Name	Function	R/W
2	TACT	Transaction Active This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see section 33.9.13.8, Transfer state. 0: The DMA in channel_n is stopped. 1: The DMA in channel_n is operating. Setting condition: - "1" is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). Clearing condition: - The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended).	R
1	RQST	Request This bit indicates whether a transfer request has been received. 0: No DMA transfer request has been received. 1: A DMA transfer request has been received. Setting conditions: - "1" is written to the STG bit in the CHCTRL_n register. - A DMA transfer request is received from the USB control. Clearing conditions: - "1" is written to the SWRST bit in the CHCTRL_n register. - "1" is written to the CLRRQ bit in the CHCTRL_n register. - In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register - In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0). - In link mode, the DMA transfer of the last descriptor (LE = 1) ends. - In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). - In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends. - The master interface receives a bus error signal.	R
0	EN	Enable This bit indicates whether the operation of DMA channel n is enabled or stopped. 0: Operation is stopped. 1: Operation is enabled. Setting conditions: - "1" is written to the SETEN bit in the CHCTRL_n register. Clearing conditions: - "1" is written to the SWRST bit in the CHCTRL_n register. - "1" is written to the CLREN bit in the CHCTRL_n register. - An error response is received during transfer. - In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0). - In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write-back to the descriptor ends). - In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0).	R

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.
Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see section 33.9.13.8, (3), Transfer suspension.)
Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.
Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

33.5.2 Channel Control Register n

33.5.2.1 Channel Control Register ch0 [CHCTRL_0] <Address: 428H>
Channel Control Register ch1 [CHCTRL_1] <Address: 468H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 20	—	Reserved area. Write 0 to these bits. When these bits are read, 0 is read	
19	CLRDMARQM	Clear DMAREQ Mask Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0: Has no effect on operation.	R/W
18	SETDMARQM	SET DMAREQ Mask Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the DMA transfer requests from the USB control. 0: Has no effect on operation.	R/W
17	CLRINTM	Clear Interrupt Mask Writing 1 to this bit releases the USBFDMAmn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.) When this bit is read, 0 is read. 1: Releases the pin output from masking set by using the SETINTM bit. 0: Has no effect on operation.	R/W
16	SETINTM	SETINTMSet Interrupt Mask Writing 1 to this bit temporarily masks the USBFDMAmn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the USBFDMAmn interrupt. 0: Has no effect on operation.	R/W
15	—	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.	
14	SETSSWPRQ	Set Software Sweep Request Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see section 33.9.13.3, (1), Forced software sweeping request). When this bit is read, 0 is read. 1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used.	R/W
13	—	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.	

Bit	Name	Function	R/W
12	SETREN	Set Register Set Enable Writing 1 to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0 is read. 1: Sets the REN bit in the CHCFG_n register. 0: Has no effect on operation.	R/W
11, 10	—	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.	
9	CLRSUS	Clear Suspend Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state. When this bit is read, 0 is read. 1: Releases the ongoing DMA transfer from the suspended state. 0: Has no effect on operation.	R/W
8	SETSUS	Set Suspend Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer. When this bit is read, 0 is read. 1: Suspends the ongoing DMA transfer. 0: Has no effect on operation.	R/W
7	CLRDER	Clear DER Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the DER bit. 0: Has no effect on operation.	R/W
6	CLRTC	Clear TC Writing 1 to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the TC bit. 0: Has no effect on operation.	R/W
5	CLREND	Clear End Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the END bit. 0: Has no effect on operation.	R/W
4	CLRRQ	Clear Request Writing 1 to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the RQST bit in the CHSTAT_n register. 0: Has no effect on operation.	R/W
3	SWRST	Software Reset Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0. When this bit is read, 0 is read. 1: Clears individual bits in the CHSTAT_n register. 0: Has no effect on operation.	R/W
2	STG	Software Trigger Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0 is read. 1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0: Has no effect on operation.	R/W
1	CLREN	Clear Enable Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see 4.13.8.3). When this bit is read, 0 is read. 1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0: Has no effect on operation.	R/W
0	SETEN	Set Enable Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0 is read. 1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0: Has no effect on operation.	R/W

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

33.5.3 Channel Configuration Register

33.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: 42CH> Channel Configuration Register ch1 [CHCFG_1] <Address: 46CH>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31	DMS	DMA Mode Select This bit specifies the DMA mode to be used. 0: Register mode (default) 1: Link mode	R/W
30	REN	Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0: Does not perform the DMA transaction successively. 1: Performs the DMA transaction successively. Setting conditions: - "1" is written to this bit. - "1" is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: - "0" is written to this bit. - The REN bit is 1, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend you to use the SETREN bit in the CHCTRL_n register.	R/W
29	RSW	Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1: Inverts the RSEL bit after a DMA transaction ends.	R/W
28	RSEL	Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0: Uses the Next0 Register Set. (Default) 1: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set.	R/W
27	SBE	Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0. 0: Stops transfer without sweeping out the buffer. (Default) 1: Stops transfer after sweeping out the buffer.	R/W
26	DIM	Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Mask the USBFDMAmn interrupt.	R/W

Bit	Name	Function	R/W
25	TCM	DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0: Does not mask the DMATC signal. (Default) 1: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set.	R/W
24	DEM	USBFDMAmn Mask When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set.	R/W
23	WONLY	Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see section 33.9.12.2, Write only mode). 0: Normal operation (default) 1: Write-only mode	R/W
22	—	Nothing is assigned to this bit. Fix this bit to 0.	
21	DAD	Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.	R/W
20	SAD	Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.	R/W
19 to 16	DDS[3:0]	Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see Table 33.21.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited	R/W

Bit	Name	Function	R/W
15 to 12	SDS[3:0]	Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see Table 33.29.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited	R/W
11	DRRP	Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See section 33.9.12.2, (a), Operation flow of link mode.) 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register.	R/W
10 to 7	—	Nothing is assigned to these bits. Fix these bits to 0.	
6, 5	—	Nothing is assigned to these bits. Fix these bits to 1.	
4	—	Nothing is assigned to this bit. Fix this bit to 0.	
3	REQD	Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0: The USB control is on the transfer source side. (Default) 1: The USB control is on the transfer destination side.	R/W
2, 1	—	Nothing is assigned to these bits. Fix these bits to 0.	
0	SEL	Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0: D0FIFO 1: D1FIFO	R/W

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 33.21 Range of Sizes That Can Be Specified in SDS and DDS Bits

Transfer Address	REQD	SDS[2:0]	DDS[2:0]
Beat aligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)
	1	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.
Beat unaligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)
	1	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

33.5.4 Channel Interval Register n

For details, see section 33.9.13.6, Interval Count Function.

33.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: 430H>
Channel Interval Register ch1 [CHITVL_1] <Address: 470H>

Bit	Name	Function	R/W
31 to 12	—	Nothing is assigned to these bits. Fix these bits to 0.	
11 to 8	DPR	Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is 0H.	R/W
7 to 4	—	Nothing is assigned to these bits. Fix these bits to 0.	R/W
3 to 0	SPR	Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is 0H.	R/W

33.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

33.6.1 Next Link Address Register n (NXLA_n)

33.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: 438H>
Next Link Address Register ch1 [NXLA_1] <Address: 478H>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRLA															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	CRLA	Current Link Address These bits indicate the address of the descriptor being used for current transaction.	R

33.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

33.7.1 Source Continuous Register n

33.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: 600H>
Source Continuous Register ch1 [SCNT_1] <Address: 620H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SCNT															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SCNT															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	SCNT	Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte)	R/W

Note: This register is used in pair with the SSKP_n register (see Figure 33.3). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

33.7.2 Source Skip Register n

33.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: 604H>
Source Skip Register ch1 [SSKP_1] <Address: 624H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SSKP															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SSKP															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	SSKP	Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte)	R/W

Note: This register is used in pair with the SCNT_n register (see Figure 33.3). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).

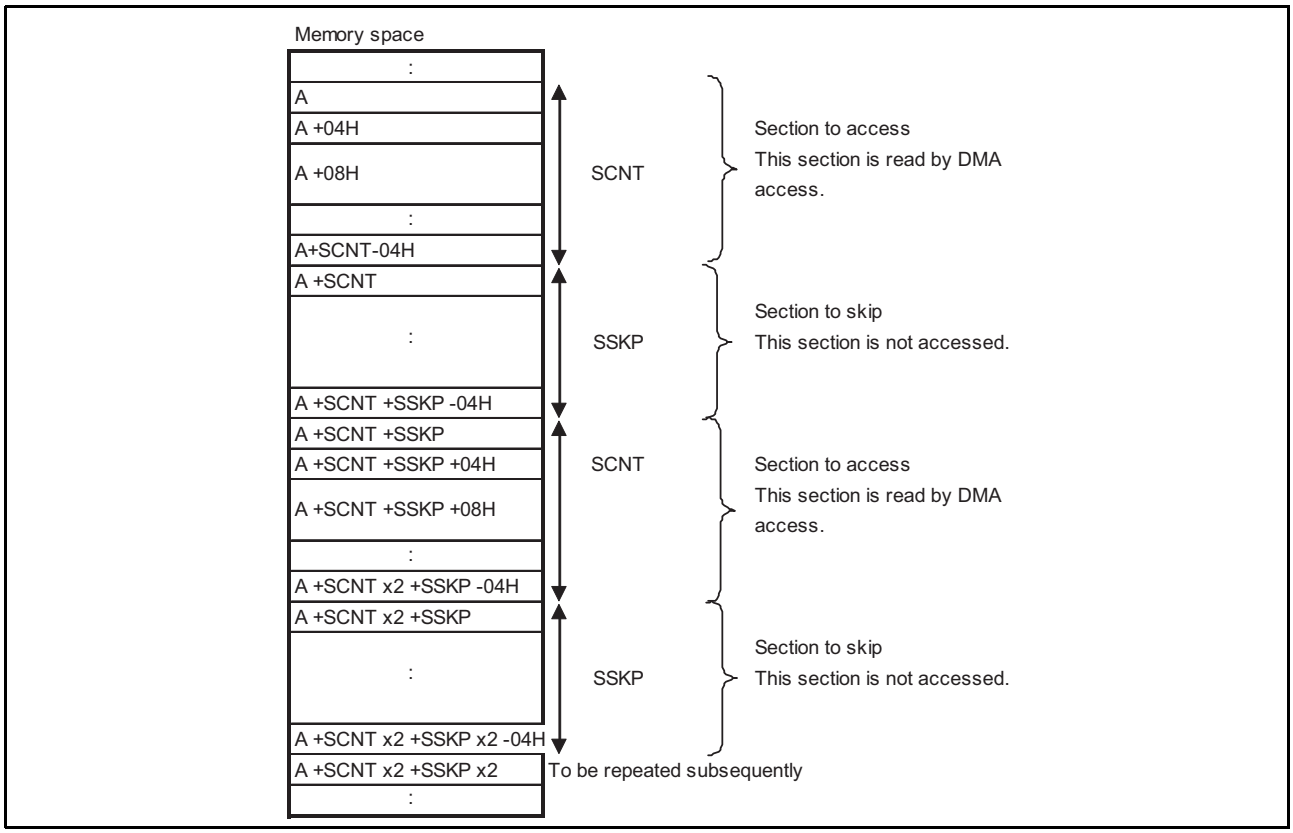

Figure 33.3 Relationship between SSKP and SCNT

You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see section 33.9.14.1, (1), Read access).

