Header	√ (with STS)	The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size).	—
	√ (no STS)	The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes.	
Source Address	√	Specify the source address.	—
Destination Address	√	Specify the destination address.	—
Transaction Size	√	Specify the transaction size.	—
	— (header)	Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size)	Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set.
Channel Config Channel Interval Channel Extension	√	Specify Channel Config, Channel Interval, and Channel Extension.	—
	— (reload)	Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited.	—
Next Link Address	√	Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor.	—

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by " √ " in Table 33.46 on memory.
No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 33.48 Example of Placing Descriptors

	Address							
DSCFM	Link Address + 1CH	Link Address + 18H	Link Address + 14H	Link Address + 10H	Link Address + 0CH	Link Address + 08H	Link Address + 04H	Link Address + 00H
3H	—	—	—	—	Next Link Address	Destination Address	Source Address	header
1H	Next Link Address	Extension	Interval	Config	Transaction Byte	Destination Address	Source Address	header

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSCFM				—	WBD	LE	LV	D	—						
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
If the WBD bit is 0 when DMAC reads the header, DMAC writes data back to this 1-byte area after the DMA transaction in accordance with the descriptor ends. At this time, DMAC writes 0 back to the LV bit. For other bits, DMAC writes the values read from the header.								If the LV bit in the header is 0 when DMAC reads the header, DMAC writes 80H back to this 1-byte area.							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STS															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Figure 33.20 Header Area

Table 33.49 Header Area

Bit position	Bit name	Meaning
31 to 28	DSCFM	Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see Table 33.46
27	—	Reserved area. Set 0.
26	WBD	Wrazite Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit.
25	LE	Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends.
24	LV	Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enable.
23	D	Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read.
22 to 16	—	Reserved area. Set 0.
15 to 0	STS	Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed.

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are

different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

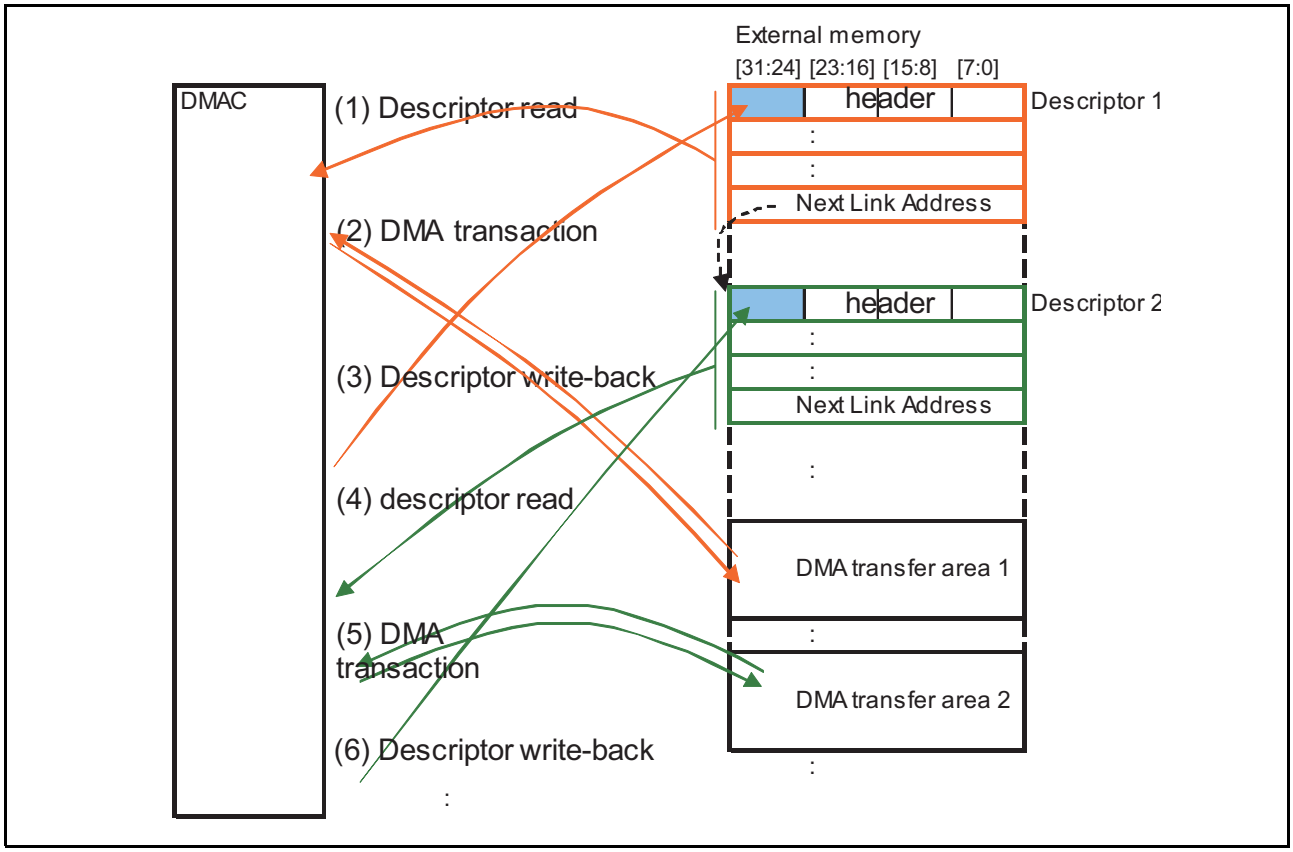

Figure 33.21 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte-size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte-size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.
If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).
If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors

  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

(d) Link configuration example

In link mode, descriptors can be configured as shown below.

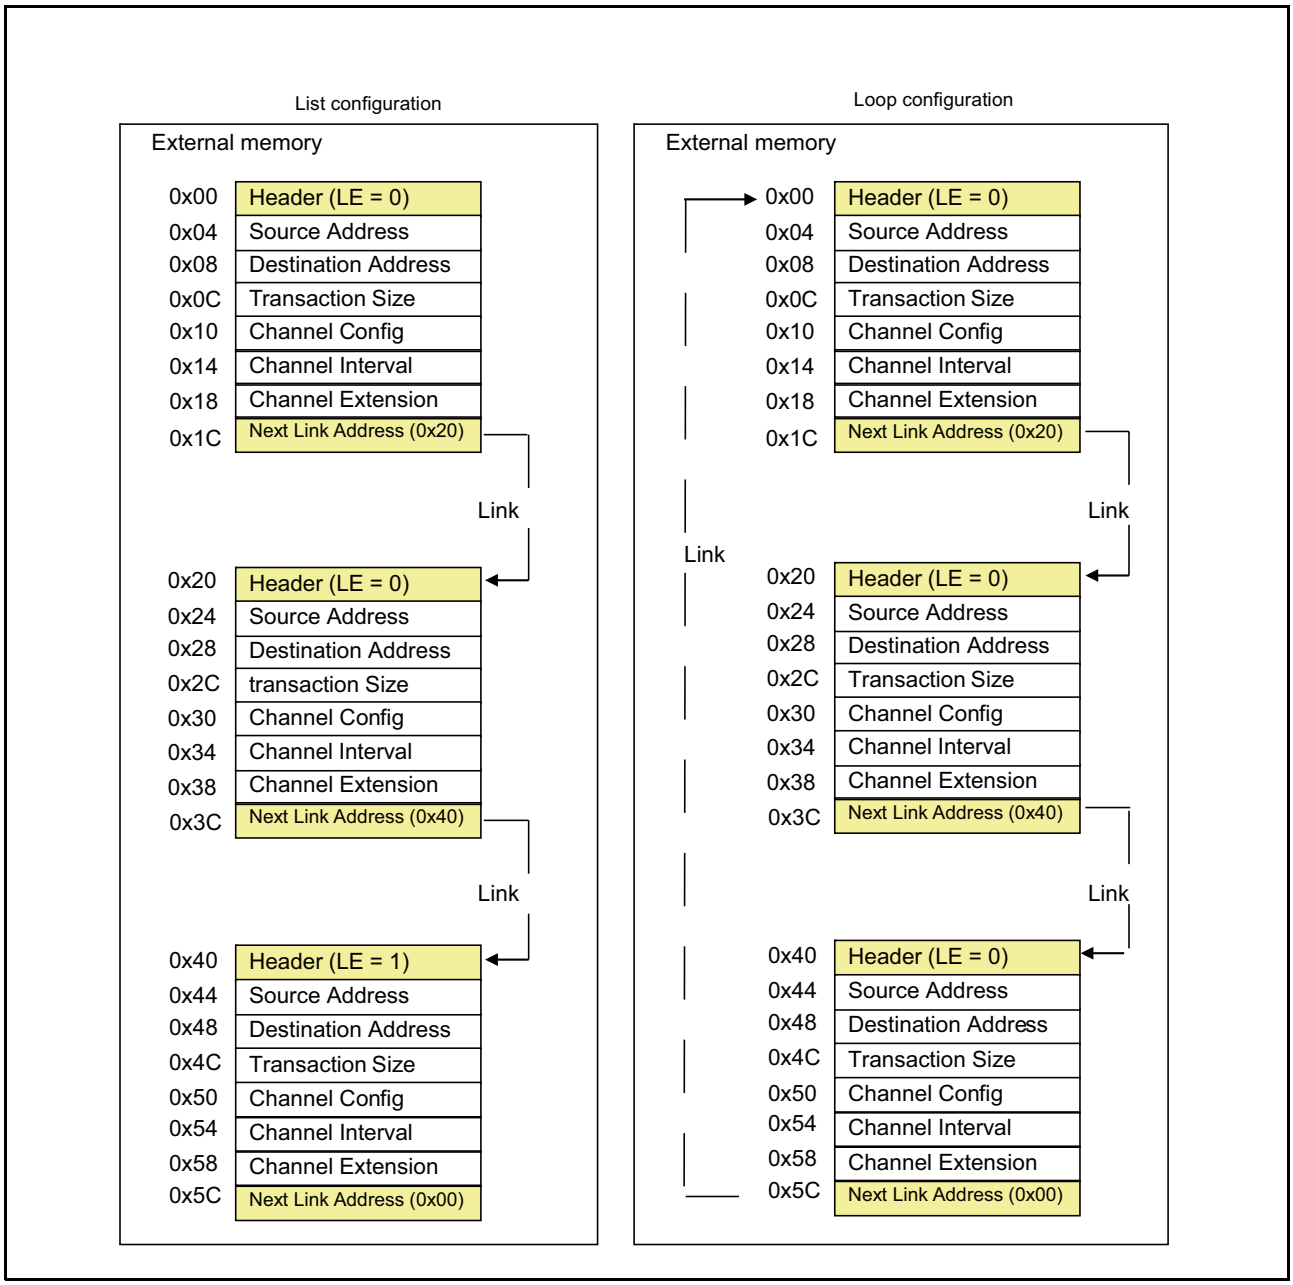

Figure 33.22 Link Mode Configuration Example

- List configuration

The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

33.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 33.50 Write-Only Mode Setting

WONLY (CHCFG)	Mode	Description
0	Normal mode	A DMA transfer is performed using the values set in Next Register Set.
1	Write-only mode	A DMA write transfer is performed without performing a DMA read transfer.

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.
Use this mode to, for example, initialize the memory area.

33.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

33.9.13.1 Transfer modes

DMAC supports only single transfer mode.
Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).
The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see 33.9.13.7, Operational difference depending on the transfer size.

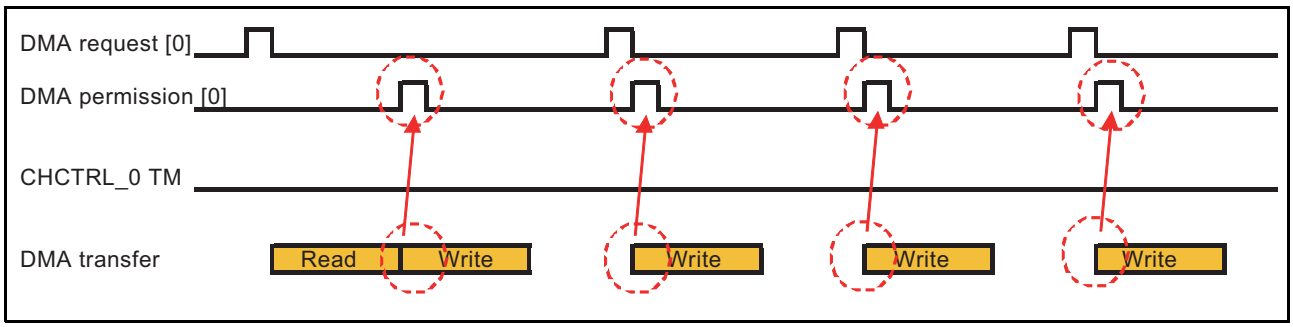

Figure 33.23 Single Transfer Mode (REQD = 1, SDS > DDS)

33.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 33.51 Priority Control Setting

Mode	PR (DCTRL)	Description	Remarks
Fixed-priority	0	Controls requests based on fixed priority (CH0 > CH1 > ...).	Use this mode if channels have priority.
Round-robin	1	Controls requests in a round-robin manner.	Use this mode to execute requests equally.

(1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.
In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

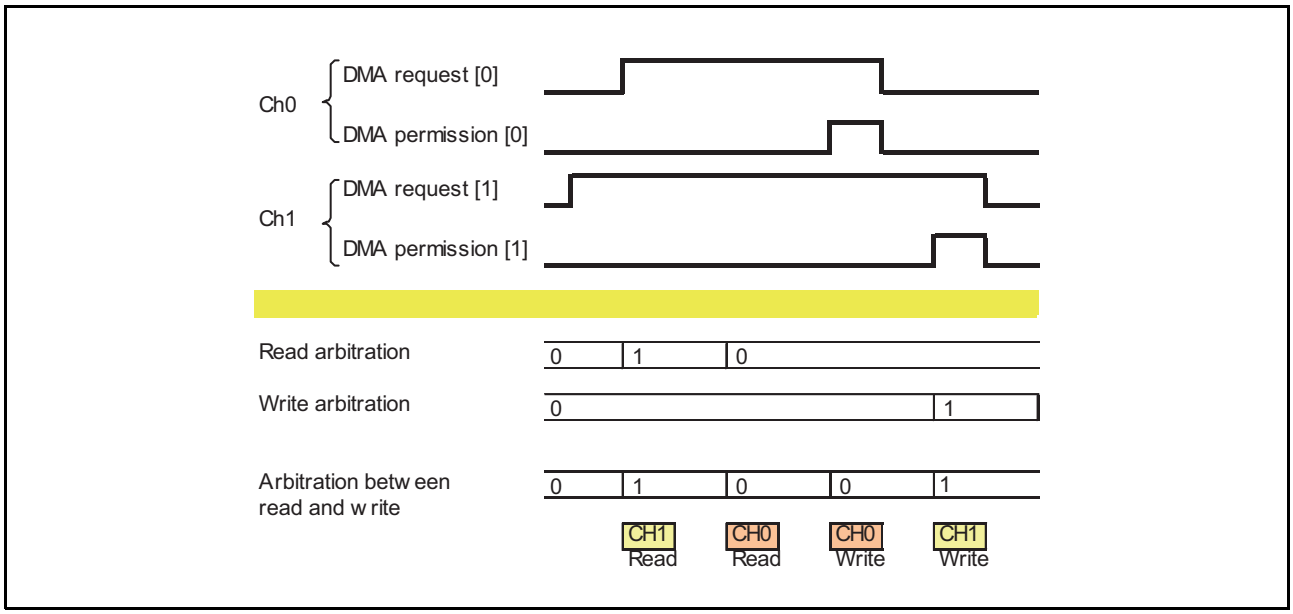

Figure 33.24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

33.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

- If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.
- If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.
- The difference from ordinary sweeping mode described in section 33.9.13.8 (3) (b), Transfer suspension (buffer sweeping enabled: SBE = 1) (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

33.9.13.4 DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 33.52 USBFDMAmn Assertion Conditions

Cause	Condition	INT_DMA[n] mask signal
DMA transaction ended	A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes)	DEM bit in the CHCFG_n register
Descriptor was invalid	LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode	DIM bit in the CHCFG_n register

33.9.13.5 DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

33.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.
The following shows an operation example.

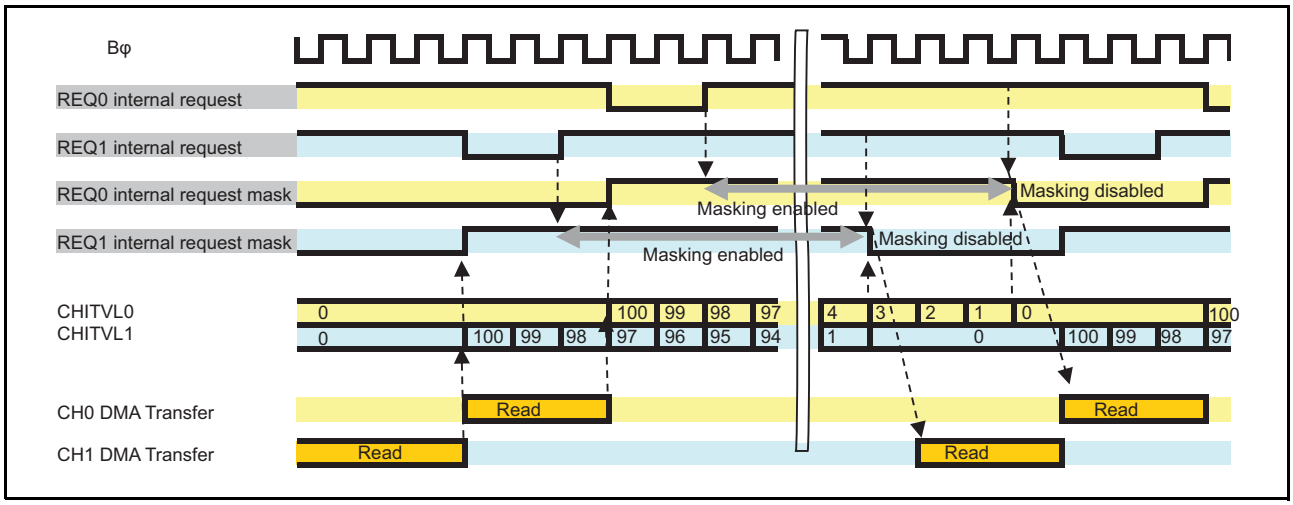

Figure 33.25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

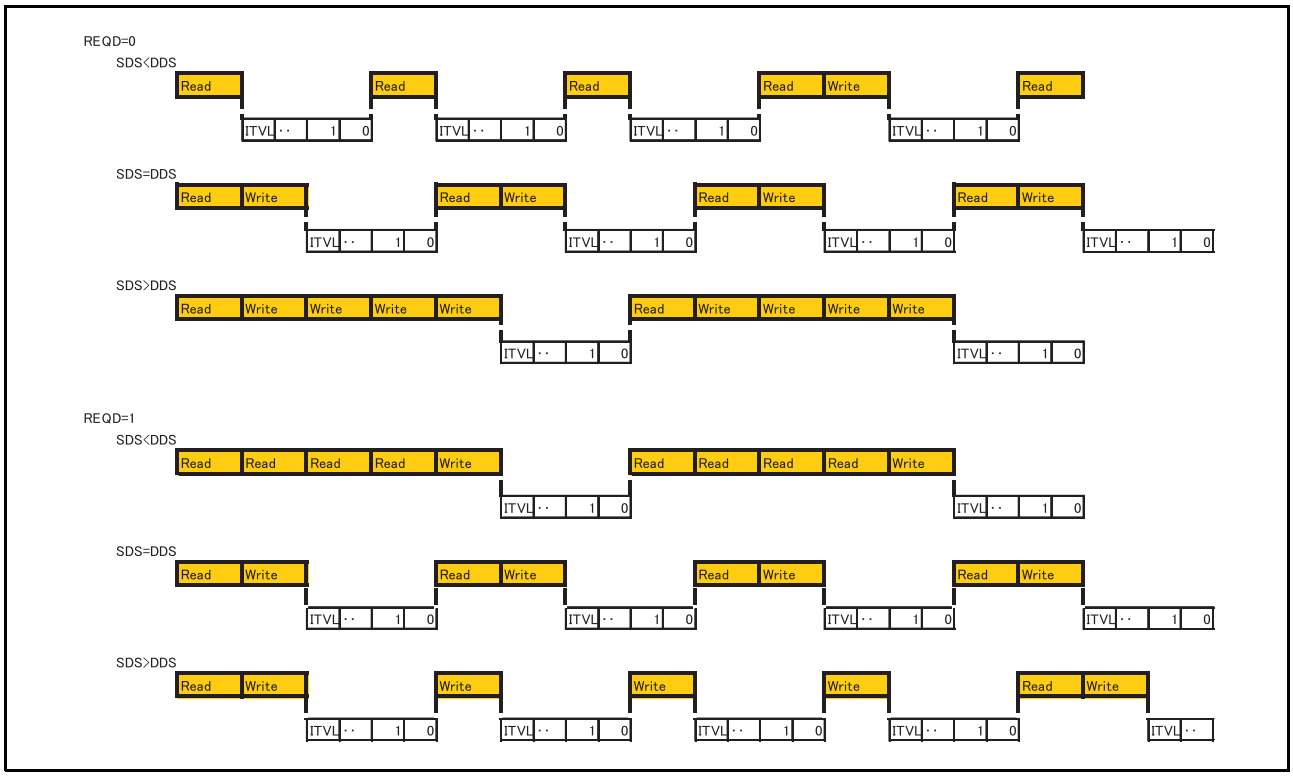

Figure 33.26 DMA Transfer Settings and Interval Count

33.9.13.7 Operational difference depending on the transfer size

(1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.
The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

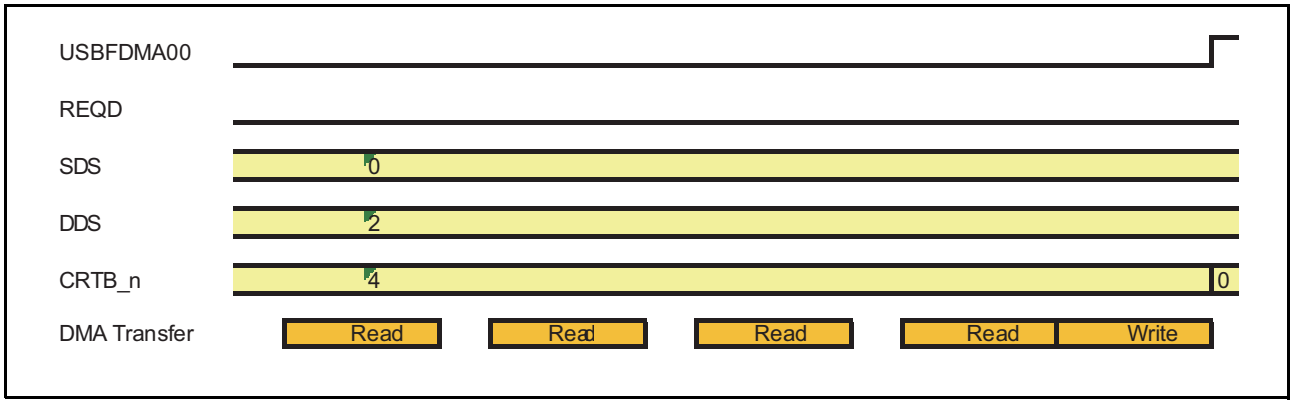

Figure 33.27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

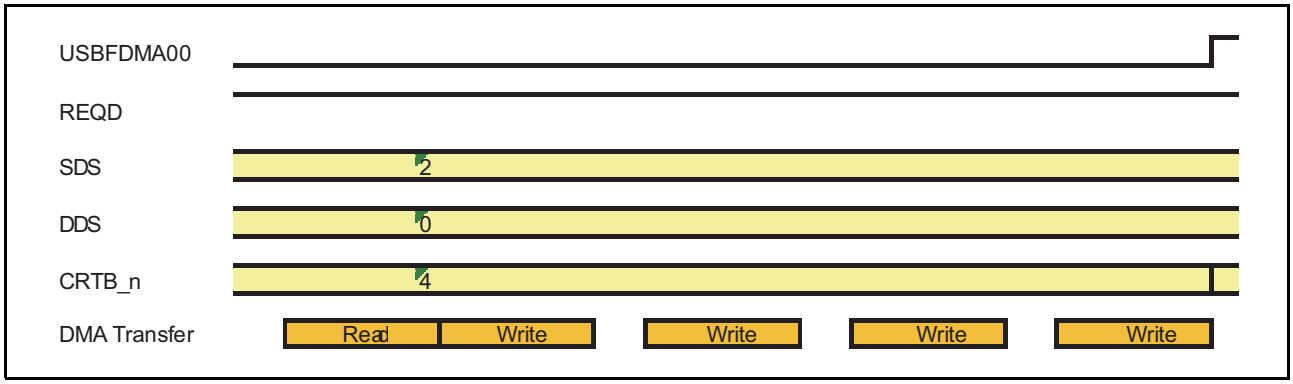

Figure 33.28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.
The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

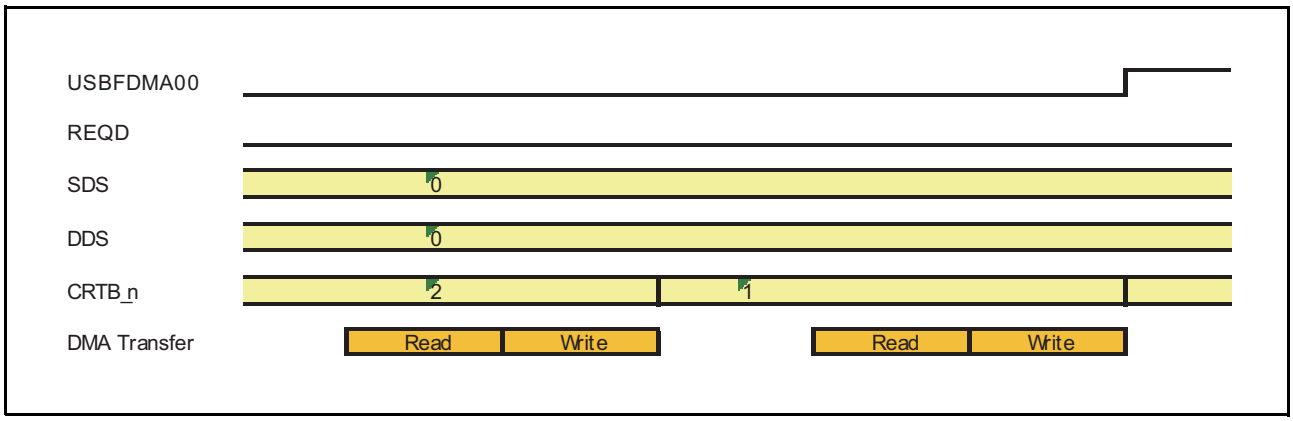

Figure 33.29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

33.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.
The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see 33.4.1, Current Source Address Register) and the DMA transfer ends.
If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

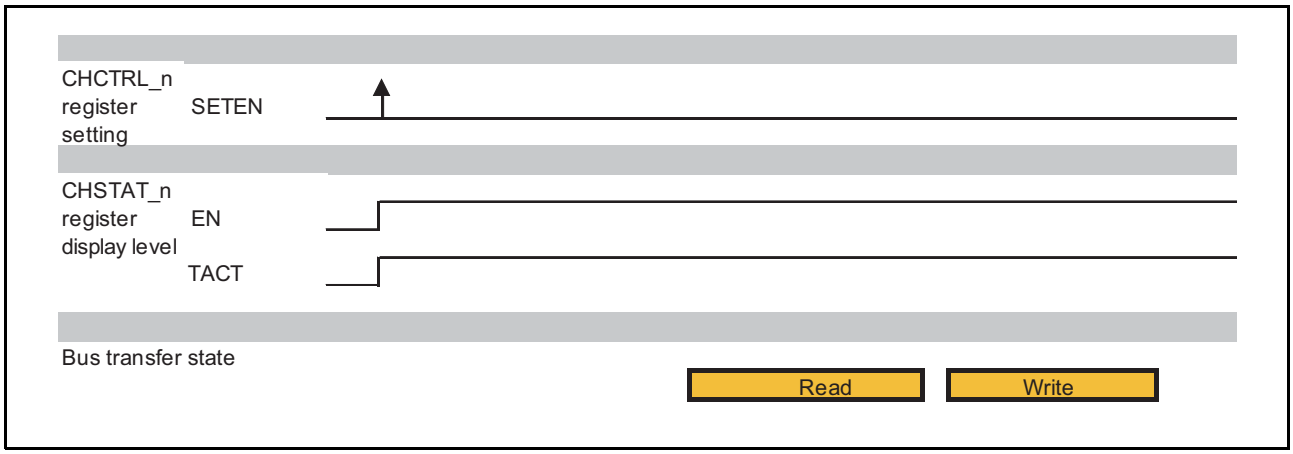

Figure 33.30 DMAC State Example 1 (Hardware Request)

(2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).
If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

(a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.
Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.
If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.
If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.
If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

(b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.
After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.
Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

(c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

(d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

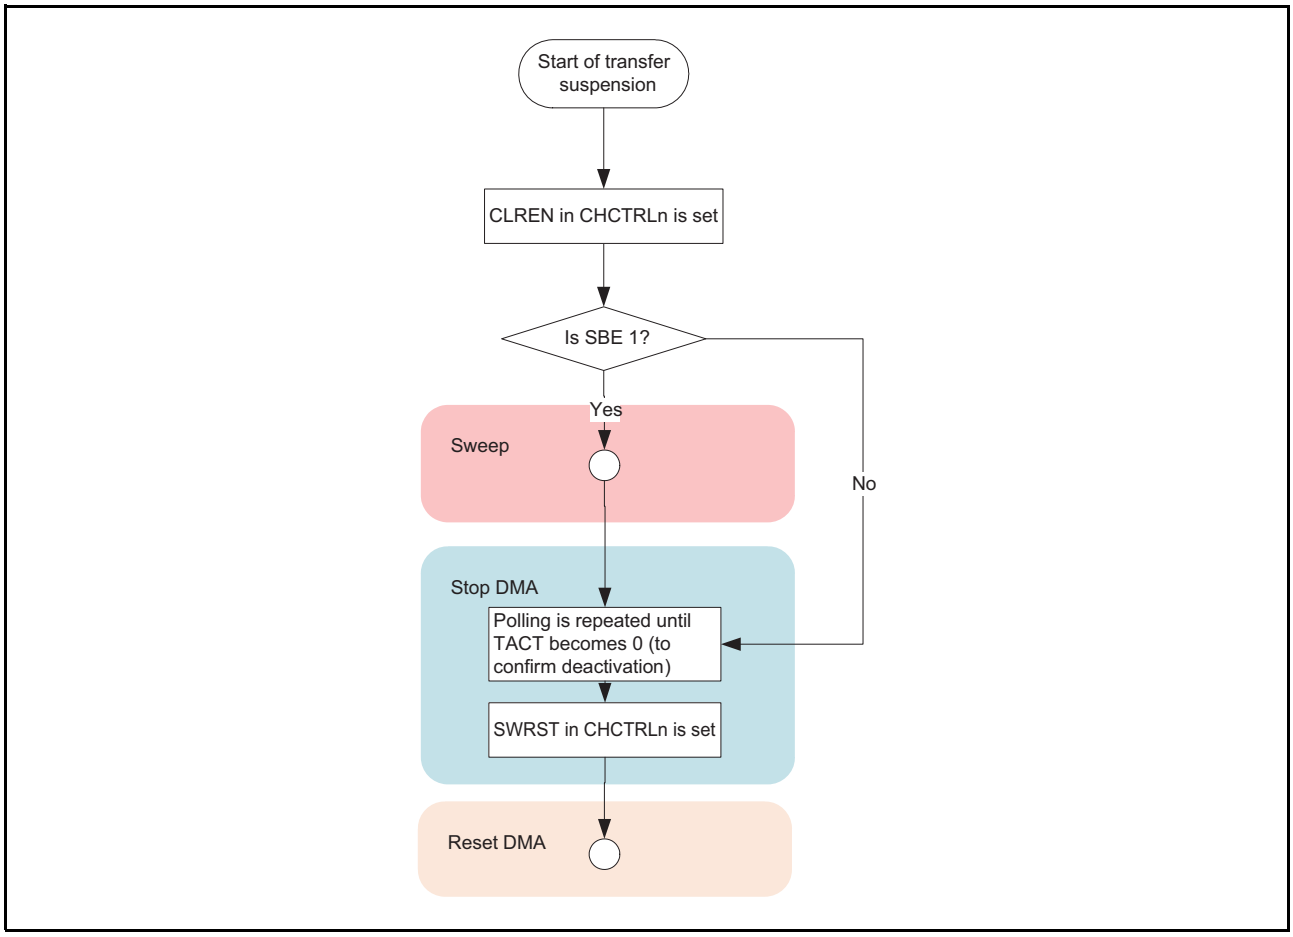

Figure 33.31 Transfer Suspension Flowchart

33.9.14 Access Type

33.9.14.1 DMA master transfer combination list

(1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.

- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 33.53 DMA Read Transfer Combination List

		AHB transfer					
		First transfer			Second transfer		
SDS	Source Address	Address	Data Size	Burst Type	Address	Data Size	Burst Type
0 (8 bits)	-	addr	8	SINGLE			
1 (16 bits)	2 byte align	{addr[31:1], 0B}	16	SINGLE			
	2 byte unalign				{addr[31:1], 0B} + 2H	16	SINGLE
2 (32 bits)	4 byte align	{addr[31:2], 00B}	32	SINGLE			
	4 byte unalign				{addr[31:2], 00B} + 4H	32	SINGLE
4 (128 bits)	16 byte align	{addr[31:4], 0H}	32	INCR4			
	16 byte unalign				{addr[31:4], 0H} + 10H	32	INCR4
5 (256 bits)	32 byte align	{addr[31:5], 00H}	32	INCR8			
	32 byte unalign				{addr[31:5], 00H} + 20H	32	INCR8
6 (512 bits)	64 byte align	{addr[31:6], 00H}	32	INCR16			
	64 byte unalign				{addr[31:6], 00H} + 40H	32	INCR16

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.

- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
  Size: Value set in DDS[2:0]
  Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)

- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.

  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

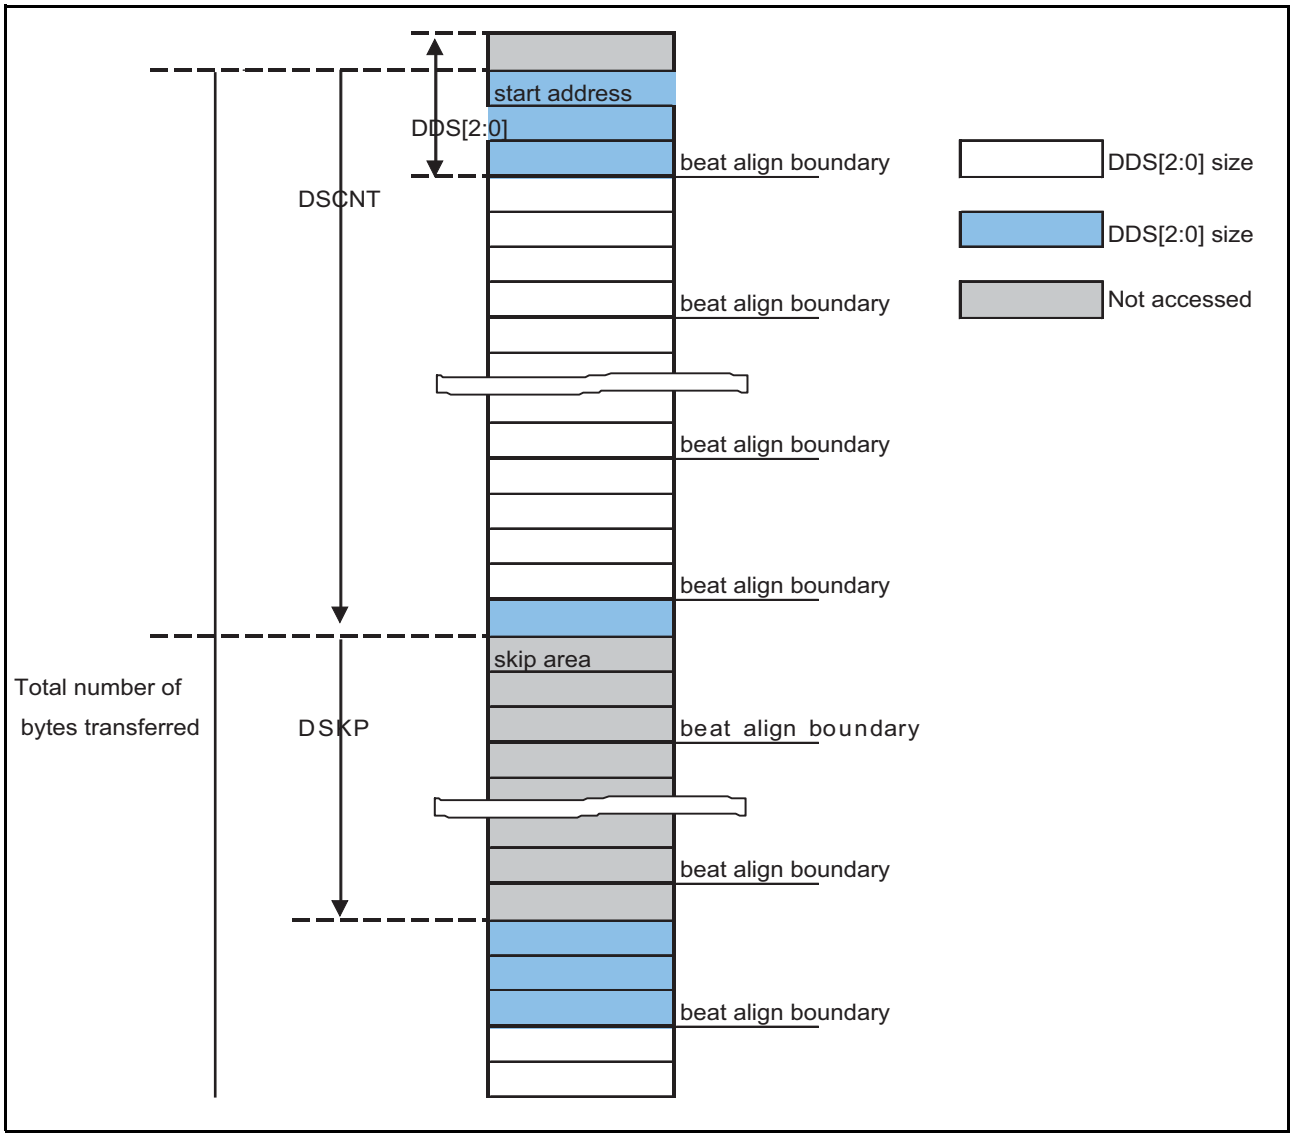

Figure 33.32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 33.54 DMA Write Transfer Combination List

	AHB transfer		
	First transfer		
DDS[2:0]	Address	Data Size	Burst Type
0 (8 bits)	addr	8	SINGLE
1 (16 bits)	{addr[31:1], 0B}	16	SINGLE
2 (32 bits)	{addr[31:2], 00B}	32	SINGLE
4 (128 bits)	{addr[31:4], 0H}	32	INCR4
5 (256 bits)	{addr[31:5], 00H}	32	INCR8
6 (512 bits)	{addr[31:6], 00H}	32	INCR16

33.9.14.2 DMA master descriptor combination list

(1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 33.55 Descriptor Read Transfer Combination List

Descriptor Format	Address	AHB Transfer					
		First Transfer			Second Transfer		
	addr[4:0]	Address	Size	Burst	Address	Size	Burst
4 words	00H	{addr[31:4], 4'b0}	32	INCR8			
	04H						
	08H						
	0CH						
	10H						
	14H				{addr[31:4], 4'b0} +20H	32	INCR8
	18H						
	1CH						
8 words	00H						
	04H				{addr[31:4], 4'b0} +20H	32	INCR8
	08H						
	0CH						
	10H						
	14H						
	18H						
	1CH						

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 33.56 Descriptor Write Transfer Combination List

Type	AHB transfer		
	Address	Size	Burst
Write-back in normal mode	{addr[31:2], 2'b0} + 3H	8	SINGLE
Write-back in the case of an error	{addr[31:2], 2'b0} + 2H	8	SINGLE

33.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.
In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 33.57 Priority of a transfer request for DMACs that are performing transfer

	Next DMAC	
Current DMAC	DMAC0	DMAC1
DMAC0	2	1
DMAC1	1	2

Priority: 1 (high), 2 (low)

33.9.16 Flowcharts of Transitions to Deep Standby and Resumption from Deep Standby

33.9.16.1 Setting at transition to deep standby

The following is the flowchart for transitions to deep standby. After having completed the procedure in the following flowchart, proceed with that in the flowchart in section 52.3.4 (1), Transition to Deep Standby Mode.

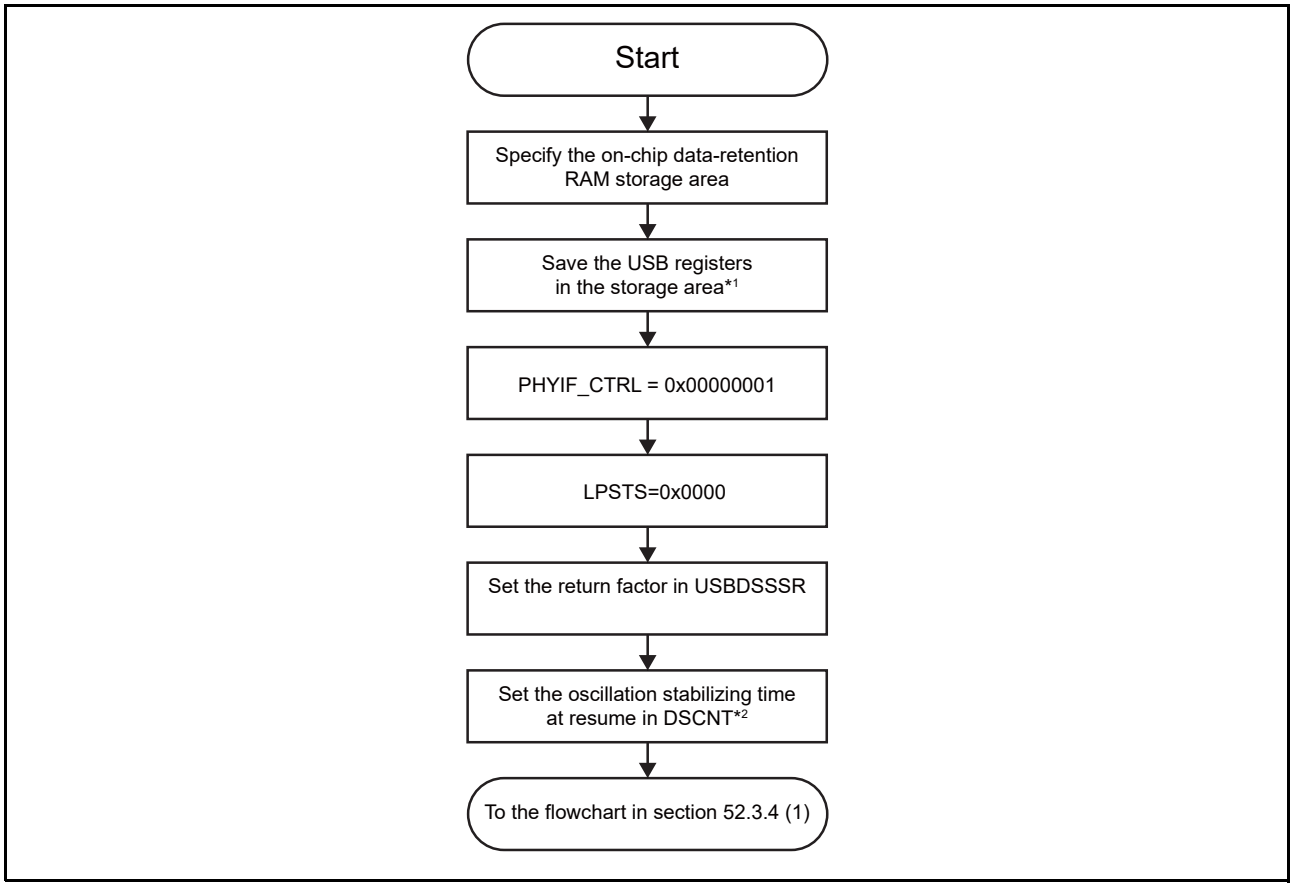

Figure 33.33 Flowchart of Transition to Deep Standby

Note 1. The registers listed in Table 33.58 must be saved.
Add registers to be saved as required even if they are not listed in the table.

Table 33.58 List of Registers to be Saved

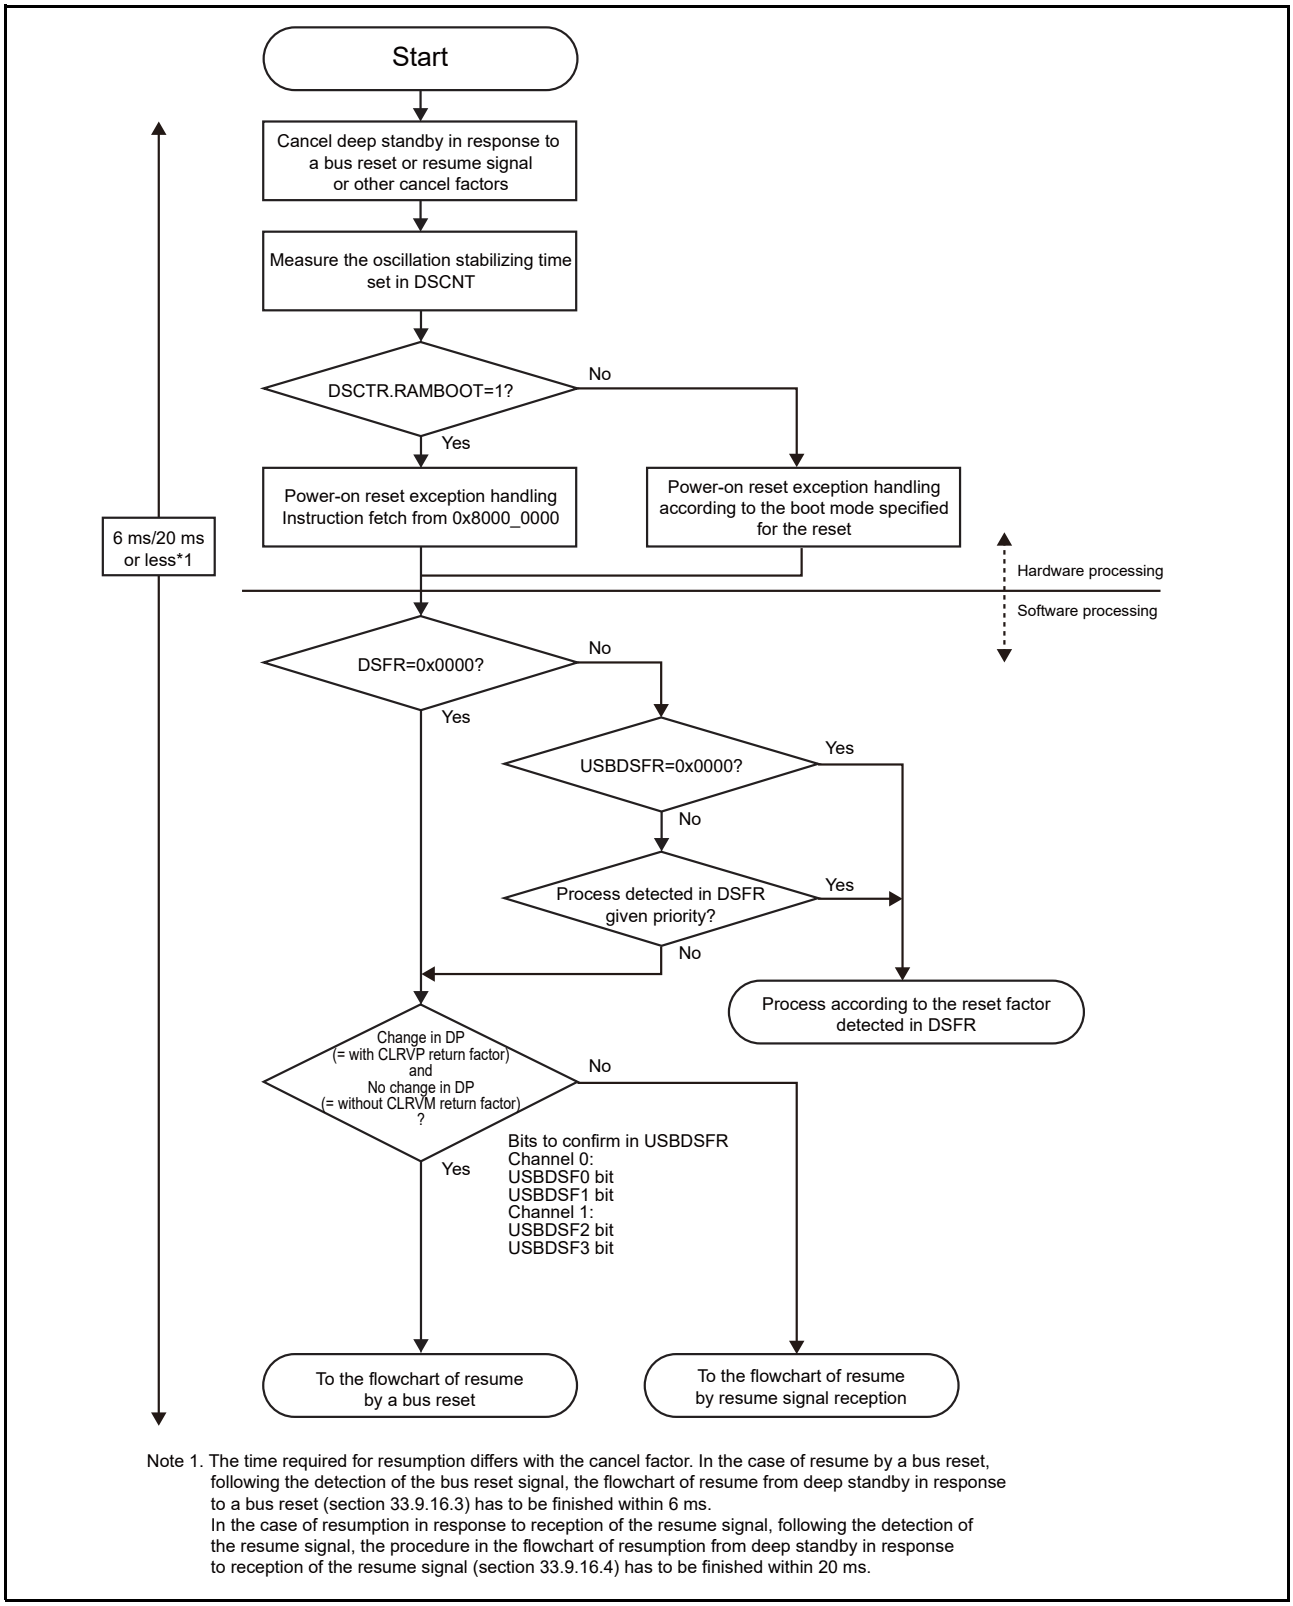
Register Name	Abbreviation	Register Name	Abbreviation
Common Control Register	COMMCTRL	DCP control register	DCPCTR
CFIFO port select register	CFIFOSEL	Pipe configuration register *	PIPECFG
Interrupt enable register 0	INTENB0	Pipe maximum packet size register *	PIPEMAXP
BRDY interrupt enable register	BRDYENB	Pipe cycle control register*	PIPEPERI
NRDY interrupt enable register	NRDYENB	Pipe buffer setting register*	PIPEBUF
BEMP interrupt enable register	BEMPENB	System configuration control register 0	SYSCFG0
Interrupt status register 0	INTSTS0	System configuration control register 1	SYSCFG1
USB address register	USBADDR	Pipe control registers (x = 1 to F)	PIPExCTR
DCP max. packet size register	DCPMAXP		

Note: * After the pipe numbers have been specified in the PIPESEL register, save the number of pipes used and their values.

Note 2. For details, see section 52.2.34, Deep standby cancel Oscillation stability count register (DSCNT).

33.9.16.2 Flowchart of determining the cancel factor of deep standby

The following shows the flowchart of determining the cancel factor, which should be proceeded after deep standby is canceled.



Note 1. The time required for resumption differs with the cancel factor. In the case of resume by a bus reset, following the detection of the bus reset signal, the flowchart of resume from deep standby in response to a bus reset (section 33.9.16.3) has to be finished within 6 ms.
In the case of resumption in response to reception of the resume signal, following the detection of the resume signal, the procedure in the flowchart of resumption from deep standby in response to reception of the resume signal (section 33.9.16.4) has to be finished within 20 ms.

Figure 33.34 Flowchart of Determining the Cancel Factor of Deep Standby

33.9.16.3 Flowchart of resumption from deep standby in response to a bus reset

The following shows the flowchart of resumption from deep standby in response a bus reset.

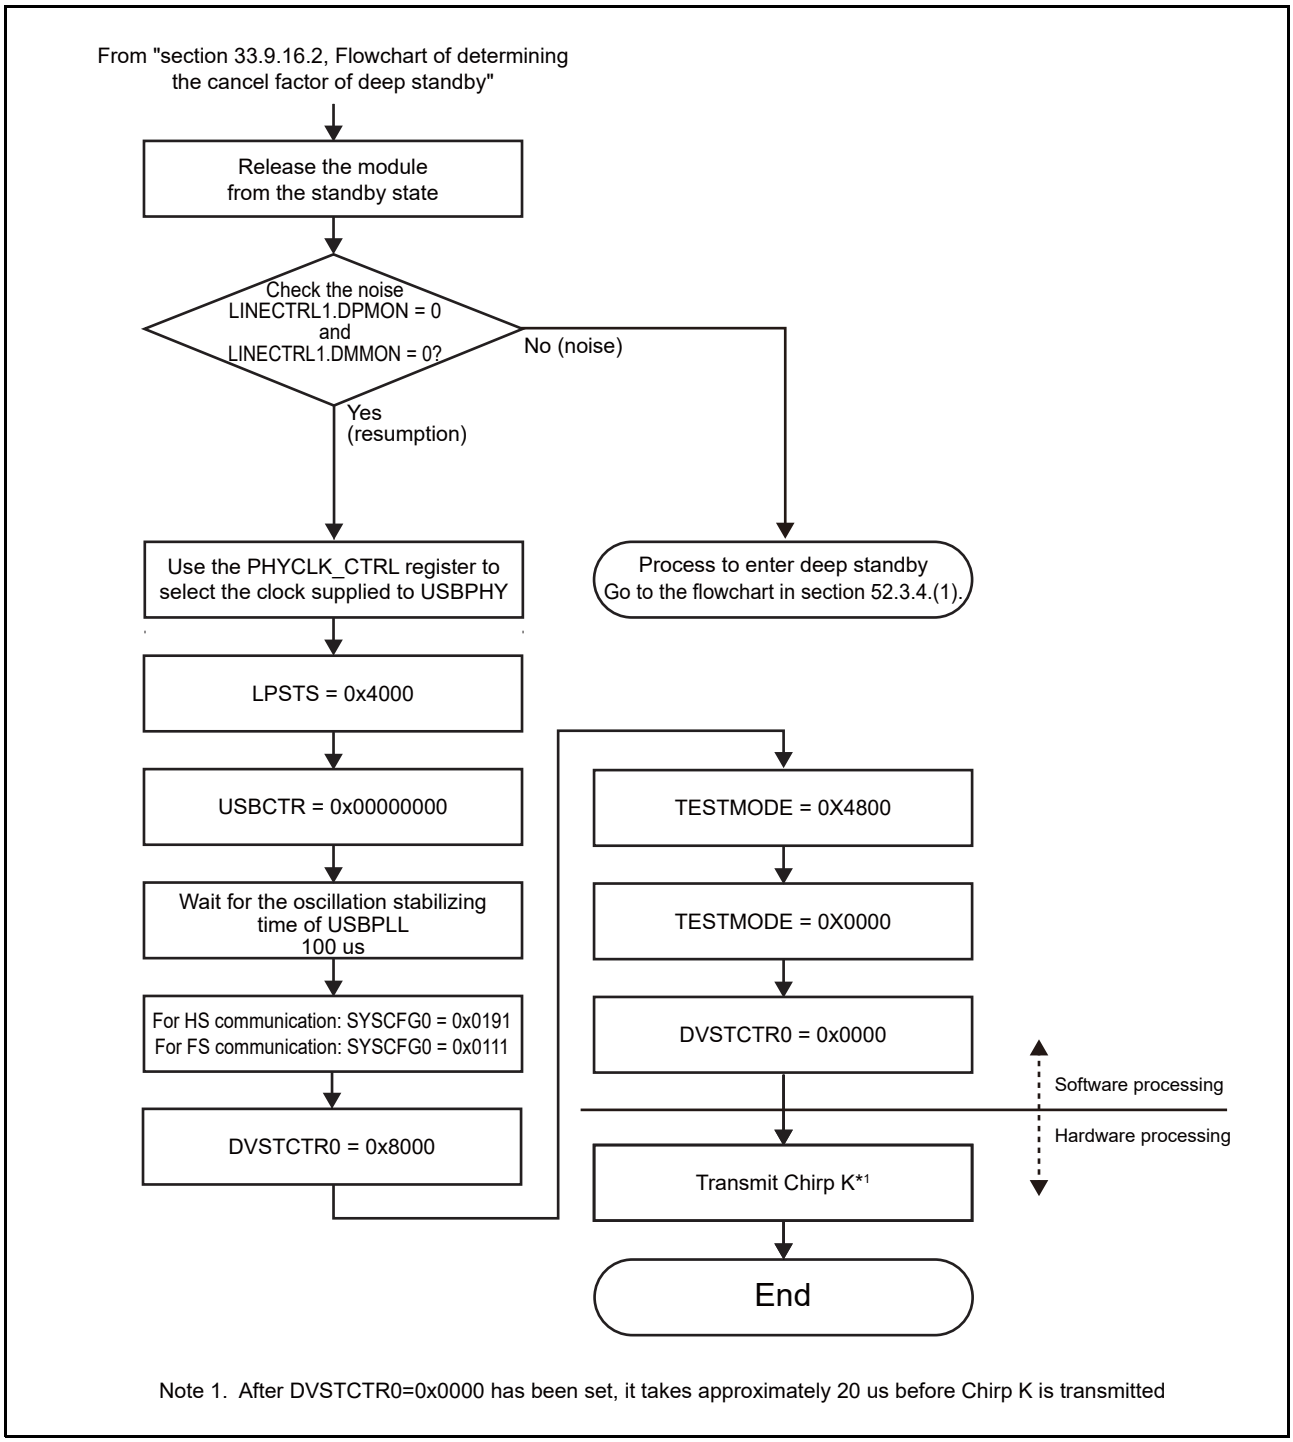


Figure 33.35 Flowchart of Resume from Deep Standby in Response to a Bus Reset

33.9.16.4 Flowchart of resumption from deep standby in response to reception of the resume signal

The following shows the flowchart of resumption from deep standby in response to reception of the resume signal.

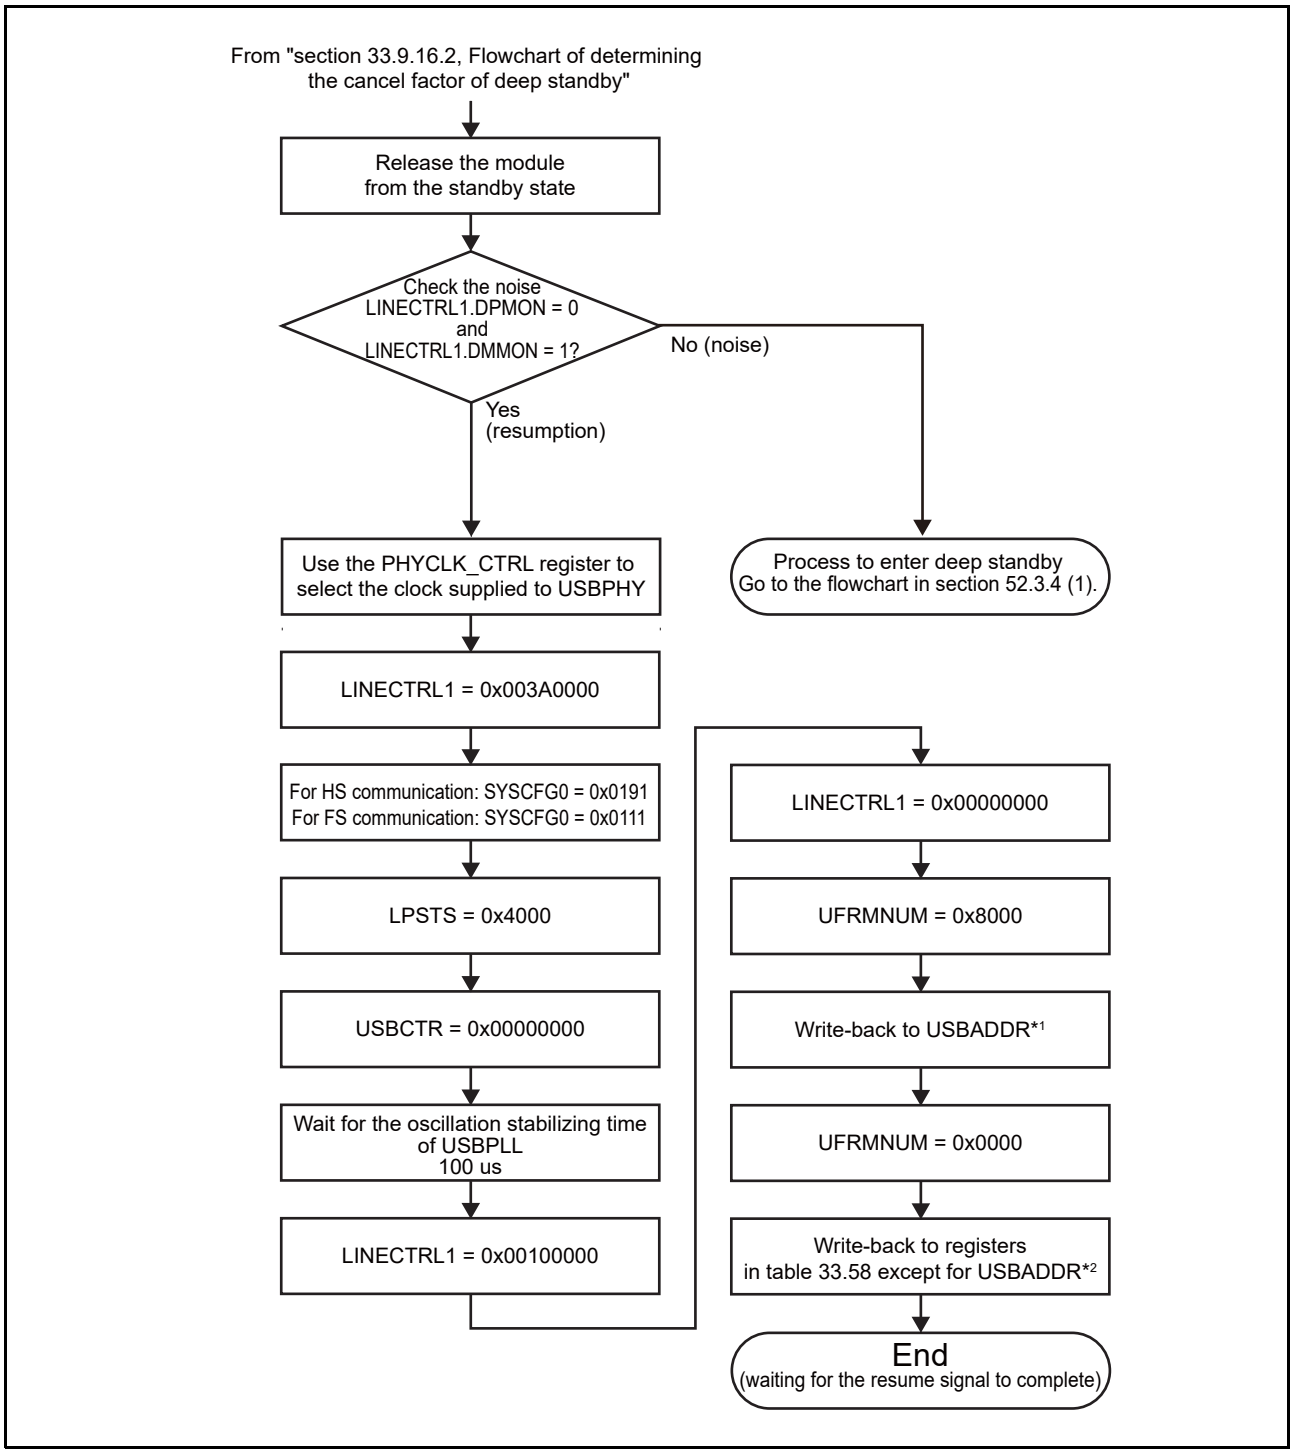

Figure 33.36 Flowchart of Resumption from Deep Standby in Response to Reception of the Resume Signal

Note 1. Writing back to the USBADDR register
Write back the USBADDR.USBADDR[6:0] value that was saved in the storage RAM area before entering deep standby to the USBADDR.USBADDR[6:0] bits.
Write back the INTSTS0.DVSQ[5:4] value that was saved in the storage RAM area before entering deep standby to the STSRECOV0[9:8] bits.
Write back 0 to the STSRECOV0[10] bit in FS operation and 1 in HS operation.

Note 2. Writing back to registers in Table 33.58 other than the USBADDR register
For the method of writing-back to the PIPECFG, PIPEMAXP, PIPEPERI, and PIPEBUF registers, see section 33.2.15, Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI).
The value to be written back to PIPExCTR depends on the value of PIPExCTR.SQMON.
When SQMON is 0, write back 1 to the SQCLR bit and write back the values that were saved in the storage RAM area before entering deep standby to the bits other than SQCLR.
When SQMON is 1, write back 1 to the SQSET bit and write back the values that were saved in the storage RAM area before entering deep standby to the bits other than SQSET.

33.9.17 Notes

33.9.17.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is 0000_1038H and SDS is 5 (256-bit), read starts from area 0000_1020H, not from address 0000_1038H. At this time, if the area from 0000_1020H to 0000_1037H contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

33.9.17.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.
To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

34. Video Display Controller 6 (1): Overview

34.1 Features

The video display controller 6 consists of the following six blocks. For the image synthesis, one plane of video image + two graphics planes, or three graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of one plane of video image + two graphics planes, or three graphics planes
5. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
6. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 6 are listed in Table 34.1.

Table 34.1 Features of video display controller 6

Item	Function
Operating frequency	Video input clock: 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications)
Input video image specification	• 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (54 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1920 pixels × 1080 lines (horizontal × vertical) Note 1. The ITU-R BT.656 and 601 standards do not include the description regarding the progressive signal. The ITU-R BT.601 standard does not include the description regarding the connection interface. Note 2. Depends on the AC characteristics of the connected device. • Examples of input video image size: XGA (1024 × 768), SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA in landscape (320 × 240), QVGA in portrait (240 × 320)
Video image recording function	• Storing the video image in the YCbCr422/YCbCr444/RGB565/RGB888 format at a rate of 1/1, 1/2, 1/4, or 1/8 field. • Maximum video image size to be stored: 1440 pixels × 1024 lines (horizontal × vertical)
Video image quality adjustment function	Contrast adjustment, brightness adjustment, horizontal noise reduction, black stretch, LTI/sharpness
Video image scaling processing	Vertical: ×1/8 to ×8, linear/hold interpolation Horizontal: ×1/8 to ×8, linear/hold interpolation IP conversion can be performed by adjusting the initial phase.
Video image rotation function	• 0/90/180/270 degree rotation in the YCbCr422/RGB565 format • Horizontal mirroring in the YCbCr422/YCbCr444/RGB565/RGB888 format

Table 34.1 Features of video display controller 6

Item	Function
Graphics	• Number of graphic planes: Three planes (graphics 0, graphics 2, and graphics 3) • Supported pixel formats: - RGB565 progressive format (α: none, R: 5 bits, G: 6 bits, B: 5 bits; 16 bits in total) - RGB888 progressive format (α: none, R: 8 bits, G: 8 bits, B: 8 bits; 24 bits in total) - α RGB1555 progressive format (α: 1 bit, R: 5 bits, G: 5 bits, B: 5 bits; 16 bits in total) - α RGB4444 progressive format (α: 4 bits, R: 4 bits, G: 4 bits, B: 4 bits; 16 bits in total) - α RGB8888 progressive format (α: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) - RGBα5551 progressive format (R: 5 bits, G: 5 bits, B: 5 bits, α: 1 bit; 16 bits in total) - RGBα8888 progressive format (R: 8 bits, G: 8 bits, B: 8 bits, α: 8 bits; 32 bits in total) - CLUT8 progressive format (CLUT: 8 bits) - CLUT4 progressive format (CLUT: 4 bits) - CLUT1 progressive format (CLUT: 1 bits) - YCbCr422 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0) - YCbCr444 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0) • Maximum image size to be read: 1440 pixels × 1440 lines (horizontal × vertical)
Graphics function	Alpha blending in rectangular area: Mixes images according to transparency rate α in the specified area (fade-in and fade-out functions are available.) Chroma-key: Mixes images using the specified RGB color and CLUT value according to transparency rate α. Alpha blending in one pixel units: Mixes images according to transparency rate α when the target graphics image is in the αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, or CLUT8/4/1 format.
	For each dot, the priority among the α values of the above functions is as follows: Alpha blending in rectangular area > Chroma-key > Alpha blending in one pixel units
Output video image size	Maximum output video image size to be set*: 1999 pixels × 2035 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the display panel. Examples of output video image size: • XGA (1024 × 768) • SVGA (800 × 600), WVGA (800 × 480), • VGA (640 × 480), WQVGA (480 × 240), • QVGA size in landscape (320 × 240) • QVGA size in portrait (240 × 320)
Output video image format	• RGB888 progressive video output (24-bit parallel output) • RGB666 progressive video output (18-bit parallel output) • RGB565 progressive video output (16-bit parallel output) • RGB888 progressive video output (8-bit serial output)
Panel output adjustment	Panel brightness/contrast adjustment, RGB gamma correction, dither processing, output format conversion
Sync signal output	Control signal output for the TFT-LCD panel
Interrupt output	• Vsync signal for video image input/output • Line interrupt output (can be output on a desired line.) • Erroneous Vsync cycle detection signal for video input • Field write completion signal • Overflow/underflow signal for the internal buffer

34.2 Block Diagram

Figure 34.1 to Figure 34.3 show the entire block diagram of this module.

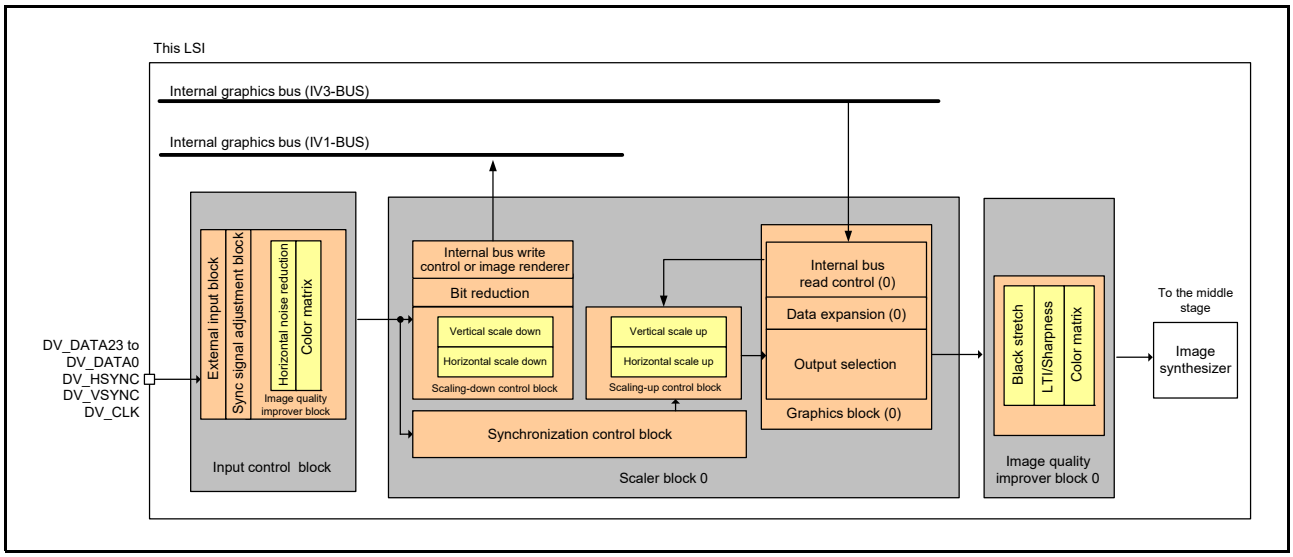

Figure 34.1 Video Display Controller 6 Former Stage Block Diagram

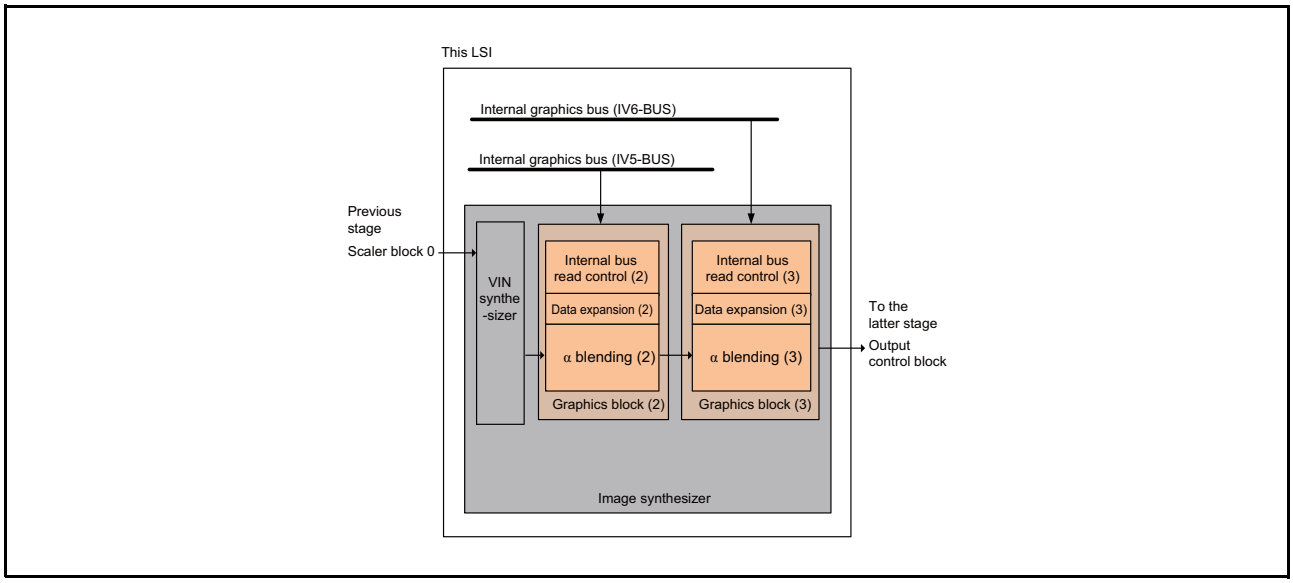

Figure 34.2 Video Display Controller 6 Middle Stage Block Diagram

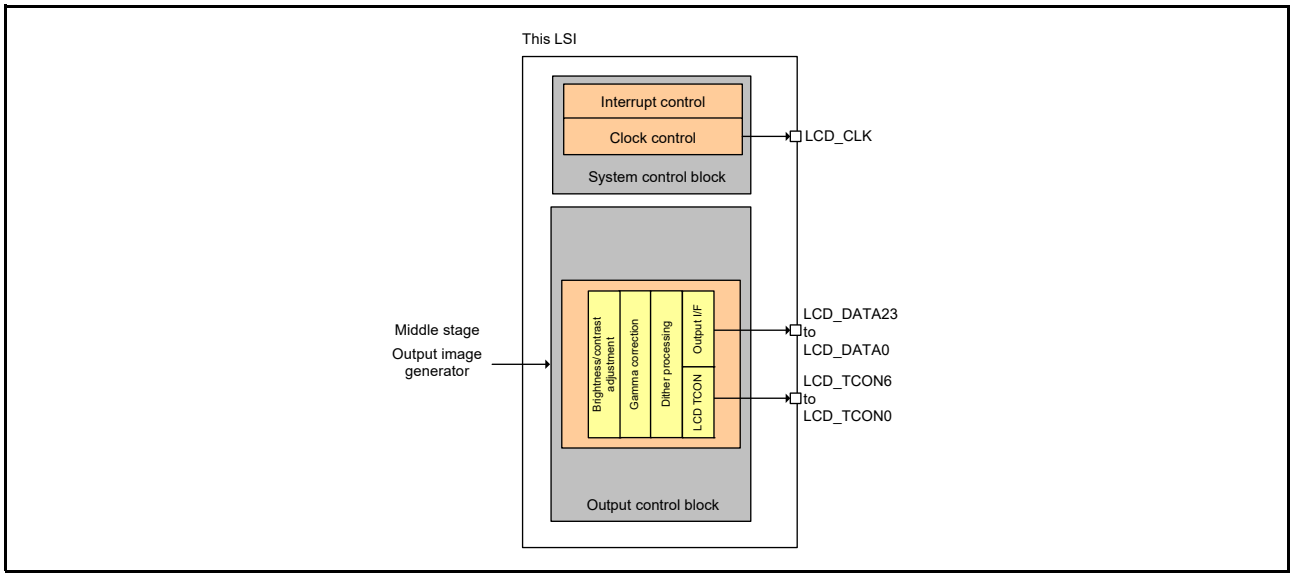

Figure 34.3 Video Display Controller 6 Latter Stage Block Diagram

34.3 Input/Output Pins

Table 34.2 shows the pin configuration.

Table 34.2 Input/Output Pins

Symbol	I/O	Pin Name	Function
DV0_CLK	Input	External input clock 0	External input 0 clock pin
DV0_VSYNC	Input	External input Vsync 0	External input 0 Vsync signal pin
DV0_HSYNC	Input	External input Hsync 0	External input 0 Hsync signal pin
DV0_DATA23 to DV0_DATA0	Input	External input video image data 0	External input 0 video image data pin
LCD0_CLK	Output	Panel clock 0	Panel output 0 clock pin
LCD0_DATA23 to LCD0_DATA0	Output	Video image data 0 for panel	Panel output 0 video image data pin
LCD0_TCON6 to LCD0_TCON0	Output	Control signal 0 for panel	Panel output 0 timing control pin
LCD0_EXTCLK	Input	Panel clock source 0	Panel clock source 0 input pin

34.4 Clocks

There are two clocks to be mainly used by the video display controller 6: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). The DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD0_EXTCLK peripheral bus clock 1 (P1φ), and LVDS PLL output clock*1 with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] and SYSCNT_PANEL_CLK.PANEL_OCKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

Note 1. For details of LVDS PLL , refer to section 41, LVDS Output Interface.

34.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

34.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel and the pointer buffer is not in use, always use this mode. However, the output Hsync signal is free running even in this mode. Figure 34.4 shows the timing of external input Vsync signal.

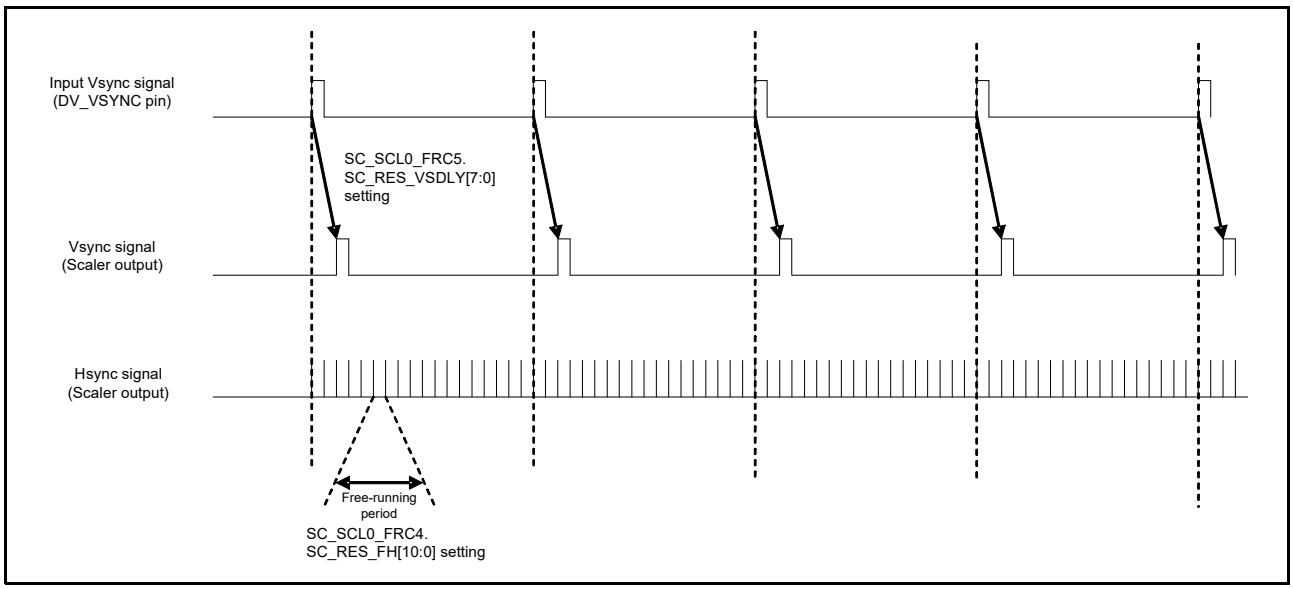

Figure 34.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

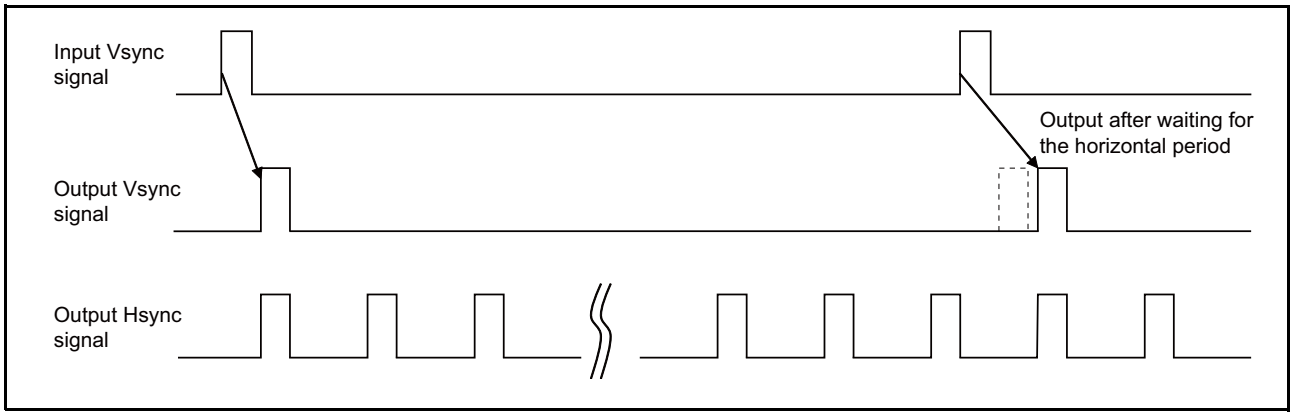

Figure 34.5 Detailed Timing Chart for Generation of the Output Vsync Signal

34.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with SC_SCL0_FRC4.SC_RES_FV[10:0]. The output Hsync signal is also free running. Figure 34.6 shows the timing.