33.7.3 Destination Continuous Register n

33.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: 608H>
Destination Continuous Register ch1 [DCNT_1] <Address: 628H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DCNT															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCNT															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	DCNT	Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte)	R/W

Note: This register is used in pair with the DSKP_n register (see Figure 33.4). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

33.7.4 Destination Skip Register n

33.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: 60CH>
Destination Skip Register ch1 [DSKP_1] <Address: 62CH>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSKP															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DSKP															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 0	DSKP	Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte)	R/W

Note: This register is used in pair with the DCNT_n register (see Figure 33.4). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

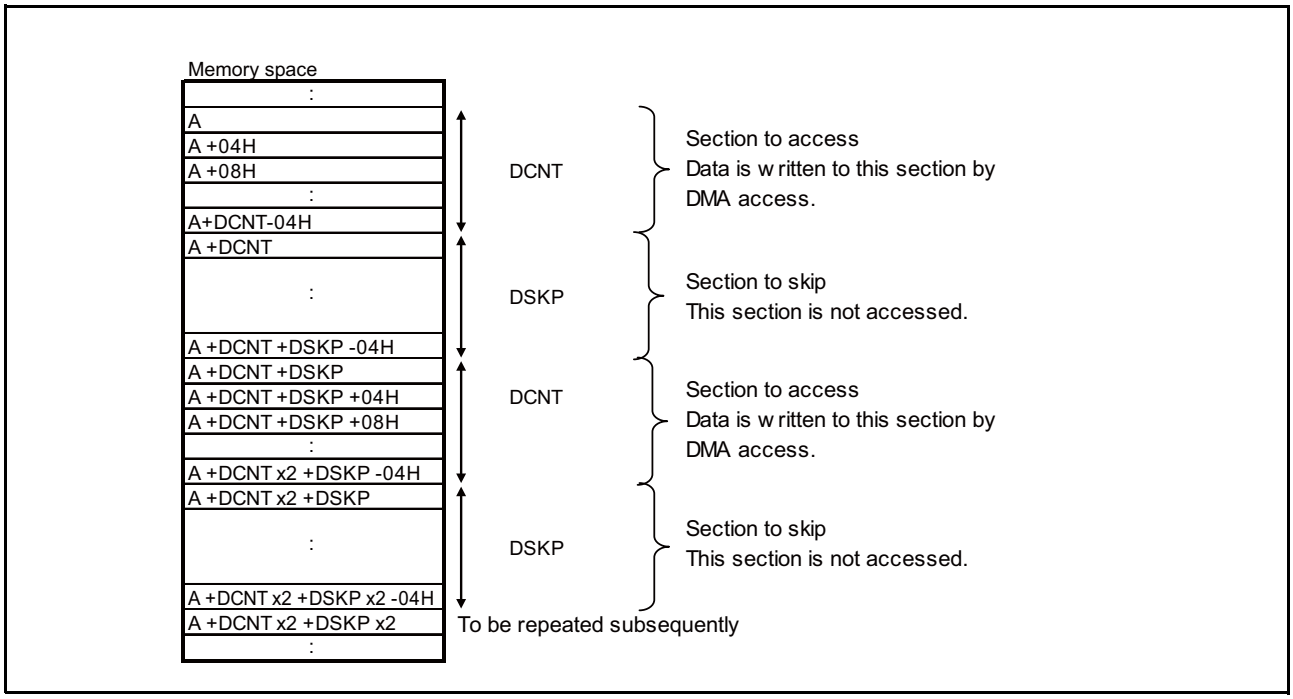

Figure 33.4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see section 33.9.14.1, (1), Read access).

33.8 DMA Register Set

The registers described below are shared by all channels.

33.8.1 DMA Control Register

33.8.1.1 DMA Control Register [DCTRL] <Address: 700H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
—				LWPR				—				LDPR			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—														LVINT	PR

—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 28	—	Nothing is assigned to these bits. Fix these bits to 0.	
27 to 24	LWPR	Link WriteBack PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode.	R/W
23 to 20		Nothing is assigned to these bits. Fix these bits to 0.	
19 to 16	LDPR	Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode.	R/W
15 to 2	—	Nothing is assigned to these bits. Fix these bits to 0.	
1	LVINT	Level Interrupt To use this module, be sure to set this bit to 1.	R/W
0	PR	Priority This bit specifies the transfer priority control mode (see section 33.9.13.2, DMA channel priority control). 0: Fixed priority mode 1: Round-robin mode	R/W

33.8.2 Descriptor Interval Register n

33.8.2.1 Descriptor Interval Register [DSCITVL] <Address: 704H>

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
—															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

—														TC1	TC0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Name	Function	R/W
31 to 2	—	Nothing is assigned to these bits. Fix these bits to 0.	
1	SUS1	This bit indicates the state of the SUS bit for DMA channel 1.	R
0	SUS0	This bit indicates the state of the SUS bit for DMA channel 0.	R

33.9 Functions

33.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.
For the parts of the sequence that are required in both host and peripheral modes, see section 32.9.1, Host/Peripheral Common Setting Sequence.

33.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.
Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

33.9.2 Interrupt Function

33.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as USBFIm (m = 0, 1). Check the status register to identify the interrupt factor.

Table 33.22 List of Interrupt functions

Bit	Interrupt name	Interrupt factor	Related status
VBINT	VBUS interrupt	The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.)	VBSTS
RESM	Resume interrupt	In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0).	—
SOFR	Frame number update interrupt	If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption.	—
DVST	Device state transition interrupt	A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received	DVSQ
CTRT	Control transfer stage transition interrupt	A transition of a control transfer stage is detected. Setup stage completed ControlWrite transfer status stage transition ControlRead transfer status stage transition Control transfer completed Control transfer sequence error	CTSQ
BEMP	Buffer empty interrupt	All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received.	PIPEBEMP
NRDY	Buffer not ready interrupt	A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer.	PIPENRDY
BRDY	Buffer ready interrupt	The buffer becomes ready (available for reading or writing data).	PIPEBRDY

The following shows the relationship between interrupts of this module.

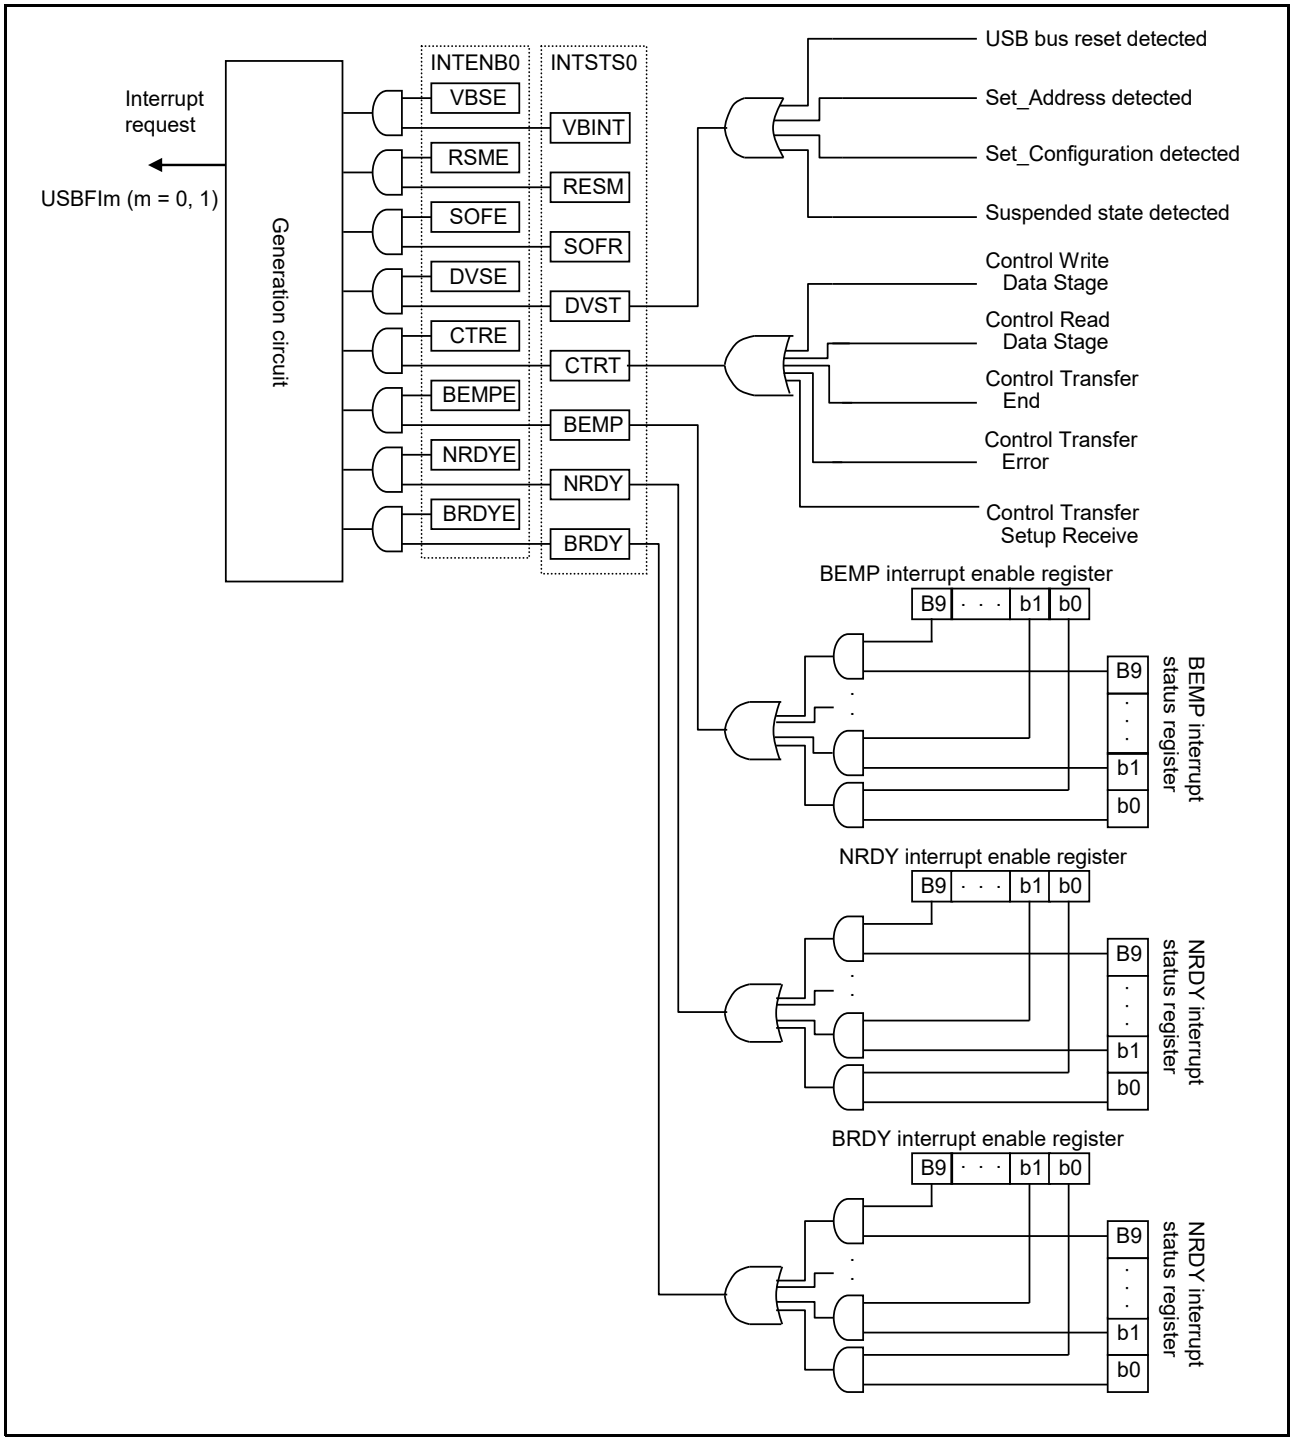

Figure 33.5 Interrupt Association Diagram

33.9.2.2 Device State Transition Interrupts

Figure 33.6 shows the device state transition diagram of this module.
This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.
To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.

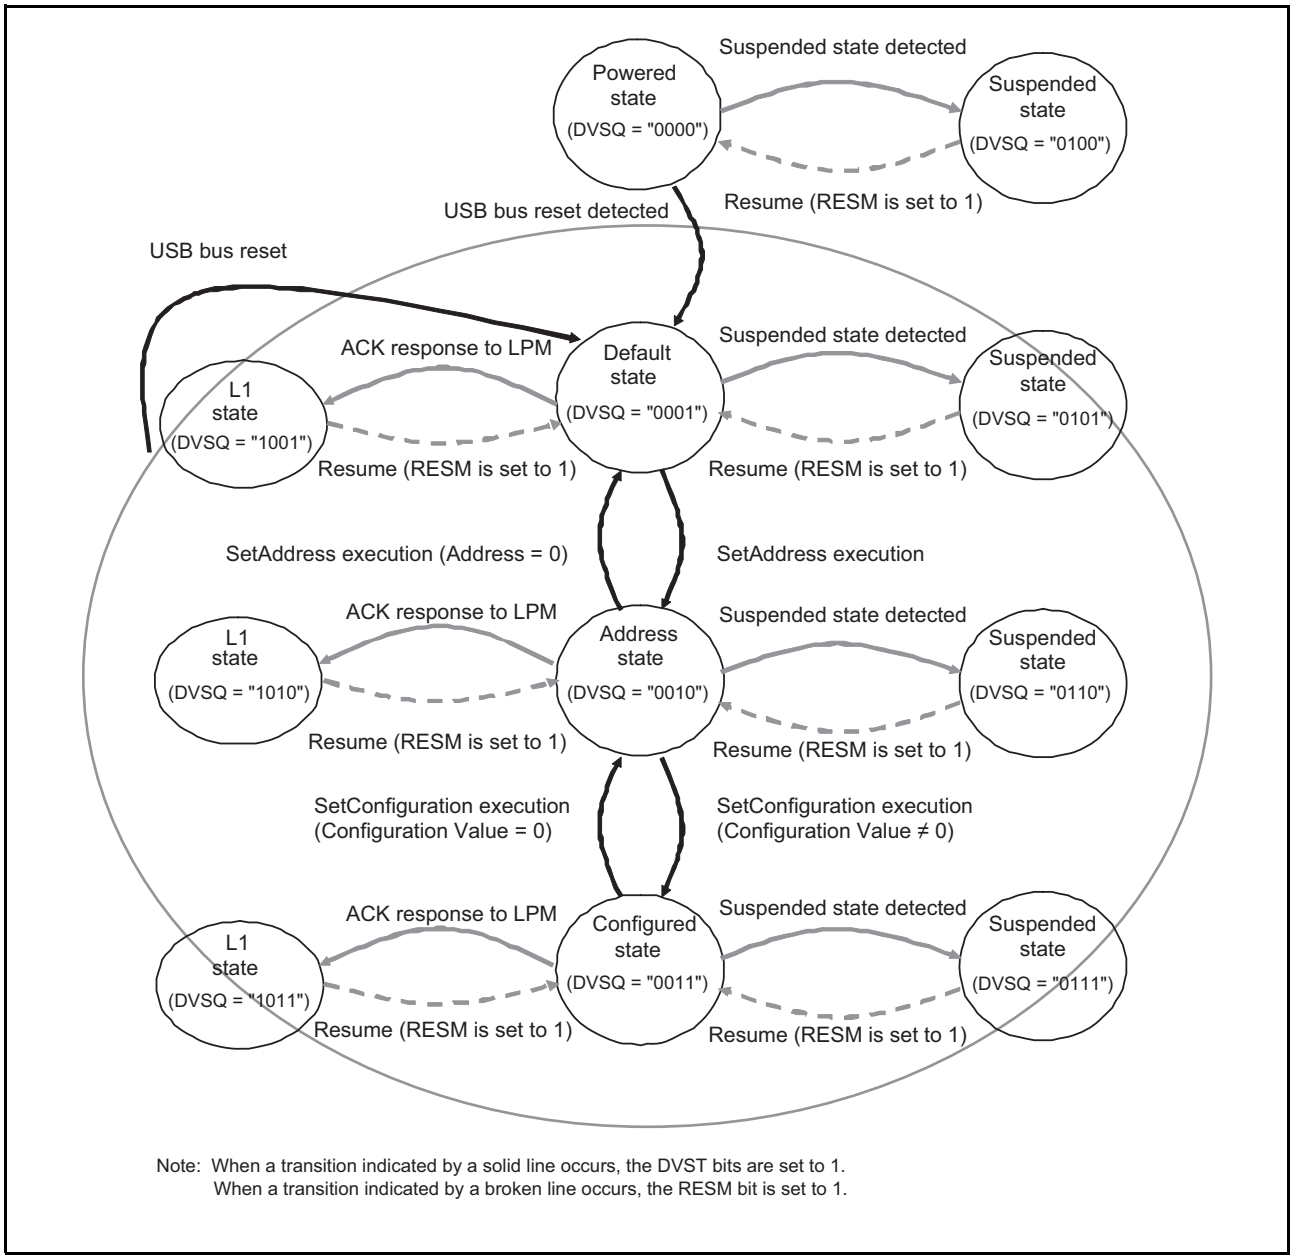

Figure 33.6 Device State Transition Diagram

33.9.2.3 Control Transfer Stage Transition Interrupts

Figure 33.7 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer.
If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(1) For Control Read transfer

(a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.
(b) An IN token is received in the status stage.
(c) A data packet "DATAPID = DATA0" is received in the status stage.

(2) For Control Write transfer

(a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.
(b) The first data packet ”DATAPID = DATA0” is received in the data stage.
(c) An OUT or PING token is received in the status stage.

(3) For Nodata Control transfer

(a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.
Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)

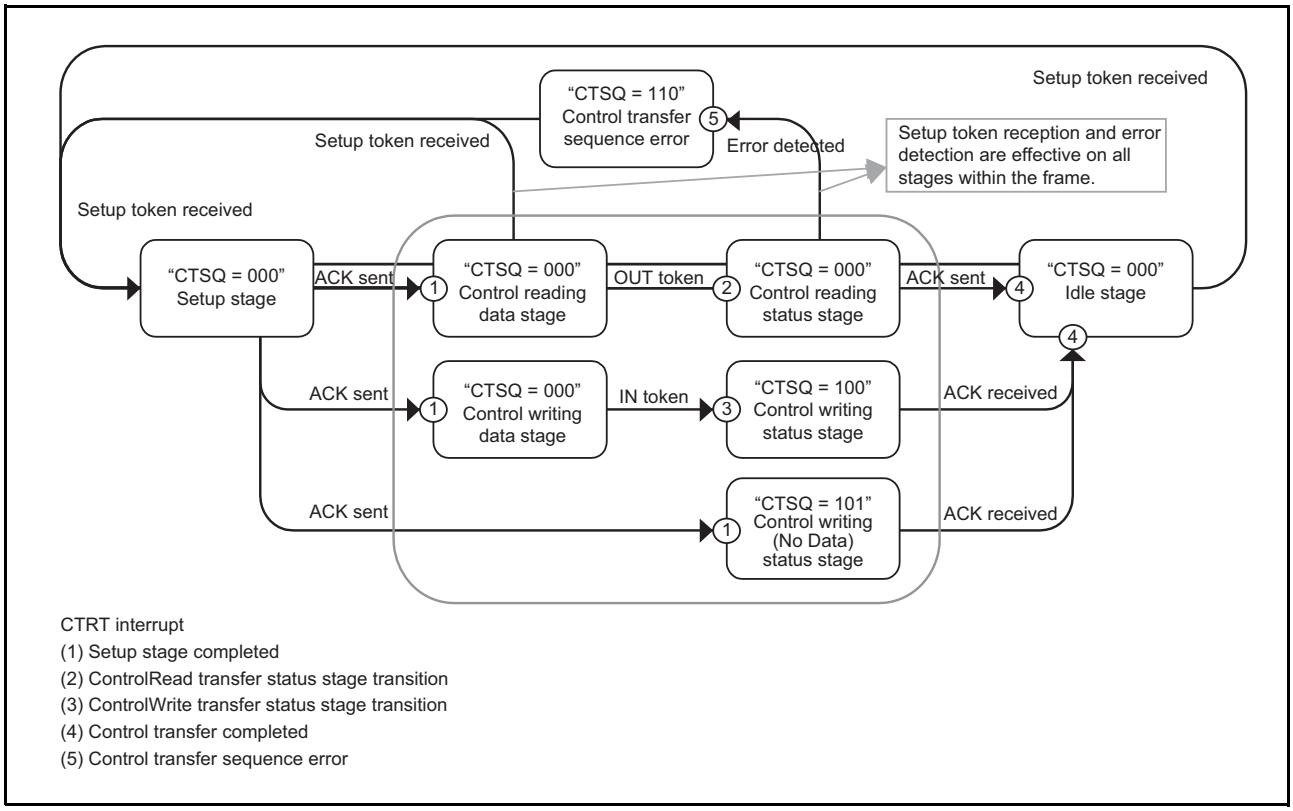

Figure 33.7 Control Transfer Stage Transition Diagram

33.9.2.4 Interrupts Relating to DMA Master

Table 33.23 List of Interrupts

Interrupt Name	Interrupt Type
USBFDMAmn (m, n = 0, 1)	A DMA transaction ends.
	An invalid descriptor is read in link mode.
USBFDMAERRm (m = 0, 1)	An error response is returned for a transfer issued by the master interface.

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

- USBFDMAmn interrupt (m, n = 0, 1)

This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

- USBFDMAERRm interrupt

This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.
Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.
On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

33.9.3 Pipe Control

Table 33.24 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 33.24 PIPE Settings

Register Name	Bit Name	Setting	Comment
DCPCFG PIPECFG	TYPE	Specifies the transfer type.	Pipes 1 to 15: Settable
	BFRE	Selects BRDY interrupt mode.	Pipes 1 to 5, 11 to 15: Settable
	DBLB	Selects double-buffer configuration.	Pipes 1 to 5, 11 to 15: Settable Pipes 9, 10: Settable only in bulk transfers
	CNTMD	Selects continuous transfer or non-continuous transfer.	DCP: Settable Pipes 1, 2, 9, 10: Settable only in bulk transfers Pipes 3 to 5, 11 to 15: Settable
	DIR	Selects transfer direction.	Settable to IN or OUT
	EPNUM	Endpoint number	Pipes 1 to 15: Settable Set to a value other than "0000" when a pipe is in use.
	SHTNAK	Disables pipes when transfer is completed.	DCP: Settable Pipes 1, 2, 9, 10: Settable only in bulk transfers Pipes 3 to 5, 11 to 15: Settable
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5, 9 to 15: Settable (up to 2 Kbytes specifiable) Pipes 6 to 8: Unsettable (fixed to 64 bytes)
	BUFNMB	Buffer memory number	DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5, 9 to 15: Settable (area 7 to 7F hex specifiable) Pipes 6 to 8: Unsettable (fixed to area 4 to 6 hex)
DCPMAXP PIPEMAXP	MXPS	Maximum packet size	Setting conforming to the USB specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 15: Unsettable
	IITV	Interval counter	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 15: Unsettable
DCPCTR PIPExCTR	BSTS	Buffer status	DCP state switched between receive and transmit buffer by ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 3 to 5, 9 to 15
	ACLRM	Auto buffer clear	Pipes 1 to 15: Settable
	SQCLR	Sequence clear	Clears data toggle bit.
	SQSET	Sequence set	Sets data toggle bit.
	SQMON	Sequence monitor	Monitors data toggle bit.
	PBUSY	Pipe busy monitor	
	PID	Response PID	
DCPCTR PIPExCTR	ATREPM	Auto response mode	Pipes 1 to 5, 9 to 15: Settable
PIPExTRE	TRENB	Transaction count enable	Pipes 1 to 5, 9 to 15: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5, 9 to 15: Settable
PIPExTRN	TRNCNT	Transaction counter	Pipes 1 to 5, 9 to 15: Settable

33.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting "PID = BUF").