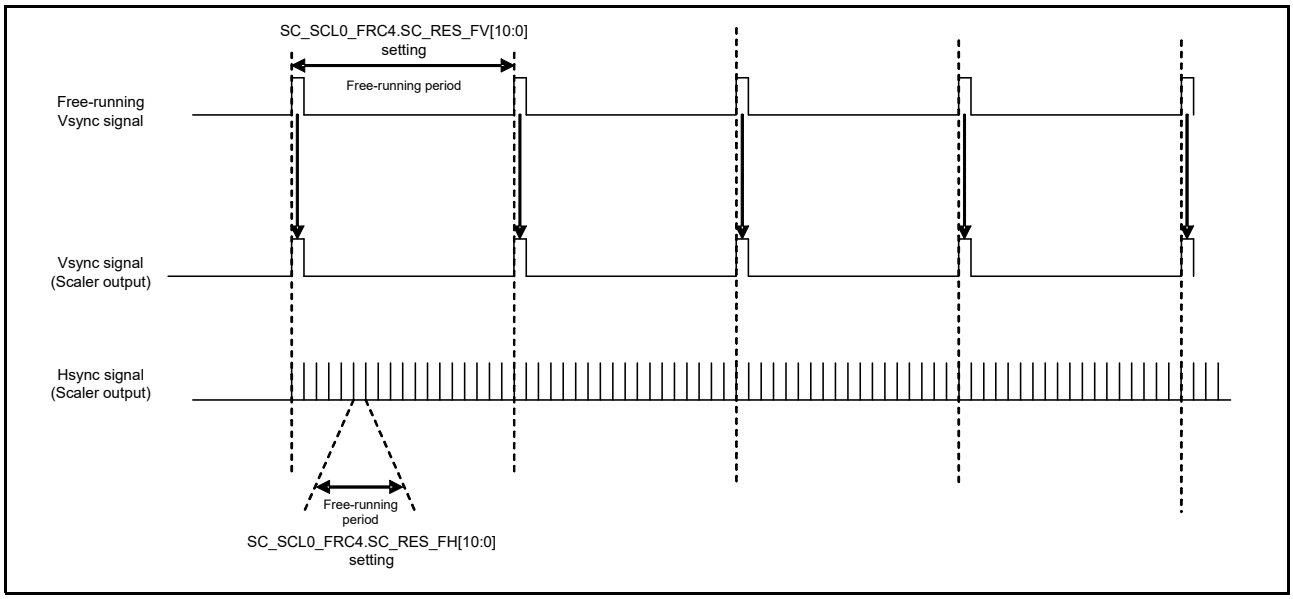

Figure 34.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

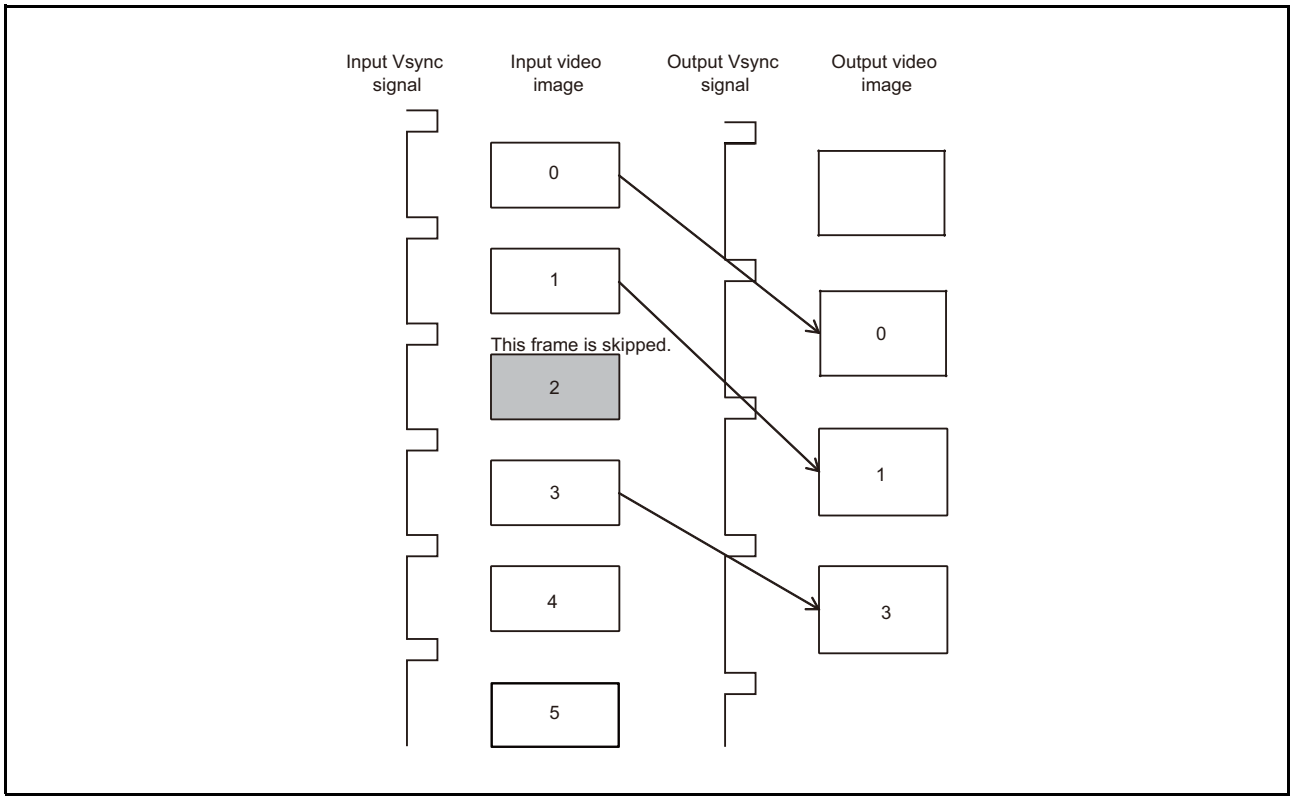

Figure 34.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

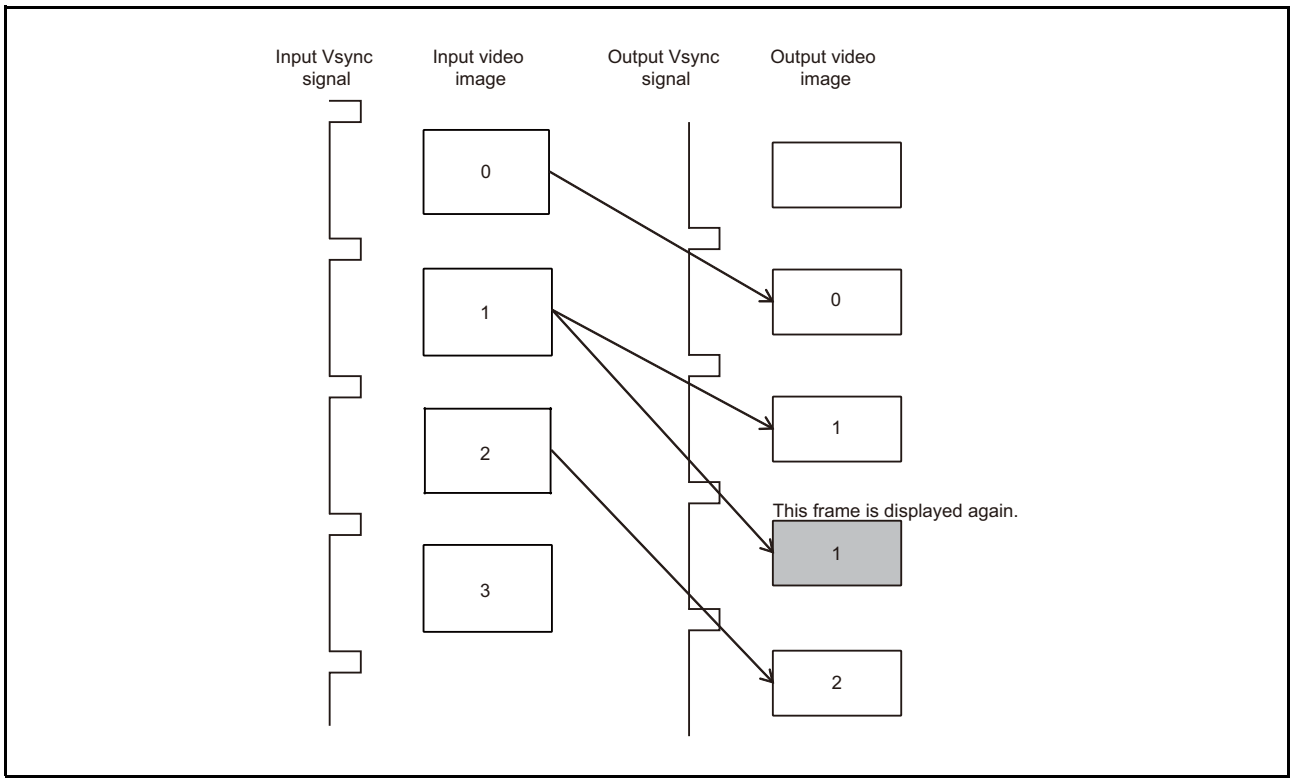

Figure 34.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

34.5.3 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

35. Video Display Controller 6 (2): Input Controller

35.1 Input Controller Functions

35.1.1 Overview of Functions

The input controller performs the on/off control of input supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

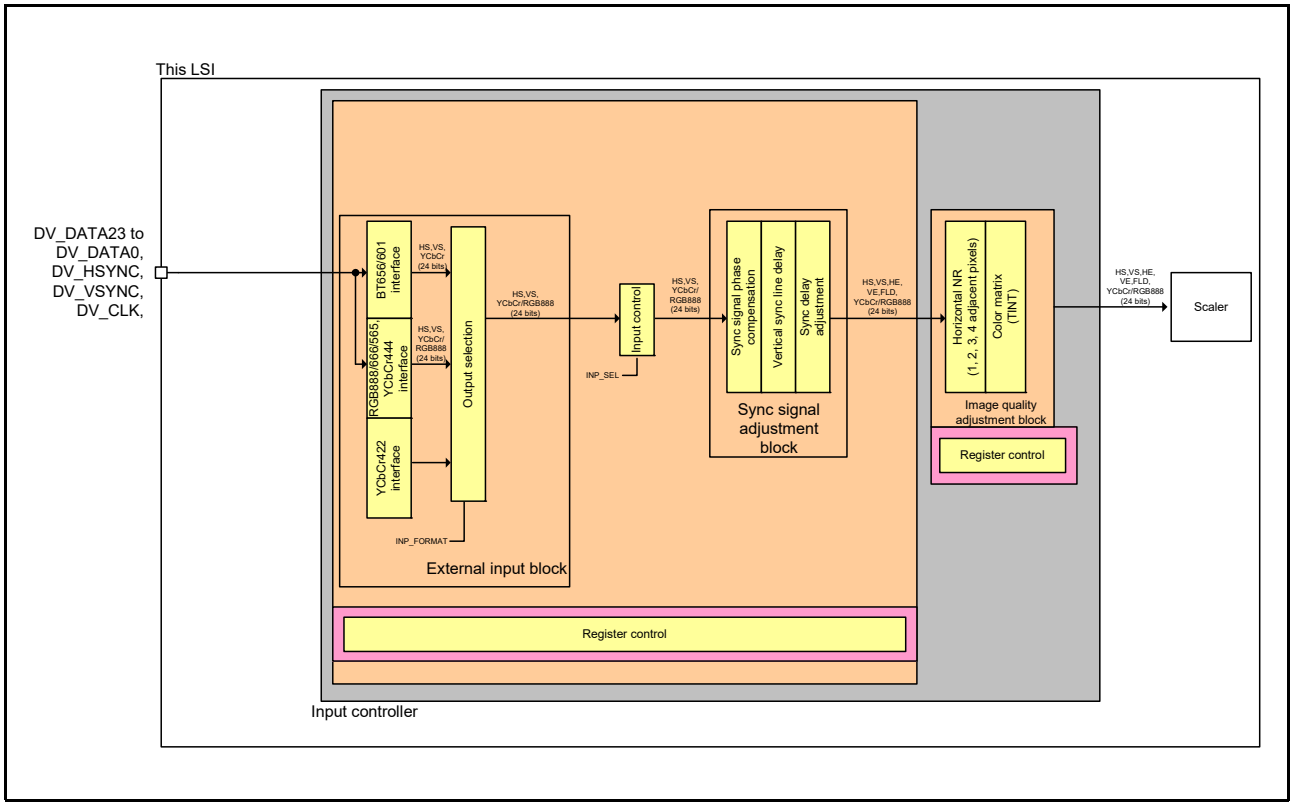

Figure 35.1 Functional Block Diagram of Input Controller

35.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 35.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMGCNT_UPDATE	IMGCNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

35.1.3 Controlling Input

The input controller performs the on/off control of input supplied via the external input pins.

Table 35.2 Input Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_SEL	0	On/Off Control of Input Supplied via External Input Pin 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.

35.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 35.3 Externally Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_ SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_ SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

35.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 35.4 Externally Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

Figure 35.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_ES_EDGE bits are 0.

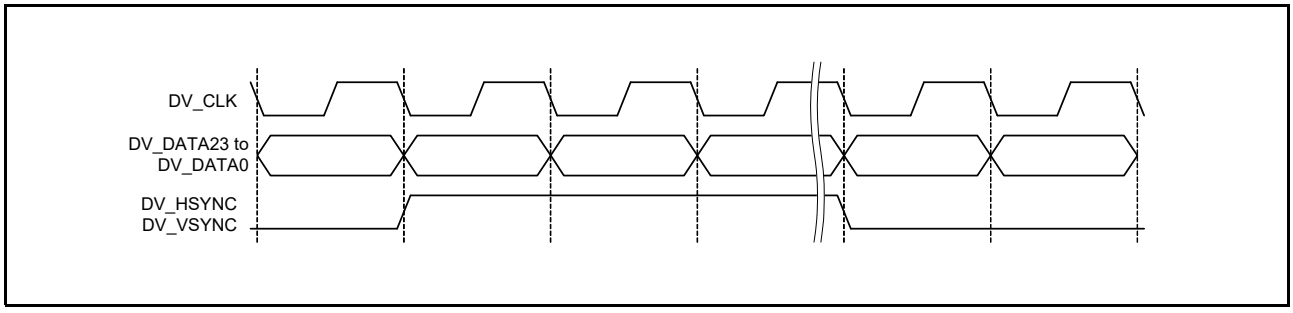

Figure 35.2 Typical Input Timing of Externally Input Signals (Clock Phase)

35.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 35.5 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_ SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_ SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

35.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 35.6.

Table 35.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	0	0	0	0
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]
DV_DATA18	Cr/ROUT[2]	Cb/BOUT[2]	Cr/ROUT[5]	Cb/BOUT[5]
DV_DATA17	Cr/ROUT[1]	Cb/BOUT[1]	Cr/ROUT[6]	Cb/BOUT[6]
DV_DATA16	Cr/ROUT[0]	Cb/BOUT[0]	Cr/ROUT[7]	Cb/BOUT[7]
DV_DATA15	Y/GOUT[7]	Y/GOUT[7]	Y/GOUT[0]	Y/GOUT[0]
DV_DATA14	Y/GOUT[6]	Y/GOUT[6]	Y/GOUT[1]	Y/GOUT[1]
DV_DATA13	Y/GOUT[5]	Y/GOUT[5]	Y/GOUT[2]	Y/GOUT[2]
DV_DATA12	Y/GOUT[4]	Y/GOUT[4]	Y/GOUT[3]	Y/GOUT[3]
DV_DATA11	Y/GOUT[3]	Y/GOUT[3]	Y/GOUT[4]	Y/GOUT[4]
DV_DATA10	Y/GOUT[2]	Y/GOUT[2]	Y/GOUT[5]	Y/GOUT[5]
DV_DATA9	Y/GOUT[1]	Y/GOUT[1]	Y/GOUT[6]	Y/GOUT[6]
DV_DATA8	Y/GOUT[0]	Y/GOUT[0]	Y/GOUT[7]	Y/GOUT[7]
DV_DATA7	Cb/BOUT[7]	Cr/ROUT[7]	Cb/BOUT[0]	Cr/ROUT[0]
DV_DATA6	Cb/BOUT[6]	Cr/ROUT[6]	Cb/BOUT[1]	Cr/ROUT[1]
DV_DATA5	Cb/BOUT[5]	Cr/ROUT[5]	Cb/BOUT[2]	Cr/ROUT[2]
DV_DATA4	Cb/BOUT[4]	Cr/ROUT[4]	Cb/BOUT[3]	Cr/ROUT[3]
DV_DATA3	Cb/BOUT[3]	Cr/ROUT[3]	Cb/BOUT[4]	Cr/ROUT[4]
DV_DATA2	Cb/BOUT[2]	Cr/ROUT[2]	Cb/BOUT[5]	Cr/ROUT[5]
DV_DATA1	Cb/BOUT[1]	Cr/ROUT[1]	Cb/BOUT[6]	Cr/ROUT[6]
DV_DATA0	Cb/BOUT[0]	Cr/ROUT[0]	Cb/BOUT[7]	Cr/ROUT[7]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 35.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:2] × 255 ÷ 63

R[7:0] = ROUT[7:2] × 255 ÷ 63

Table 35.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

INP_FORMAT[2:0]	1	1	1	1
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA17	ROUT[7]	BOUT[7]	ROUT[2]	BOUT[2]

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 35.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:3] × 255 ÷ 31

R[7:0] = ROUT[7:3] × 255 ÷ 31

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 35.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 35.1.12, BT656/BT601/YCbCr422 Format Setting.

Figure 35.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

35.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devises which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 35.12 in section 35.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 35.14 lists the timing.

Table 35.14 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 2
	1 (Field 2)	2 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 35.11 and Figure 35.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

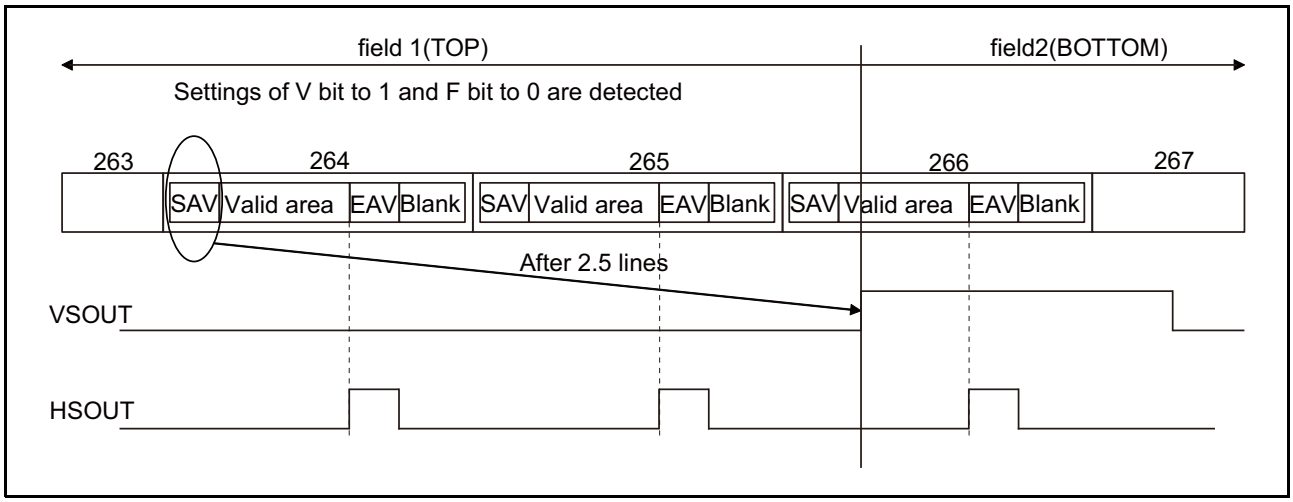

Figure 35.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

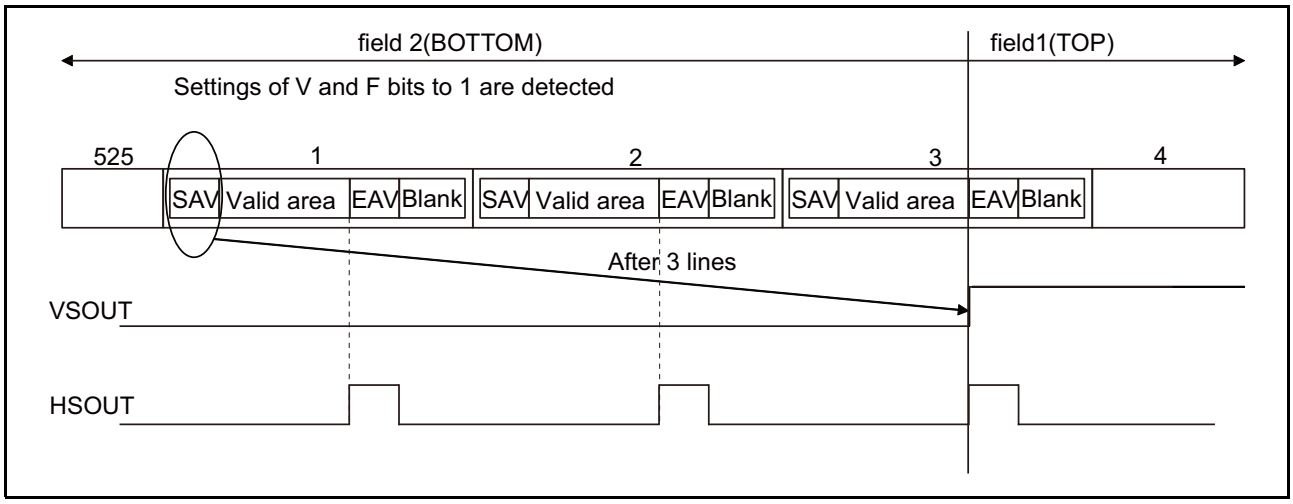

Figure 35.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 35.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format. Figure 35.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The filed is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

		One Horizontal Period

Figure 35.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

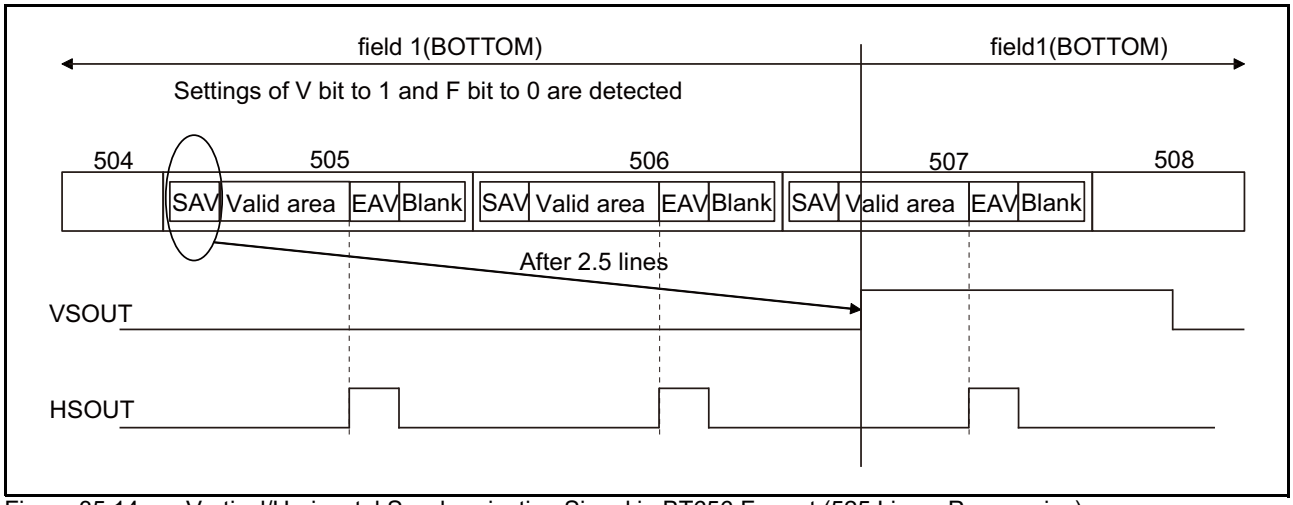

Figure 35.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

35.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 35.15 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[11:0] bits.

The INP_FH50[11:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 35.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 35.16 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

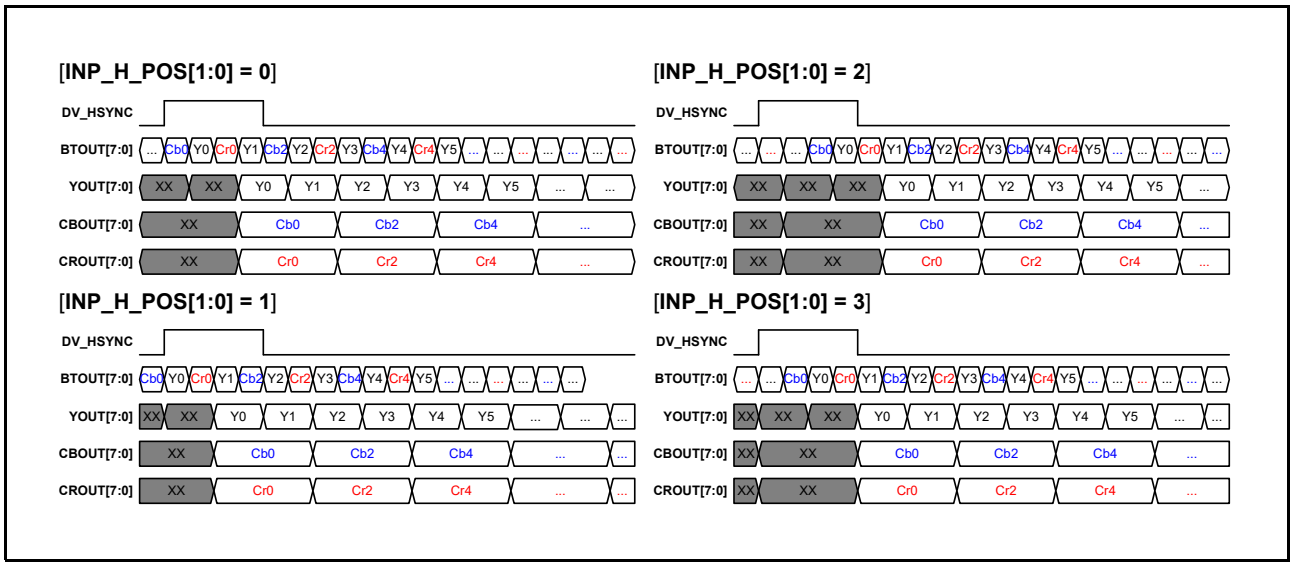

Figure 35.15 YCbCr Data Expansion for BT656/BT601 Input

Table 35.17 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

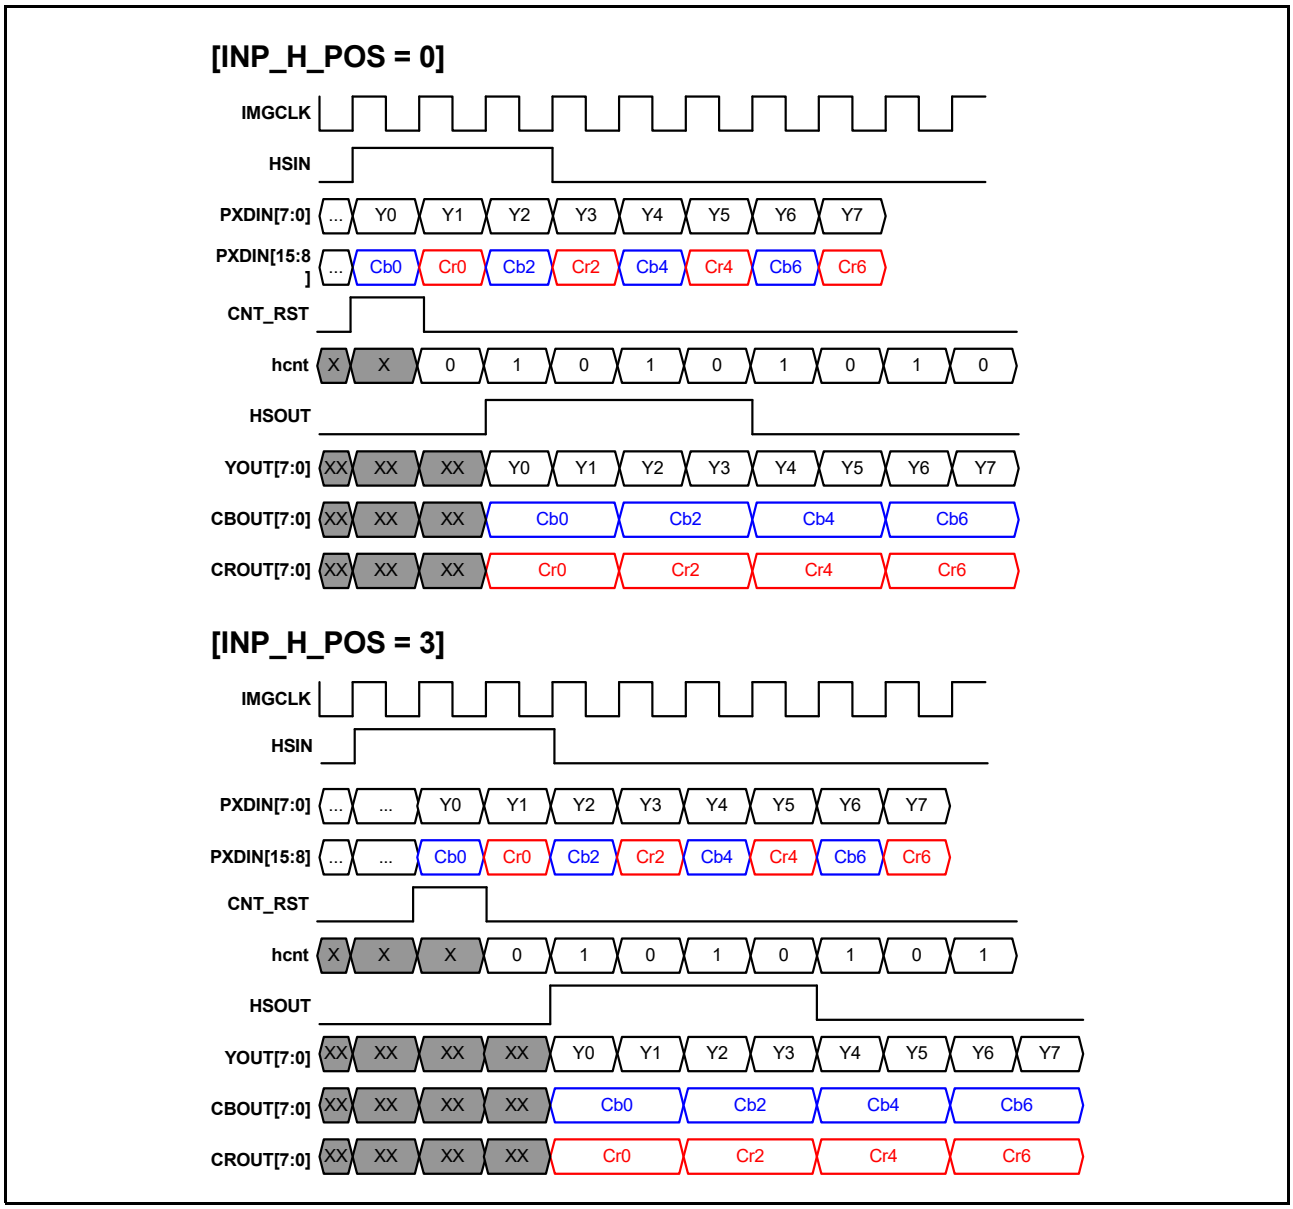

Figure 35.16 YCbCr Data Expansion for YCbCr422 Input

Table 35.18 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

35.1.13 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 35.19.

Table 35.19 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: 87.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 5 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1080lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more *1
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: 1920 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more *2
Number of vertical lines (V_BP+V_ACTIVE+V_FP)	Between vertical synchronization signals: 2047 lines or less
Number of horizontal pixels (H_BP+H_ACTIVE+H_FP)	Between horizontal synchronization signals: 4095 CLK or less

Note 1. When V_FP is below four lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least four lines.

Note 2. When H_FP is below 16 cycles, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 cycles of the pixel clock.

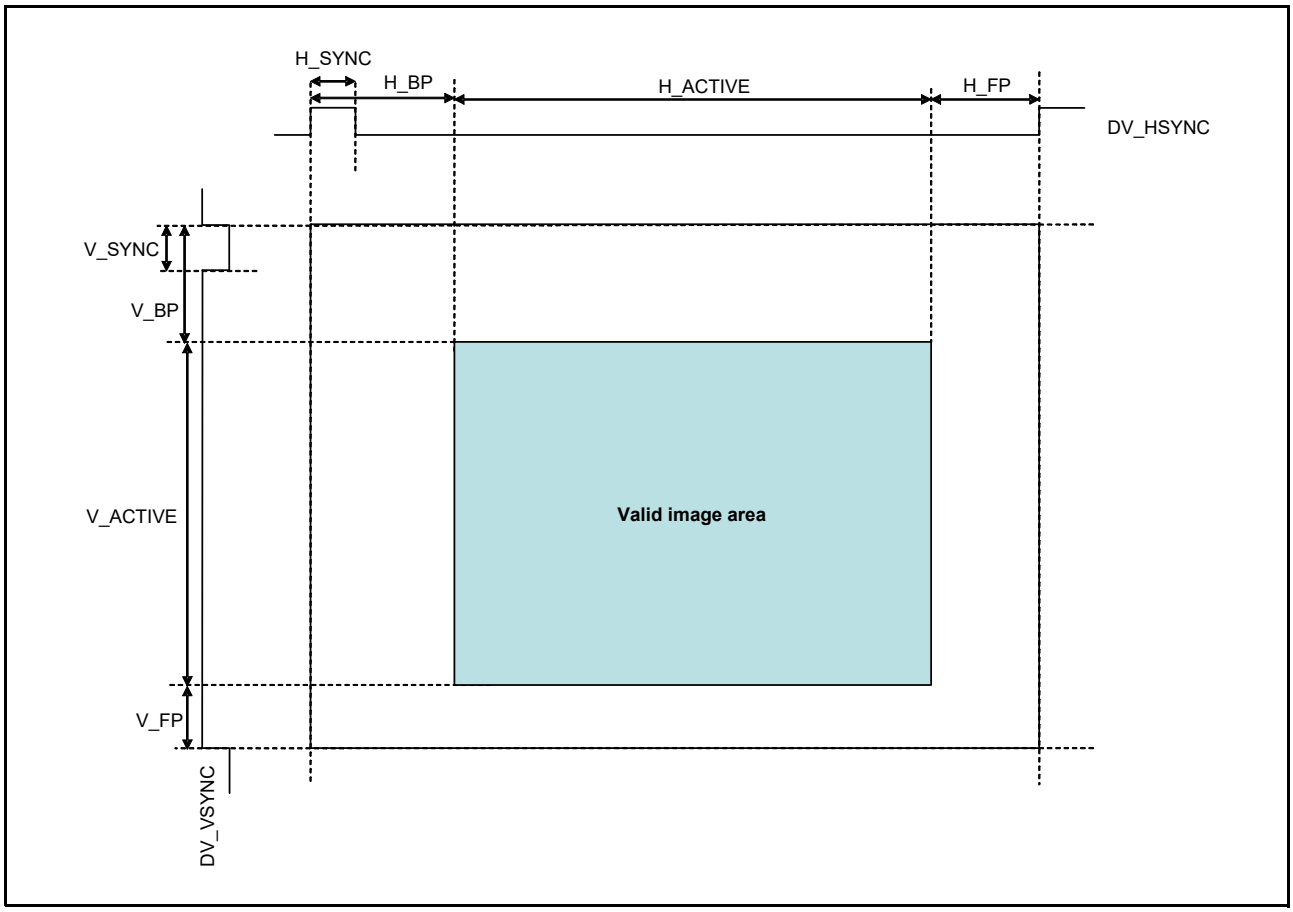

Figure 35.17 YCbCr/RGB Signal Reception Timing

35.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

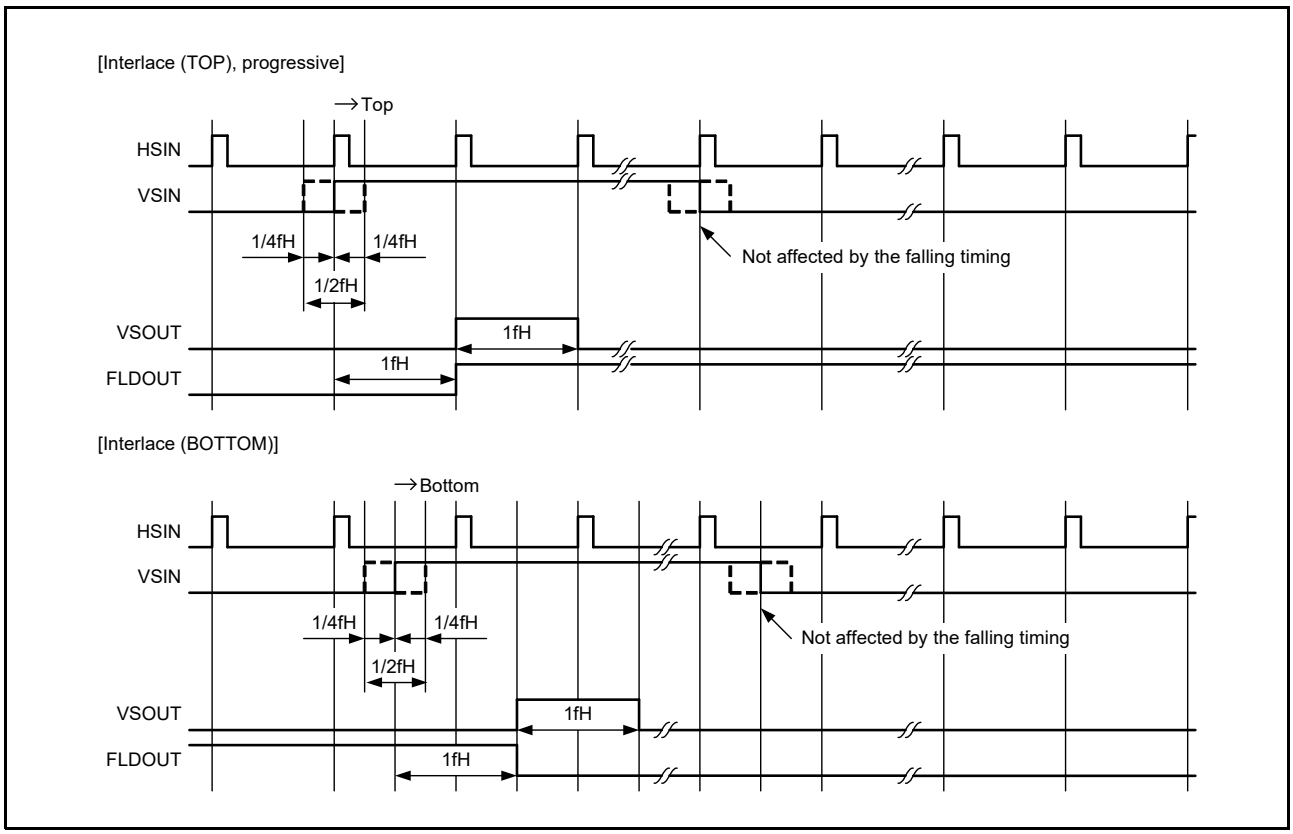

Figure 35.18 Vsync Signal Phase Adjustment

The timings of 1/2fH Vsync signal phase and 1/4fH Vsync signal phase are set with INP_FH50[11:0] and INP_FH25[11:0], respectively.

Table 35.20 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[11:0]	858	Vsync Signal 1/2fH Phase Timing Should be 1/2 the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[11:0]	429	Vsync Signal 1/4fH Phase Timing Should be 1/4 the horizontal cycle.

35.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

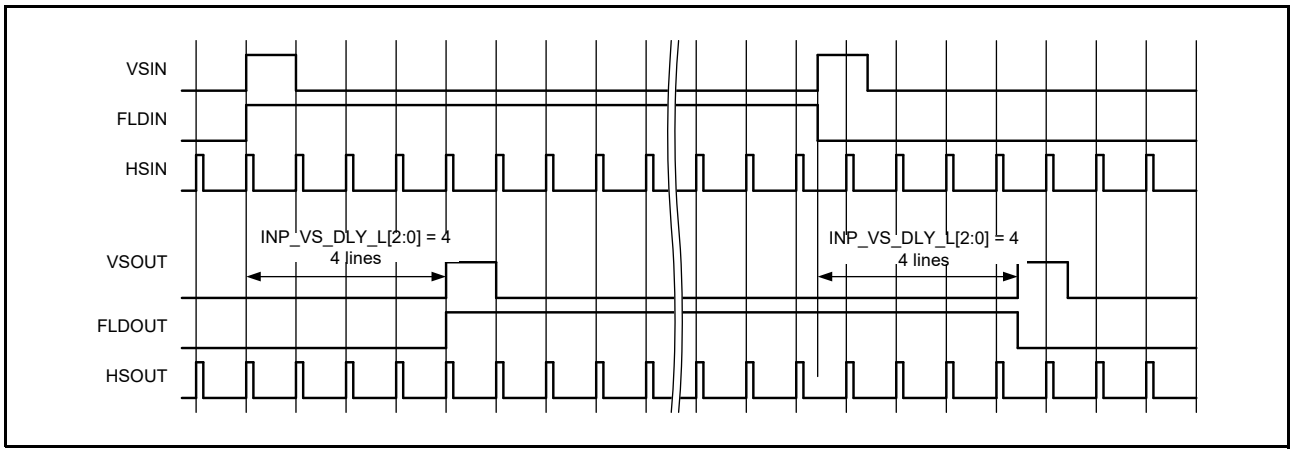

Figure 35.19 Timing of Vsync Signal Delay in Line Units

Table 35.21 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

35.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 35.22 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

35.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$BPF_{(1)} = \frac{1}{4}(-1 \times Z_{(-1)}, 2 \times Z_{(0)}, -1 \times Z_{(+1)})$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$BPF_{(2)} = \frac{1}{4}(-1 \times Z_{(-2)}, 2 \times Z_{(0)}, -1 \times Z_{(+2)})$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$BPF_{(3)} = \frac{1}{4}(-1 \times Z_{(-3)}, 2 \times Z_{(0)}, -1 \times Z_{(+3)})$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$BPF_{(4)} = \frac{1}{4}(-1 \times Z_{(-4)}, 2 \times Z_{(0)}, -1 \times Z_{(+4)})$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ In the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

ABS(BPF(n)) ≤ absolute value of detected noise amount when ABS(BPF(n)) ≤ NR1D_Y/CB/CR_TH:
NOISE_ABS = ABS(BPF(n))
ABS(BPF(n)) > absolute value of detected noise amount when ABS(BPF(n)) > NR1D_Y/CB/CR_TH:
NOISE_ABS = NR1D_Y/CB/CR_TH

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

Computation when the amount of detected noise (BPF(n)) is negative (−):
$DOUT = DIN + NOISE\_ABS \div 2^{(NR1D\_Y/CB/CR\_GAIN+1)}$
Computation when the amount of detected noise (BPF(n)) is positive (+):
$DOUT = DIN - NOISE\_ABS \div 2^{(NR1D\_Y/CB/CR\_GAIN+1)}$

Table 35.23 Horizontal Noise Reduction

Register Name	Bit Name	Initial Value	Description
IMGCNT_NR_CNT0	NR1D_MD	1	Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode
IMGCNT_NR_CNT0	NR1D_ON	0	Noise Reduction On/Off Control 0: Noise Reduction Off 1: Noise Reduction On
IMGCNT_NR_CNT0	NR1D_Y_TAP[1:0]	0	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT0	NR1D_Y_TH[6:0]	8	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT0	NR1D_Y_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CB_TAP[1:0]	0	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CB_TH[6:0]	8	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CB_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CR_TAP[1:0]	0	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CR_TH[6:0]	8	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CR_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

35.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128
CBBIN_A = CBBIN + IMGCNT_MTX_B – 128
CRRIN_A = CRRIN + IMGCNT_MTX_R – 128
YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256
CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256
CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

(2) GBR to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128
CBBIN_A = CBBIN + IMGCNT_MTX_B – 128
CRRIN_A = CRRIN + IMGCNT_MTX_R – 128
YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A +IMGCNT_MTX_GR×CRRIN_A) ÷ 256
CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128
CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 35.24 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	0.587	IMGCNT_ MTX_GG = 150	0.114	IMGCNT_MTX_GB = 29	0.299	IMGCNT_MTX_GR = 77
CBBOUT	–0.331	IMGCNT_ MTX_BG = 1963	0.500	IMGCNT_MTX_BB = 128	–0.169	IMGCNT_MTX_BR = 2005
CRROUT	–0.419	IMGCNT_ MTX_RG = 1941	–0.081	IMGCNT_MTX_RB = 2027	0.500	IMGCNT_MTX_RR = 128

(3) YCbCr to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128
CBBIN_A = CBBIN – 128
CRRIN_A = CRRIN – 128
YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A +IMGCNT_MTX_GR×CRRIN_A) ÷ 256
CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256
CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

Table 35.25 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	1.000	IMGCNT_ MTX_GG = 256	–0.344	IMGCNT_MTX_GB = 1960	–0.714	IMGCNT_MTX_GR = 1865
CBBOUT	1.000	IMGCNT_ MTX_BG = 256	1.772	IMGCNT_MTX_BB = 454	0.000	IMGCNT_MTX_BR = 0
CRROUT	1.000	IMGCNT_ MTX_RG = 256	0.000	IMGCNT_MTX_RB = 0	1.402	IMGCNT_MTX_RR = 359

(4) YCbCr to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128
CBBIN_A = CBBIN – 128
CRRIN_A = CRRIN – 128
YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256
CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128
CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 35.26 YCbCr to GBR Conversion

Register Name	Bit Name	Initial Value	Description

35.2 Register Descriptions

Table 35.27 and Table 35.28 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 35.27 Register Configuration of Input Controller

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

35.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	INP_FH50[11:0]											
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	INP_FH25[11:0]											
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	INP_FH50 [11:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	INP_FH25 [11:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[11:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The INP_FH25[11:0] bits are updated when the INP_IMG_UPDATE bit is 1.

35.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	INP_VS_DLY_L[2:0]			INP_FLD_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INP_VS_DLY[7:0]								INP_HS_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

35.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_VEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_VEN	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

35.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NR1D_MD	—	—	—	NR1D_ON
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_Y_TH[6:0]							—	—	NR1D_Y_TAP[1:0]		—	—	NR1D_Y_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NR1D_MD	1	R/W	Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NR1D_ON	0	R/W	Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_Y_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_Y_TAP[1:0]	0	R/W	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_Y_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	NR1D_CB_TH[6:0]							—	—	NR1D_CB_TAP[1:0]		—	—	NR1D_CB_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_CR_TH[6:0]							—	—	NR1D_CR_TAP[1:0]		—	—	NR1D_CR_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	NR1D_CB_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB]
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	NR1D_CB_TAP[1:0]	0	R/W	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	NR1D_CB_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_CR_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_CR_TAP[1:0]	0	R/W	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_CR_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD[1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_GB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_GB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GR[10:0]	0	R/W	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.12 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_B[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_B[7:0]	128	R/W	Offset (DC) Adjustment of Cb/B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_BG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.13 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_BB[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_BB[10:0]	256	R/W	Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_BR[10:0]	0	R/W	Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.14 Image Quality Adjustment Block Matrix CRR Adjustment Register 0 (IMGCNT_MTX_CRR_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_R[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_RG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_R[7:0]	128	R/W	Offset (DC) Adjustment of Cr/R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_RG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.15 Image Quality Adjustment Block Matrix CRR Adjustment Register 1 (IMGCNT_MTX_CRR_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_RB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_RR[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_ MTX_RB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_RR[10:0]	256	R/W	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.3 Usage Methods

35.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 35.29 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[11:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[11:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 35.30 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[11:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[11:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

35.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 35.31 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

36. Video Display Controller 6 (3): Scaler

36.1 Scaler

36.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

In scaler 0, either enlargement process or graphics 0 process can be used.

The functional block diagram of scaler 0 is shown below.

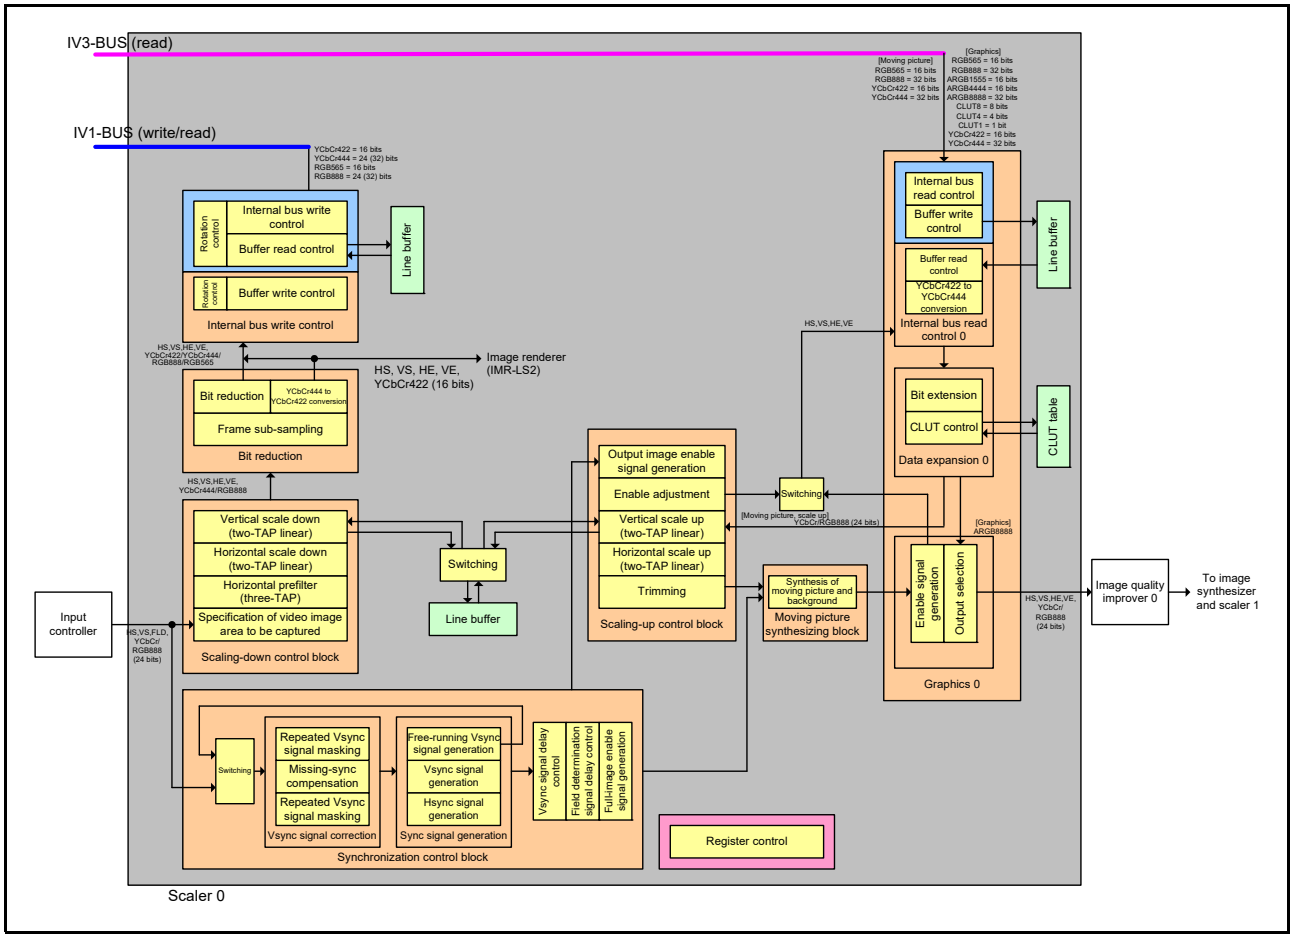

Figure 36.1 Functional Block Diagram of Scaler 0

The registers and bits in the scaler are named SC0_xxxx and those in the graphics blocks are named GR0_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

36.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 36.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

36.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 36.2 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

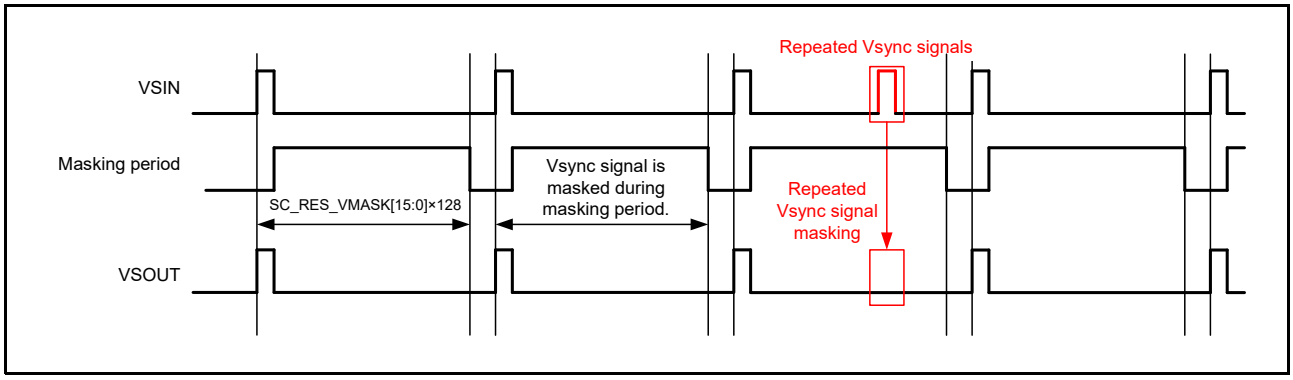

Figure 36.2 Timing for Masking Repeated Vsync Signals

Table 36.3 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

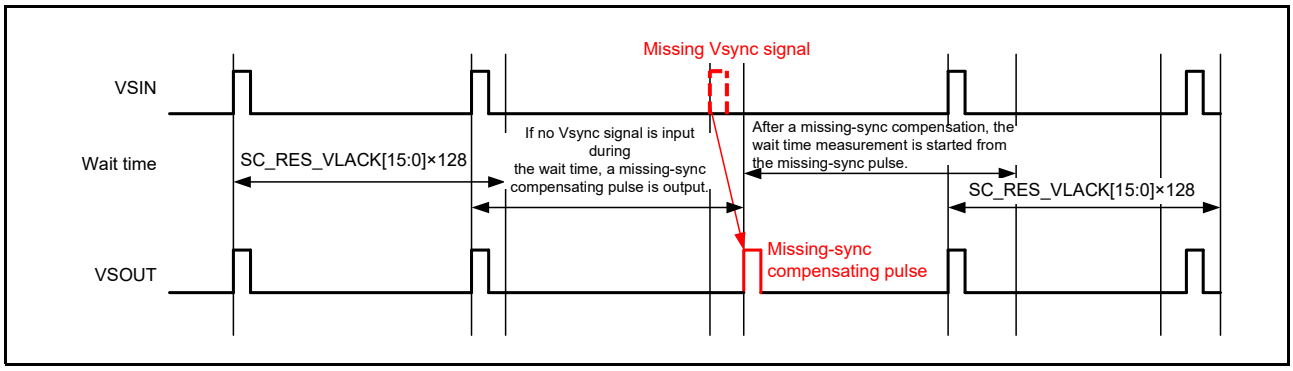

Figure 36.3 Compensation of Missing Vsync Signals

Table 36.4 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

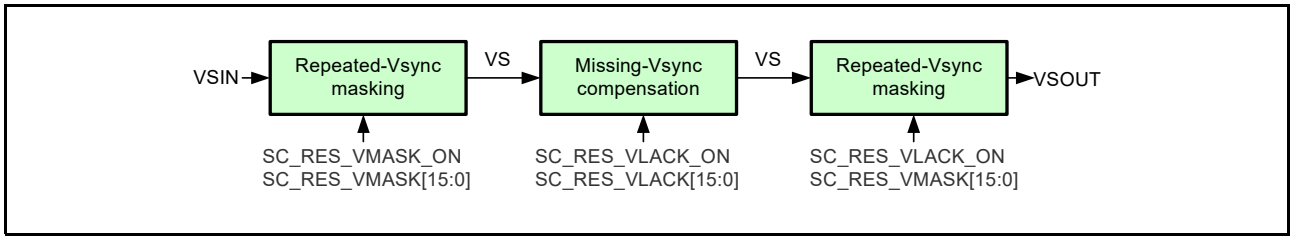

Figure 36.4 Repeated-Vsync Masking and Missing-Vsync Compensation

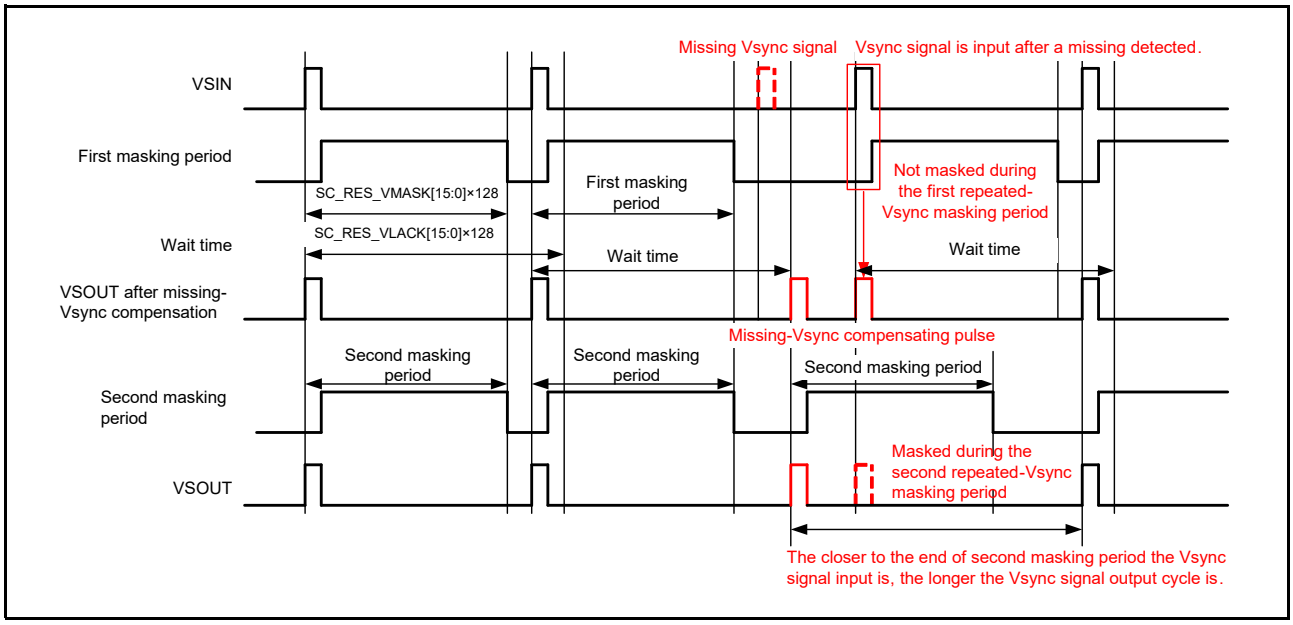

Figure 36.5 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]
Vsync period [usec] = horizontal period [usec] × (SC_RES_FV + 1)

Table 36.5 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH +1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 36.6 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

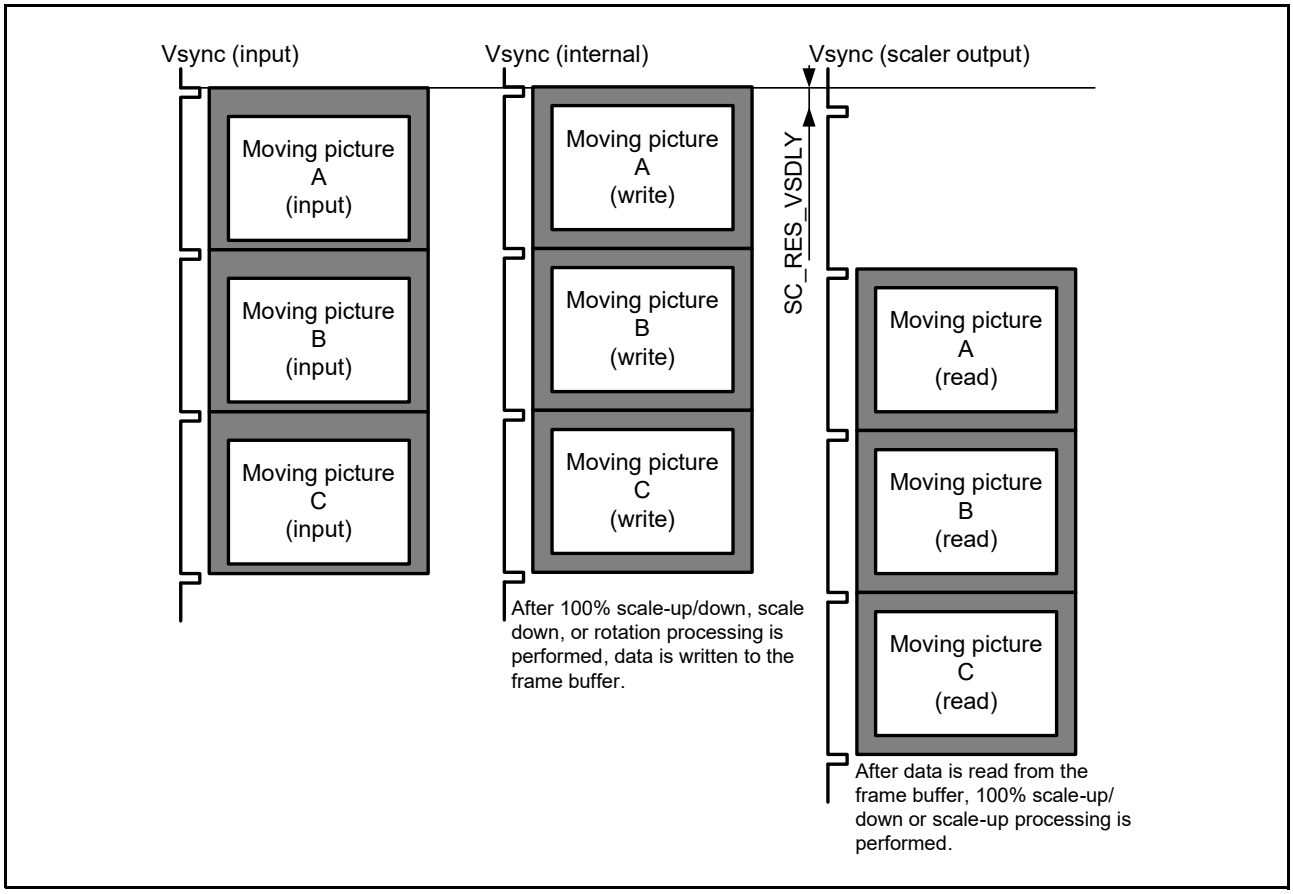

Figure 36.6 Vsync Signal Phases (Two Frame-Buffer Planes Used)

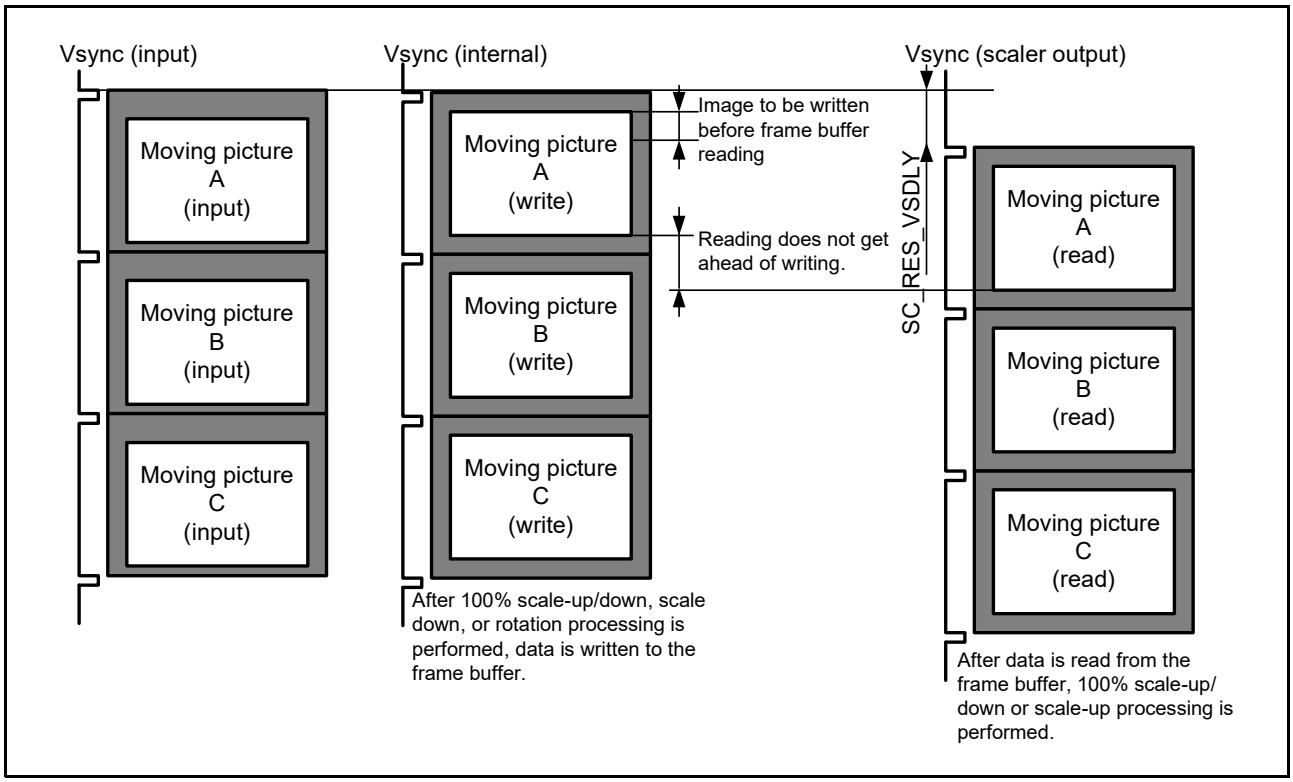

Figure 36.7 Vsync Signal Phases (One Frame-Buffer Plane Used)

36.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 36.7 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 4063 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[11:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 4063 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 36.8 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 36.9 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).

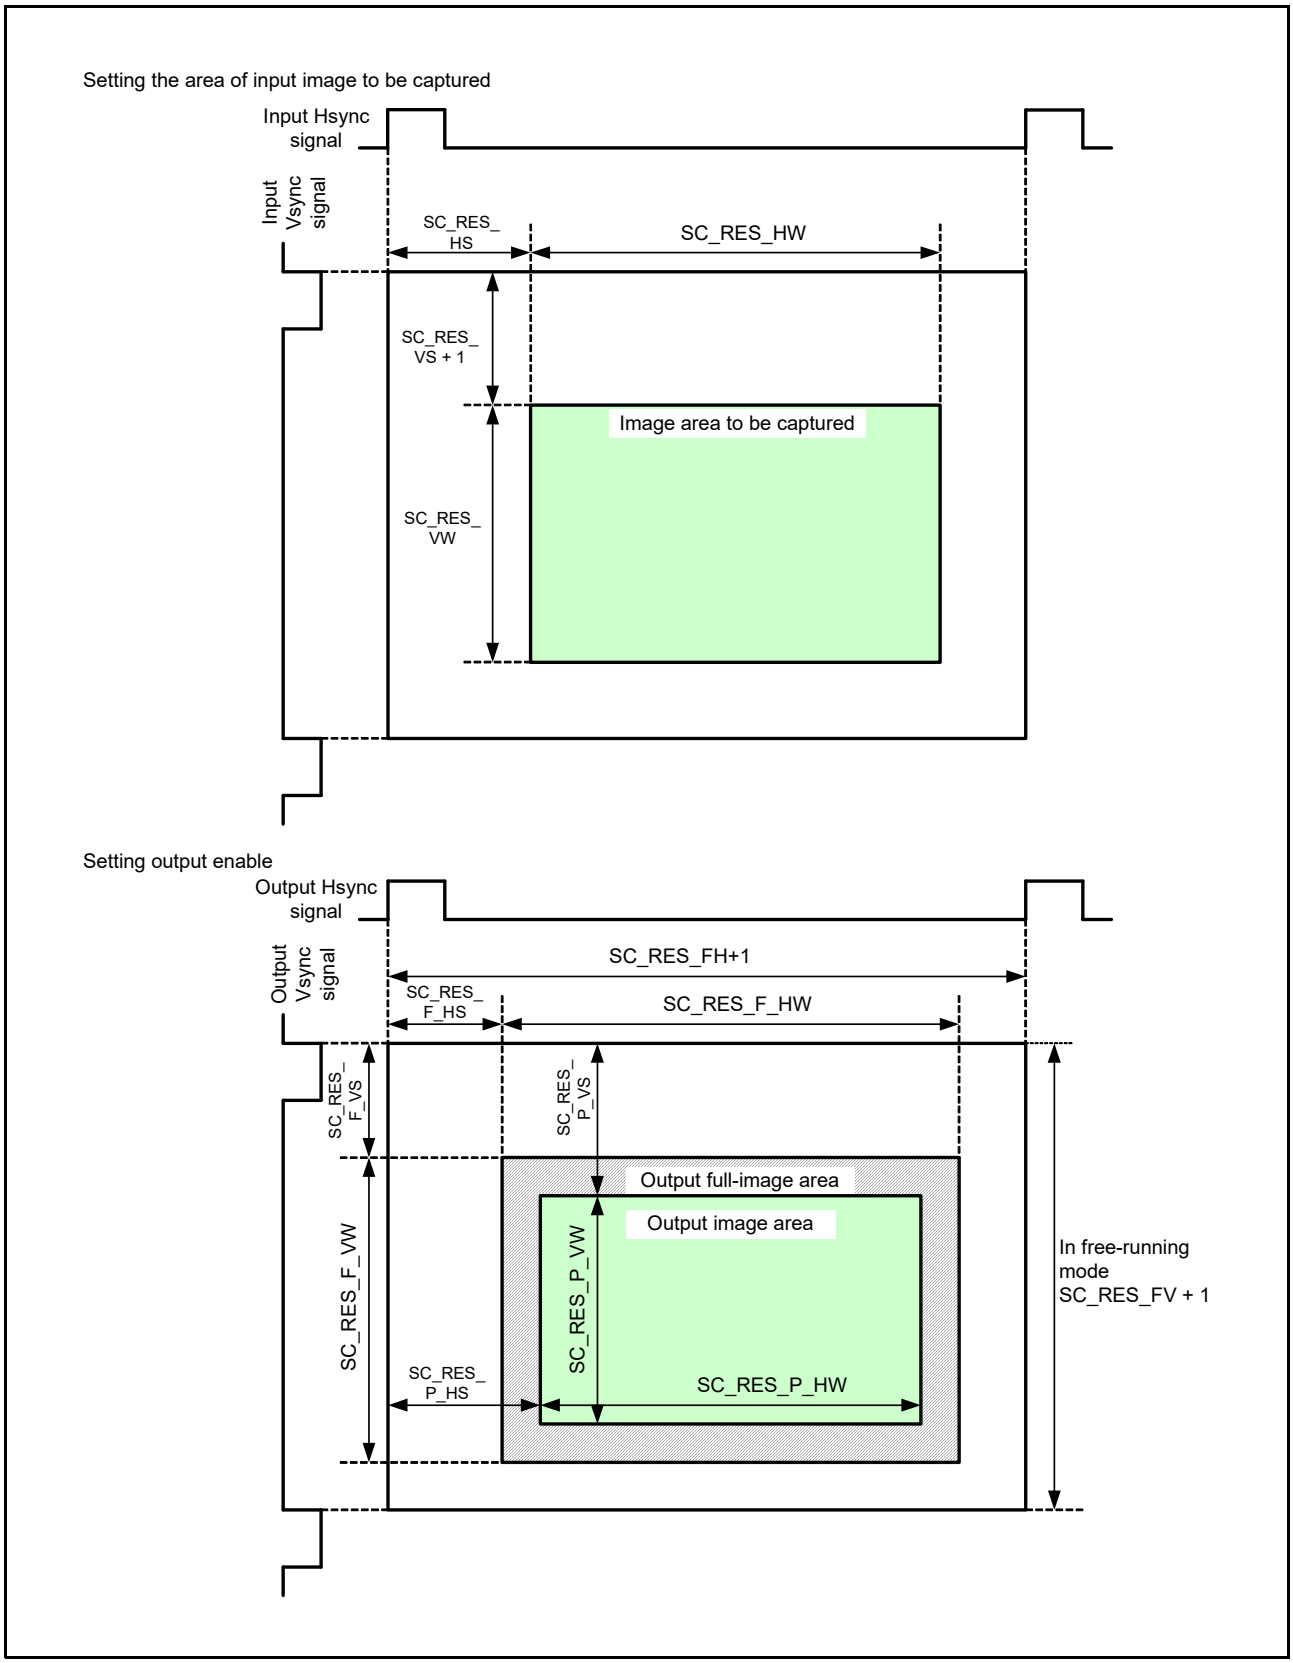

Figure 36.8 Enable Settings

36.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.
When the image input from the input controller has a vertical valid period greater than 1024 lines or a horizontal valid period greater than 1440 clock cycles, be sure to scale down the image so that the vertical valid period is no greater than 1024 lines and the horizontal valid period is no greater than 1440 clock cycles by using the scaling-down control block.

Table 36.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
180° rotation	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

Table 36.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
270° rotation	(Horizontal input→vertical output) scale down	(Vertical input→horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

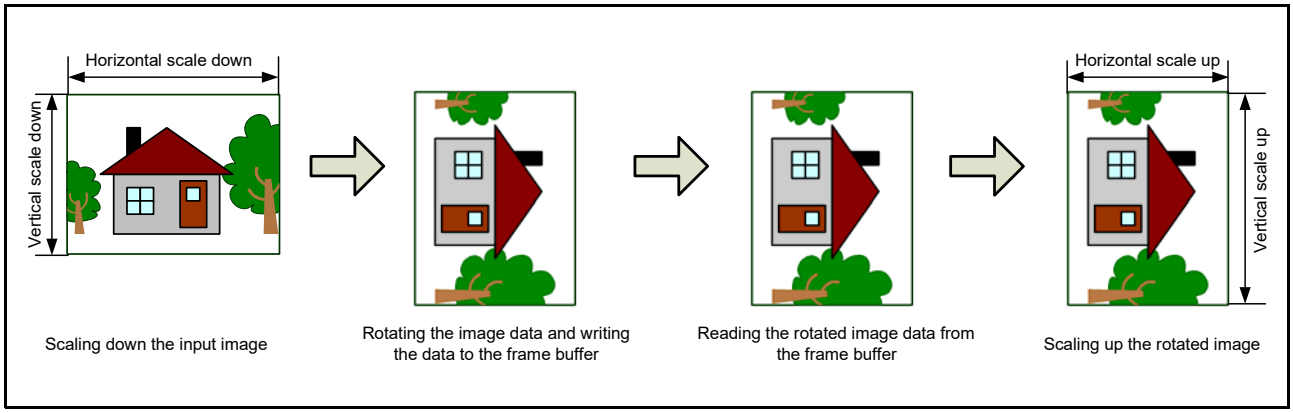

Figure 36.9 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 36.11 Impossible Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
90° rotation 270° rotation	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale down	Horizontal 100% scale up/ vertical scale down	Horizontal 100% scale up/ vertical scale up

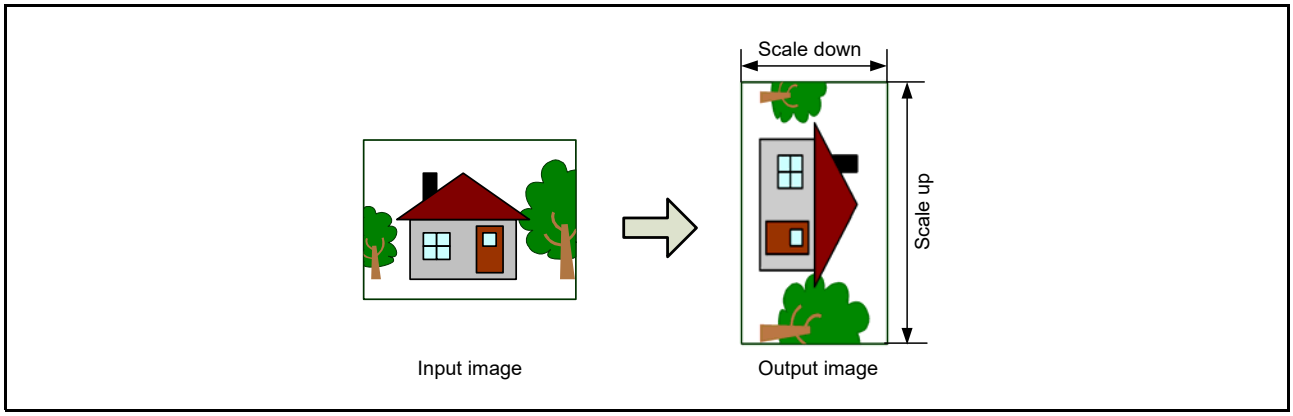

Figure 36.10 Impossible Scaling Process

36.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 36.12 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 36.13 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

36.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$X_{interpo} = X_n$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

SC_RES_DS_H_RATIO = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_DS_H_RATIO should be determined.

RATIO_org = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)
σ = (RATIO_org × (SC_RES_OUT_HW − 1) − (SC_RES_HW − 1) × 4096) ÷ (SC_RES_OUT_HW − 1)
SC_RES_DS_H_RATIO = roundup (RATIO_org − σ)

Table 36.14 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_HW ÷ SC_RES_OUT_HW × 4096) SC_RES_DS_H_RATIO < 4096: Setting prohibited SC_RES_DS_H_RATIO = 4096: 100% scale up SC_RES_DS_H_RATIO > 4096: Scale down

Note: The SC_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

36.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$X_{interpo} = X_n$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_VW ÷ SC_RES_OUT_VW × 4096)

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_VW ÷ SC_RES_OUT_VW × 4096)
σ = (RATIO_org × (SC_RES_OUT_VW − 1) − (SC_RES_VW − 1) × 4096) ÷ (SC_RES_OUT_VW − 1)
SC_RES_V_RATIO = round (RATIO_org − σ)

Table 36.15 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_ INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.
The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

36.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$X_{interpo} = X_n$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

SC_RES_US_H_RATIO = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_US_H_RATIO should be determined.

RATIO_org = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)
σ = (RATIO_org × (SC_RES_P_HW − 1) − (SC_RES_IN_HW − 1) × 4096 ÷ (SC_RES_P_HW − 1)
SC_RES_US_H_RATIO = round (RATIO_org − σ)

Table 36.16 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_ INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_IN_HW ÷ SC_RES_P_HW × 4096) SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

36.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)
σ = (RATIO_org × (SC_RES_P_VW − 1) − (SC_RES_IN_VW − 1) × 4096) ÷ (SC_RES_P_VW − 1)
SC_RES_V_RATIO = round (RATIO_org − σ)

Table 36.17 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

36.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 36.18.

Table 36.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Rotation	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HB_INIPHASE = 2048
180° rotation	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
270° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HT_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 36.19 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

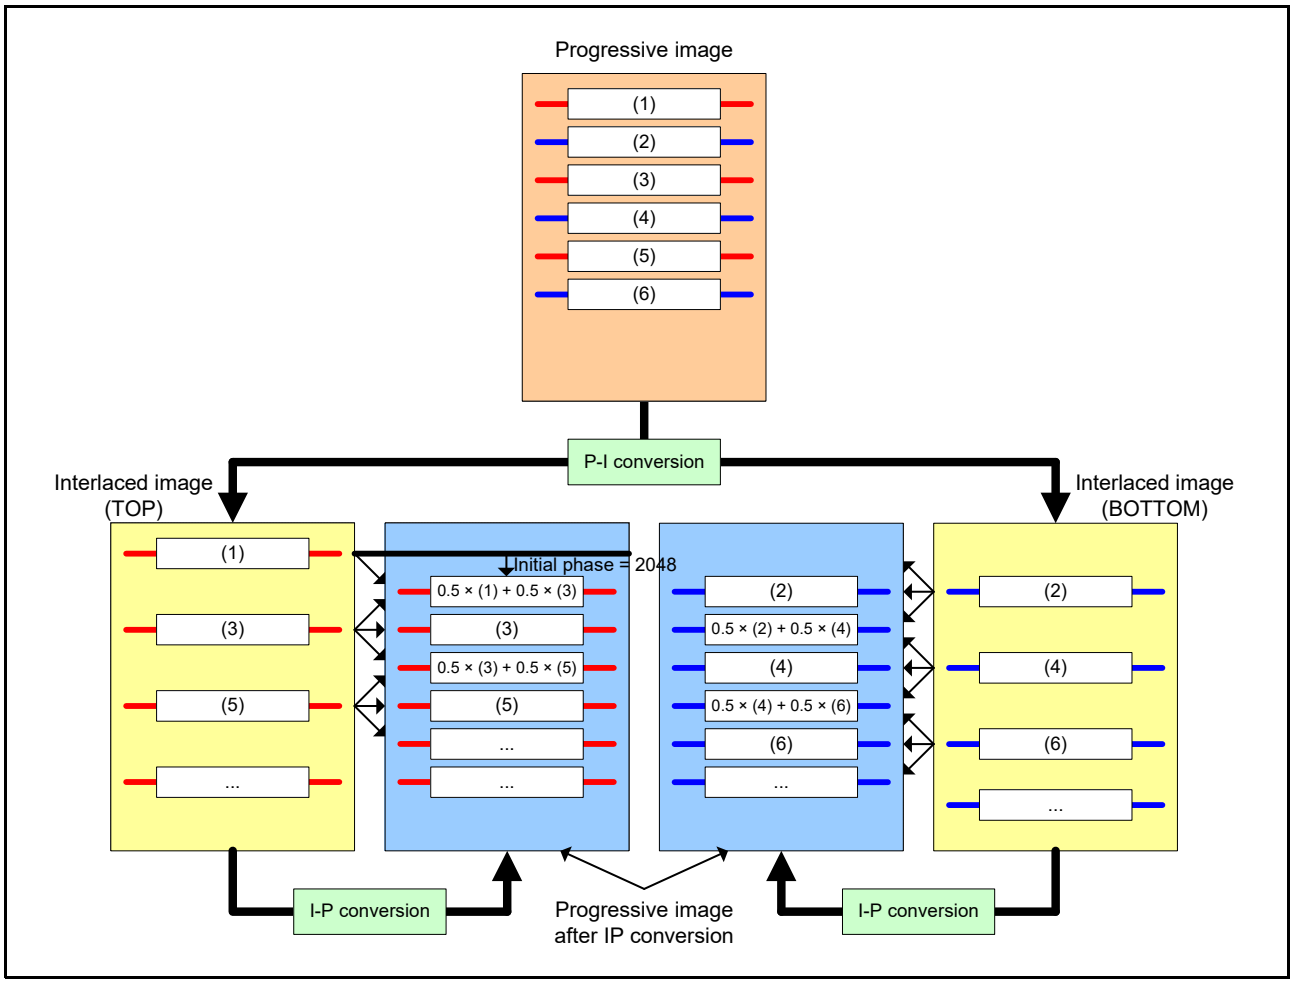

Figure 36.11 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 36.20 Settings for Field Determination Signal Control

Input Signal	Rotation	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—	—
Interlace	Normal Horizontal mirroring 180° rotation	Vertical scale down	—	—
		Vertical scale up	One plane or less	0
			Two planes or more	1
	90° rotation 270° rotation	(Horizontal input → vertical output) scale down	—	—
		(Horizontal input → vertical output) scale up	Two planes or more	1

Table 36.21 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

36.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 36.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output. However, setting this is prohibited in this product.
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

36.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_VCUT and SC_RES_HCUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

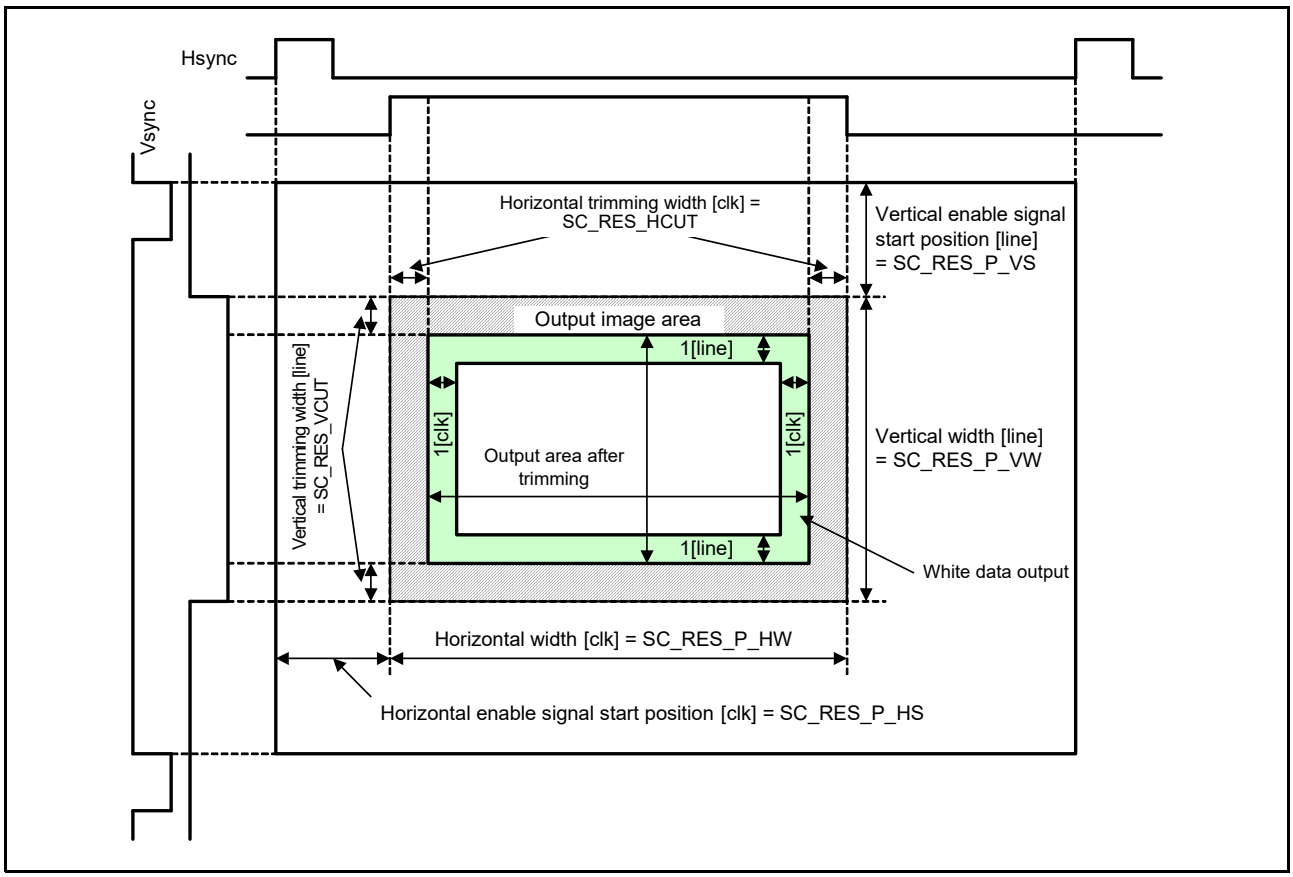

Figure 36.12 Area Relationship for Trimming (Frame Lines Displayed)

Table 36.23 Trimming Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_HCUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_VCUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

36.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 36.24 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

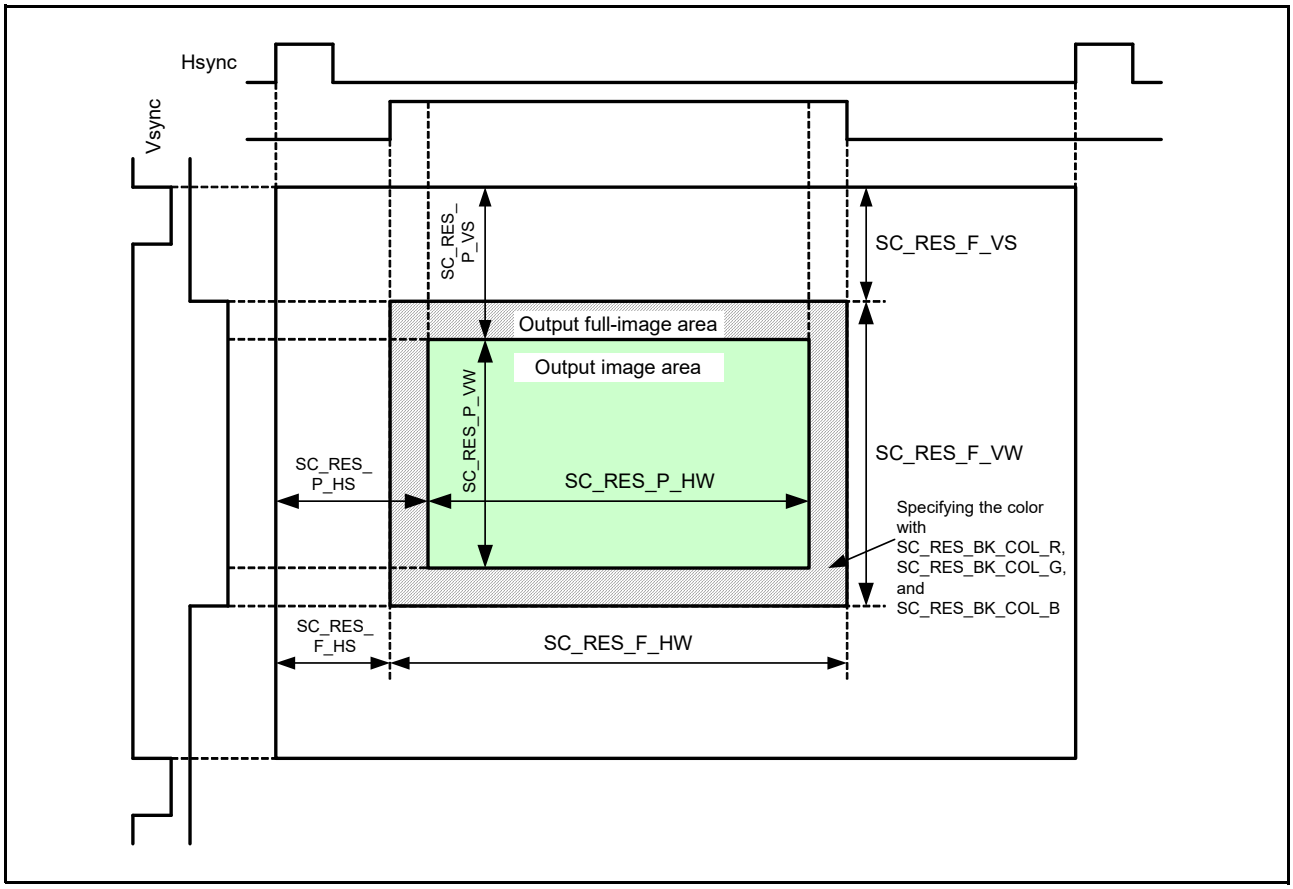

Figure 36.13 Area Relationship with Output Image Size Smaller than a Full Screen

36.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2 × 2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see section 39.1.7, Dither Process in section 39, Video Display Controller 6 (7): Output Controller.
Input YCbCr signals are converted into YCbCr422 signals and output to the image renderer. For distortion correction, refer to section 42, Image Renderer (IMR-LS2).

Table 36.25 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring, rotation)
*	0	YCbCr422 (normal, horizontal mirroring, rotation), YCbCr422 (image renderer)

Table 36.26 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 pattern dither)

36.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 36.27 and Table 36.28 show the relationship between various writing modes for image processing and video signals.