DCP: Set 64 for high-speed operation.
DCP: Set 8, 16, 32, or 64 for full-speed operation.
Pipes 1 to 5: Set 512 for high-speed bulk transfer.
Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.
Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.
Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.
Pipes 6 to 8: Set 64.

Pipe 9:
- For interrupt transfer, set a value from 1 to 64.
- For high-speed bulk transfer, set 512.
- For full-speed bulk transfer, set 8, 16, 32, or 64.

Pipe 10:
- For interrupt transfer, set a value from 1 to 64.
- For high-speed bulk transfer, set 512.
- For full-speed bulk transfer, set 8, 16, 32, or 64.

Pipes 11 to 15:
- For high-speed bulk transfer, set 512.
- For full-speed bulk transfer, set 8, 16, 32, or 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

33.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

- Response PID setting

The response PID specifies the response to a transaction from the host.
(a) NAK: Always sends a NAK response to a generated transaction.
(b) BUF: Responds to a transaction in accordance with the buffer memory state.
(c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result.
This module writes data to the PID bits in the following cases:

(a) NAK:
(A) The SETUP token is received normally (for the DCP only).
(B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.
(C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

(b) BUF:
This module does not write "BUF".

(c) STALL:
(A) When a maximum packet size over error is detected in a received data packet
(B) When a control transfer sequence error is detected

33.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK). Figure 33.8 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

- All bits in the DCPCFG and DCPMAXP registers
- SQCLR and SQSET bits in the DCPCTR register
- All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers
- ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register
- All bits in the PIPExTRE and PIPExTRN registers

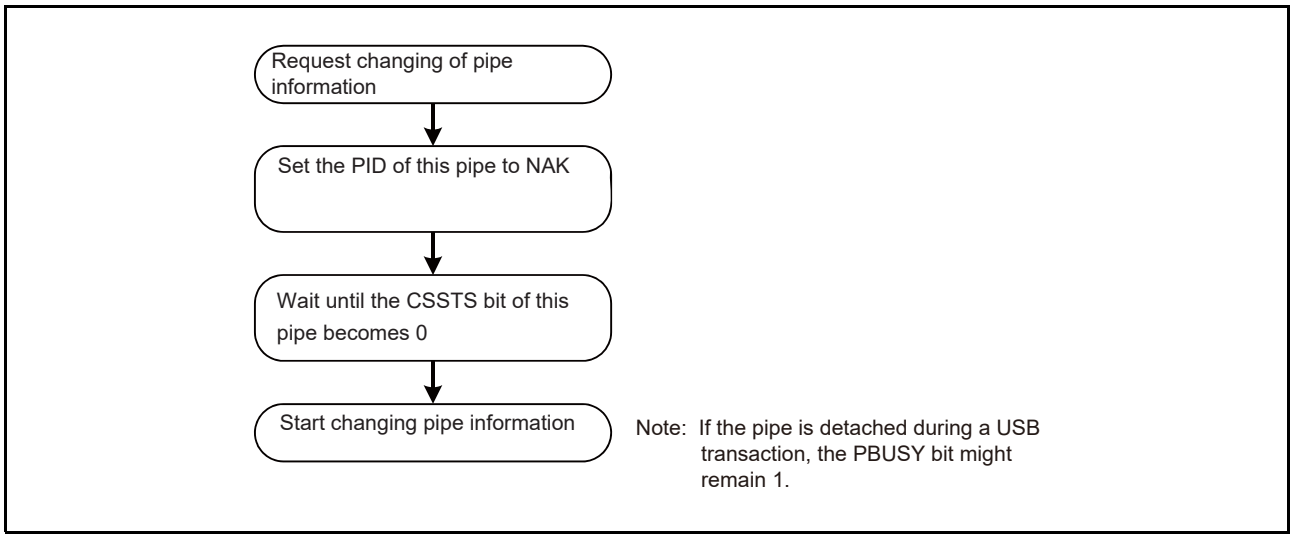

Figure 33.8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

- All bits in the DCPCFG and DCPMAXP registers
- All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers
- ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

33.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with "PID = DATA1" without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

33.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

33.9.4.1 FIFO buffer allocation

Figure 33.9 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.

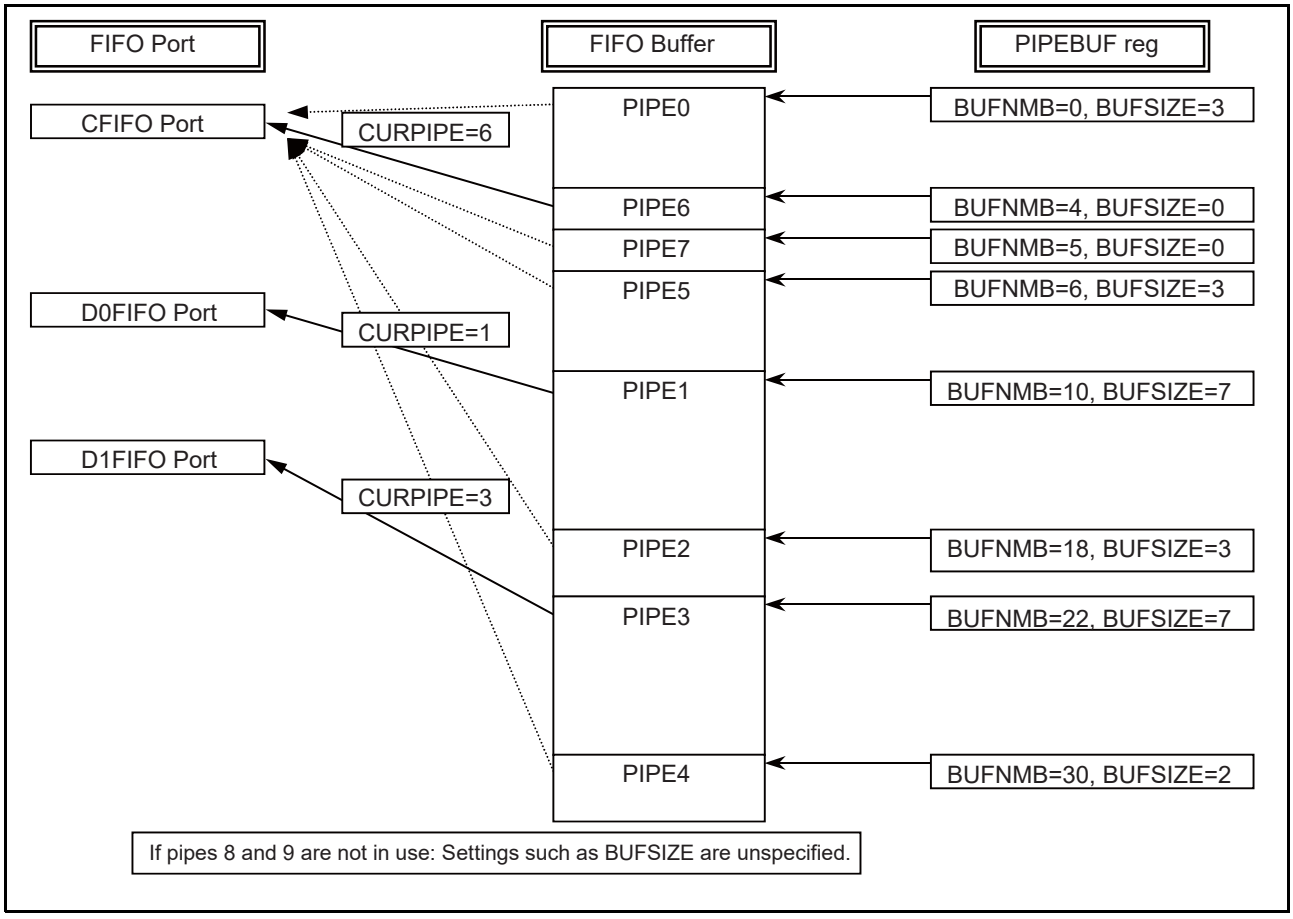

Figure 33.9 Example of FIFO Buffer Memory Mapping

33.9.4.2 Clearing FIFO buffers

Table 33.25 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 33.25 List of FIFO Buffer Clearing Modes

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR register DxFIFOCTR register	DxFIFOSEL register	PIPExCTR register
Function	The FIFO buffer on the CPU side is cleared.	The FIFO buffer is automatically cleared after the data is read from the specified pipe.	The buffer is automatically cleared to discard all the received packets.
Clearing method	Write "1" to clear.	1: Mode enabled 0: Mode disabled	1: Mode enabled 0: Mode disabled

33.9.5 FIFO Port Functions

This section describes FIFO port functions. Table 33.26 shows the FIFO port function settings for this module.
If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/DxFIFOCTR register must be used to set write end.
To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.
When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.
The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 33.26 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DxFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Rewinds buffer memory (re-read, re-write)	
	DCLRM	Reads received data of the specified pipe, and then automatically clears the received data	DxFIFO only
	DREQE	Asserts DREQ signal	DxFIFO only
	MBW	Specifies FIFO port access bit width	
	BIGEND	Selects FIFO port endian	CFIFO only
	ISEL	Specifies FIFO port access direction	DCP only
	CURPIPE	Selects current pipe	
C/DxFIFOCTR	BVAL	Finishes buffer memory write	
	BCLR	Clears CPU-side buffer memory	
	FRDY	Monitors FIFO port ready	
	DTLN	Confirms received data length	

33.9.5.1 FIFO port selection

Table 33.27 lists pipes that can be selected for each FIFO port.
Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 33.10 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 33.27 FIFO Port Access for Each Pipe

Pipe	Access Method	Usable Port
DCP	CPU access	CFIFO port register
Pipes 1 to 15	CPU access	CFIFO port register
	DMA access	DxFIFO port register

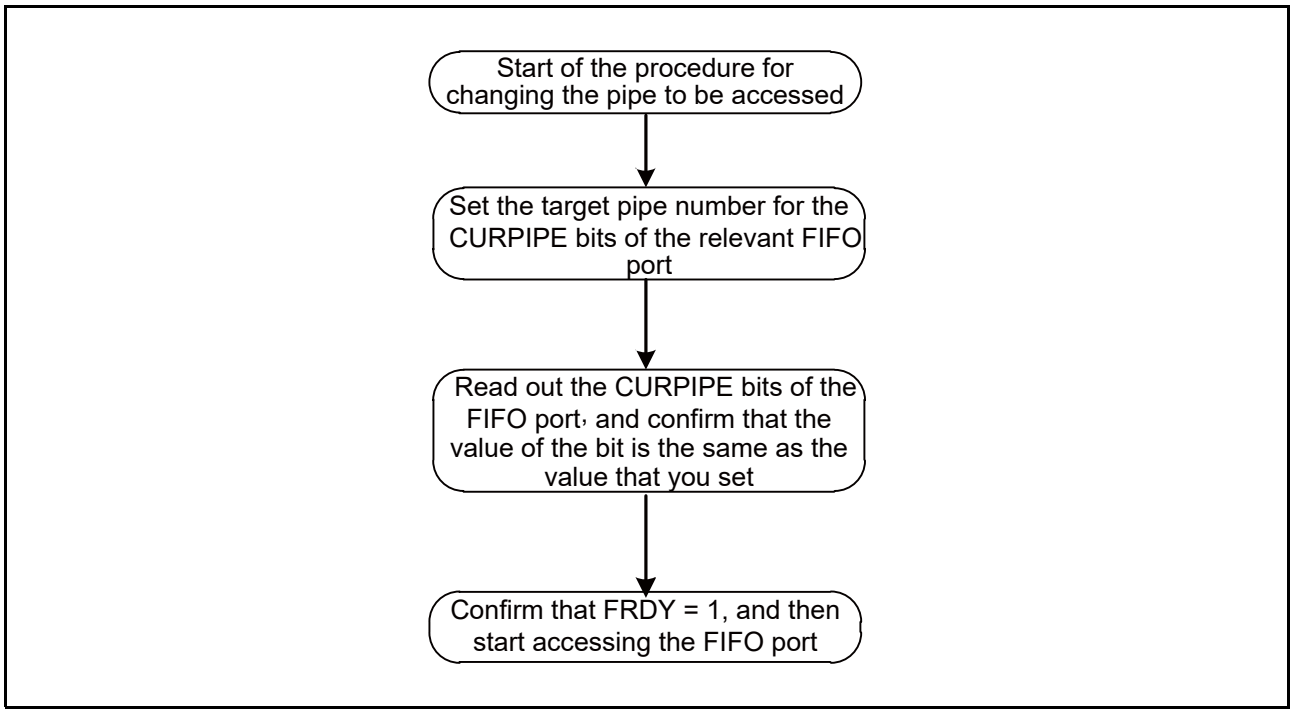

Figure 33.10 Pipe Switching Procedure for FIFO Port Access

33.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 33.28 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.
As shown in Table 33.28, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 33.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

	Register Setting			
	DCLRM = 0		DCLRM = 1	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Clearing unnecessary		Clearing unnecessary	
Zero-length packet received	Clearing necessary			
Normal short packet received	Clearing unnecessary	Clearing necessary		
Transaction count end				

33.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The "last data" here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 33.29 shows when this module generates a BRDY interrupt.

Table 33.29 BRDY Interrupt Generation Timing

	Register Setting	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1
Buffer full (normal packet received)	When packet is received	No interrupt generated
Zero-length packet received	When packet is received	When packet is received
Normal short packet received	When packet is received	When received data has been read from the buffer memory
Transaction count end	When packet is received	When received data has been read from the buffer memory

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

33.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

33.9.6.1 Control transfer

(1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   (a) VALID bit in the INTSTS0 register: 1
   (b) PID bit in the DCPCTR register: NAK
   (c) CCPL bit in the DCPCTR register: 0

2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.
By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see Figure 33.7.

(2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.
A transaction is executed by setting the PID bit in the DCPCTR register to BUF.
The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.
For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.
After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

(a) bmRequestType ≠ "0x00"
(b) wIndex ≠ "0x00"
(c) wLength ≠ "0x00"
(d) wValue > "0x7F"
(e) DVSQ = "011 (Configured)"

Software must respond to all requests other than SET_ADDRESS.

33.9.7 Bulk Transfer (Pipes 1 to 5 and 9 to 15)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

33.9.7.1 NYET handshake control

Table 33.30 lists responses to tokens received in a bulk or control transfer.
When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 33.30 List of Responses to Received Tokens

PID bit value	Buffer memory state*1	Received token	Response	Note
NAK/STALL	-	SETUP	ACK	-
	-	IN/OUT/PING	NAK/STALL	-
BUF	-	SETUP	ACK	-
	RCV-BRDY	OUT/PING	ACK	Receives data packet when OUT token is received *1
	RCV-BRDY	OUT	NYET	Receives data packet *2
	RCV-BRDY	OUT (Short)	ACK	Receives data packet *2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/1	Sends data packet
	TRN-NRDY	IN	NAK	

Note: Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has send data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

33.9.8 Interrupt Transfer (Pipes 6 to 9 and 10)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.
Note that this module does not support high-bandwidth interrupt transfers.

33.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

33.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.
Table 33.31 and Table Table 33.32 describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 33.31 Error Detection during Transmission/Reception of Token

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	No interrupt is generated (ignored as a corrupted packet).
3	Overrun error, underrun error	An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token.
4	Interval error	An NRDY interrupt is not generated.

Table 33.32 Error Detection during Reception of Data Packet

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	An NRDY interrupt is generated and the CRCE bit is set.
3	Packet size error (too large packet)	A BEMP interrupt is generated and the PID bit is set to STALL.

33.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.
The following shows actions that can be taken in response to a received PID.

1. IN direction:

(a) DATA0: Used to send packets.
(b) DATA1: Not used to send packets.
(c) DATA2: Not used to send packets.
(d) mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

(a) DATA0: Packets are received normally.
(b) DATA1: Packets are received normally.
(c) DATA2: Packets are ignored.
(d) mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

(a) DATA0: Packets are received normally.
(b) DATA1: Packets are received normally.
(c) DATA2: Packets are received normally.
(d) mDATA: Packets are received normally.

33.9.9.3 Interval counter

(1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer.
The interval counter enables the functions listed in Table 33.33.

Table 33.33 Functions of the Interval Counter

Transfer Direction	Function	Detecting Condition
IN	Transmit buffer flush function	An IN token cannot successfully be received within the interval frame during isochronous IN transfer.
OUT	Notification of unreceived token	An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer.

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2^n (micro) frames, where n is the value of the IITV bit.

(2) Interval counter initialization

This module initializes the interval counter under the following conditions:

(a) Power on reset
The IITV bit is initialized.

(b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:
1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.
2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

33.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called "send data setup for isochronous transfer".
This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 33.11 shows examples of sending using the send data setup function for isochronous transfer by setting "IITV = 0" (each frame) in this module.

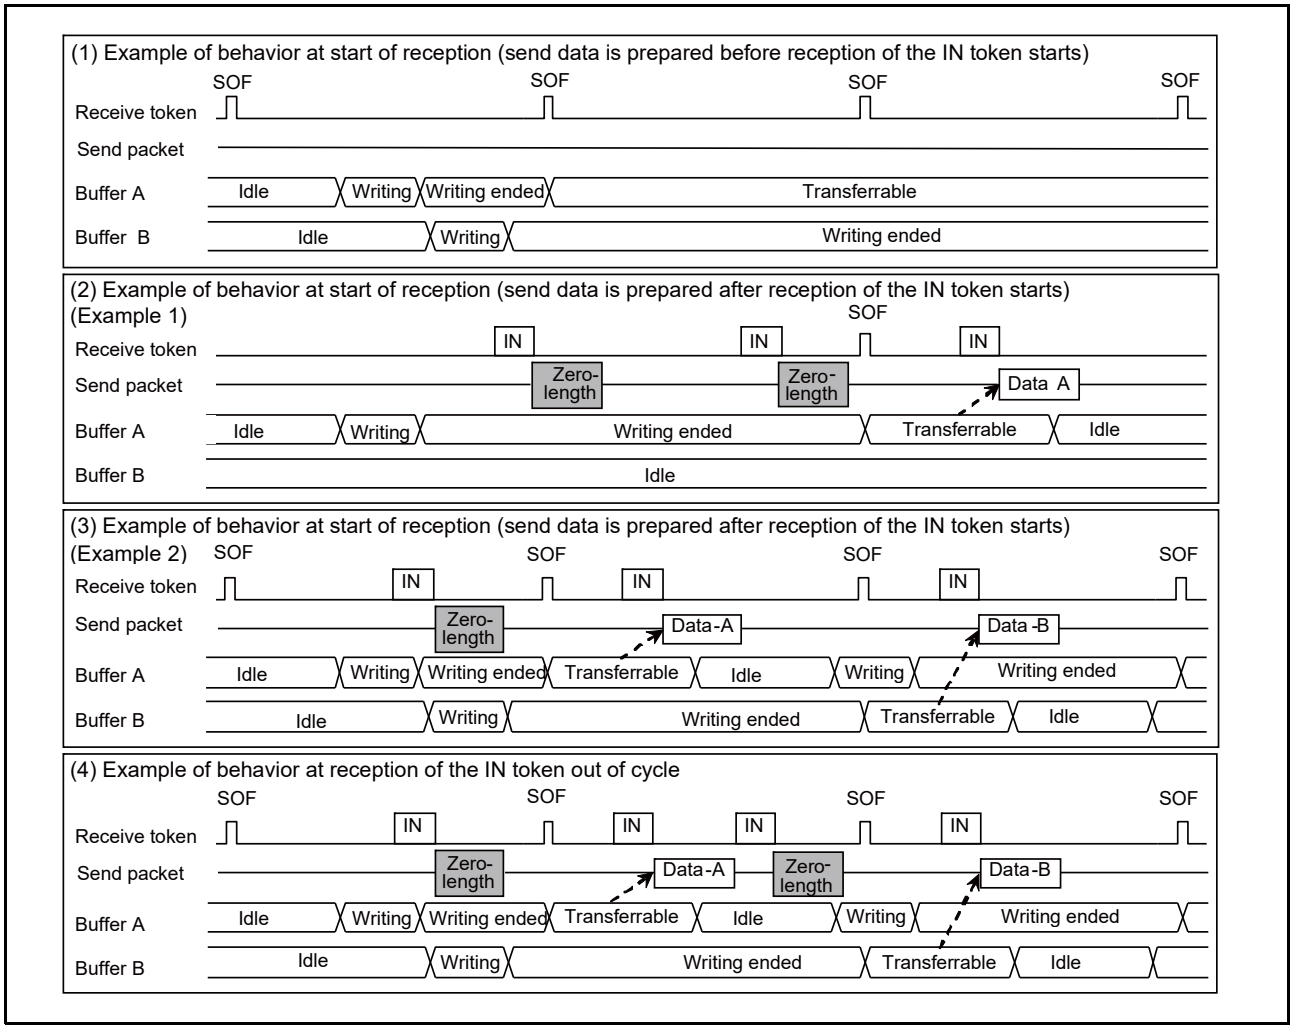

Figure 33.11 Examples of Data Setup Function Behavior

33.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.
At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
   Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
   Buffer flush operation is performed after the first successful transaction.

Figure 33.12 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

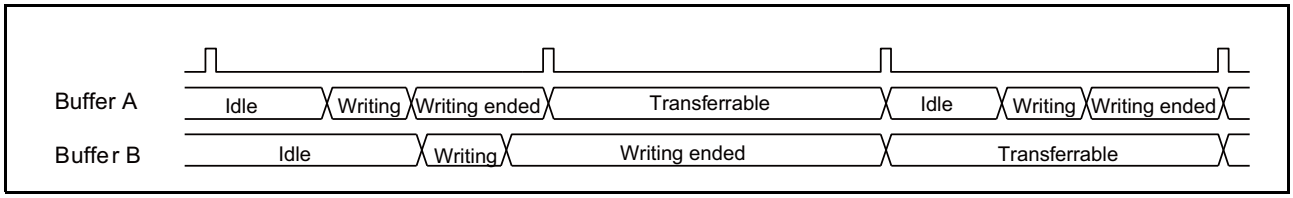

Figure 33.12 Example of Buffer Flush Function Behavior

Figure 33.13 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.
If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.
Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.
In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:
(a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.
(b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:
(a) If the buffer is ready to receive data, data is received and a normal response is returned.
(b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

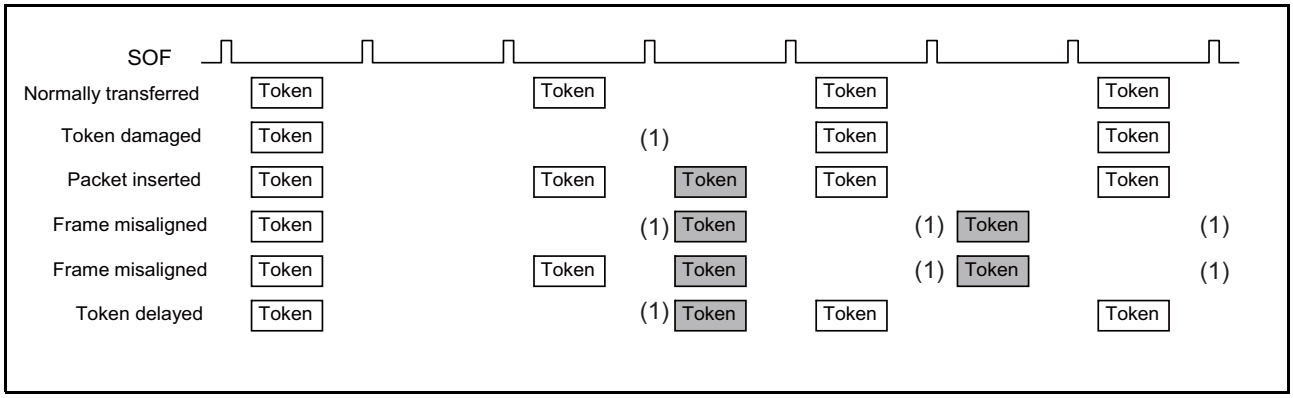

Figure 33.13 Example of Occurrence of Interval Error (when IITV is 1)

33.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:
(1) Power on reset
(2) USB bus reset
(3) Suspended state detected

The SOF interpolation operates according to the following specifications:
(1) Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.
(2) The interpolation function does not operate until an SOF packet is received.
(3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.
(4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.
(5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:
(1) Updating of frame number or micro-frame number
(2) SOFR interrupt and micro SOF lock
(3) SOF pulse output
(4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.
If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.
However, if a micro SOF packet for which "micro-FRNM = 000" is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which "micro-FRNM = 000" is not set are successfully received.