Table 36.27 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2	90° rotation	Disabled	Enabled	Enabled	Disabled
3	180° rotation	Disabled	Enabled	Enabled	Disabled
4	270° rotation	Disabled	Enabled	Enabled	Disabled
5 to 7	Setting prohibited	—	—	—	—

Table 36.28 Horizontal Mirroring and Rotation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

36.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 36.29 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 36.30 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 36.31 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 36.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B+ SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Table 36.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1. Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

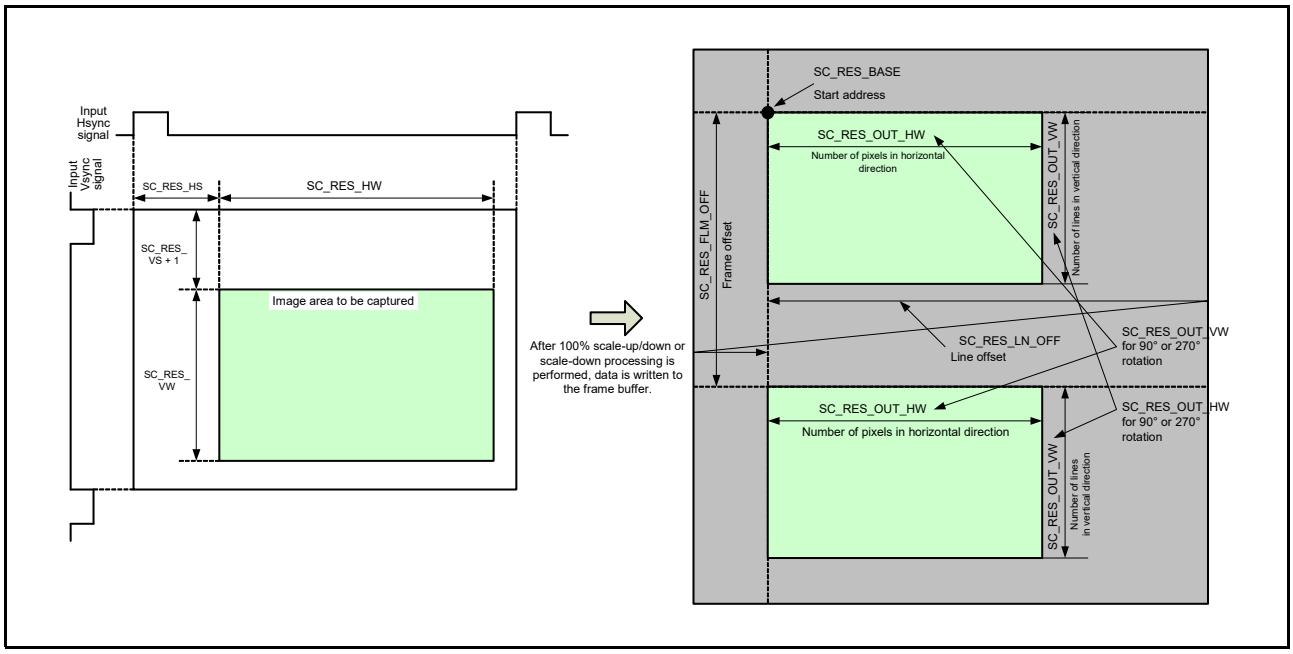

Figure 36.14 Data Arrangement in Frame Buffer

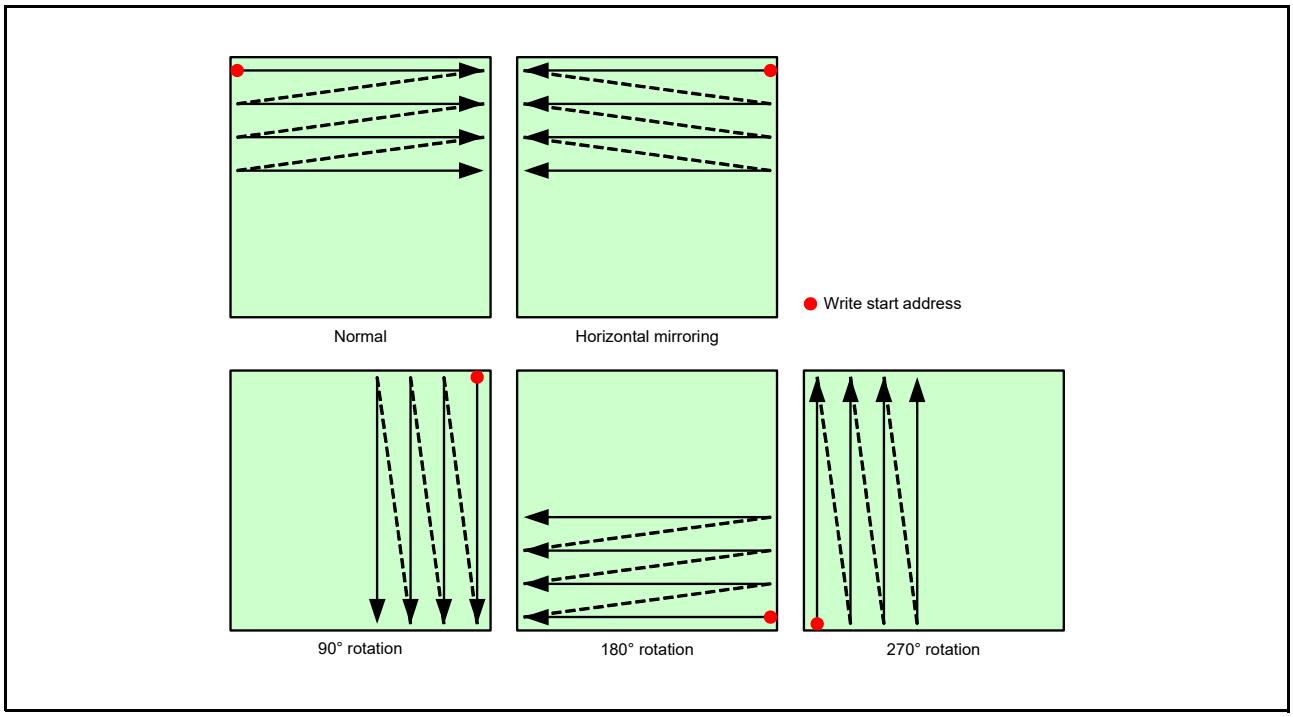

Figure 36.15 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 36.33 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_ NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_ NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_ CNT[9:0]	—	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_ CNT_B[9:0]	—	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 36.34 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

36.1.18 Selecting a Scaling-up Process or Graphics 0 Process

Scaling-up process and graphics 0 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 36.35 Selection of Scaling-Up Process and Graphics 0 Process

Type of Output Scaling Display	SC_RES_ IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 processing block	GR_FLM_LNUM* GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

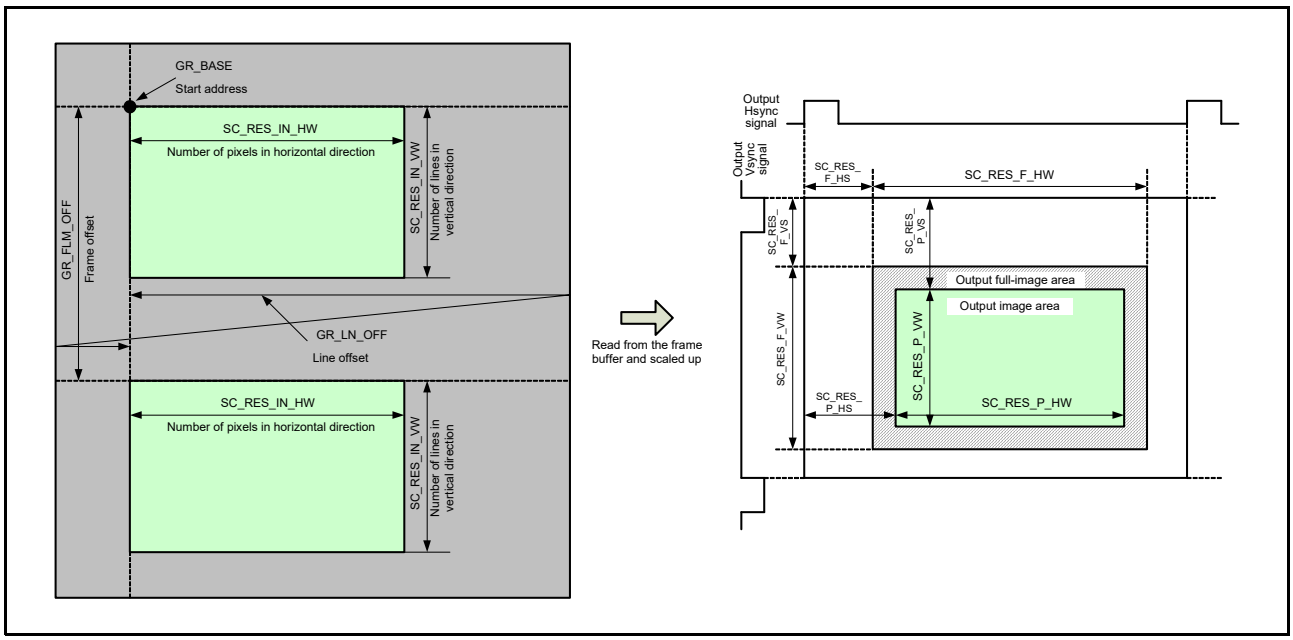

Figure 36.16 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

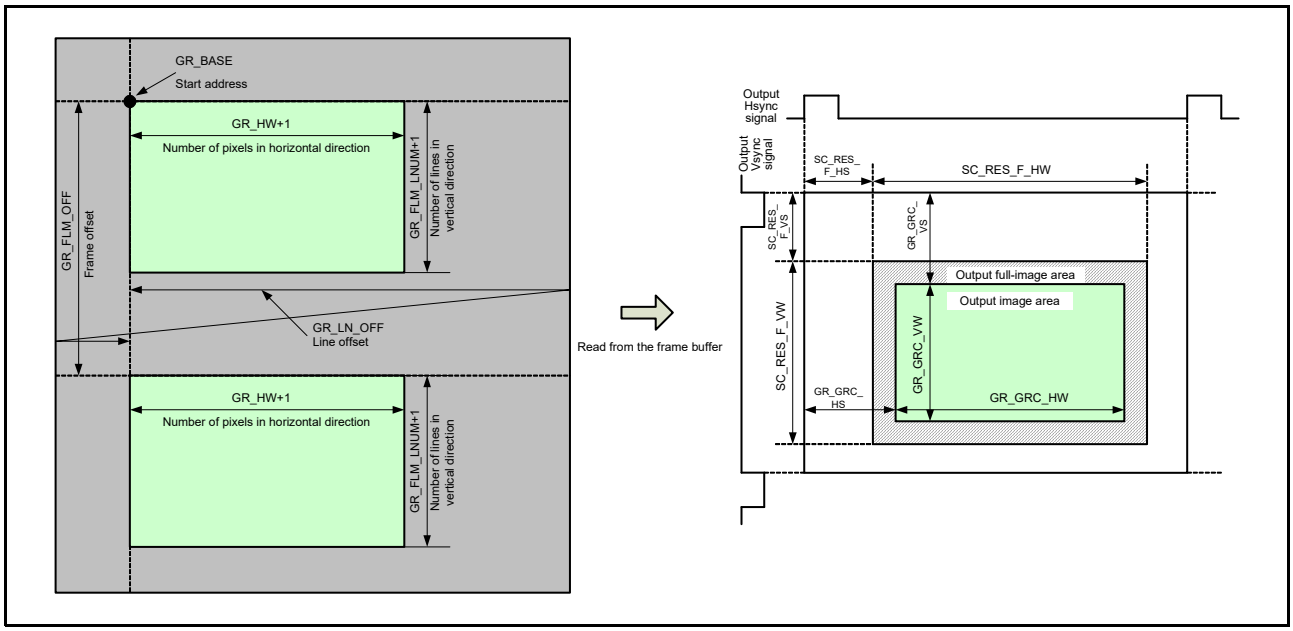

Figure 36.17 Area Setting for Graphics Display

Table 36.36 Scaling-Up Process or Graphics 0 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to section 38, Video Display Controller 6 (5): Image Synthesizer.

36.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 36.37 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top

36.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer (GR_FLM_SEL = 3), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When (write pointer value) – (read pointer value) ≤ 1

The read pointer value is not updated (the same frame is displayed continuously).

(B) When (write pointer value) – (read pointer value) = 2

The read pointer is incremented by one with the next updating timing.

(C) When (write pointer value) – (read pointer value) ≥ 3

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control

(A) When SC_RES_WENB = 0

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with SC_RES_WENB = 1

As the pointer buffer value is determined, the frame buffer is read.

Table 36.38 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_PBUF0	SC_BUF0_ADD	0	Start address of the write buffer pointed to by pointer buffer 0
SC_SCL1_PBUF1	SC_BUF1_ADD	0	Start address of the write buffer pointed to by pointer buffer 1
SC_SCL1_PBUF2	SC_BUF2_ADD	0	Start address of the write buffer pointed to by pointer buffer 2
SC_SCL1_PBUF3	SC_BUF3_ADD	0	Start address of the write buffer pointed to by pointer buffer 3
SC_SCL1_PBUF_FLD	SC_FLD_INF0	0	Top or bottom field information pointed to by pointer buffer 0 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF1	0	Top or bottom field information pointed to by pointer buffer 1 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF2	0	Top or bottom field information pointed to by pointer buffer 2 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF3	0	Top or bottom field information pointed to by pointer buffer 3 0: Bottom 1: Top
SC_SCL1_PBUF_CNT	SC_PBUF_RST	0	Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
SC_SCL1_MON1	SC_PBUF_NUM	0	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC_RES_TB_ADD_MOD = 1 in SC_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Links to distortion correction. 3: Links to pointer buffer.
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

For other frame buffer read operation and graphics processing, refer to section 38, Video Display Controller 6 (5): Image Synthesizer.

36.2 Register Descriptions

Table 36.39 shows the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]-										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

36.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT[10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

36.2.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output. However, setting this is prohibited in this product.

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_HW[11:0]											
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_HS + SC0_RES_HW should be equal to or less than 4063 (clock cycles).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_HW [11:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC0_RES_HS + SC0_RES_HW should be equal to or less than 4063 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.15 Horizontal Scale Down Register (SC0_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC0_RES_PFIL_SEL	SC0_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC0_RES_HW ÷ SC0_RES_OUT_HW × 4096) SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE[11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE[11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC0_RES_VW ÷ SC0_RES_OUT_VW × 4096) For scale up: round (SC0_RES_IN_VW ÷ SC0_RES_P_VW × 4096) SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

36.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_US_V_ON	—	—	—	SC0_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO [15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INTERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]								SC0_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R:8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B:8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

36.2.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD	SC0_RES_DS_WR_MD [2:0]			SC0_RES_MD [1:0]		SC0_RES_LOOP	SC0_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_DS_WR_MD [2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_ LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC0_RES_ BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.
SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_ BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]		—	—	—	SC0_RES_FLD_SEL	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1. SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

36.2.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVERFLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT[9:0]	0	R	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

36.2.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B [31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B [14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B [9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.39 Write Detection Register B (SC0_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT_B[9:0]	0	R	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

36.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	SC0_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF2_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

36.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF3_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

36.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC0_FLD_INF3	—	—	—	—	—	—	—	SC0_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_FLD_INF1	—	—	—	—	—	—	—	SC0_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC0_FLD_INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_FLD_INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_FLD_INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top

36.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR0_UPDATE	—	—	—	GR0_P_VEN	—	—	—	GR0_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR0_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

36.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

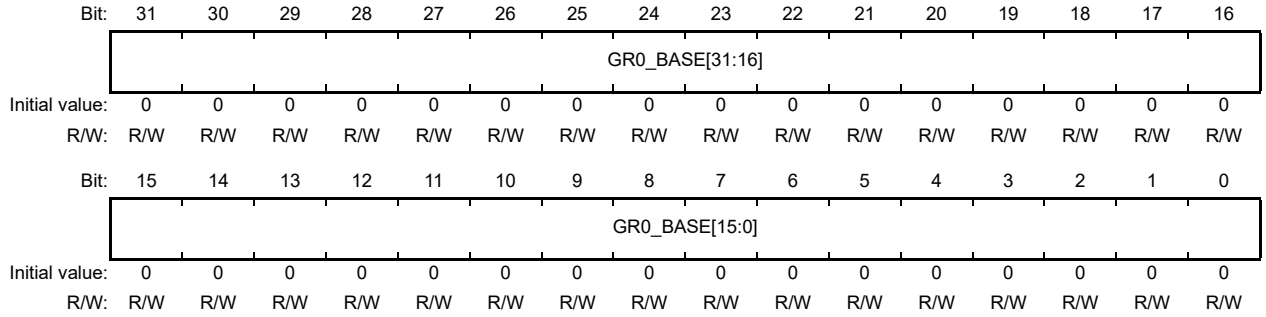
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]		—	—	—	GR0_IMR_FLM_INV	—	—	—	GR0_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Links to distortion correction. 2: Links to distortion correction. 3: Links to pointer buffer.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_IMR_FLM_INV	0	R/W	Sets the frame buffer number for distortion correction. 0: Does not replace the numbers of the frames to be read. 1: Replaces the numbers of the frames to be read.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF_DIR and GR0_IMR_FLM_INV are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.
GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR0_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]			—	GR0_CNV444_MD	—	—	GR0_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR0_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR0_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_ RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

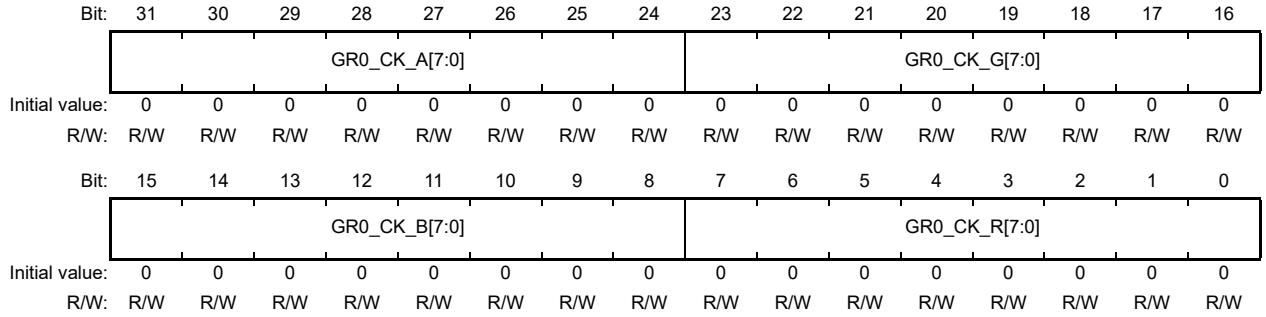
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR0_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_CK_G [7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_B [7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_R [7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A0[7:0]								GR0_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B0[7:0]								GR0_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR0_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR0_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.62 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A1[7:0]								GR0_G1[7:0]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE_B[7:0]								GR0_BASE_R[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR0_BASE_ G[7:0]	0	R/W	Background Color G/Y Signal G/Y: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_BASE_ B[7:0]	128	R/W	Background Color B/Cb Signal B: Unsigned 8 bits (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
7 to 0	GR0_BASE_ R[7:0]	128	R/W	Background Color R/Cr Signal R: Unsigned 8 bits (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.64 CLUT Table Control Register (Graphics 0) (GR0_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.3 Usage Method

36.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.40.

Here, the over-scan rate is assumed to be 100%.

Table 36.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output

Input Signal	Output Signal	Signal Format	Rotation	Buffer Planes	Scaling Filter
1440 × 240	640 × 480	YCbCr	Normal	Two planes	2-tap linear

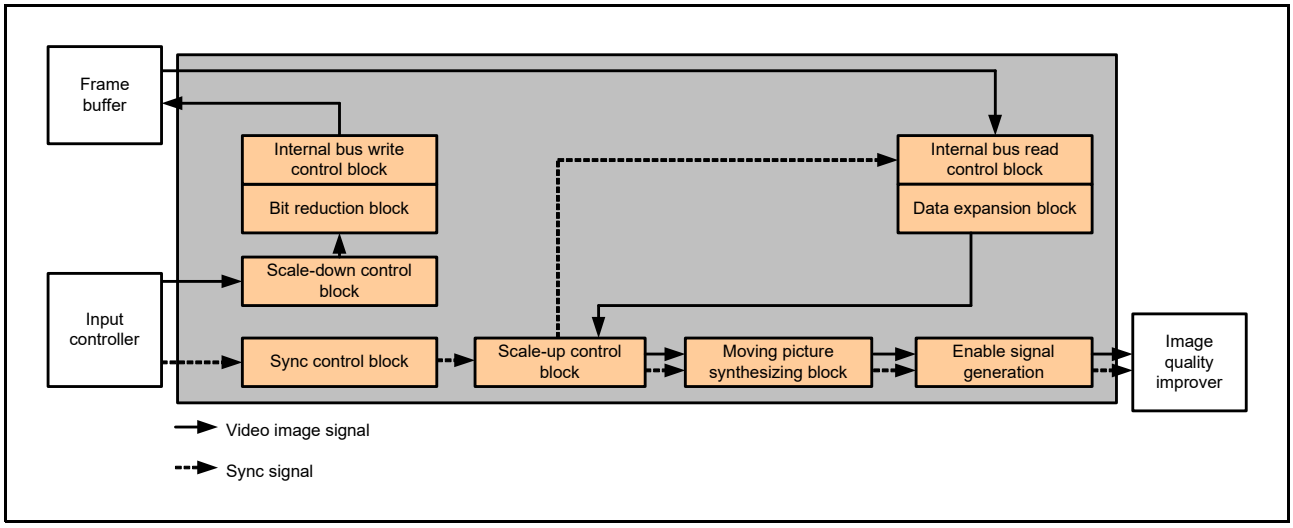

Figure 36.18 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (1440 ÷ 640 × 4096) = 9216

σ = (9216 × (640 − 1) − (1440 − 1) × 4096) ÷ (640 − 1) = −8.01

Horizontal scaling ratio = roundup (9216 − (−8.01)) = 9225

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (240 ÷ 480 × 4096) = 2048

σ = (2048 × (480 − 1) − (240 − 1) × 4096) ÷ (480 − 1) = 4.27

Vertical scaling ratio = round (2048 − (4.07)) = 2044

(4) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640 × 240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset × 240 pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024 × 256 pixels.

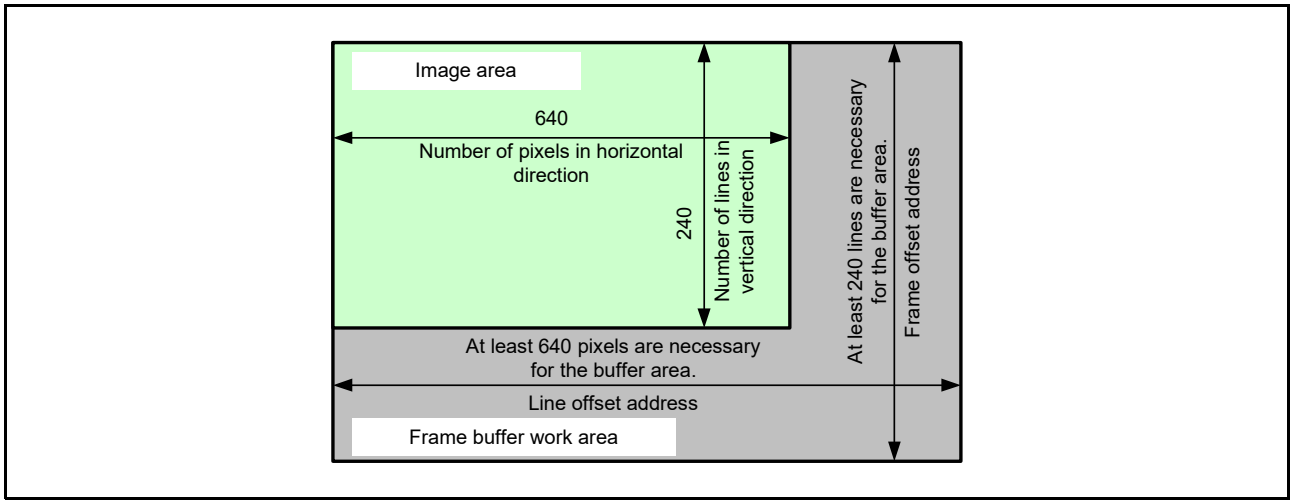

Figure 36.19 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

SC_RES_LN_OFF[14:0] = 1024 × 2 = 2048
GR_LN_OFF[14:0] = 1024 × 2 = 2048

The frame offset address values to be set are:

SC_RES_FLM_OFF[22:0] = SC_RES_LN_OFF[14:0] × 256 = 524288
GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 256 = 524288

(5) Register Setting Example

Table 36.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	0	External Vsync selected
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)

36.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.42.

Table 36.42 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

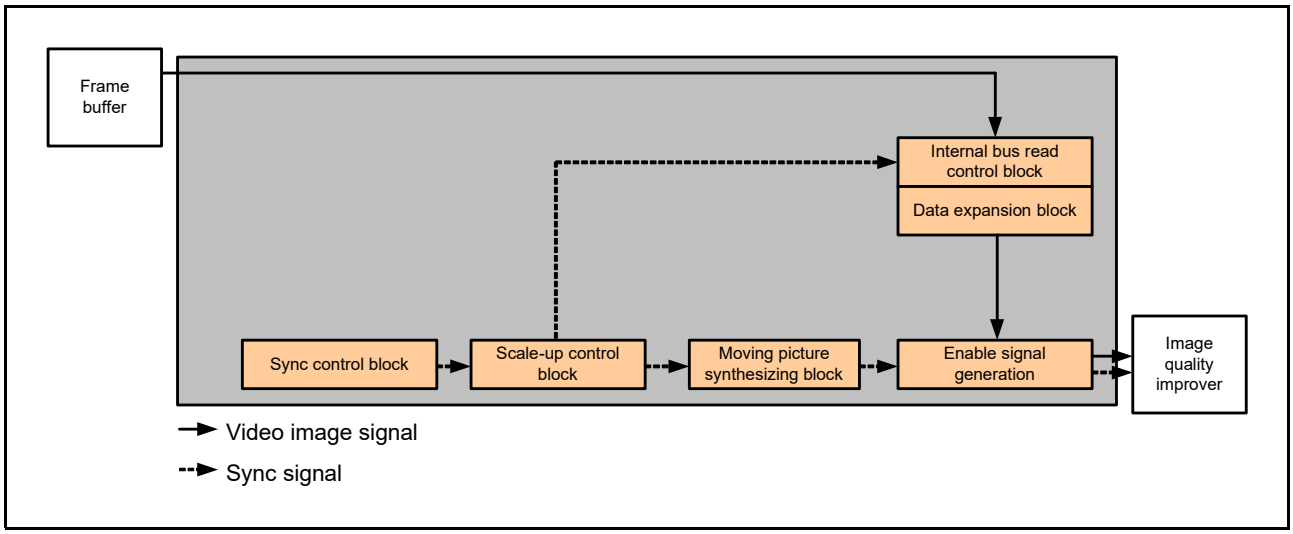

Figure 36.20 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 4 = 2560

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 1228800

(3) Register Setting Example

Table 36.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)

36.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.44.

Table 36.44 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

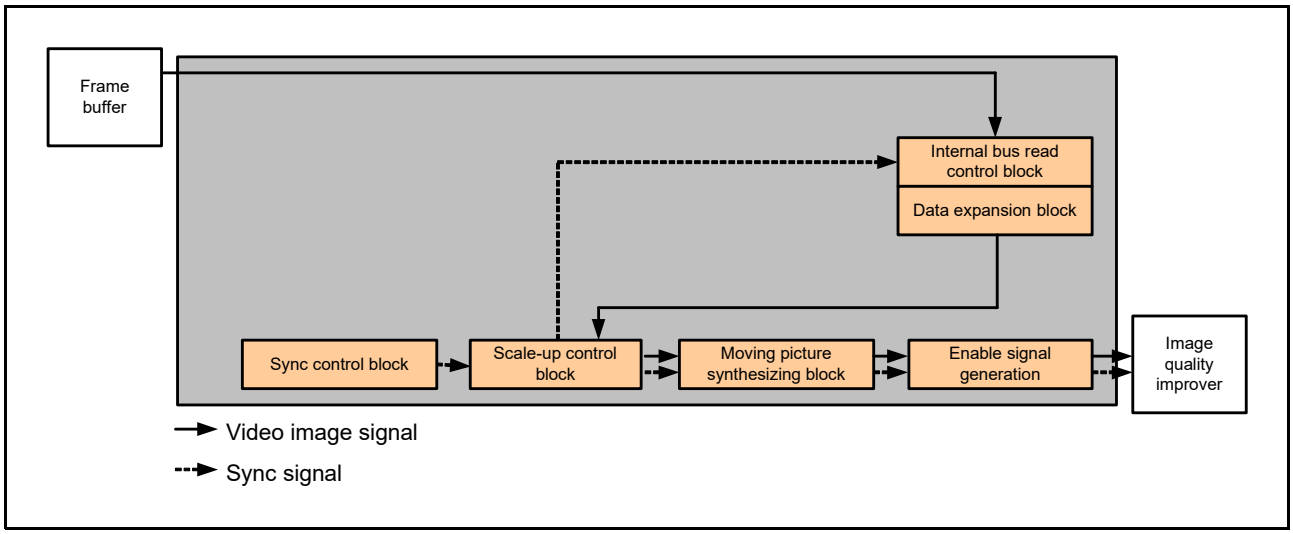

Figure 36.21 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (640 ÷ 800 × 4096) = 3277
σ = (3277 × (800 − 1) − (640 − 1) × 4096) ÷ (800 − 1) = 1.23
Horizontal scaling ratio = round (3277 − (1.23)) = 3276

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (480 ÷ 600 × 4096) = 3277
σ = (3277 × (600 − 1) − (480 − 1) × 4096) ÷ (600 − 1) = 1.57
Vertical scaling ratio = round (3277 − (1.57)) = 3275

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 2 = 1280

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 614400

(5) Register Setting Example

Table 36.45 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)

37. Video Display Controller 6 (4): Image Quality Improver

37.1 Image Quality Improver

37.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 37.1 is a functional block diagram of the image quality improver. Image quality improver 0 is connected to scaler 0.

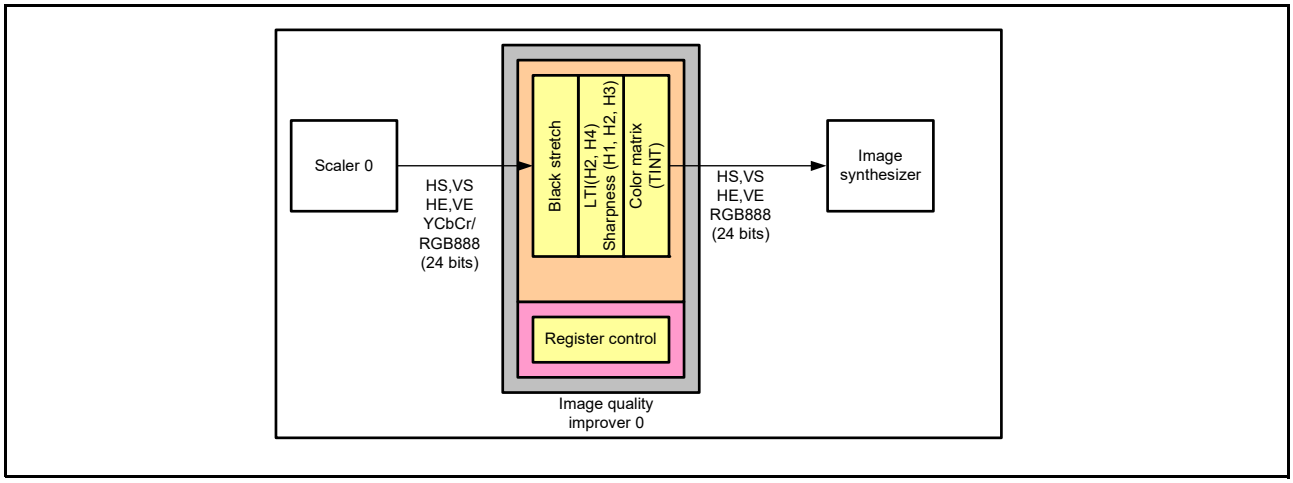

Figure 37.1 Functional Block Diagram of Image Quality Improver

37.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that registers for the improver can be identified by the number in the register name like ADJ0_xxxx. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 37.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

37.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 37.2 is a drawing illustrating black stretch correction.

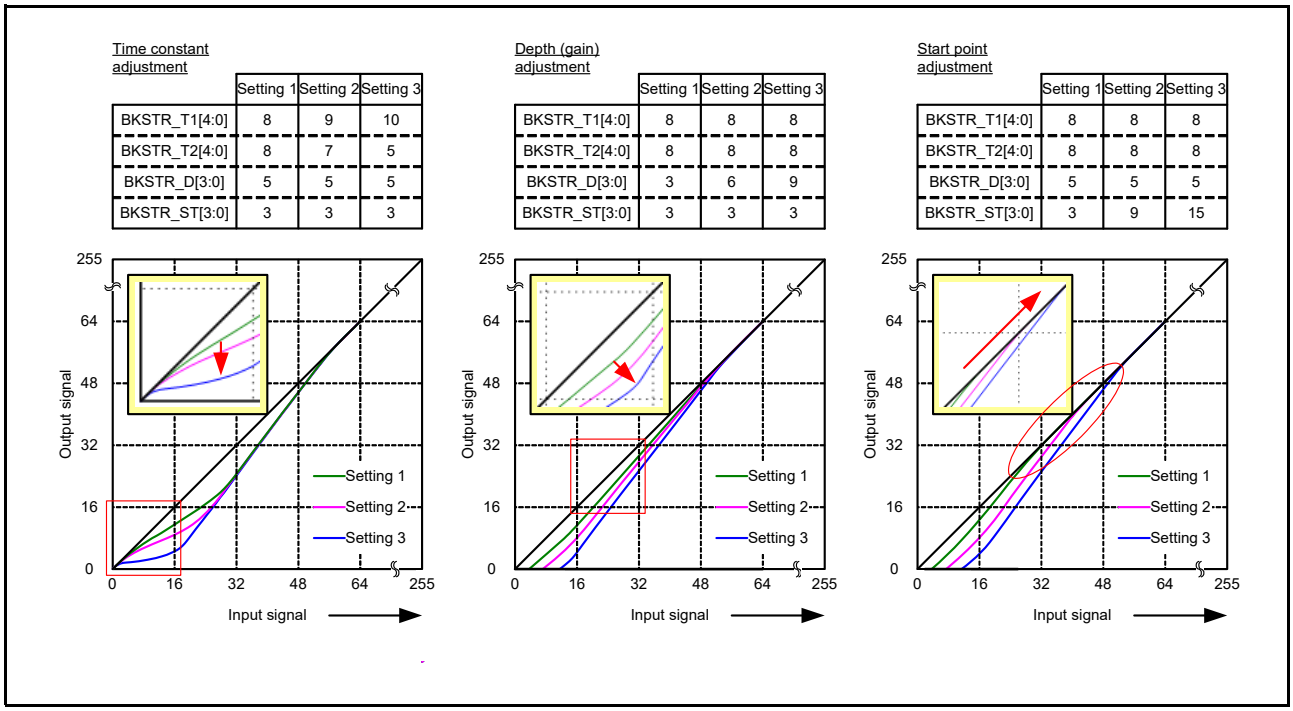

Figure 37.2 Black Stretch Correction (With Sample Settings)

Table 37.2 Black Stretch Control

Register Name	Bit Name	Initial Value	Description
ADJ_BKSTR_SET	BKSTR_ON	0	Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On
ADJ_BKSTR_SET	BKSTR_ST[3:0]	0	Black Stretch Start Point 0 (low) to 15 (high)
ADJ_BKSTR_SET	BKSTR_T1[4:0]	0	Black Stretch Time Constant (T1) 0 (small) to 31 (large)
ADJ_BKSTR_SET	BKSTR_T2[4:0]	0	Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited
ADJ_BKSTR_SET	BKSTR_D[3:0]	0	Black Stretch Depth 0 (shallow) to 15 (deep)

37.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 37.3 shows enhancer area setting.

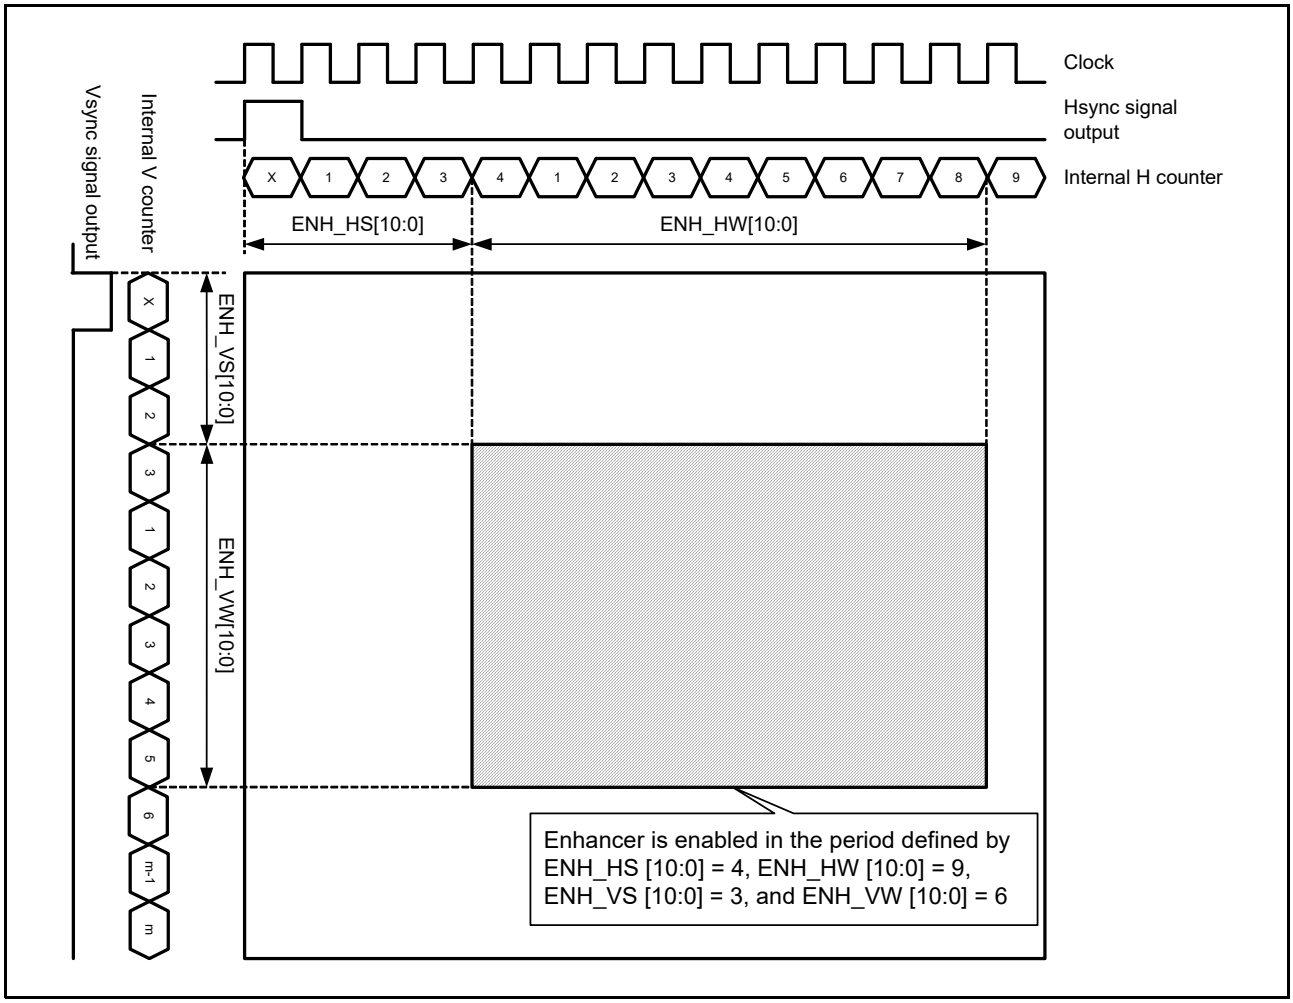

Figure 37.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 37.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM1	ENH_MD	1	Operating Mode 0: RGB mode 1: YCbCr mode
ADJ_ENH_TIM2	ENH_VS[10:0]	0	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
ADJ_ENH_TIM2	ENH_VW[10:0]	0	Width of Vertical Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM3	ENH_HS[10:0]	0	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
ADJ_ENH_TIM3	ENH_HW[10:0]	0	Width of Horizontal Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM1	ENH_DISP_ON	0	Frame Line Display in Enhancer-Enabled Area 0: Off 1: On

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

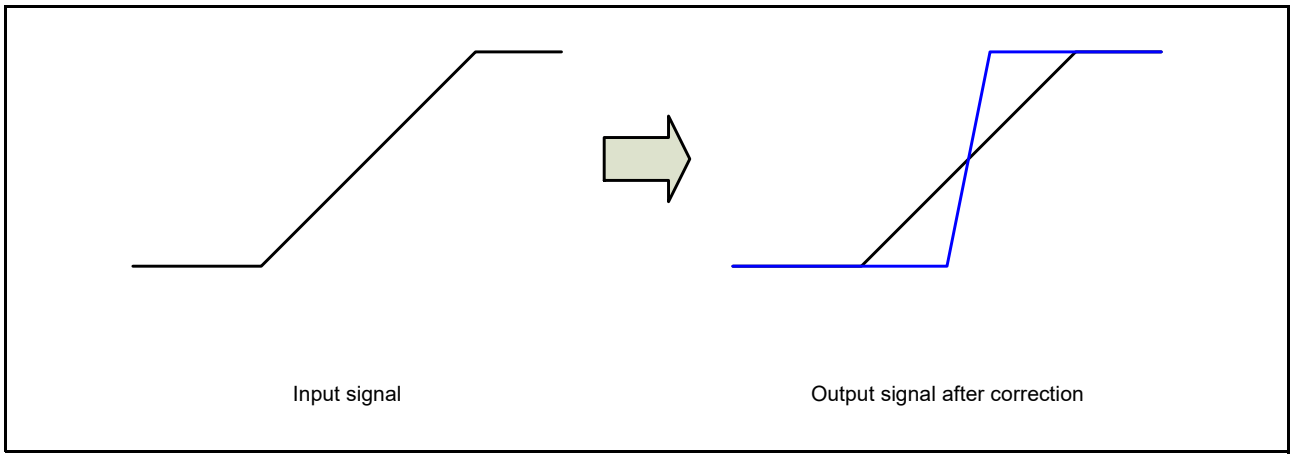

Figure 37.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 37.4 Reference Pixel Table for LTI

LTI Band	Reference Pixel for Edge Detection	LPF Application	Median Filter Reference Pixels
Horizontal LTI (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)	Adjacent pixel used as reference
Horizontal LTI (H4)	Fourth adjacent pixel used as reference	LPF (1,2,1)	Adjacent pixel or second adjacent pixel used as reference

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

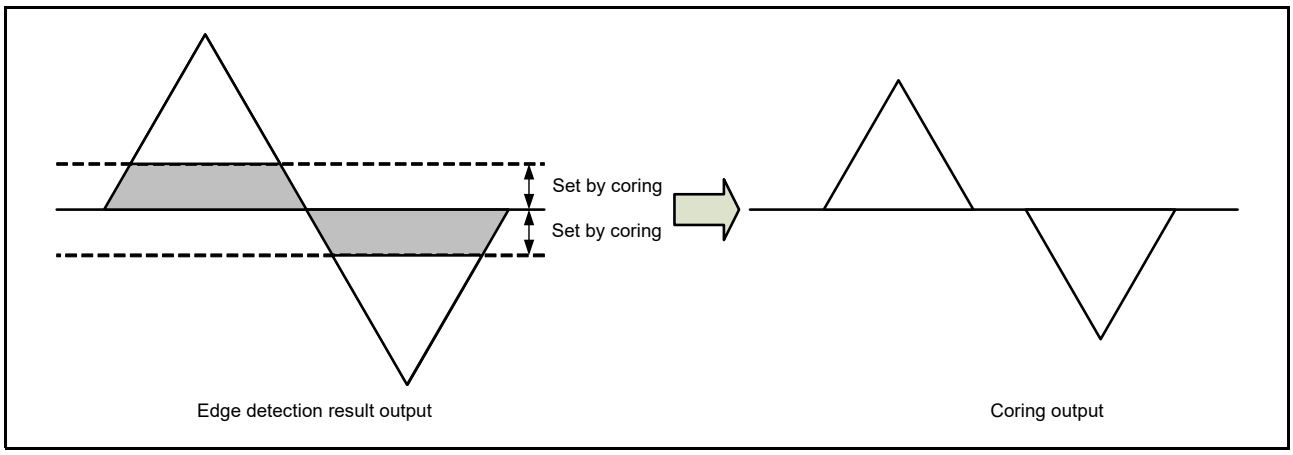

Figure 37.5 LTI Coring

Table 37.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI1	LTI_H_ON	0	LTI On/Off Control 0: LTI off 1: LTI on
ADJ_ENH_LTI1	LTI_H2_INC_ZERO [7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H2_INC_ZERO or |left TAP value – center TAP value| < LTI1_H2_INC_ZERO.
ADJ_ENH_LTI1	LTI_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_LTI1	LTI_H2_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI1	LTI_H2_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)
ADJ_ENH_LTI2	LTI_H4_INC_ZERO[7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H4_INC_ZERO or |left TAP value – center TAP value| < LTI1_H4_INC_ZERO.