33.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.
The table below compares the features of the L2 (suspend) state and L1 state.

Table 33.34 Comparison Between Suspend (L2) State and L1 State

Item	L1	Suspend (L2)
Transition	LPM Transaction	3-ms idle period
Host-activated resumption	(Host) Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms (Device) 10-µs K drive	(Host) Min. 20-ms K drive (Device) 10-ms K drive
Device-activated resumption	(Device) 50-µs K drive (Host) 60- to 990-µs K drive (Device) 10-µs K drive	(Device) 1-ms to 15-ms K drive (Host) Min. 20-ms K drive (Device) 10-ms K drive
Signaling	Low and Full Speed Idle	Low and Full Speed Idle

The following describes the processing for transition to and resumption from the L1 state.

33.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.
Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 33.35 Relationship between LPM Response and Descriptor

LPM Response	bcdUSB	Presence of USB 2.0 Ex. Desc	USB 2.0 Ex. Desc LPM	Response When LPM Is Received	Remarks
Not respond	0200	Not present	--	Not Respond	Standard action in the case where this module does not respond to LPM
	0201	Present	LPM = 0	STALL	This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response.
Respond	0201	Present	LPM = 1	ACK or NYET	Standard action in the case where this module responds to LPM

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.
When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.
When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.
When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

33.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with "No response", "ACK", "NYET", or "STALL" according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 µs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.
For 2, both retransmission control and transition to the L1 state are processed by the hardware.
Transition to the L1 state can be identified through a DVST interrupt.
For 3, a RESM interrupt occurs on detection of host K in the L1 state.
For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

33.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

Note: This HIRD value negotiation function must also be supported on the host side.

33.9.12 DMA Mode

33.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 33.36 DMA mode settings

DMS (CHCFG)	Mode	Description
0	Register mode	Performs DMA transfer based on the values set by Next Register Set.
1	Link mode	Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing.

(1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.
Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

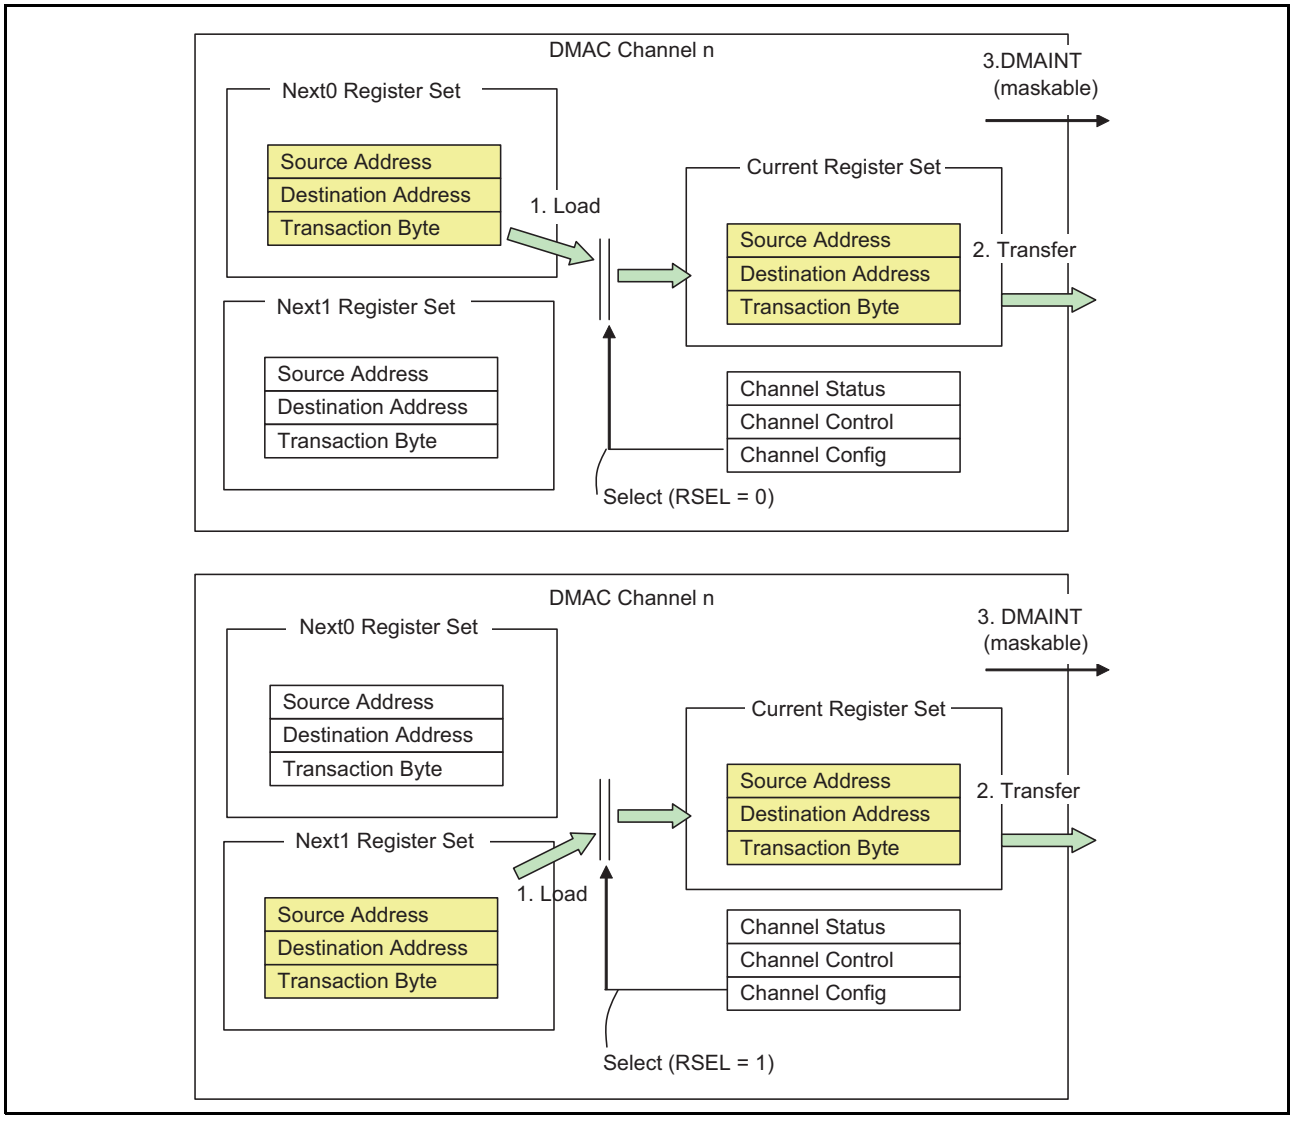

Figure 33.14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

(a) Operation flow of register mode

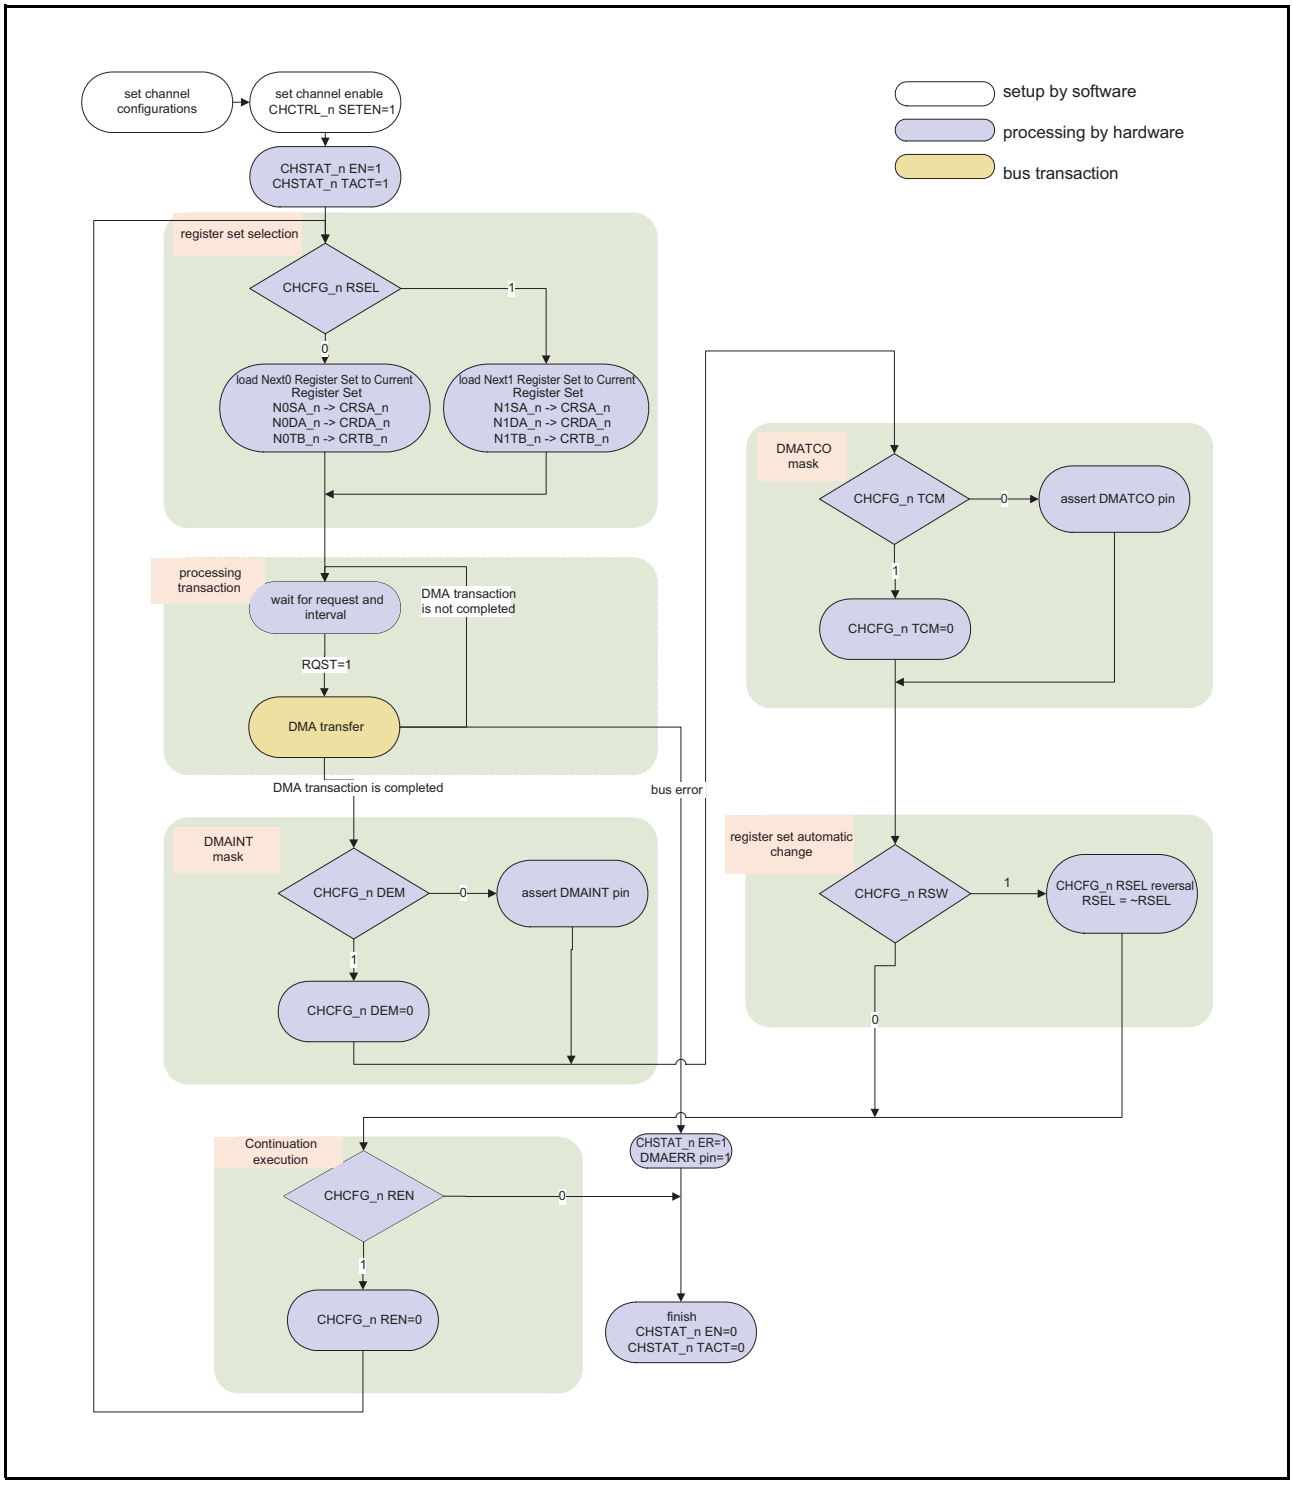

Figure 33.15 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting

The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
(see section 33, DMA Transfer).

2. Register set selection

When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction

A DMA transaction is executed based on the values that are set. For details about transfer, section 33.9.13, DMA Transfer.

4. The USBFDMAmn masking

The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking

DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover

Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution

Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

(b) Register mode setting

- Register mode setting

The register set to be processed is selected.

Table 33.37 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Processes Next0 Register Set.
	1	Processes Next1 Register Set.

- USBFDMAmn masking

The USBFDMAmn interrupt can be masked.

Table 33.38 USBFDMAmn Mask Setting

DEM (CHCFG_n)	Description
0	Asserts the USBFDMAmn interrupt when the DMA transaction is completed.
1	Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0.

- DMATC mask setting

DMATC from DMAC control to USB control can be masked.

Table 33.39 DMATC Mask Setting

DEM (CHCFG_n)	Description
0	Asserts DMATC when the DMA transaction is completed.
1	Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0.

- Automatic transaction execution for a register set

After a DMA transaction finishes, another DMA transaction can be executed.

Table 33.40 Automatic Execution Setting for a Register Set

REN (CHCFG_n)	Behavior	Remarks
0	The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes.	Use this setting to execute a DMA transaction only once.
1	After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful.	Use this setting to continue processing of register set contents.

- Automatic register set switchover setting

After a DMA transaction finishes, the next register set to be processed can be switched.

Table 33.41 Automatic Execution Setting for a Register Set

RSW (CHCFG_n)	Behavior	Remarks
0	The register set is not switched when a DMA transaction finishes.	Use this setting to use only one register set.
1	When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set.	Use this setting to switch the register set.

(c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 33.42 Register Mode Setting Example

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	0 (not masked)	0 (not masked)	0 (not switched)	0 (continuous execution disabled)

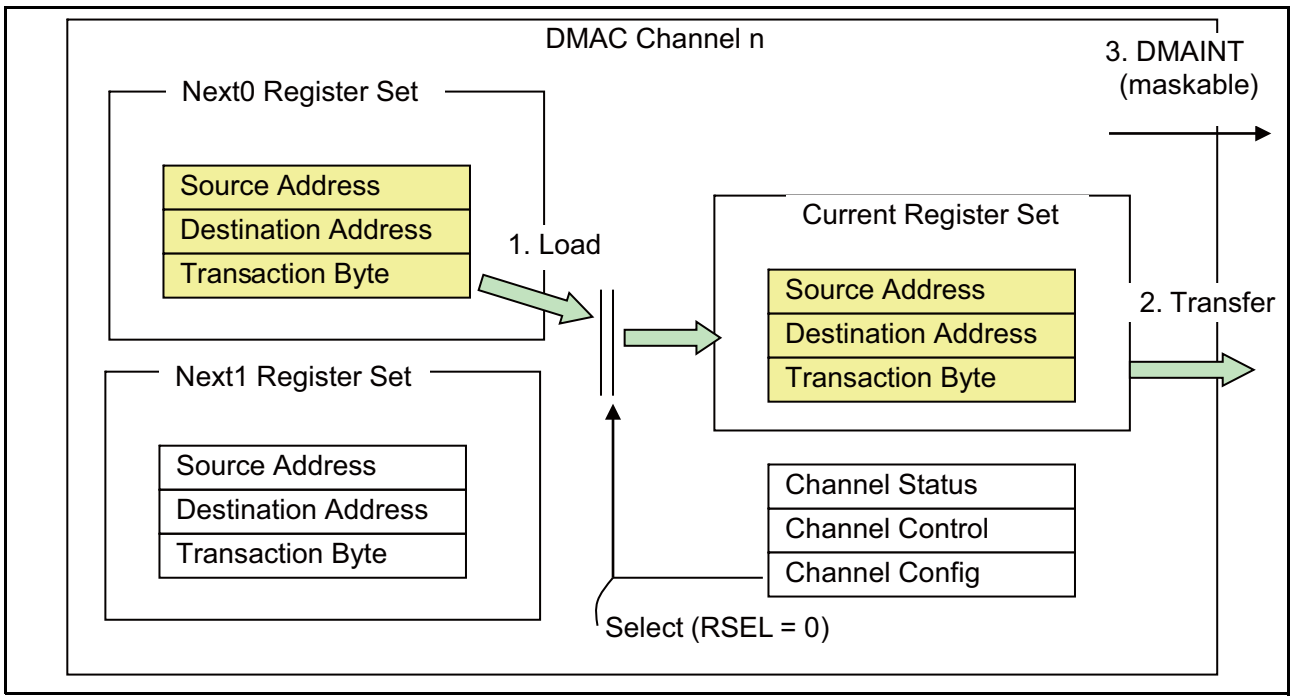

Figure 33.16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 33.43 Automatic Register Set processing Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	1 (masked)	0 (not masked)	1 (switched)	1 (continuous execution enabled)