Table 37.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI2	LTI_H4_MEDIAN_TAP_SEL	0	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
ADJ_ENH_LTI2	LTI_H4_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI2	LTI_H4_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

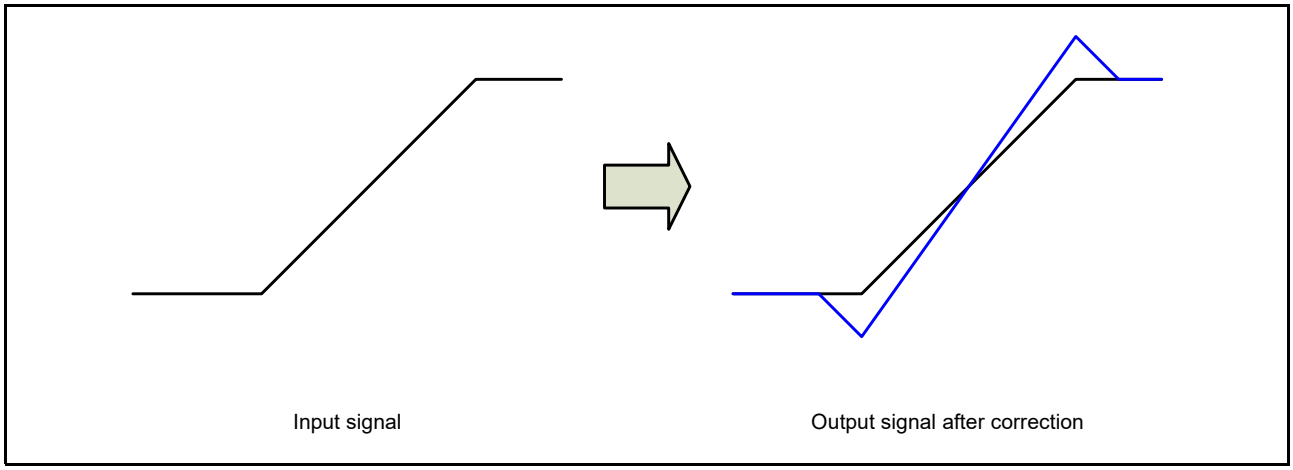

Figure 37.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 37.6 Reference Pixel Table for Sharpness

Sharpness Band	Reference Pixel for Edge Detection	LPF Application
Horizontal sharpness (H1)	Adjacent pixel used as reference	LPF not applied
Horizontal sharpness (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)
Horizontal sharpness (H3)	Third adjacent pixel used as reference	LPF (1,2,1)

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

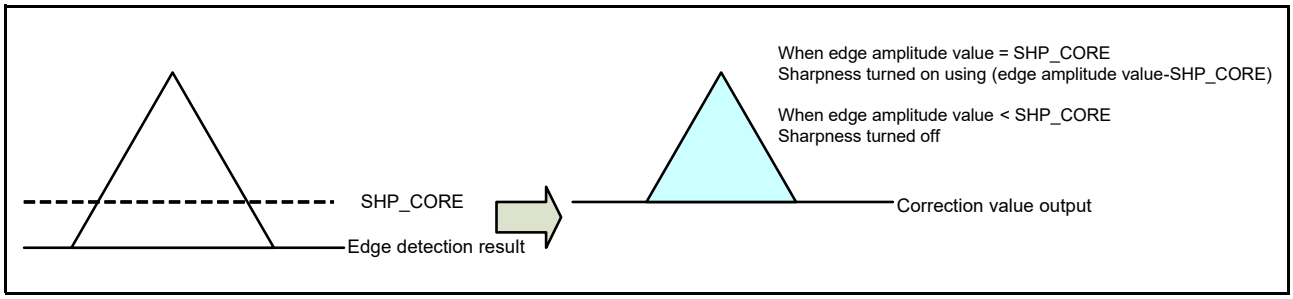

Figure 37.7 Sharpness Characteristics

Table 37.7 Sharpness Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_SHP1	SHP_H_ON	0	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
ADJ_ENH_SHP3	SHP_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_SHP2	SHP_H1_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
ADJ_ENH_SHP2	SHP_H1_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
ADJ_ENH_SHP2	SHP_H1_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP2	SHP_H1_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP1	SHP_H1_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP4	SHP_H2_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
ADJ_ENH_SHP4	SHP_H2_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
ADJ_ENH_SHP4	SHP_H2_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP4	SHP_H2_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP3	SHP_H2_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP6	SHP_H3_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
ADJ_ENH_SHP6	SHP_H3_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
ADJ_ENH_SHP6	SHP_H3_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP6	SHP_H3_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP5	SHP_H3_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

37.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN + ADJ_MTX_B − 128

CRRIN_A = CRRIN + ADJ_MTX_R − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

(2) YCbCr to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN − 128

CRRIN_A = CRRIN − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

Table 37.8 Matrix Coefficients (Standard Values) of SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Bit Setting	Coefficient	Bit Setting	Coefficient	Bit Setting
YGOUT	1.000	ADJ_MTX_GG = 256	–0.344	ADJ_MTX_GB = 1960	–0.714	ADJ_MTX_GR = 1865
CBBOUT	1.000	ADJ_MTX_BG = 256	1.772	ADJ_MTX_BB = 454	0.000	ADJ_MTX_BR = 0
CRROUT	1.000	ADJ_MTX_RG = 256	0.000	ADJ_MTX_RB = 0	1.402	ADJ_MTX_RR = 359

Table 37.9 Color Matrix Control

Register Name	Bit Name	Initial Value	Description
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	2	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128(0) to 255 (+127) [LSB])
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	B Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	1960	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	1865	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	256	Gain Adjustment of Y/G Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	454	Gain adjustment of Cb/B signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	Gain Adjustment of Cr/R Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	256	Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	359	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

37.2 Register Description

Table 37.10 shows the register configuration.

[Symbols used in Register Description]

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.
R/WC1: Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.
R: Read-only. The write value should always be 0.
—/W: Write-only. Read value is undefined.

Table 37.10 Image Quality Improver Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register in image quality improver (image quality improver 0)	ADJ0_UPDATE	R/WC1	H'0000 0000	H'FCFF 7680	32
Black stretch register (image quality improver 0)	ADJ0_BKSTR_SET	R/W	H'0000 0000	H'FCFF 7684	32
Enhancer timing adjustment register 1 (image quality improver 0)	ADJ0_ENH_TIM1	R/W	H'0000 0010	H'FCFF 7688	32
Enhancer timing adjustment register 2 (image quality improver 0)	ADJ0_ENH_TIM2	R/W	H'0023 01E0	H'FCFF 768C	32
Enhancer timing adjustment register 3 (image quality improver 0)	ADJ0_ENH_TIM3	R/W	H'0091 0280	H'FCFF 7690	32
Enhancer sharpness register 1 (image quality improver 0)	ADJ0_ENH_SHP1	R/W	H'0000 0000	H'FCFF 7694	32
Enhancer sharpness register 2 (image quality improver 0)	ADJ0_ENH_SHP2	R/W	H'0000 0000	H'FCFF 7698	32
Enhancer sharpness register 3 (image quality improver 0)	ADJ0_ENH_SHP3	R/W	H'0000 0000	H'FCFF 769C	32
Enhancer sharpness register 4 (image quality improver 0)	ADJ0_ENH_SHP4	R/W	H'0000 0000	H'FCFF 76A0	32
Enhancer sharpness register 5 (image quality improver 0)	ADJ0_ENH_SHP5	R/W	H'0000 0000	H'FCFF 76A4	32
Enhancer sharpness register 6 (image quality improver 0)	ADJ0_ENH_SHP6	R/W	H'0000 0000	H'FCFF 76A8	32
Enhancer LTI register 1 (image quality improver 0)	ADJ0_ENH_LTI1	R/W	H'000A 0000	H'FCFF 76AC	32
Enhancer LTI register 2 (image quality improver 0)	ADJ0_ENH_LTI2	R/W	H'000A 0000	H'FCFF 76B0	32
Matrix mode register in image quality improver (image quality improver 0)	ADJ0_MTX_MODE	R/W	H'0000 0002	H'FCFF 76B4	32
Matrix YG control register 0 in image quality improver (image quality improver 0)	ADJ0_MTX_YG_ADJ0	R/W	H'0080 0100	H'FCFF 76B8	32
Matrix YG control register 1 in image quality improver (image quality improver 0)	ADJ0_MTX_YG_ADJ1	R/W	H'07A8 0749	H'FCFF 76BC	32
Matrix CBB control register 0 in image quality improver (image quality improver 0)	ADJ0_MTX_CBB_ADJ0	R/W	H'0080 0100	H'FCFF 76C0	32
Matrix CBB control register 1 in image quality improver (image quality improver 0)	ADJ0_MTX_CBB_ADJ1	R/W	H'01C6 0000	H'FCFF 76C4	32

Table 37.10 Image Quality Improver Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Matrix CRR control register 0 in image quality improver (image quality improver 0)	ADJ0_MTX_CRR_ADJ0	R/W	H'0080 0100	H'FCFF 76C8	32
Matrix CRR control register 1 in image quality improver (image quality improver 0)	ADJ0_MTX_CRR_ADJ1	R/W	H'0000 0167	H'FCFF 76CC	32

37.2.1 Register Update Control Register in Image Quality Improver (ADJ0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADJ0_VEN	0	R/WC1	Image Quality Improver Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

37.2.2 Black Stretch Register (ADJ0_BKSTR_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	BKSTR_ON	BKSTR_ST[3:0]				BKSTR_D[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BKSTR_T1[4:0]					—	—	—	BKSTR_T2[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	BKSTR_ON	0	R/W	Black Stretch On/Off Control 0: Black stretch off 1: Black stretch on
23 to 20	BKSTR_ST [3:0]	0	R/W	Black Stretch Start Point Setting values: 0 (low) to 15 (high)
19 to 16	BKSTR_D [3:0]	0	R/W	Depth of Black Stretch Setting Values: 0 (shallow) to 15 (deep)
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	BKSTR_T1 [4:0]	0	R/W	Black Stretch Time Constant (T1) Setting Values: 0 (small) to 31 (large)
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	BKSTR_T2 [4:0]	0	R/W	Black Stretch Time Constant (T2) Setting Values: 0 (small) to 31 (large)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.3 Enhancer Timing Adjustment Register 1 (ADJ0_ENH_TIM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENH_MD	—	—	—	ENH_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENH_MD	1	R/W	Operating Mode 0: RGB mode 1: YCbCr mode
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ENH_DISP_ON	0	R/W	Frame Line Display On/Off of Enhancer-Enabled Area 0: Display off 1: Display on

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.4 Enhancer Timing Adjustment Register 2 (ADJ0_ENH_TIM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_CLIP_O [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_CLIP_U [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_GAIN_O [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_GAIN_U [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H2_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H2_ LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H2_ CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H2_CLIP_O[7:0]								SHP_H2_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H2_GAIN_O[7:0]								SHP_H2_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H2_ CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
23 to 16	SHP_H2_ CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
15 to 8	SHP_H2_ GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
7 to 0	SHP_H2_ GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H3_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H3_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.11 Enhancer Sharpness Register 6 (ADJ0_ENH_SHP6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H3_CLIP_O[7:0]								SHP_H3_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H3_GAIN_O[7:0]								SHP_H3_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H2_INC_ZERO or | left TAP value – center TAP value | < LTI_H2_INC_ZERO
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H4_GAIN[7:0]								LTI_H4_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H4_MEDIAN_TAP_SEL	0	R/W	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
23 to 16	LTI_H4_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H4_INC_ZERO or | left TAP value – center TAP value | < LTI_H4_INC_ZERO
15 to 8	LTI_H4_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H4_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_R [7:0]	128	R/W	R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RG [10:0]	256	R/W	Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.20 Matrix CRR Control Register 1 in Image Quality Improver (ADJ0_MTX_CRR_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_RB[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_RR[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	1	1	0	0	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.3 Usage Method

37.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 37.11 Black Stretch Setting Register

Register Name	Bit Name	Set Value
ADJ_BKSTR_SET	BKSTR_ON	When black stretch is on: 1
ADJ_BKSTR_SET	BKSTR_D[3:0]	Set the depth of black stretch. The depth increases as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_ST[3:0]	Set the start point of black stretch. The stretching area becomes larger as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T1[4:0]	Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T2[4:0]	Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger.

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

37.3.2 LTI Processing of Enhancer

Figure 37.8 shows an example of LTI adjustment.

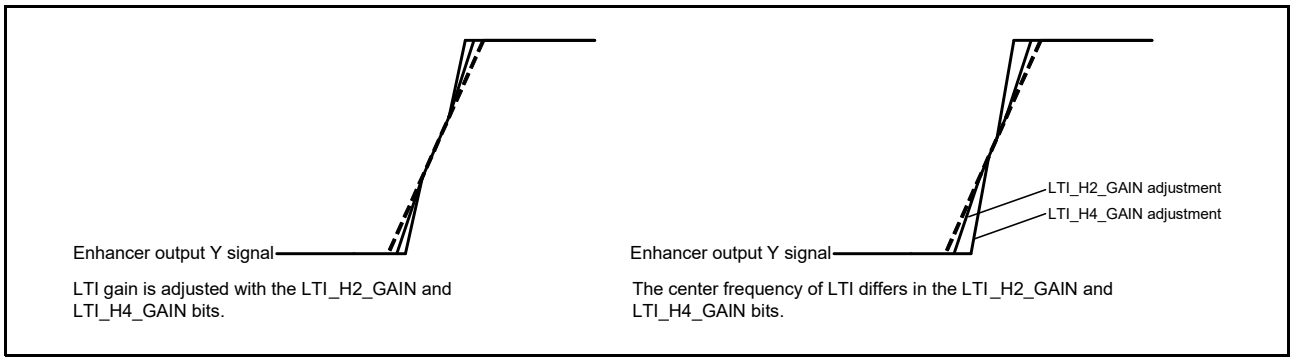

Figure 37.8 Example of LTI Adjustment

37.3.3 Sharpness Processing of Enhancer

Figure 37.9 shows an example of sharpness adjustment.

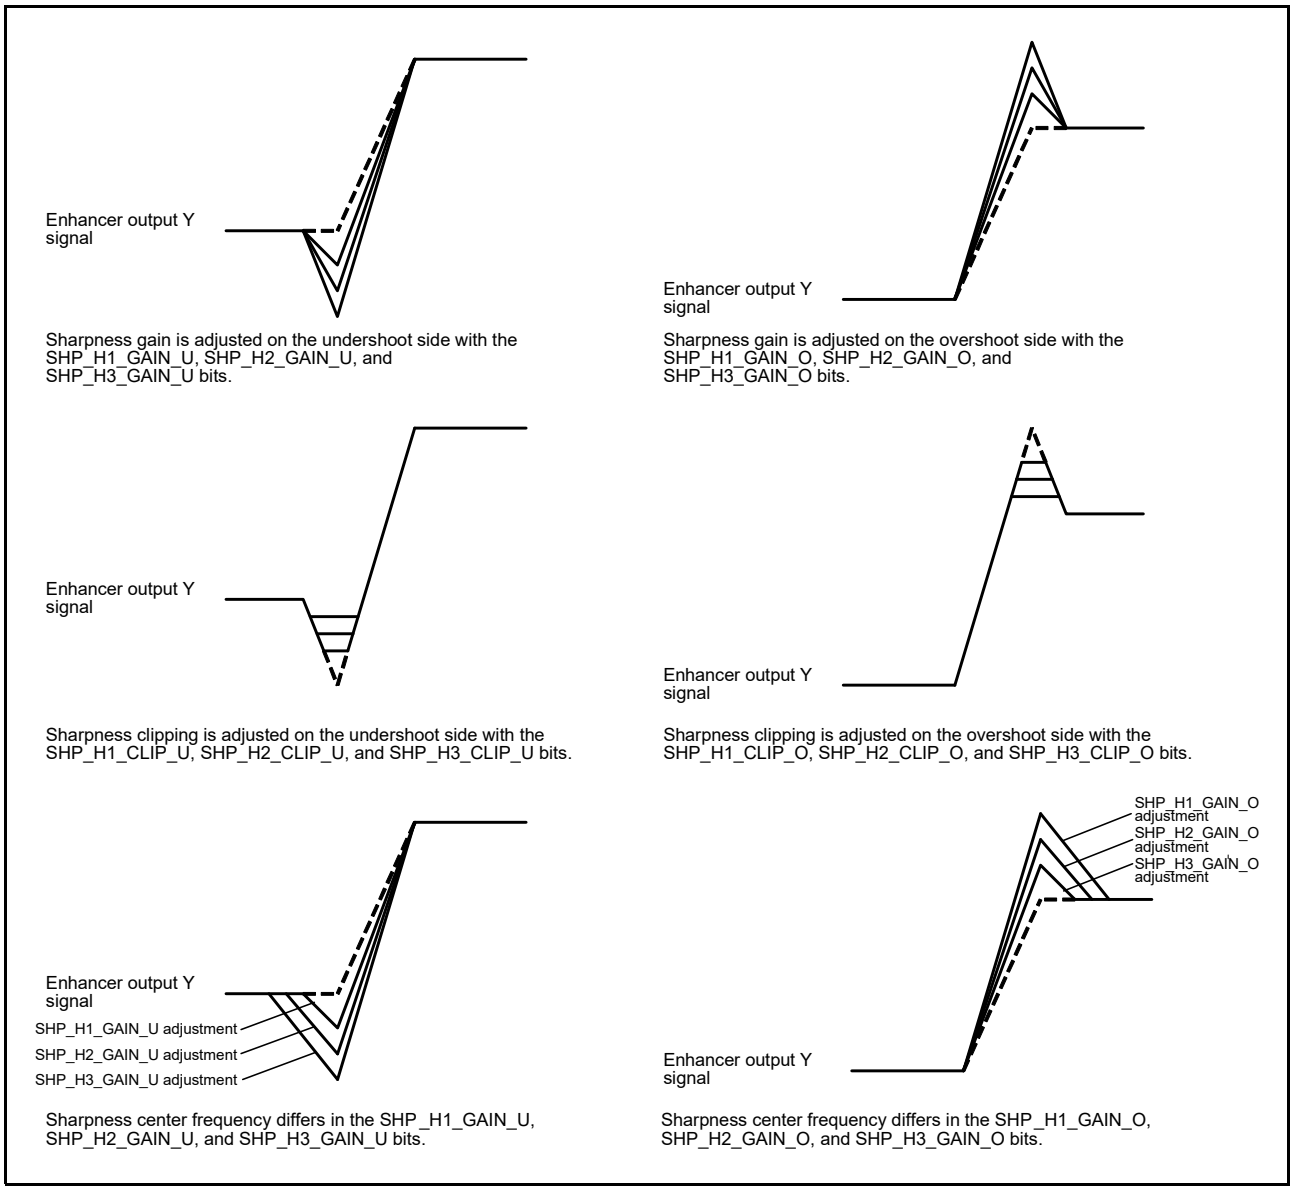

Figure 37.9 Example of Sharpness Adjustment

37.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 37.12 shows an example of GBR conversion setting.

Table 37.12 Recommended Setting Values for Matrix Conversion

		GBR to GBR Conversion	YCBCR to GBR Conversion
Register Name	Bit Name	Recommended Values	Recommended Values
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	0	256
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	0
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

38. Video Display Controller 6 (5): Image Synthesizer

38.1 Image Synthesizer

38.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

One video plane + two graphics planes, or three graphics planes can be selected for synthesis.

RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 process), and YCbCr444 (for the graphics 0 process) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 2 and 3 processes) of lower-layer graphics and current graphics can be displayed.

It is recommend that the frame buffer is placed in the on-chip large-capacity RAM. Both the on-chip large-capacity RAM and an external SDRAM can be used for the frame buffer, but the bus bandwidth might become short and display might not be possible if an external SDRAM is used for the frame buffer.

The functional block diagram of the image synthesizer is shown below.

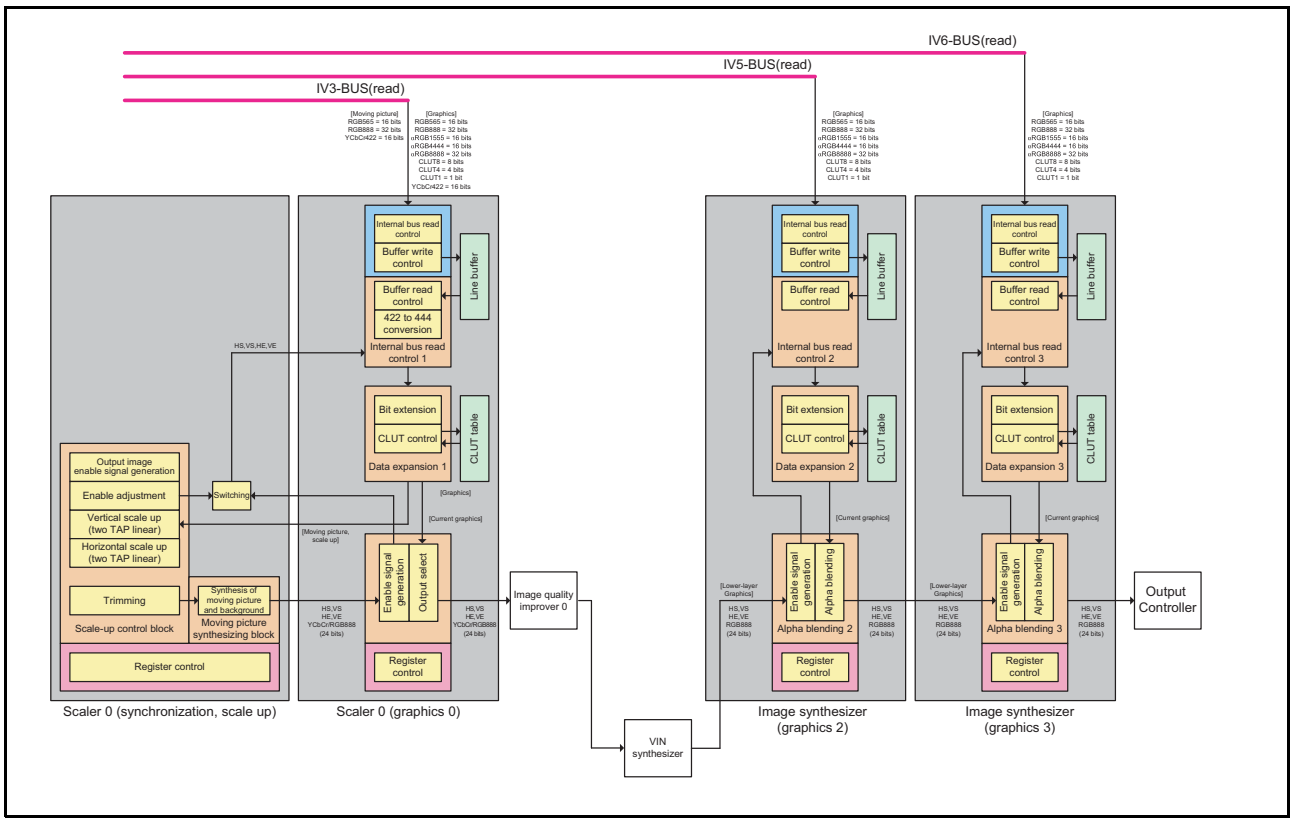

Figure 38.1 Functional Block Diagram of Image Synthesizer

38.1.2 Graphics Data Read Control

Graphics data read can be controlled for the three processes: the graphics 0 process in the scaler 0, and the graphics 2 and 3 processes in the image synthesizer.

The register bits of each process can be identified by the number in the register name like GR0_xxxx, GR2_xxxx, and GR3_xxxx, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_xxxx for convenience sake.

In the VIN synthesizer, graphics data read is not controlled. In this manual, the name is omitted like GR_xxxx for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 38.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update * 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 38.2 Frame Buffer Burst Transfer Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_BST_MD	0	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 38.3 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected.*1 1: Register GR_FLM_NUM selected. 2: Control linked to distortion correction, or frame 0 selected.*2 3: Control linked to pointer buffer, or setting prohibited.*3
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Note 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.
Note 2. For the graphics 0 process, frame buffer control links to distortion correction. For the graphics 2 and 3 processes, frame 0 is selected.
Note 3. For the graphics 0 process, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 38.4 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(5) Distortion Correction Frame Buffer Control

Two frames (frames 0 and 1) are used for distortion correction, and the frame numbers to be read by the image renderer are set.
The frame numbers to be read (frames 0 and 1) can be switched by setting the GR_IMR_FLM_INV bit.
This bit is enabled only when the GR_FLM_SEL bits are set to 2.

Table 38.5 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR1_FLM1	GR1_IMR_FLM_INV	0	Sets the frame buffer number for distortion correction.* 0:Does not switch the frame numbers to be read. 1:Switches the frame numbers to be read.

Note: * This function is supported for the graphics 0 process only.

(6) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 38.6 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(7) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bits to set the display data start position (the lower three bits should be fixed).

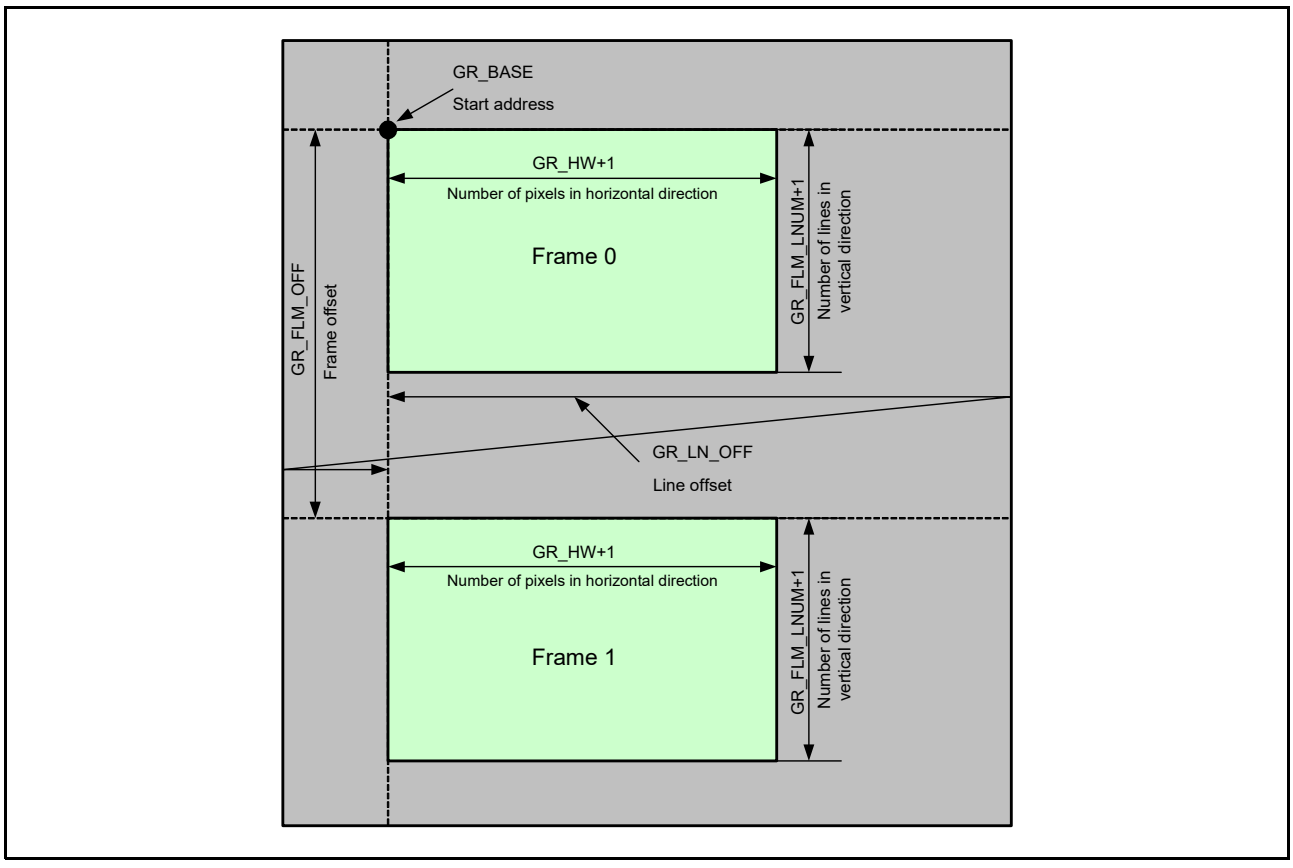

Figure 38.2 Data Arrangement in Frame Buffer

Table 38.7 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be set to 000.
GR_FLM3	GR_LN_OFF[14:0]	0	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0:GR_BASE Line 1:GR_BASE + GR_LN_OFF × 1 : Line n: GR_BASE + GR_LN_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.
GR_FLM4	GR_FLM_OFF[22:0]	0	Frame Buffer Frame Offset Address (lower) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_BASE Buffer 1: GR_BASE + GR_FLM_OFF × 1 : Buffer n: GR_BASE + GR_FLM_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.

(8) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 38.8 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR_FLM_LOOP + 1).

(9) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 38.9 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0:Increments the address by the line offset address. 1:Decrements the address by the line offset address.

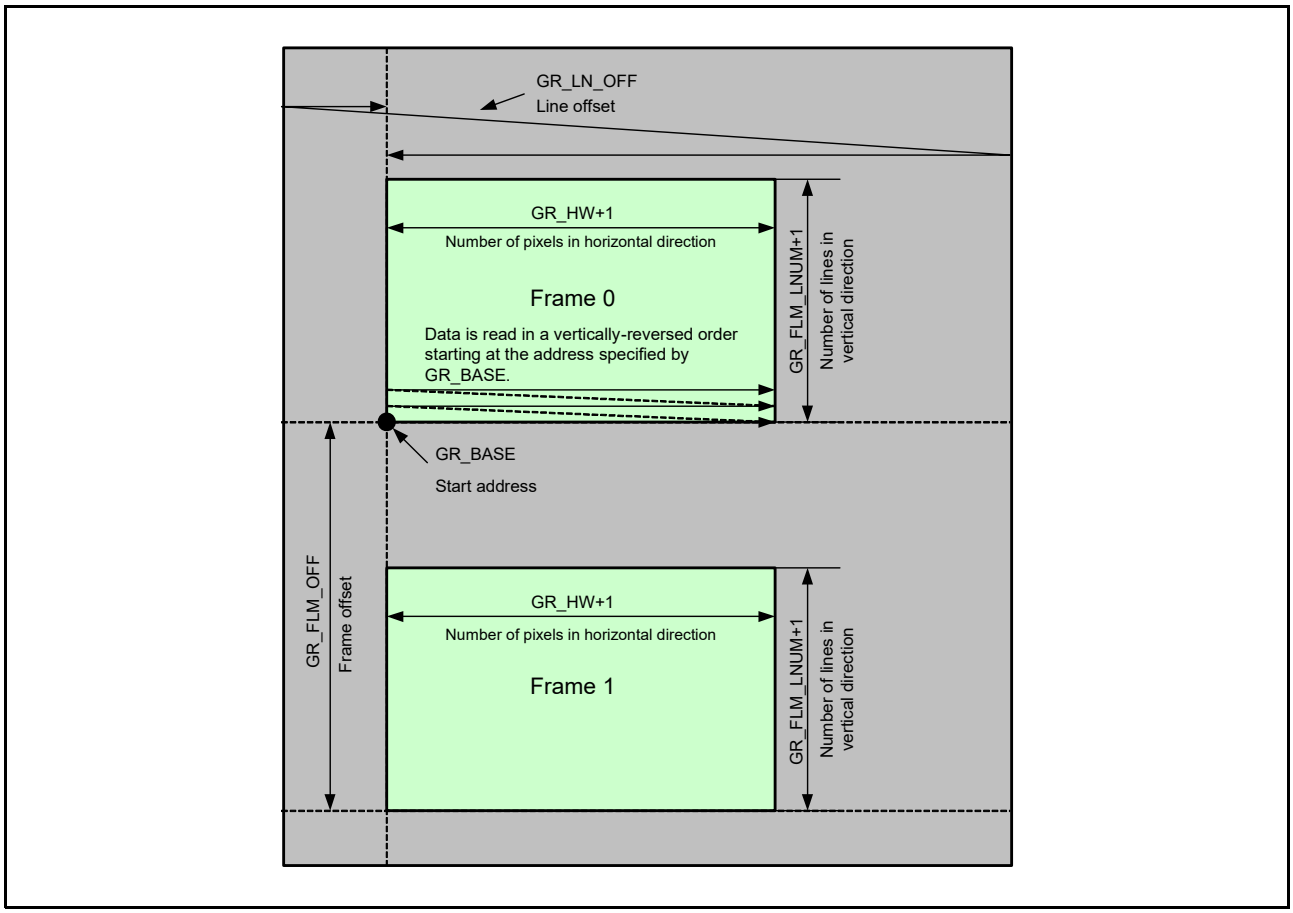

Figure 38.3 Data Arrangement with Line Offset and Decrement Control

(10) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 2, and 3 processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 process.

The GR_FORMAT[3:0] bits select a signal format.

Table 38.10 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 process, and is prohibited for the graphics 2 and 3 processes.

(11) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

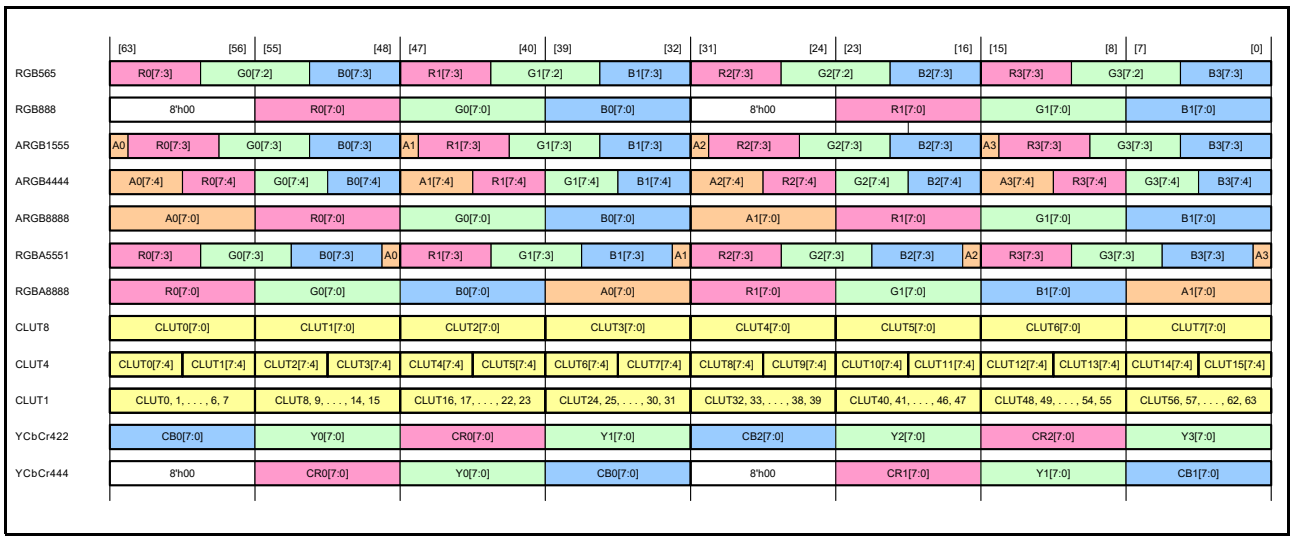

Figure 38.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

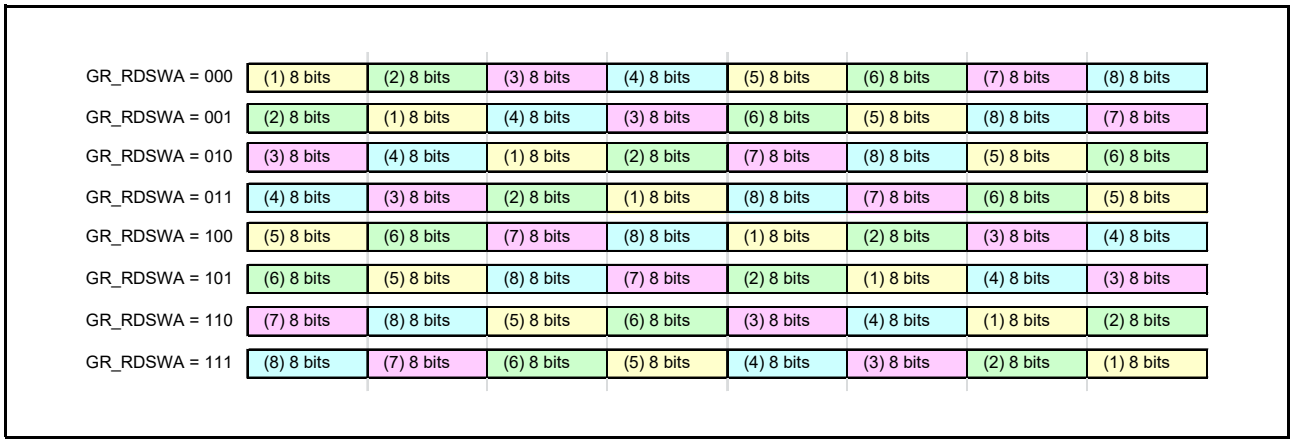

Figure 38.5 Data Arrangement with Endian Control Enabled

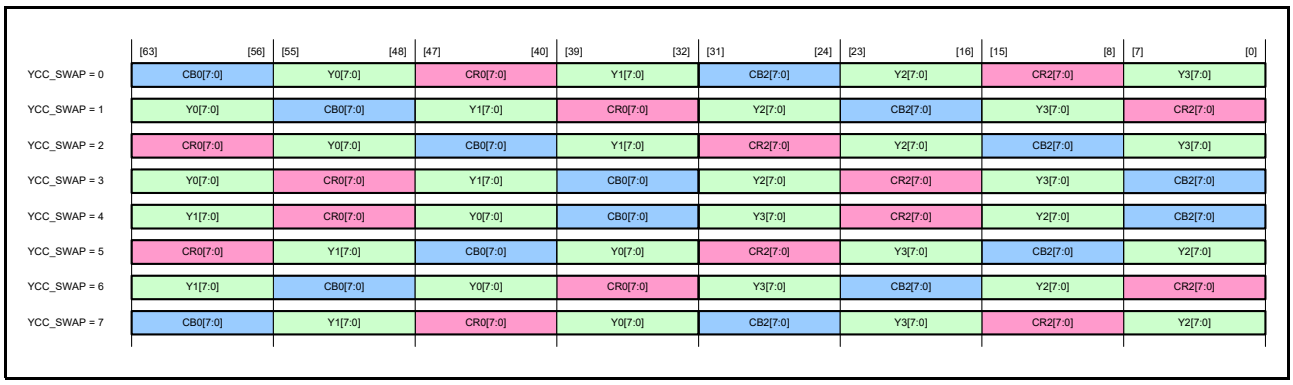

Figure 38.6 YCbCr422 Data Arrangement with Swapping Enabled

Table 38.11 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. * 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note: * These bits are supported for the graphics 0 process only.

(12) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 38.12 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

Note 1. The functions int() and mod() output a quotient and a remainder, respectively.
Note 2. The YCbCr422 format is not supported for the graphics 2 and 3 processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
Note 3. The YCbCr444 format is not supported for the graphics 2 and 3 processes.

Table 38.13 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

(13) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 process is converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2 and 3 processes.

Table 38.14 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation

Note: * This bit is not provided for the graphics 2 and 3 processes, for which the YCbCr422 format is not supported.

(14) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, αRGB1555, and αRGB4444 formats are converted to the αRGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGBα5551 format is converted to the RGBα8888 format. The RGBα5551 to RGBα8888 format conversion is omitted because it differs from the αRGB5551 to αRGB8888 format conversion only in the position of α.

- RGB565 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion G[7:0] = G[5:0] × 259 ÷ 64 (round off to an integer), approximation of #G[5:0] × 255 ÷ 63

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- RGB888 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

- αRGB1555 to αRGB8888 Format Conversion

  After conversion, α[7:0] is GR_A1 when α input is 1, and GR_A0 when 0.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion, G[7:0] = G[4:0] × 263 ÷ 32 (round off to an integer), approximation of #G[4:0] × 255 ÷ 31

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- αRGB4444 to αRGB8888 Format Conversion

  After conversion, α[7:0] = α[3:0] × 17

  After conversion, R[7:0] = R[3:0] × 17

  After conversion, G[7:0] = G[3:0] × 17

  After conversion, B[7:0] = B[3:0] × 17

(15) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

38.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 38.7 shows the graphics display area.

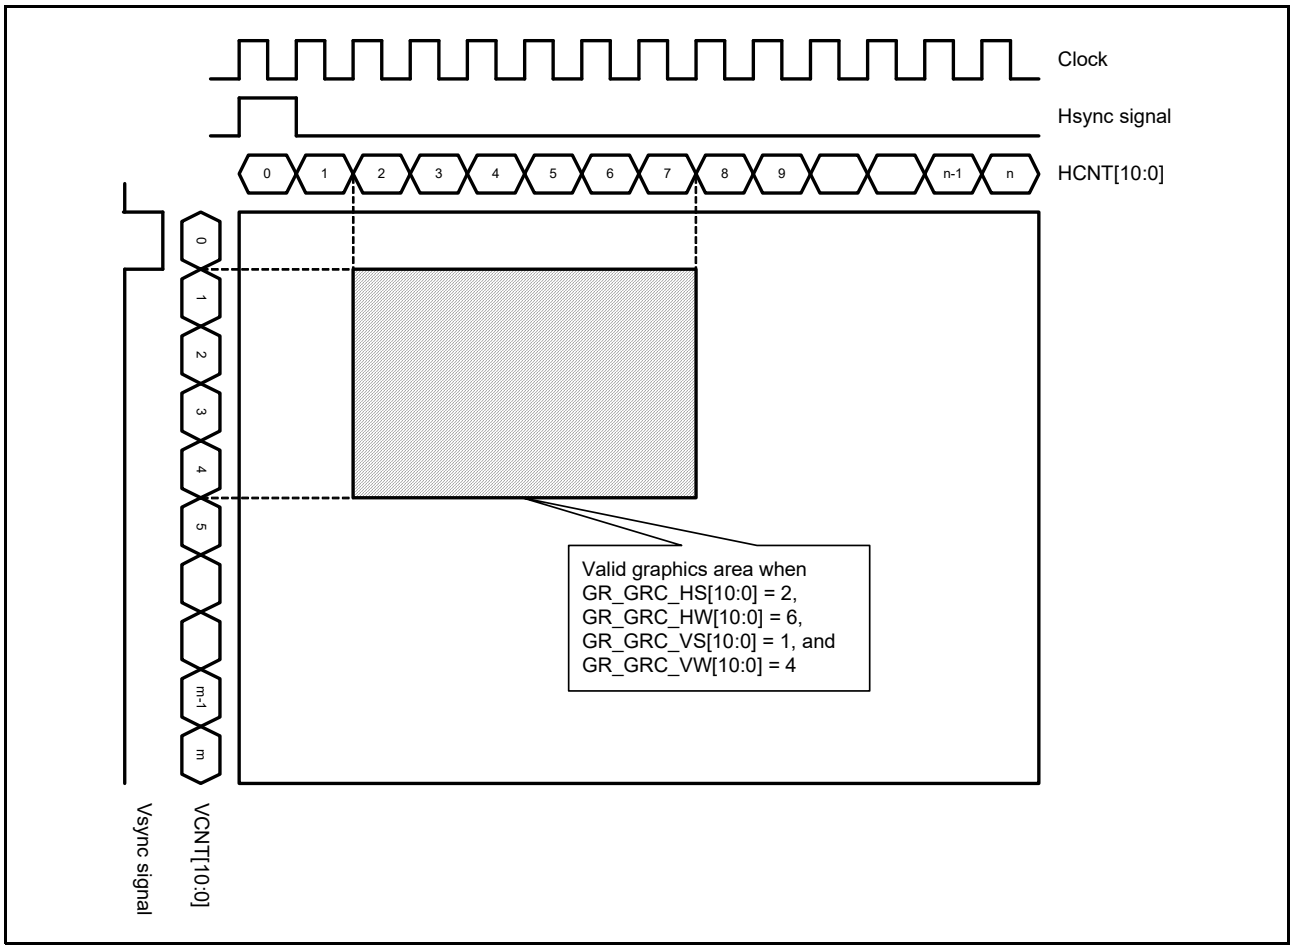

Figure 38.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 38.15 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

38.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 38.16 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 process only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used.

Note: * This function is supported for the graphics 3 process only; these bits are not supported for the graphics 0 and 2 processes.

38.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 38.17 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 38.17 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported *1	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	αRGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	αRGB4444	Supported	Supported *1	Not supported	Supported
4	αRGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGBα5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGBα8888	Supported	Supported	Not supported	Supported

Note 1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 38.1.2 (14) Bit Extension.)
Note 2. Since α value is 255, the current graphics is always displayed.
Note 3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.
Note 4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α, G, B, and R values (8 bits for each value). The CLUT table is not referenced.
Note 5. YCbCr422 and YCbCr444 are supported for the graphics 0 process, but any type of blending and chroma-key processing cannot be used.

38.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected.
This function is not supported for the VIN synthesizer.

Table 38.18 shows the settings for various display types.

Table 38.18 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

Note 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler.
Note 2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 2 and 3 processes only.

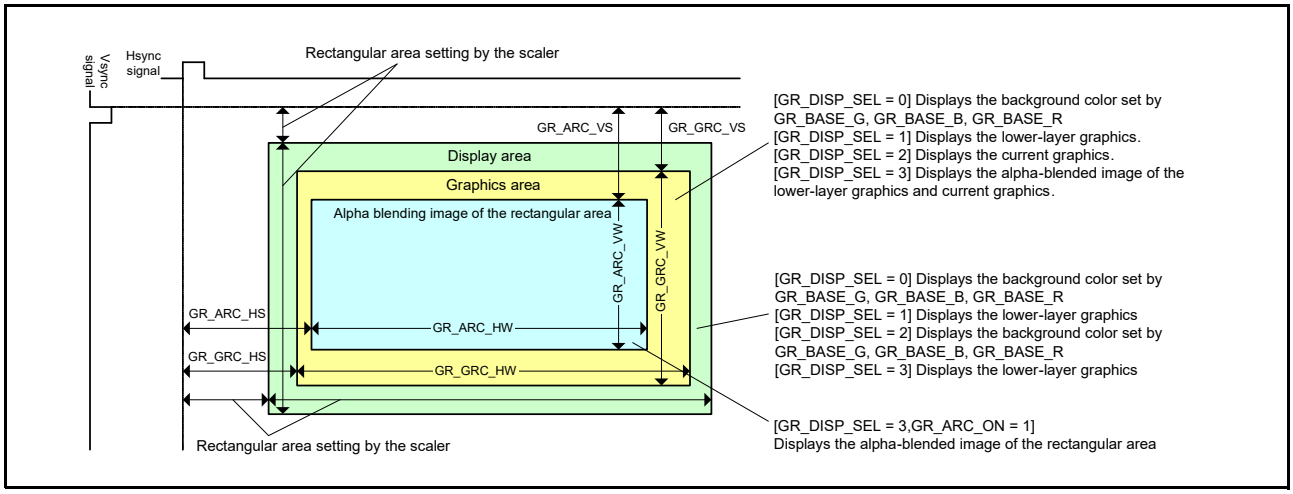

Figure 38.8 Graphic Display Types

Figure 38.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 38.1.

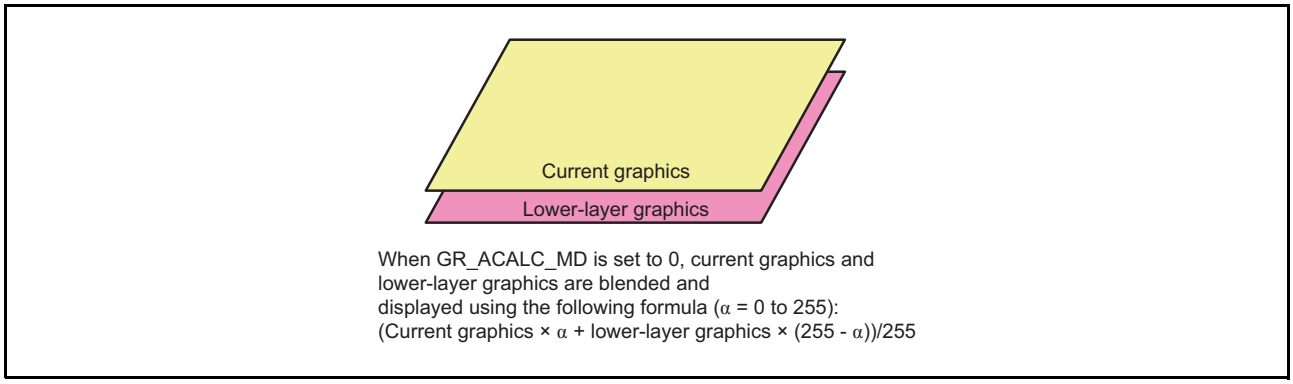

Figure 38.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 38.19 Alpha Blending Setting

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0:Background color display 1:Lower-layer graphics display 2:Current graphics display 3:Blended display of lower-layer graphics and current graphics*1
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area *3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units *3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note 1. The graphics 0 process supports the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only.
Note 2. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.
Note 3. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

38.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 38.20 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

38.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

38.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

38.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 process.

Figure 38.10 shows the rectangular area setting for alpha blending.

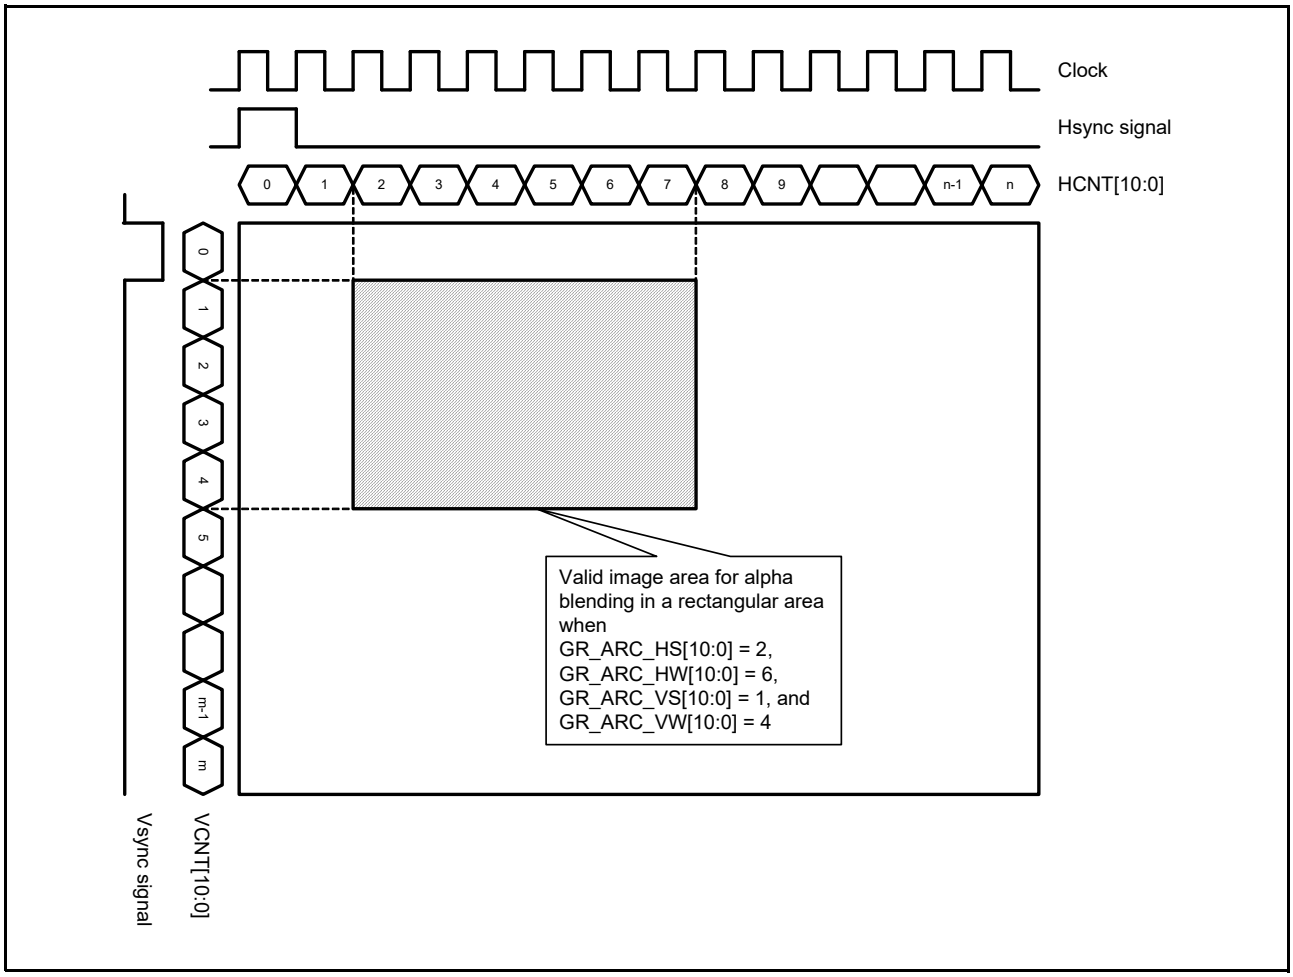

Figure 38.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 38.21 Setting of Rectangular Area for Alpha Blending

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

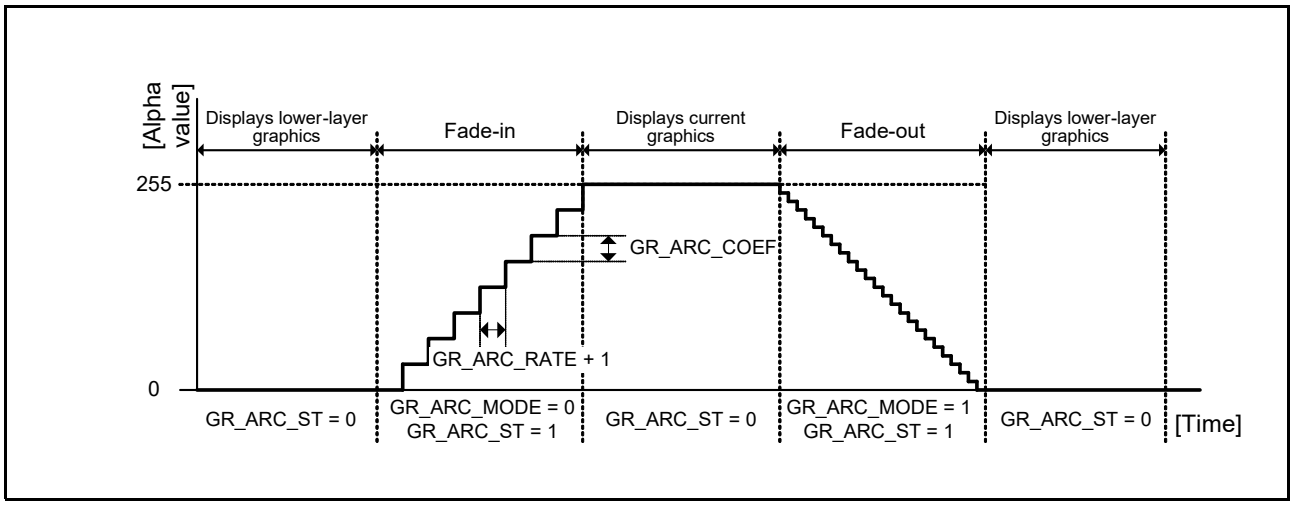

Figure 38.11 Fade In and Fade Out

Table 38.22 Setting for Alpha Blending in a Rectangular Area

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 38.23 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing * α: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

38.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

CLUT input of the current graphics = GR_CK_KCLUT

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 38.24 Setting for CLUT-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_ KCLUT[7:0]	0	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB])
GR_AB10	GR_A0[7:0]	0	CLUT1 α0 Signal * Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 format and α = 0.
GR_AB10	GR_G0[7:0]	0	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_B0[7:0]	0	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_R0[7:0]	0	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.
GR_AB11	GR_A1[7:0]	0	CLUT1 α1 Signal * Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 format and α = 1.
GR_AB11	GR_G1[7:0]	0	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_B1[7:0]	0	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_R1[7:0]	0	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

38.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 process and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

G output = (G value × α value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value × α value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value × α value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

[GR_ACALC_MD = 1 (premultiplication)]

G output = (G value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

38.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to αRGB8888 based on the CLUT table. When the format is CLUT1, it is converted to αRGB8888 based on the register value.

Figure 38.12 shows data arrangement in the CLUT table.

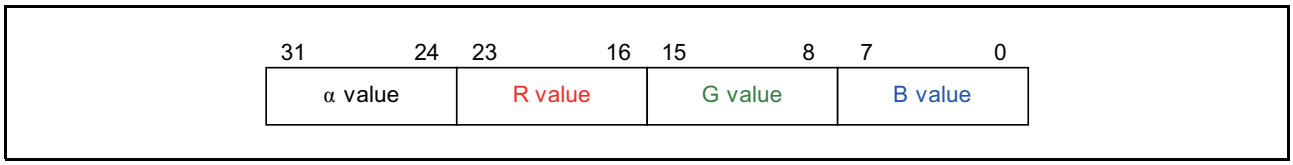

Figure 38.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses:

Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)

Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)

Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table. To switch the CLUT tables after having written to one, execute a dummy read from any location in the address space of the given CLUT table before switching them.

Table 38.25 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.

38.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

[GR_ARC_MUL=0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL=1 (premultiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.17 Selection of Lower-Layer Graphics in VIN Synthesizer

Graphics 0 is allocated to the lower-layer graphics in the VIN synthesizer.

Table 38.26 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	Specifies lower-layer plane in the scaler. 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited

38.2 Register Descriptions

Table 38.27 to Table 38.30 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 38.27 shows the register configuration for the graphics 2 process.

Table 38.28 shows the register configuration for the graphics 3 process.

Table 38.29 shows the CLUT table configuration.

Table 38.30 shows the register configuration for the VIN synthesizer.

The register configuration for the graphics 0 process is described in section 36, Video Display Controller 6 (3): Scaler.

Table 38.27 Register Configuration of the Image Synthesizer (Graphics 2 Process)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Graphics 2 register update control register	GR2_UPDATE	R/WC1	H'0000 0000	H'FCFF 7700	32

R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

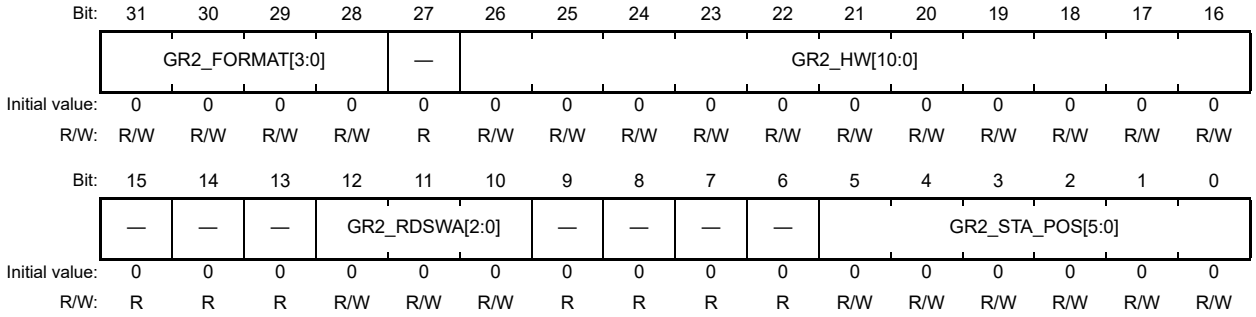
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_ FORMAT[3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR2_ RDSWA[2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR2_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line.

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1.
GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ ARC_MUL	GR2_ ACALC_MD	—	GR2_ARC_ ON	—	—	—	GR2_ARC_ DISP_ON	—	—	—	GR2_GRC_ DISP_ON	—	—	GR2_DISP_SEL [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_ DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_ DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR2_DISP_ SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_ KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_ KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_ KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_ KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_ SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

38.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR3_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR3_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

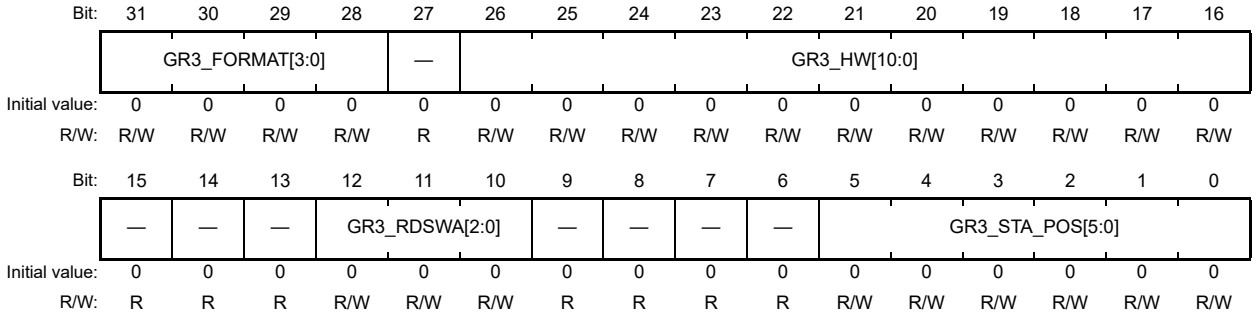
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR3_RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR3_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line.

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_ARC_MUL	GR3_ACALC_MD	—	GR3_ARC_ON	—	—	—	GR3_ARC_DISP_ON	—	—	—	GR3_GRC_DISP_ON	—	—	GR3_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_ KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_ KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_ KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_ KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

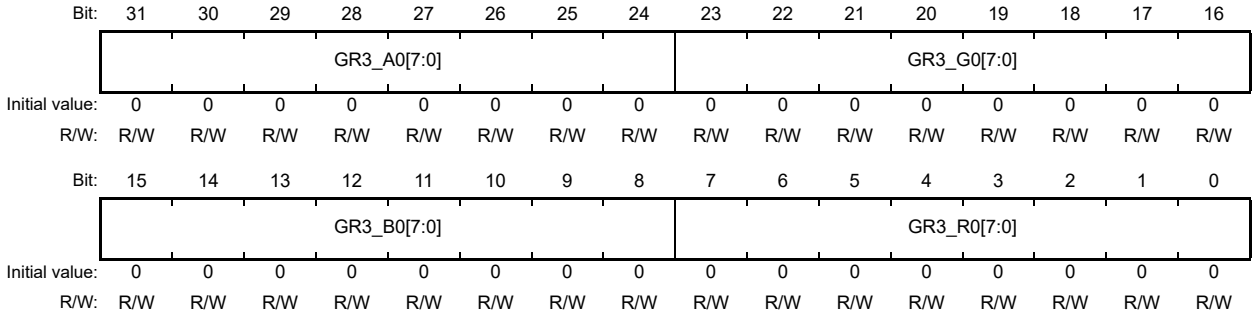
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

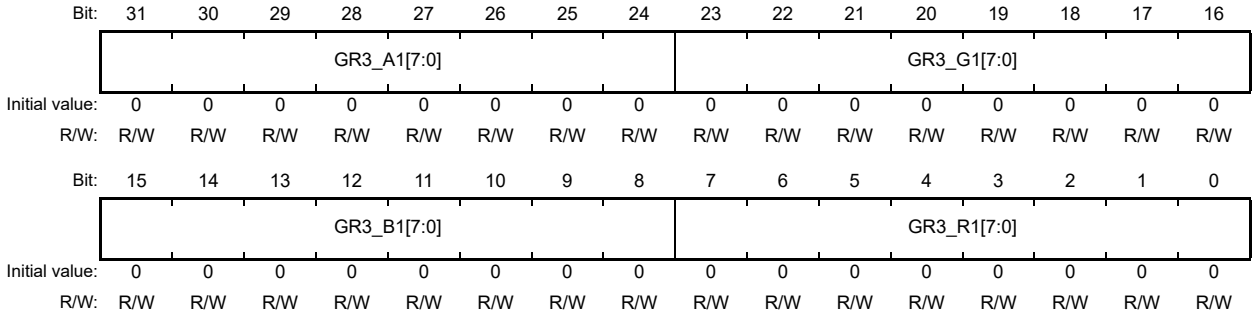
38.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited
1, 0	GR_VIN_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (fixed to black) 1: Lower-layer graphics display 2: Setting prohibited 3: Setting prohibited

Note: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.3 Usage Method

38.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], and GR_VIN_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 2, and 3 processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state. Note that the background color for the VIN synthesizer is fixed to black.

38.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

39. Video Display Controller 6 (7): Output Controller

39.1 Output Controller

39.1.1 Overview of Functions

The output controller subjects RGB signals output from the image synthesizer to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion.
RBG signals can be output from the LVDS. For output from the LVDS, see section 41, LVDS Output Interface.
Figure 39.1 shows the function block diagram of the output controller.

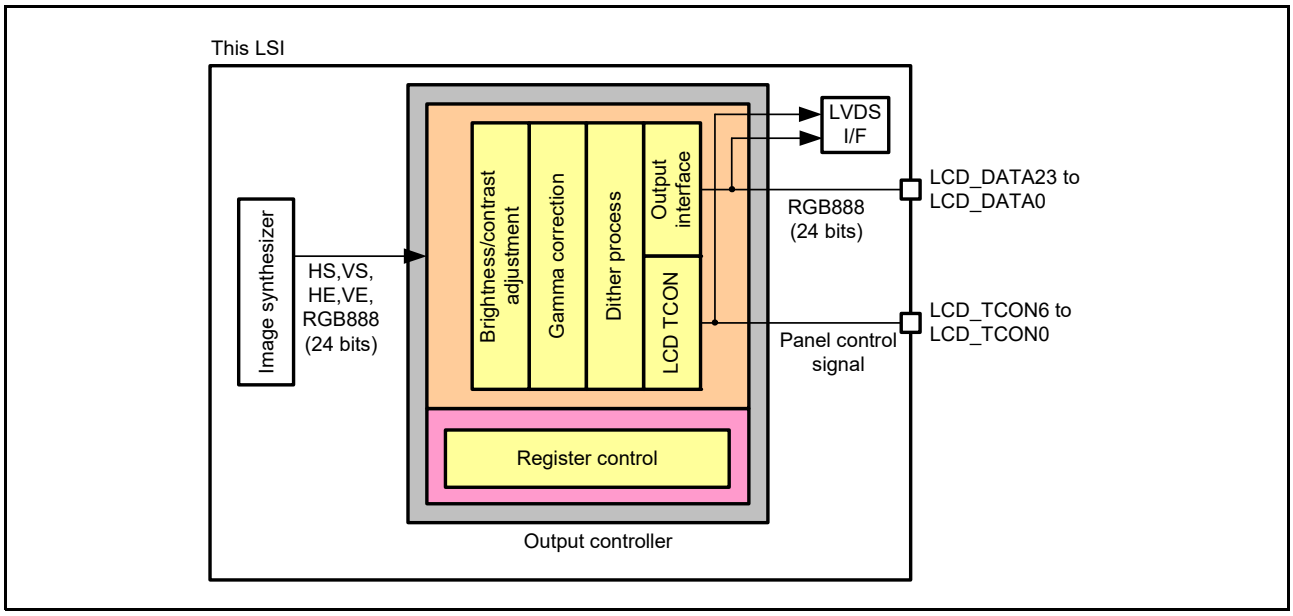

Figure 39.1 Functional Block Diagram of Output Controller

39.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 39.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

39.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 39.2 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast

39.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from the image synthesizer.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

BRT_GOUT = GIN + PBRT_G − 512
BRT_BOUT = BIN + PBRT_B − 512
BRT_ROUT = RIN + PBRT_R − 512

Table 39.3 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

39.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

GOUT = BRT_GOUT × CONT_G/128
BOUT = BRT_BOUT × CONT_B/128
ROUT = BRT_ROUT × CONT_R/128

Table 39.4 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

39.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$

DIN: Input signal (8-bit)
DOUT: Output signal (10-bit)
$TH_{(n)}$: Threshold (8-bit)
$OFFSET_{(n)}$: Offset value (19-bit)
$GAIN_{(n)}$: Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF\_O_{(n)}$ (When n = 0, $OFFSET_{(0)} = 0$.)
$DEF\_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)}$ (When n = 0, $OFFSET_{(0)} = 0$.)

$OFFSET_{(n)}$: Offset value of current area (19-bit)
$OFFSET_{(n-1)}$: Offset value of previous area (19-bit)
$DEF\_O_{(n)}$: Difference in offset value of Current and previous area (19-bit)
$TH_{(n)}$: Threshold of current area (8-bit)
$TH_{(n-1)}$: Threshold of previous area (8-bit)
$GAIN_{(n-1)}$: Gain coefficient of previous area (11-bit)

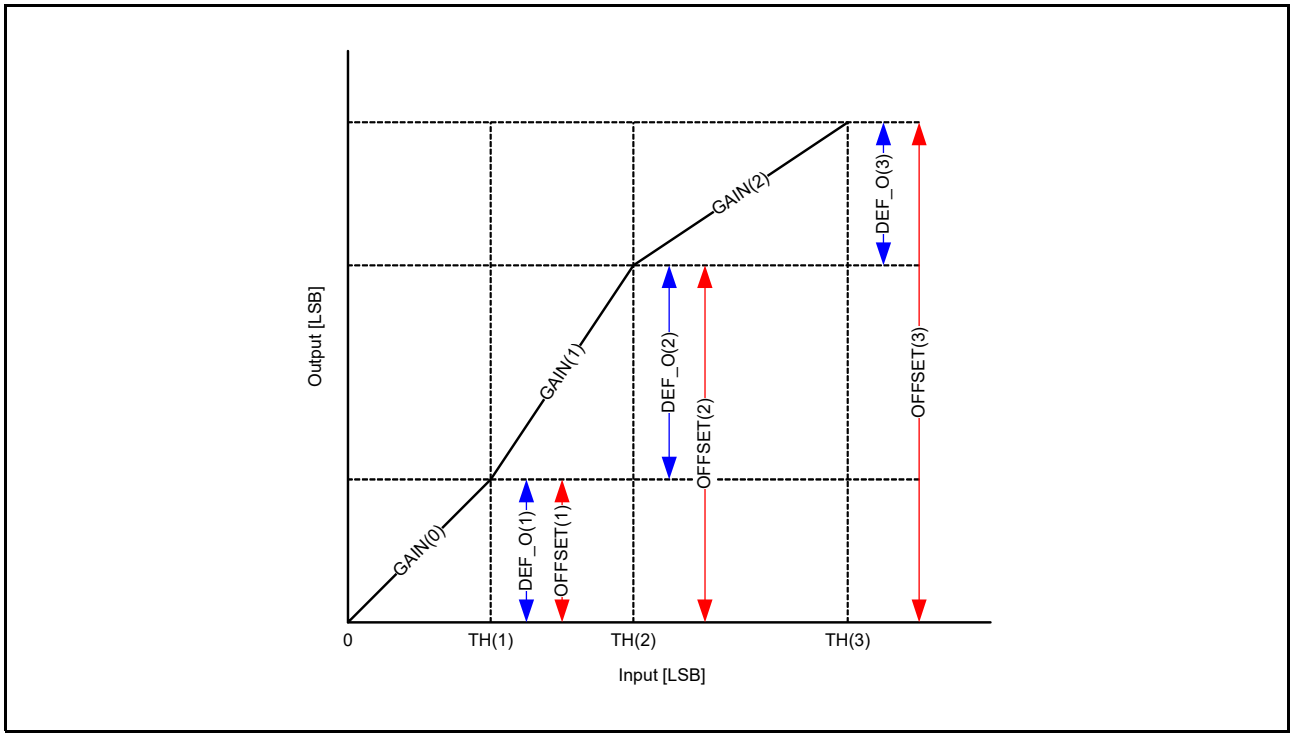

Figure 39.2 Corresponding Chart of Offset Calculation Formulas

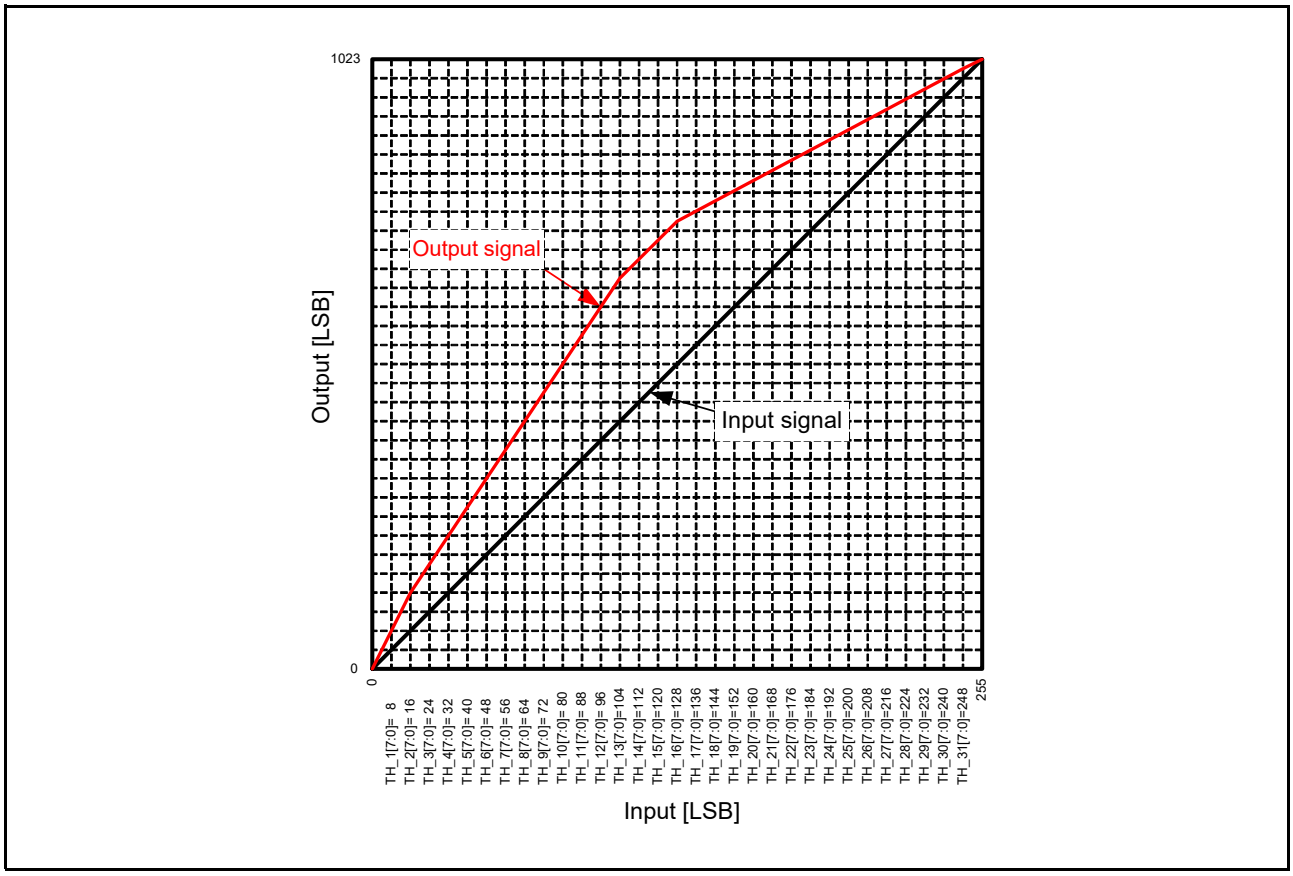

Figure 39.3 Example of Input-Output Characteristics of Gamma Correction

GAM_R_LUT1 to GAM_R_LUT16	GAM_R_GAIN_00 to GAM_R_GAIN_31[10:0]	1024	Gain Adjustment of Area 0 to 31 of R Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])

39.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2 × 2 pattern dither mode and random pattern dither mode.

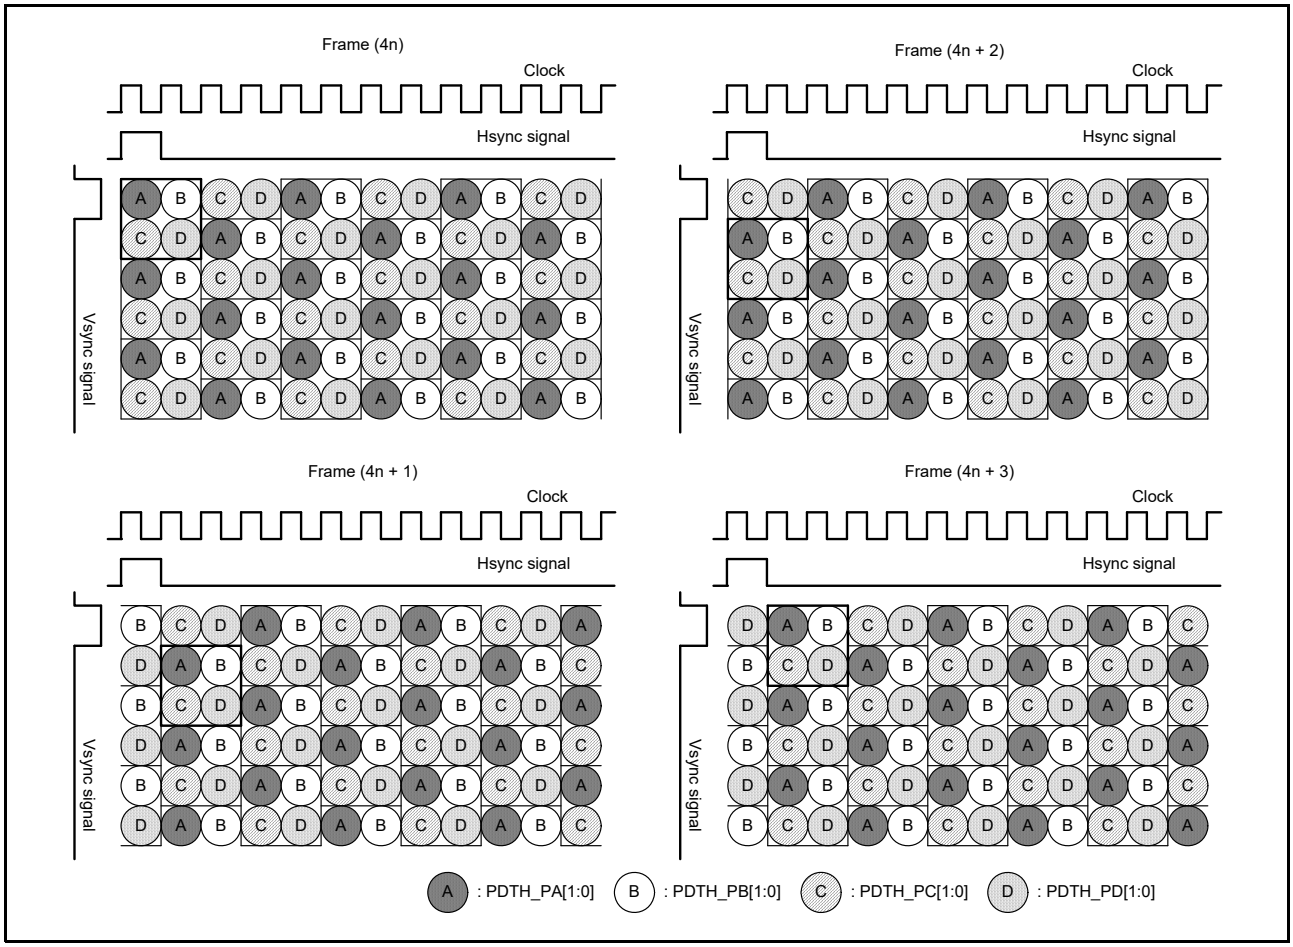

Figure 39.4 Operation Specification of 2 × 2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (truncate the number below the decimal point)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (truncate the number below the decimal point)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (truncate the number below the decimal point)

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 39.6 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description
OUT_PDTHA	PDTH_SEL[1:0]	0	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither

OUT_PDTHA	PDTH_PA[1:0]	3	Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PB[1:0]	0	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

39.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 39.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 39.7 Bit Allocation of RGB Signal Input for RGB888 Output

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 39.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

Table 39.10 Bit Allocation of RGB Signal Input for Serial RGB Output

(5) Parallel to Serial Conversion

As shown in Table 39.11, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 39.11 Specifications of Serial RGB Output

OUT_FRQ_SEL	1	1	2	2
OUT_DIR_SEL	0	1	0	1
Line (2n-1)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)
Line 2n	Repeated (g → b → r)	Repeated (r → b → g)	Repeated (r → g → b → X)	Repeated (X → b → g → r)

Figure 39.5 and Figure 39.6 show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

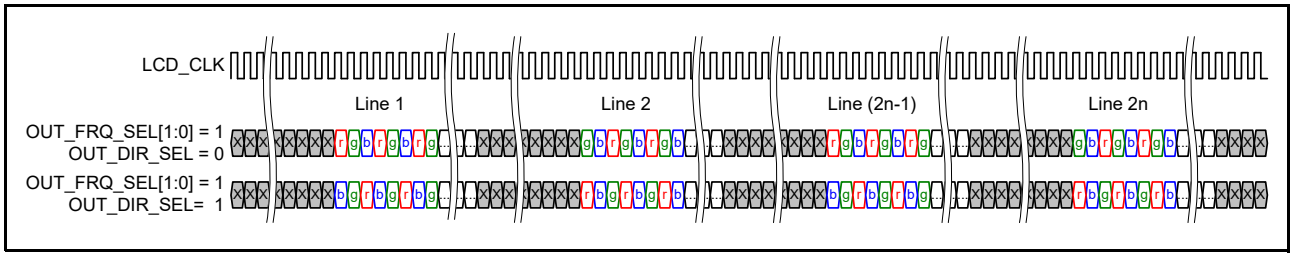

Figure 39.5 Timing of Parallel to Serial Conversion in Triple Speed Mode

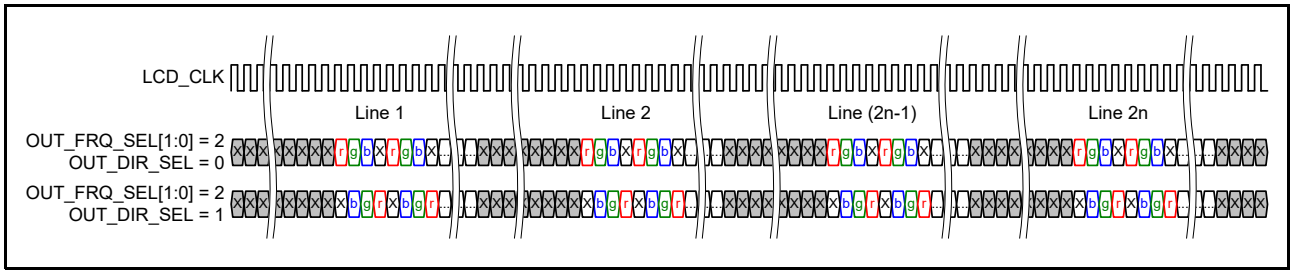

Figure 39.6 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

Figure 39.7 shows the timing of the clock phases of the serial RGB output (triple speed mode).

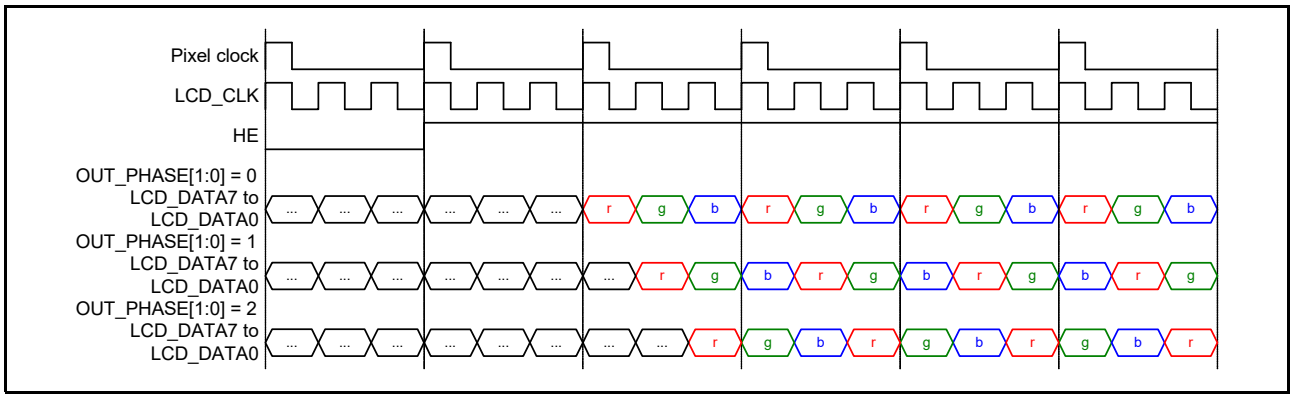

Figure 39.7 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

Figure 39.8 shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

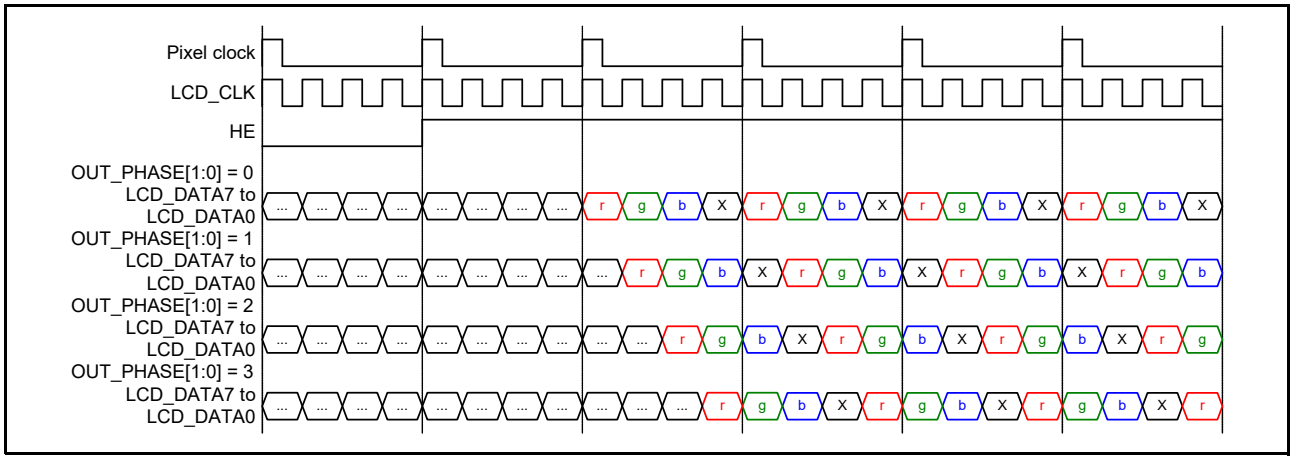

Figure 39.8 Timing of Clock Phases of Serial RGB Output (Quadruple Speed Mode)

Table 39.12 Output Format Conversion

39.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 39.13 lists the timing signals that are generated by LCD TCON

Table 39.13 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STH/SP/HS	Horizontal	• Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	• Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	• Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	• Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

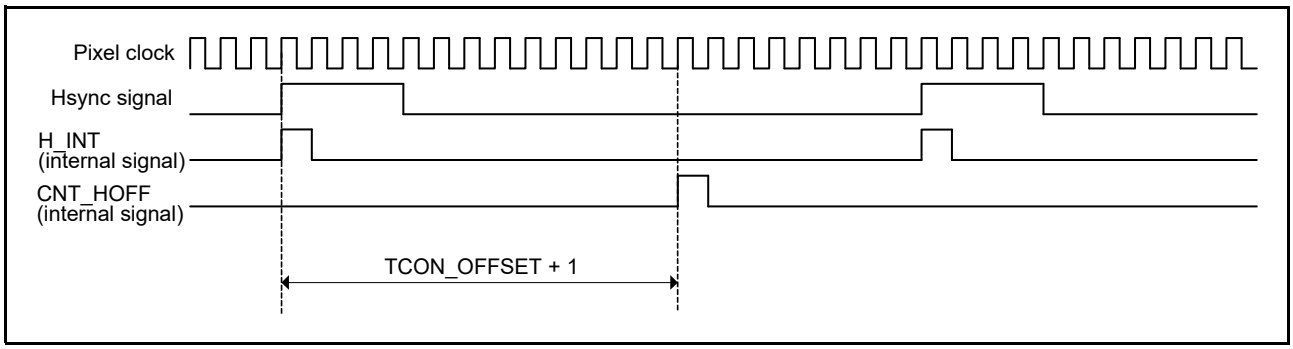

Figure 39.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 39.14 Horizontal Reference Signal Selection

Signal Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

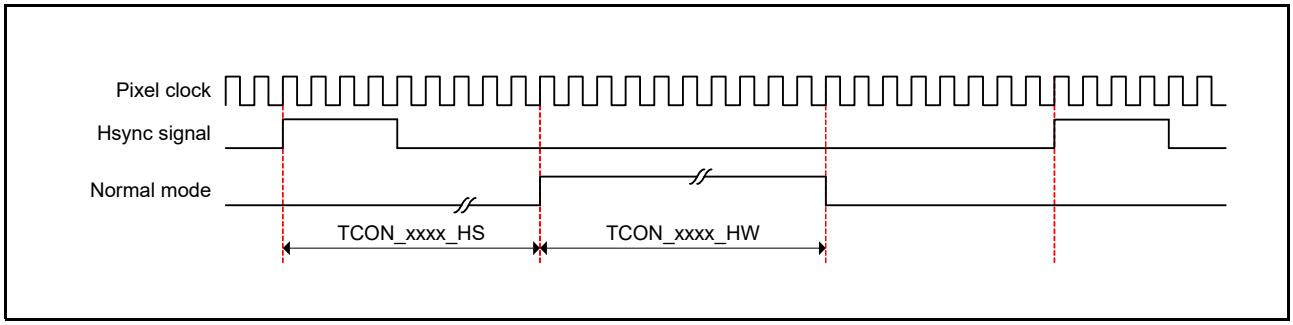

Figure 39.10 Horizontal Panel Driver Signal (in Normal Mode)

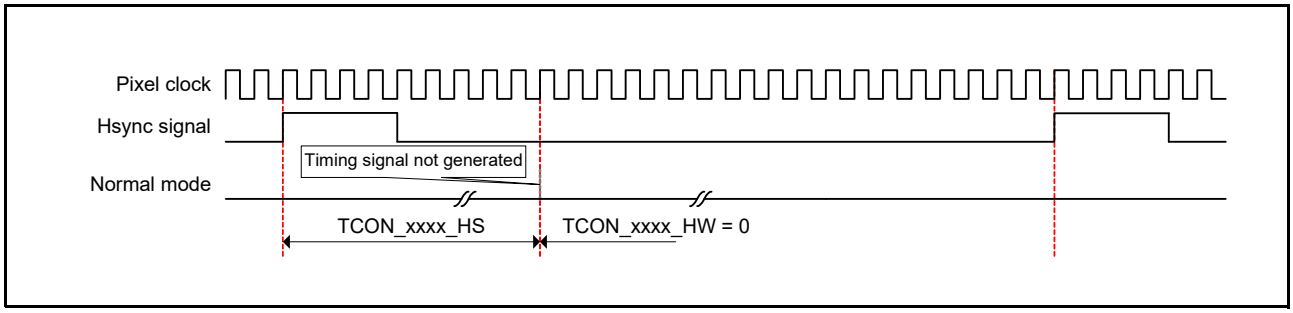

Figure 39.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

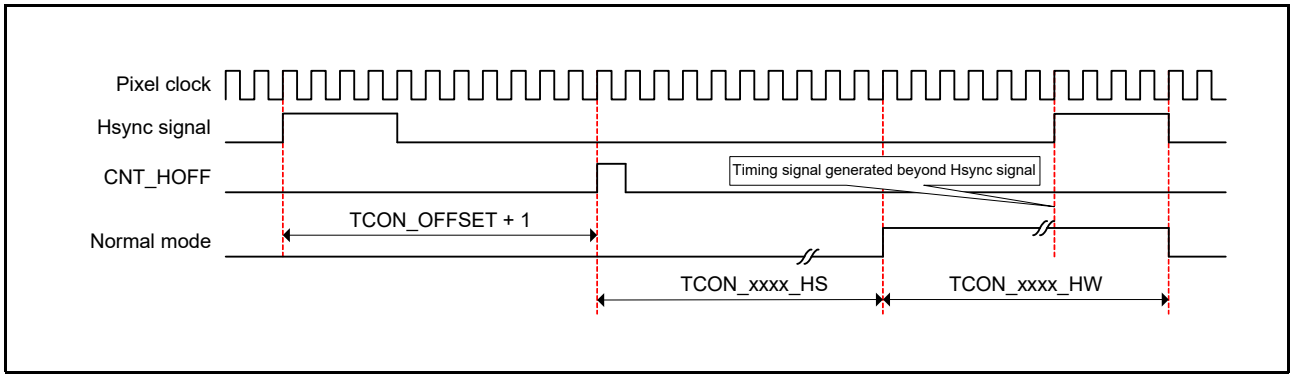

Figure 39.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 39.15 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 39.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