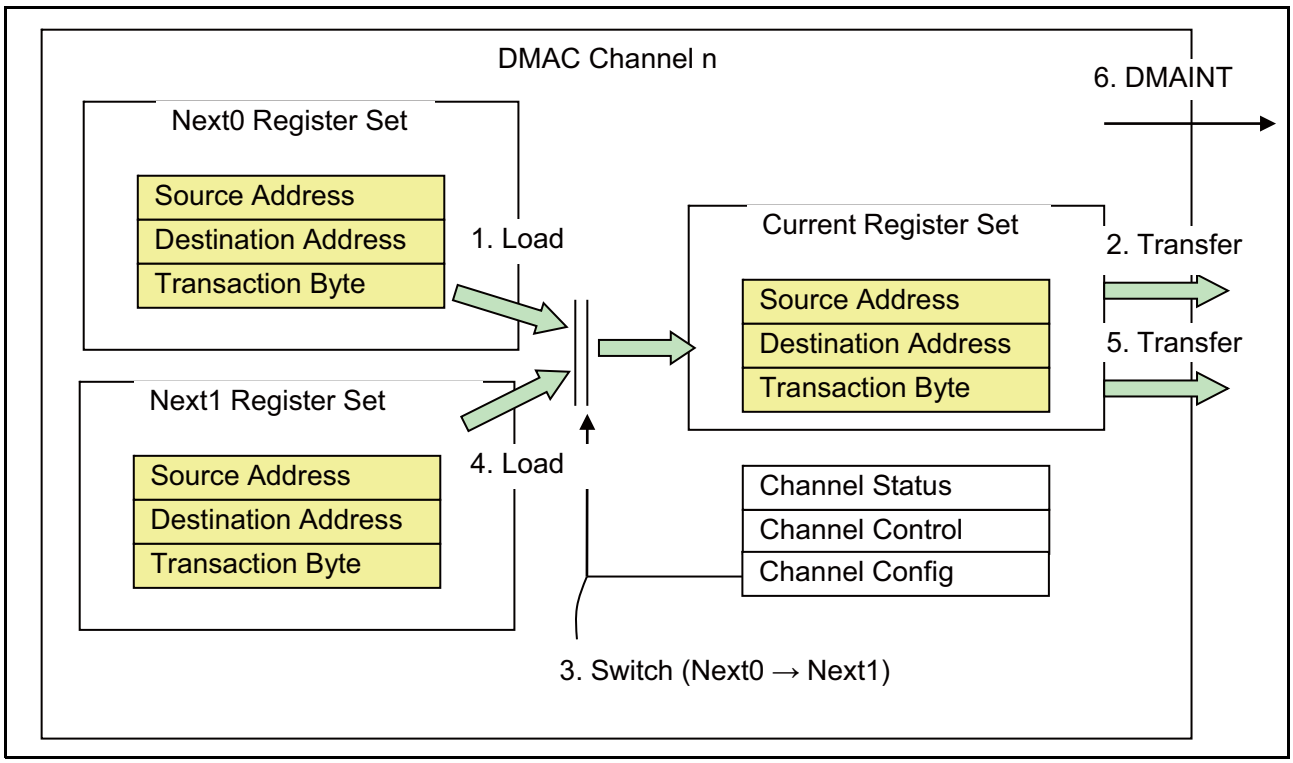

Figure 33.17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

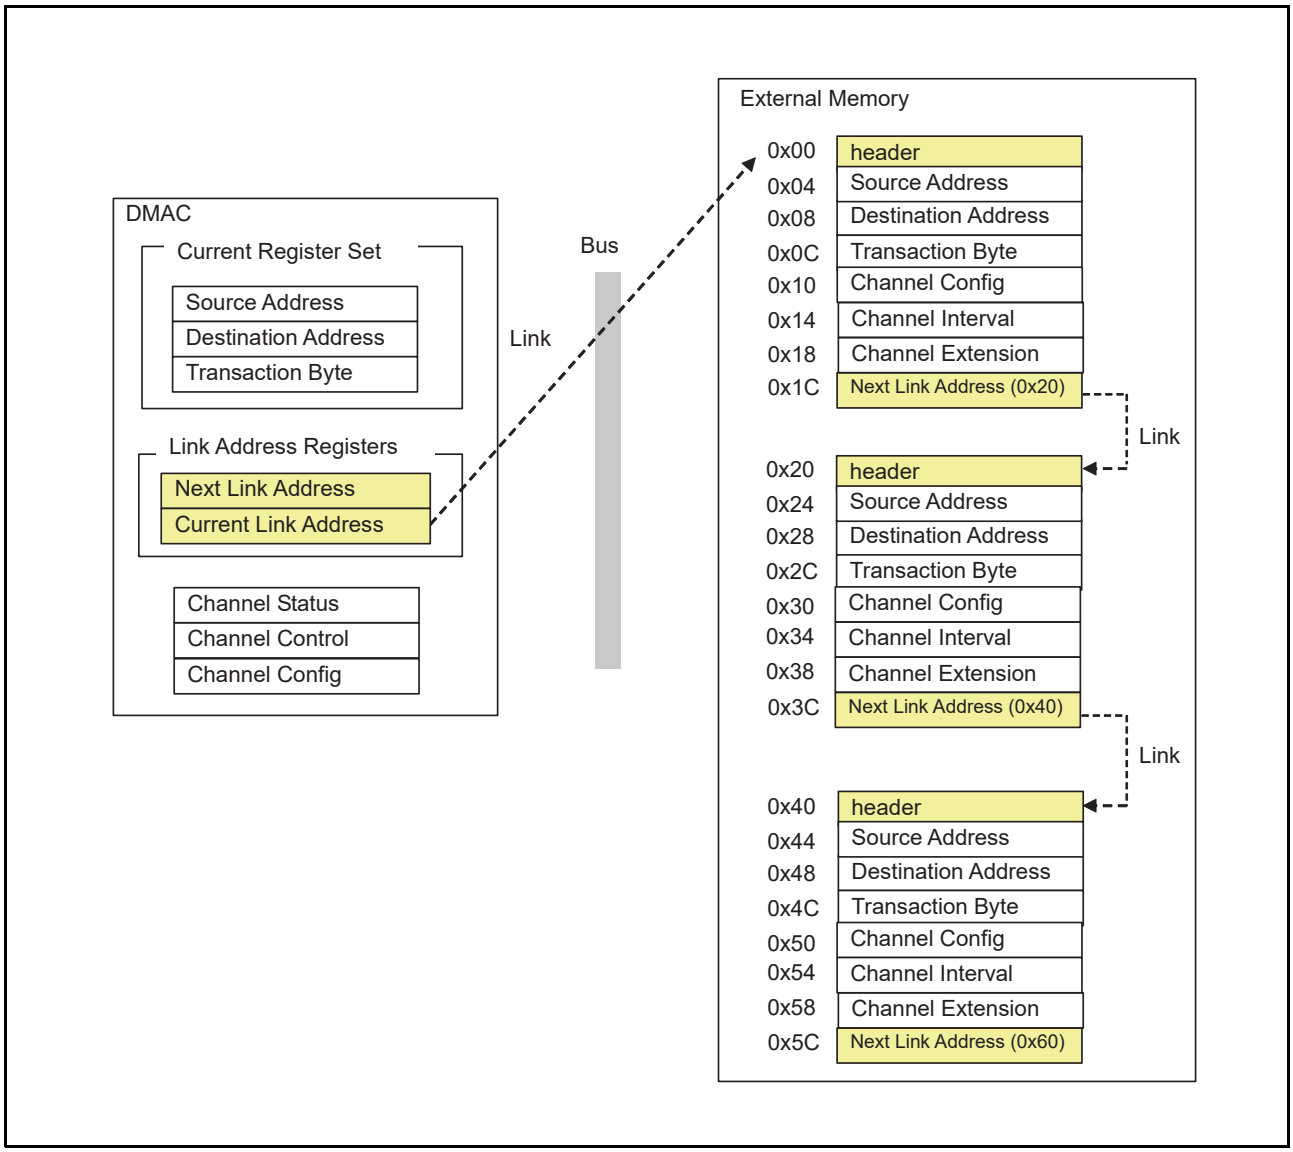

Figure 33.18 Overview of Link Mode

(a) Operation flow of link mode

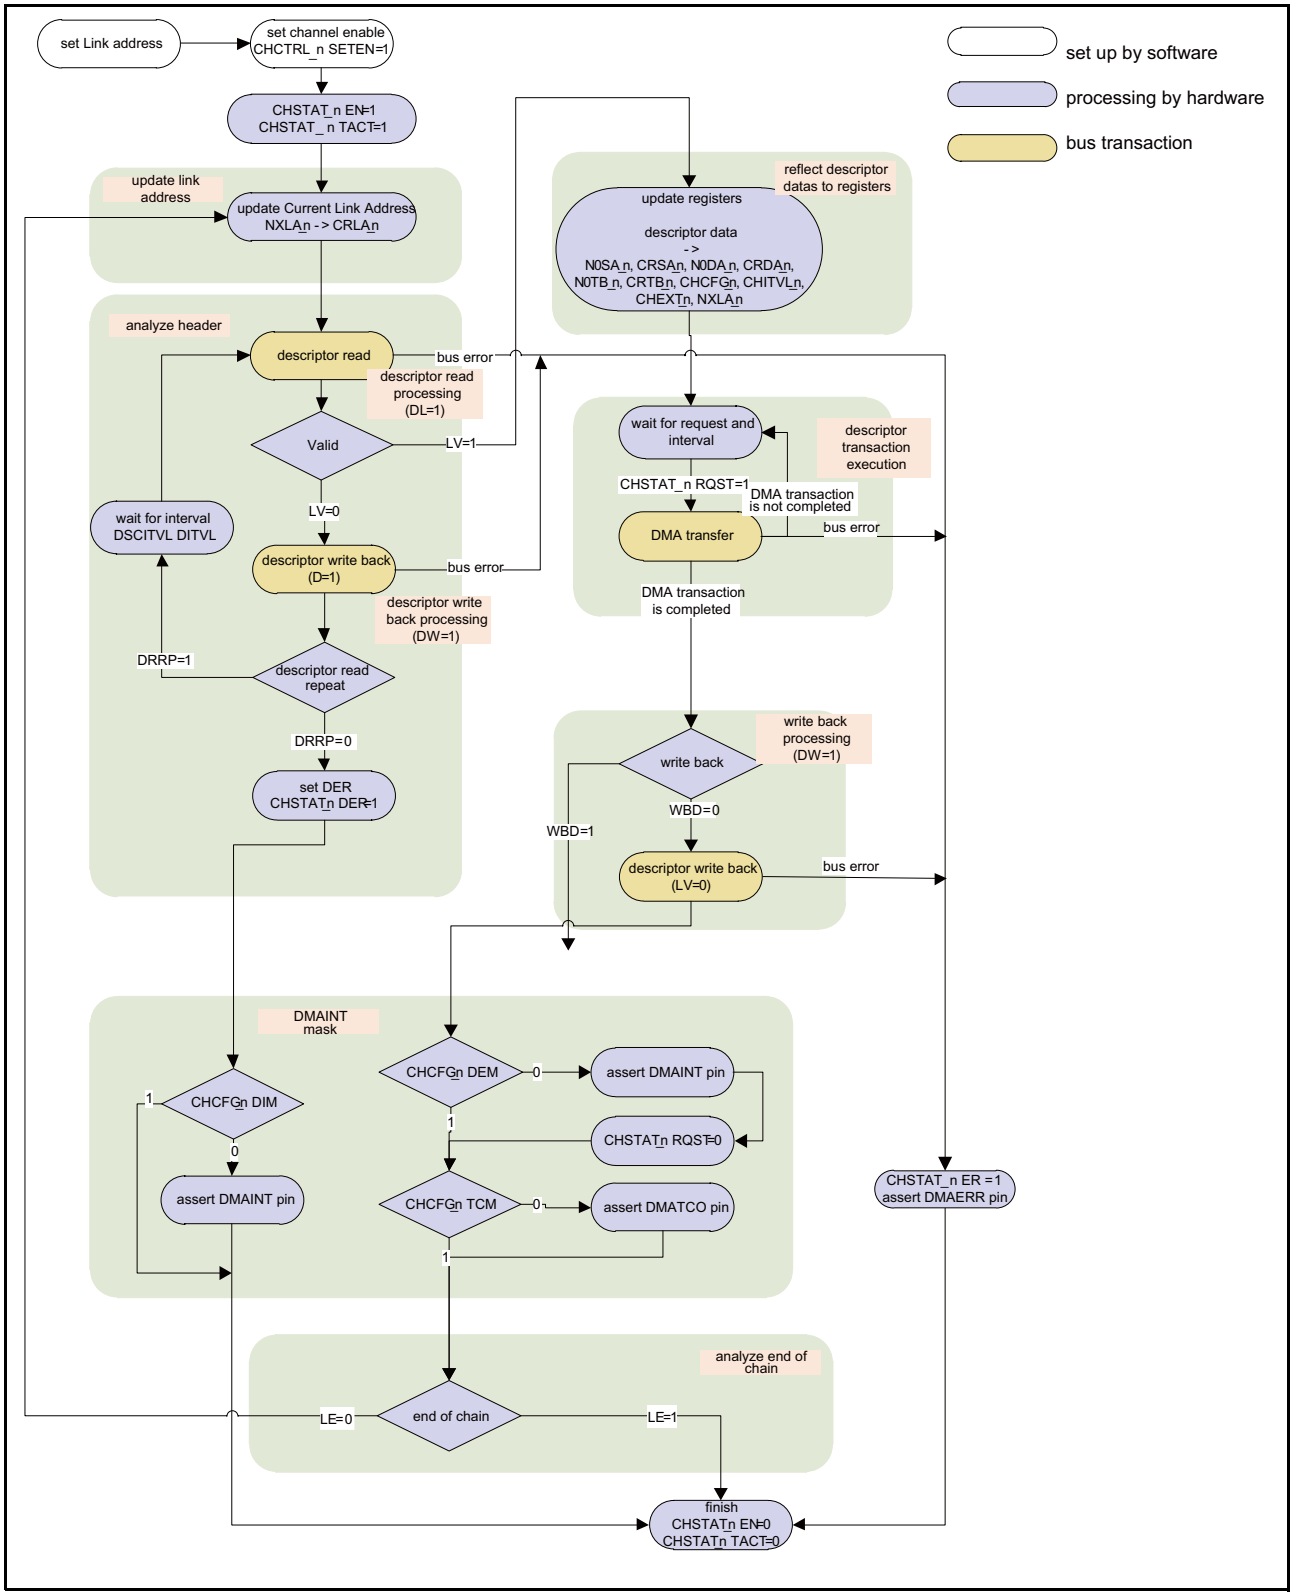

Figure 33.19 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.

2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.

3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.

5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see section 33.9.13, DMA Transfer.

6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.

7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.

9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

(b) Register setting

- Link mode setting

To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 33.44 Link Mode Setting

DMS (CHCFG_n)	Description
1	This module operates in link mode. The setting of this bit cannot be changed by using a descriptor.

- Link address setting

The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target.
Before starting link mode, set the link target in the NXLA_n register.
After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 33.45 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register.
Current Link Address Register (CRLA_n)	This register is used to display the link target that is being executed. This is a read-only register.

(c) Descriptor setting

DMAC supports multiple descriptor formats.
A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.
The following table shows the relationship between DSCFM values and descriptor formats.

Table 33.46 Descriptor Formats

DSCFM	Descriptor Size	Next Link Address	Channel Extension	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	header
3	4 words	√	— (reload)	— (reload)	— (reload)	— (header)	√	√	√ (with STS)
1	8 words	√	√	√	√	√	√	√	√ (no STS)
Other than the above	If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3.								

Table 33.47 Explanation of the Marks in Table 33.46

Field	Mark	Description	Remarks