Table 39.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

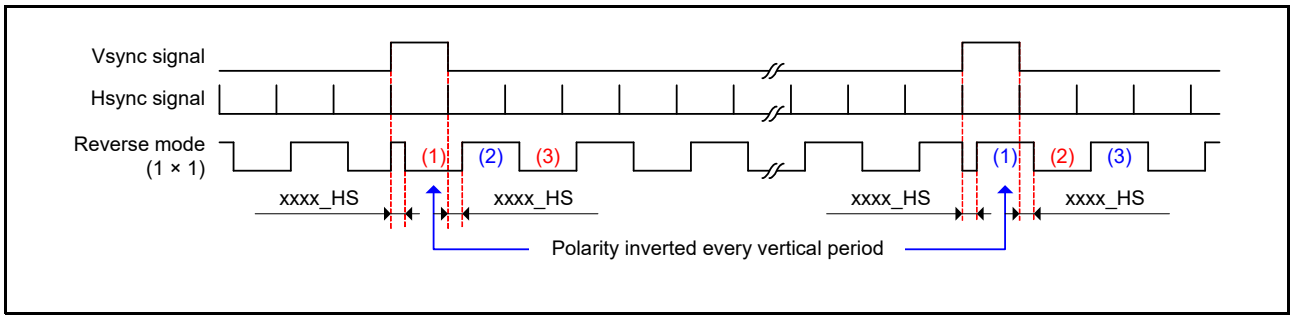

Figure 39.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

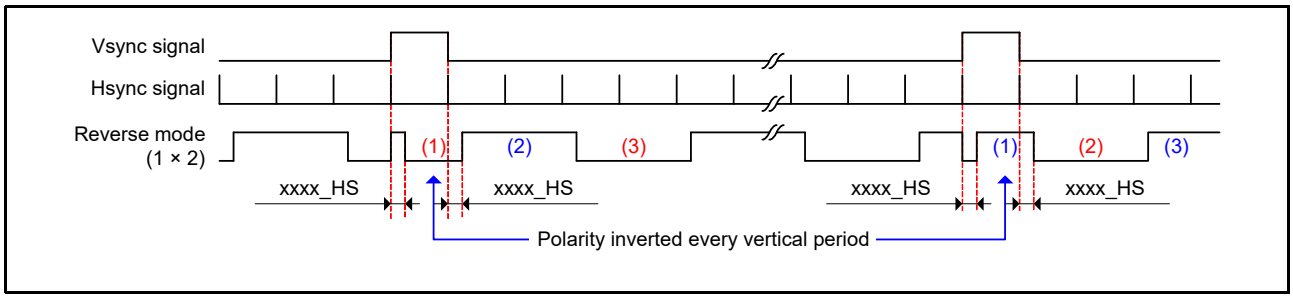

Figure 39.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

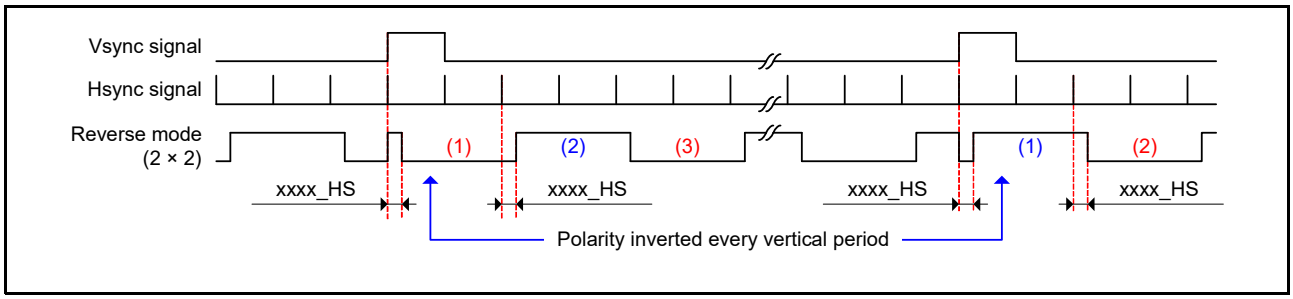

Figure 39.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 39.17 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

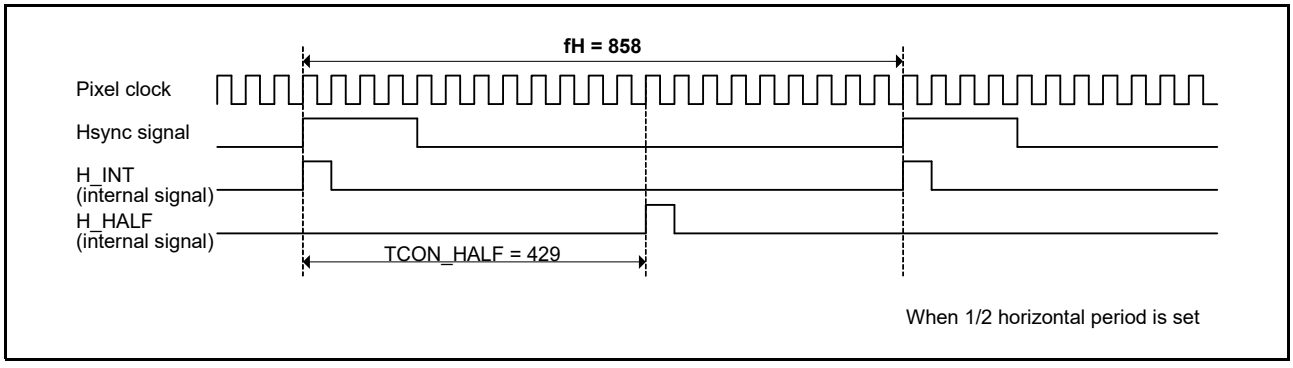

Figure 39.16 1/2 Pulse (H_HALF) Signal Generation

Table 39.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

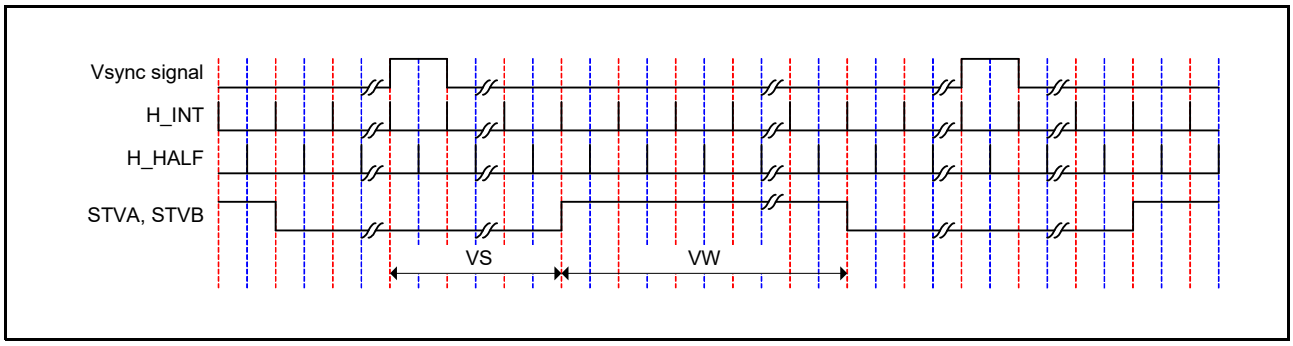

Figure 39.17 Vertical Panel Driver Signal (H_INT Reference Operation)

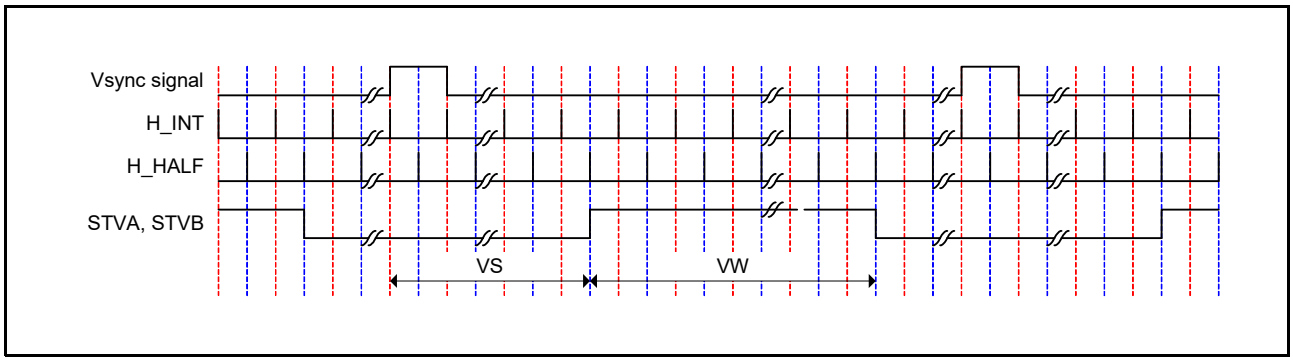

Figure 39.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

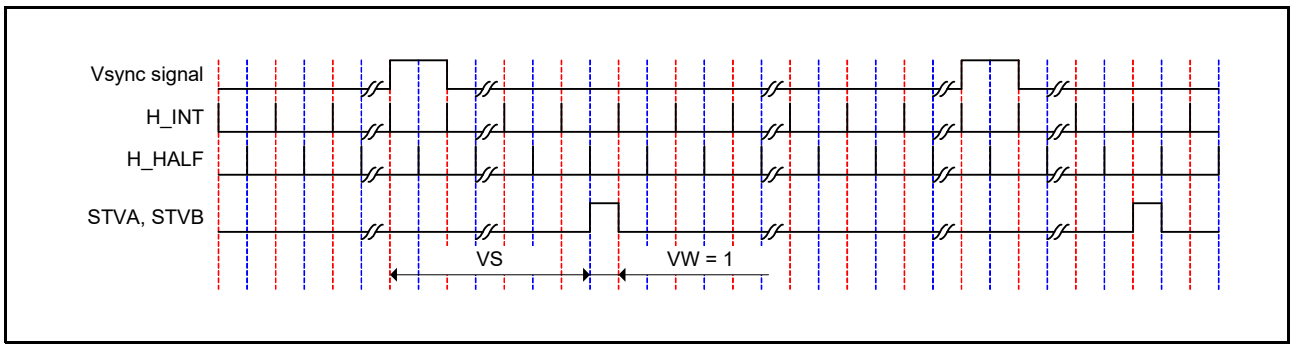

Figure 39.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 39.19 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

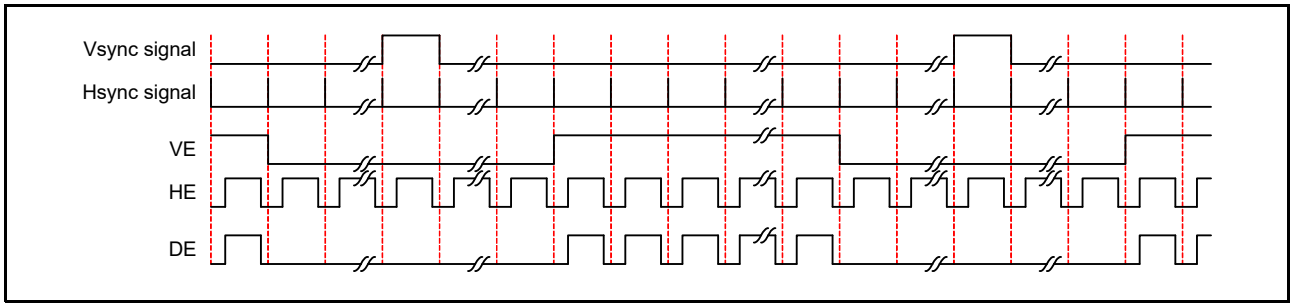

Figure 39.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 39.20 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 39.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STVB2	TCON_STVB_SEL [2:0]	1	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Table 39.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH2	TCON_STH_SEL [2:0]	2	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STB2	TCON_STB_SEL [2:0]	7	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

TCON_TIM_POLB2	TCON_POLB_SEL [2:0]	6	Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 39.22 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

39.2 Register Descriptions

Table 39.23 to Table 39.25 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 39.23 Gamma Correction Block Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register G in gamma correction block	GAM_G_UPDATE	R/WC1	H'0000 0000	H'FCFF 7800	32
Function switch register in gamma correction block	GAM_SW	R/W	H'0000 0000	H'FCFF 7804	32

Table 39.25 Output Controller Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register in output controller	OUT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7A00	32
Output interface register	OUT_SET	R/W	H'001F 0000	H'FCFF 7A04	32
Brightness (DC) correction register 1	OUT_BRIGHT1	R/W	H'0000 0200	H'FCFF 7A08	32
Brightness (DC) correction register 2	OUT_BRIGHT2	R/W	H'0200 0200	H'FCFF 7A0C	32
Contrast (gain) correction register	OUT_CONTRAST	R/W	H'0080 8080	H'FCFF 7A10	32
Panel dither register	OUT_PDTHA	R/W	H'0000 3021	H'FCFF 7A14	32
Output phase control register	OUT_CLK_PHASE	R/W	H'0000 0000	H'FCFF 7A24	32

39.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_G_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_G_VEN	0	R/WC1	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

39.2.2 Function Switch Register in Gamma Correction Block (GAM_SW)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_ON	0	R/W	Gamma Correction On/Off Control 0: Off 1: On

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.3 Table Setting Register G1 to G16 in Gamma Correction Block (GAM_G_LUT1 to GAM_G_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_G_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_G_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 0 of G Signal GAM_G_LUT2: Gain Adjustment of Area 2 of G Signal GAM_G_LUT3: Gain Adjustment of Area 4 of G Signal GAM_G_LUT4: Gain Adjustment of Area 6 of G Signal GAM_G_LUT5: Gain Adjustment of Area 8 of G Signal GAM_G_LUT6: Gain Adjustment of Area 10 of G Signal GAM_G_LUT7: Gain Adjustment of Area 12 of G Signal GAM_G_LUT8: Gain Adjustment of Area 14 of G Signal GAM_G_LUT9: Gain Adjustment of Area 16 of G Signal GAM_G_LUT10: Gain Adjustment of Area 18 of G Signal GAM_G_LUT11: Gain Adjustment of Area 20 of G Signal GAM_G_LUT12: Gain Adjustment of Area 22 of G Signal GAM_G_LUT13: Gain Adjustment of Area 24 of G Signal GAM_G_LUT14: Gain Adjustment of Area 26 of G Signal GAM_G_LUT15: Gain Adjustment of Area 28 of G Signal GAM_G_LUT16: Gain Adjustment of Area 30 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])
26 to 16	*	1024	R/W	*: Bit Name GAM_G_LUT1: GAM_G_GAIN_00[10:0] GAM_G_LUT2: GAM_G_GAIN_02[10:0] GAM_G_LUT3: GAM_G_GAIN_04[10:0] GAM_G_LUT4: GAM_G_GAIN_06[10:0] GAM_G_LUT5: GAM_G_GAIN_08[10:0] GAM_G_LUT6: GAM_G_GAIN_10[10:0] GAM_G_LUT7: GAM_G_GAIN_12[10:0] GAM_G_LUT8: GAM_G_GAIN_14[10:0] GAM_G_LUT9: GAM_G_GAIN_16[10:0] GAM_G_LUT10: GAM_G_GAIN_18[10:0] GAM_G_LUT11: GAM_G_GAIN_20[10:0] GAM_G_LUT12: GAM_G_GAIN_22[10:0] GAM_G_LUT13: GAM_G_GAIN_24[10:0] GAM_G_LUT14: GAM_G_GAIN_26[10:0] GAM_G_LUT15: GAM_G_GAIN_28[10:0] GAM_G_LUT16: GAM_G_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 1 of G Signal GAM_G_LUT2: Gain Adjustment of Area 3 of G Signal GAM_G_LUT3: Gain Adjustment of Area 5 of G Signal GAM_G_LUT4: Gain Adjustment of Area 7 of G Signal GAM_G_LUT5: Gain Adjustment of Area 9 of G Signal GAM_G_LUT6: Gain Adjustment of Area 11 of G Signal GAM_G_LUT7: Gain Adjustment of Area 13 of G Signal GAM_G_LUT8: Gain Adjustment of Area 15 of G Signal GAM_G_LUT9: Gain Adjustment of Area 17 of G Signal GAM_G_LUT10: Gain Adjustment of Area 19 of G Signal

Bit	Bit Name	Initial Value	R/W	Description

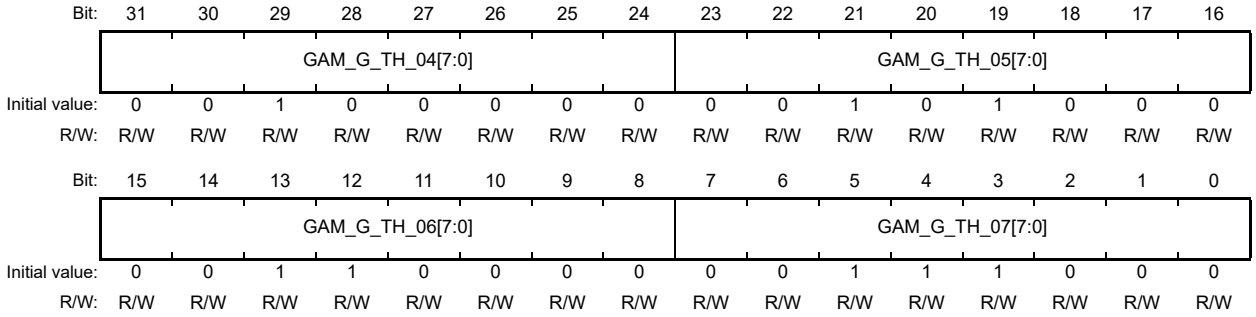
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GAM_G_TH_01[7:0]	8	R/W	Start Threshold of Area 1 of G Signal Unsigned (0 to 255 [LSB]) 0 < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_02[7:0]	16	R/W	Start Threshold of Area 2 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_03[7:0]	24	R/W	Start Threshold of Area 3 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_04[7:0]	32	R/W	Start Threshold of Area 4 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_05[7:0]	40	R/W	Start Threshold of Area 5 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_06[7:0]	48	R/W	Start Threshold of Area 6 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_07[7:0]	56	R/W	Start Threshold of Area 7 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.6 Area Setting Register G3 in Gamma Correction Block (GAM_G_AREA3)

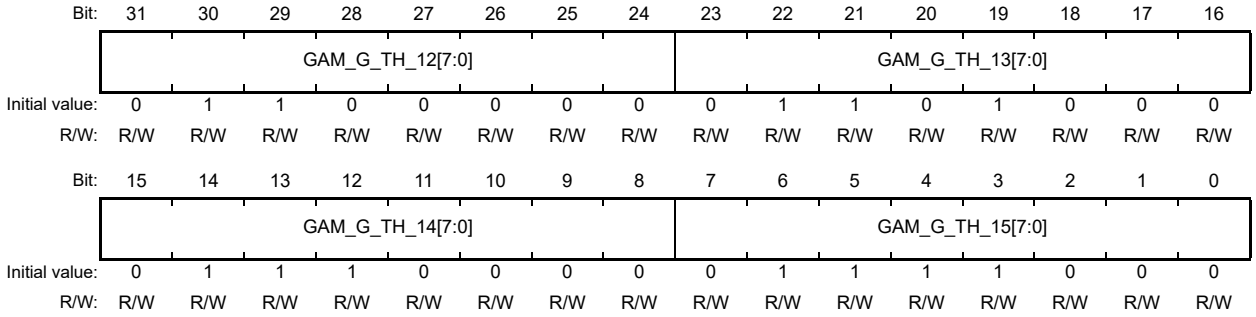
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_08[7:0]								GAM_G_TH_09[7:0]							
Initial value:	0	1	0	0	0	0	0	0	0	1	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_10[7:0]								GAM_G_TH_11[7:0]							
Initial value:	0	1	0	1	0	0	0	0	0	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_08[7:0]	64	R/W	Start Threshold of Area 8 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_09[7:0]	72	R/W	Start Threshold of Area 9 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_10[7:0]	80	R/W	Start Threshold of Area 10 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_11[7:0]	88	R/W	Start Threshold of Area 11 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

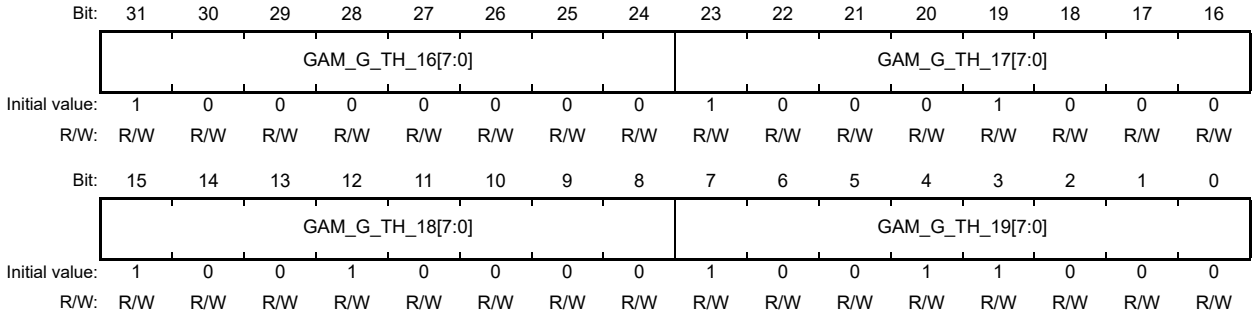
39.2.7 Area Setting Register G4 in Gamma Correction Block (GAM_G_AREA4)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_12[7:0]	96	R/W	Start Threshold of Area 12 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_13[7:0]	104	R/W	Start Threshold of Area 13 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_14[7:0]	112	R/W	Start Threshold of Area 14 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_15[7:0]	120	R/W	Start Threshold of Area 15 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.8 Area Setting Register G5 in Gamma Correction Block (GAM_G_AREA5)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_16 [7:0]	128	R/W	Start Threshold of Area 16 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_17 [7:0]	136	R/W	Start Threshold of Area 17 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_18 [7:0]	144	R/W	Start Threshold of Area 18 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_19 [7:0]	152	R/W	Start Threshold of Area 19 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.9 Area Setting Register G6 in Gamma Correction Block (GAM_G_AREA6)

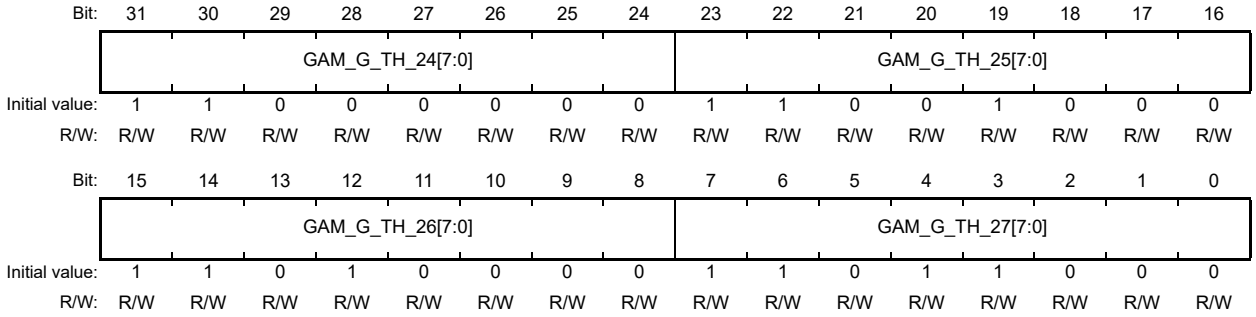
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_20[7:0]								GAM_G_TH_21[7:0]							
Initial value:	1	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_22[7:0]								GAM_G_TH_23[7:0]							
Initial value:	1	0	1	1	0	0	0	0	1	0	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_20 [7:0]	160	R/W	Start Threshold of Area 20 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_21 [7:0]	168	R/W	Start Threshold of Area 21 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_22 [7:0]	176	R/W	Start Threshold of Area 22 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_23 [7:0]	184	R/W	Start Threshold of Area 23 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

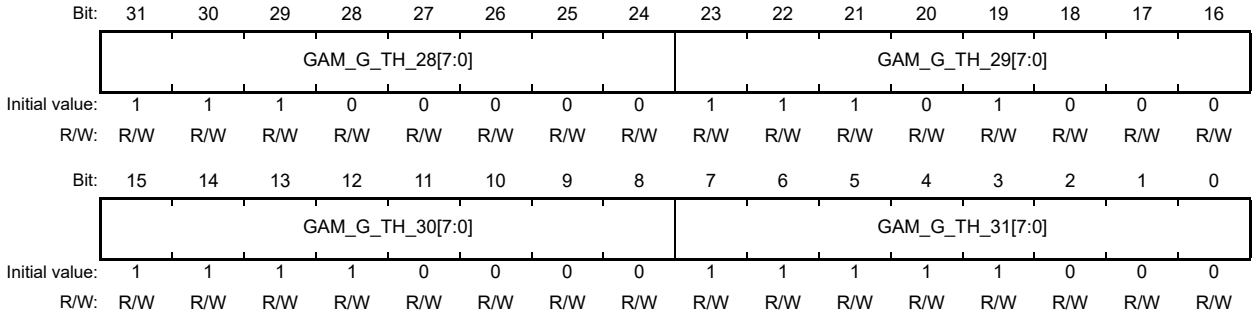
39.2.10 Area Setting Register G7 in Gamma Correction Block (GAM_G_AREA7)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_24 [7:0]	192	R/W	Start Threshold of Area 24 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_25 [7:0]	200	R/W	Start Threshold of Area 25 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_26 [7:0]	208	R/W	Start Threshold of Area 26 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_27 [7:0]	216	R/W	Start Threshold of Area 27 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_28 [7:0]	224	R/W	Start Threshold of Area 28 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_29 [7:0]	232	R/W	Start Threshold of Area 29 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_30 [7:0]	240	R/W	Start Threshold of Area 30 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_31 [7:0]	248	R/W	Start Threshold of Area 31 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.12 Register Update Control Register B in Gamma Correction Block (GAM_B_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_B_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_B_VEN	0	R/WC1	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

39.2.13 Table Setting Register B1 to B16 in Gamma Correction Block (GAM_B_LUT1 to GAM_B_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_B_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_B_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_16[7:0]	128	R/W	Start Threshold of Area 16 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_17[7:0]	136	R/W	Start Threshold of Area 17 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_18[7:0]	144	R/W	Start Threshold of Area 18 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_19[7:0]	152	R/W	Start Threshold of Area 19 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.29 Area Setting Register R6 in Gamma Correction Block (GAM_R_AREA6)

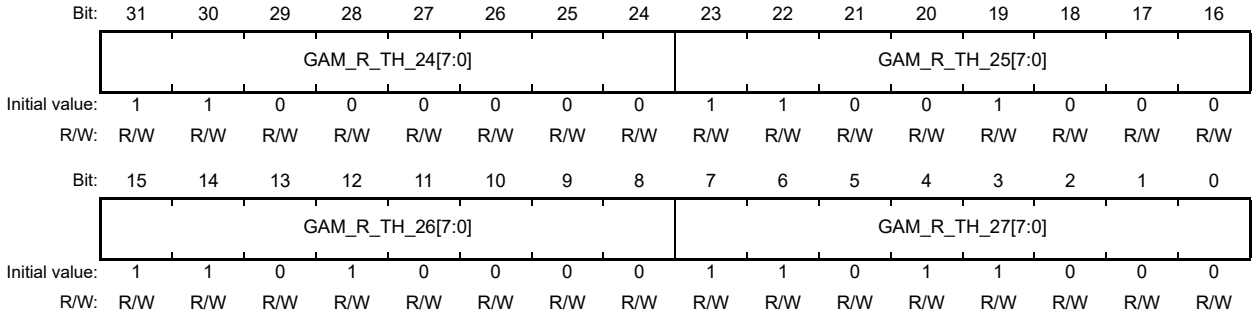
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_20[7:0]								GAM_R_TH_21[7:0]							
Initial value:	1	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_22[7:0]								GAM_R_TH_23[7:0]							
Initial value:	1	0	1	1	0	0	0	0	1	0	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_20[7:0]	160	R/W	Start Threshold of Area 20 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_21[7:0]	168	R/W	Start Threshold of Area 21 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_22[7:0]	176	R/W	Start Threshold of Area 22 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_23[7:0]	184	R/W	Start Threshold of Area 23 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.30 Area Setting Register R7 in Gamma Correction Block (GAM_R_AREA7)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_24[7:0]	192	R/W	Start Threshold of Area 24 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_25[7:0]	200	R/W	Start Threshold of Area 25 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_26[7:0]	208	R/W	Start Threshold of Area 26 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_27[7:0]	216	R/W	Start Threshold of Area 27 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_28[7:0]								GAM_R_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_30[7:0]								GAM_R_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.32 TCON Register Update Control Register (TCON_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_VEN	0	R/WC1	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

39.2.33 TCON Reference Timing Setting Register (TCON_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_HALF[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVA_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVA_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVB_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVB_VW[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STH_HS_SEL	—	—	—	TCON_STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL[2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STB_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STB_HS [10:0]	144	R/W	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STB_HW [10:0]	640	R/W	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STB_HS_SEL	—	—	—	TCON_STB_INV	—	TCON_STB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STB_HS_SEL	0	R/W	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STB_INV	0	R/W	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STB_SEL[2:0]	7	R/W	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_CPV_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_CPV_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_CPV_HS [10:0]	0	R/W	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_CPV_HW [10:0]	0	R/W	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_CPV_HS_SEL	—	—	—	TCON_CPV_INV	—	TCON_CPV_SEL[2:0]

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL[2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]		—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_ HS_SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_ SEL[2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]		—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_IN	—	TCON_POLB_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD[1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS_SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL[2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

39.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDIAN_ON	—	—	—	OUT_SWAP_ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT_FORMAT [1:0]		—	—	OUT_FRQ_SEL [1:0]		—	—	—	OUT_DIR_SEL	—	—	OUT_PHASE [1:0]

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDIAN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP_ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT_FORMAT[1:0]	0	R/W	Output Format Select 0: RBG888 1: RGB666 2: RGB565 3: Serial RGB
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT_FRQ_SEL [1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OUT_DIR_SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	OUT_PHASE[1:0]	0	R/W	Clock Phase Adjustment During Serial RGB Output Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

39.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_G[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_G[9:0]	512	R/W	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

39.2.52 Brightness (DC) Correction Register 2 (OUT_BRIGHT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PBRT_B[9:0]

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	PDTH_SEL[1:0]	0	R/W	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	PDTH_FORMAT [1:0]	0	R/W	Panel Dither Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Setting prohibited
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PDTH_PA[1:0]	3	R/W	Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PDTH_PB[1:0]	0	R/W	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	PDTH_PC[1:0]	2	R/W	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PDTH_PD[1:0]	1	R/W	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

39.2.55 Output Phase Control Register (OUT_CLK_PHASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OUTCNT_FRONT_GAM	—	—	—	OUTCNT_LCD_EDGE	—	OUTCNT_STVA_EDGE	OUTCNT_STVB_EDGE	OUTCNT_STH_EDGE	OUTCNT_STB_EDGE	OUTCNT_CPV_EDGE	OUTCNT_POLA_EDGE	OUTCNT_POLB_EDGE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OUTCNT_FRONT_GAM	0	R/W	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	OUTCNT_LCD_EDGE	0	R/W	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	OUTCNT_STVA_EDGE	0	R/W	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
5	OUTCNT_STVB_EDGE	0	R/W	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
4	OUTCNT_STH_EDGE	0	R/W	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
3	OUTCNT_STB_EDGE	0	R/W	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
2	OUTCNT_CPV_EDGE	0	R/W	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
1	OUTCNT_POLA_EDGE	0	R/W	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
0	OUTCNT_POLB_EDGE	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

39.3 Usage Methods

39.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

39.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 39.26 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

39.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 39.27 and Table 39.28.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 39.27 Setting Example of Synchronizing Signal

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 39.28 Setting Example of Data System

Register Name	Bit Name	RGB888	Serial RGB (Triple Speed)	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_PIXEL_INV_ON	0	0	When the function of reducing number of simultaneous changes is to be used: 1
OUT_SET	OUT_SUM_MOVE[4:0]	31	31	When OUT_PIXEL_INV_ON = 1, this register becomes valid. Sets the simultaneous changing threshold.
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1
OUT_SET	OUT_PHASE[1:0]	0	0	Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode)

40. Video Display Controller 6 (8): System Controller

40.1 System Controller

40.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

40.1.2 Interrupt Control

Ten interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 40.1 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S0_WLINE	INT_STA 9	Write specification line signal input to scaling-down control block in scaler 0 (not usable in this product)

Table 40.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA9	0	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (prohibited setting in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 40.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT9_ON	0	S0_WLINE Interrupt Output On/Off 0: Off 1: On (prohibited setting in this product)

40.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 40.4 control the panel clock.

Table 40.4 Panel Clock Control

Register Name	Bit Name	Initial Value	Description
SYSCNT_PANEL_CLK	PANEL_ICKSEL [1:0]	0	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
SYSCNT_PANEL_CLK	PANEL_OCKSEL [1:0]	0	Panel Clock Output Select 0: Divided clock generated from clock source selected by PANEL_CLK[1:0] 1: LVDS PLL clock 2: LVDS PLL clock divided by 7 3: Setting prohibited
SYSCNT_PANEL_CLK	PANEL_ICKEN	0	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.*
SYSCNT_PANEL_CLK	PANEL_DCDR [5:0]	1	Clock Frequency Division Ratio Refer to Table 40.5 for details on the settings. Note: Settings other than those in Table 40.5 are prohibited.

Note: * Set this bit to 0 before changing the value of the LVDS_CLK_EN bit in LVDS_CLKSELR.

Table 40.5 I/O Clock Frequency and Divisors

		I/O Clock Frequency (MHz)		
DCDR[5:0]	Clock Ratio	27.00	54.00	66.67
000001	1/1	27.00	54.00	66.67
000010	1/2	13.50	27.00	33.33
000011	1/3	9.00	18.00	22.22
000100	1/4	6.75	13.50	16.67
000101	1/5	5.40	10.80	13.33
000110	1/6	4.50	9.00	11.11
000111	1/7	3.86	7.71	9.52
001000	1/8	3.38	6.75	8.33
001001	1/9	3.00	6.00	7.41
001100	1/12	2.25	4.50	5.56
010000	1/16	1.69	3.38	4.17
011000	1/24	1.13	2.25	2.78
100000	1/32	0.84	1.69	2.08

40.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 40.6.

Table 40.6 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

40.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 40.7 Register Configuration of System Controller (CH0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 7A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 7A84	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 7A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 7A90	32
Panel clock control register	SYSCNT_PANEL_CLK	R/W	H'0001	H'FCFF 7A98	16
CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 7A9A	16

40.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA7	—	—	—	INT_STA6	—	—	—	INT_STA5	—	—	—	INT_STA4
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA3	—	—	—	INT_STA2	—	—	—	INT_STA1	—	—	—	INT_STA0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA7	0	R/W	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA6	0	R/W	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA5	0	R/W	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA4	0	R/W	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA3	0	R/W	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA2	0	R/W	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	INT_STA1	0	R/W	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA0	0	R/W	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

40.2.2 Interrupt Control Register 2 (SYSCNT_INT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	$\overline{\text{INT\_STA9}}$	—	—	—	$\overline{\text{INT\_STA8}}$
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA9	0	R/W	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (prohibited setting in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA8	0	R/W	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

40.2.3 Interrupt Control Register 4 (SYSCNT_INT4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_OUT7_ON	—	—	—	INT_OUT6_ON	—	—	—	INT_OUT5_ON	—	—	—	INT_OUT4_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

8	GR2_CLT_SEL_ST	—	R	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CLT_SEL_ST	—	R	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

41. LVDS Output Interface

This LSI has a module for providing a low voltage differential signaling (LVDS) output interface. This module converts the RGB signals output from video display controller 6 to the LVDS format that has six bits each for R, G, and B signals, and outputs the converted signals. It has a dedicated phase-locked loop (PLL) circuit, which can generate a clock with a desired frequency by dividing or multiplying the input clock frequency.

The clock output from this PLL can be used as the panel clock for video display controller 6 even when LVDS output is not used. This PLL is called LVDS PLL in this section.

41.1 Features

- Four pairs of differential output conforming to the TIA/EIA-644 standard (three pairs for data and one pair for the clock)
- When LVDS output is not used, the LVDS pins can be used as CMOS input/output pins.
- LVDS PLL for generating a clock with a desired frequency
- LVDS PLL power-down function

41.2 Block Diagram

Figure 41.1 shows a block diagram of the LVDS output interface configuration.

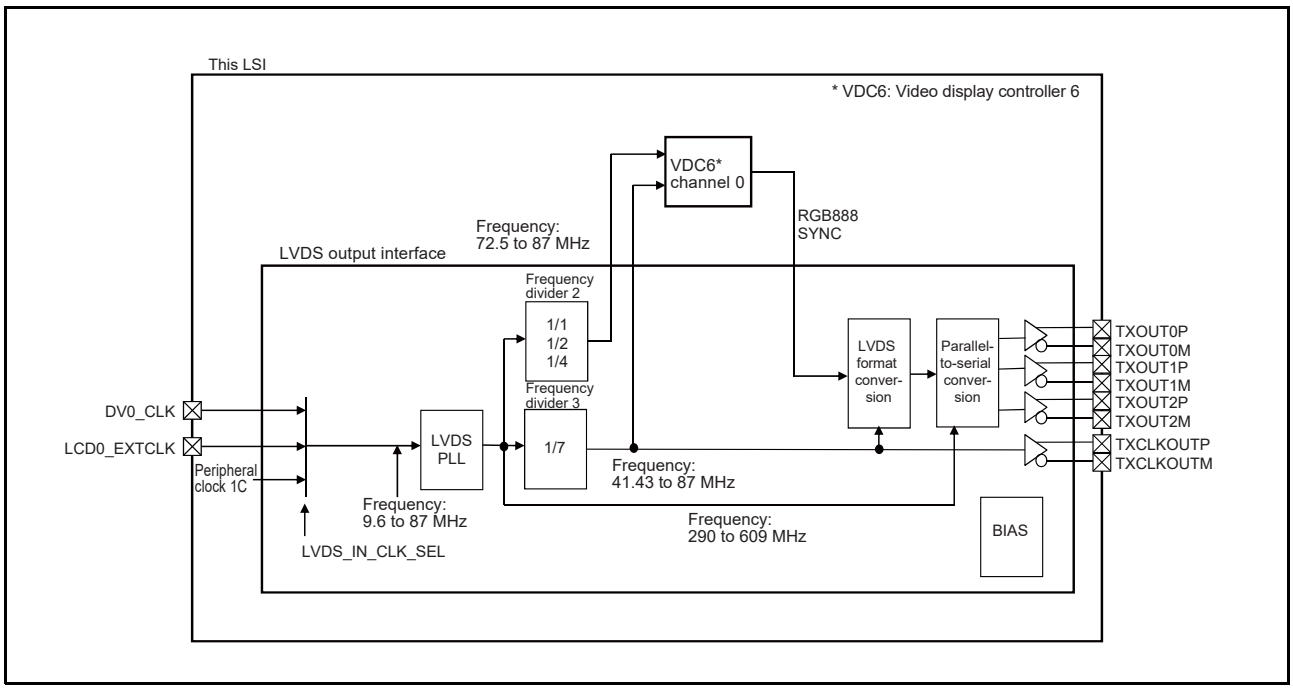

Figure 41.1 Block Diagram of LVDS Output Interface Configuration

Figure 41.2 shows a block diagram of the LVDS PLL circuit.

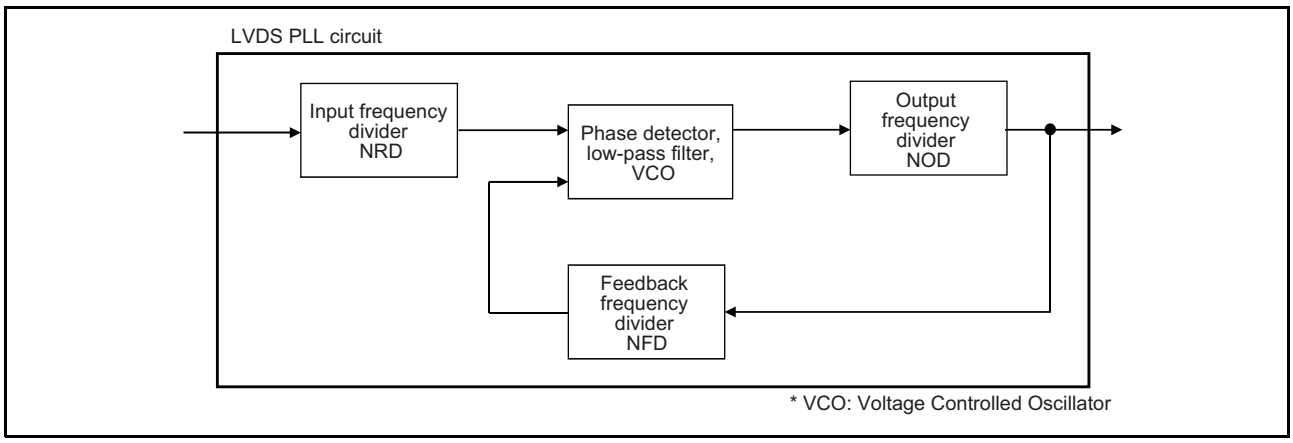

Figure 41.2 Block Diagram of LVDS PLL Circuit

41.3 Input/Output Pins

Table 41.1 shows the pin configuration.

Table 41.1 Pin Configuration

Pin Name	Symbol	I/O	Function
LVDS analog power supply pin	LVDSAPVcc	Input	Power supply pin for LVDS output
LVDS PLL power supply pin	LVDSPLLVcc	Input	Power supply pin for LVDS PLL
LVDS data output pin 0P	TXOUT0P	Output	LVDS data output pins
LVDS data output pin 0M	TXOUT0M	Output	
LVDS data output pin 1P	TXOUT1P	Output	
LVDS data output pin 1M	TXOUT1M	Output	
LVDS data output pin 2P	TXOUT2P	Output	
LVDS data output pin 2M	TXOUT2M	Output	
LVDS clock output pin CP	TXCLKOUTP	Output	LVDS clock output pins
LVDS clock output pin CM	TXCLKOUTM	Output	

41.4 Register Descriptions

Table 41.2 shows the register configuration.

Table 41.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
LVDS register update control register	LVDS_UPDATE	R/W	H'00000000	H'FCFF7A30	32
LVDS format conversion register L	LVDSFCL	R/W	H'00000321	H'FCFF7A34	32
LVDS clock select register	LCLKSELR	R/W	H'00000000	H'FCFF7A50	32
LVDSPLL setting register	LPLLSETR	R/W	H'00000001	H'FCFF7A54	32

41.4.1 LVDS Register Update Control Register (LVDS_UPDATE)

LVDS_UPDATE controls the timing for updating LVDS registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVDS_UPDATE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	LVDS_ UPDATE	0	R/W	LVDS Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

41.4.2 LVDS Format Conversion Register L (LVDSFCL)

LVDSFCL is used to make necessary settings for conversion of the RGB signals output from video display controller 6 to the LVDS format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SYNC_MODE	—	—	—	—	SYNC_POL[1:0]		—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LVDS_SEL2[3:0]				LVDS_SEL1[3:0]				LVDS_SEL0[3:0]			
Initial value:	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SYNC_MODE	0	R/W	SYNC Mode Switch Switches the SYNC mode. 0: LVDS_TCON0 and LVDS_TCON2 are transmitted through LVDS signals. 1: Fixed values are transmitted as LVDS_TCON0 and LVDS_TCON2 through LVDS signals. The fixed values are specified in the SYNC_POL bits.
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	SYNC_POL [1:0]	00	R/W	LVDS_TCON0 and LVDS_TCON2 Value The values specified in these bits are output as the LVDS_TCON0 and LVDS_TCON2 values through LVDS signals when the SYNC_MODE bit is set to 1. SYNC_POL[1]: Specifies the LVDS_TCON0 output value. SYNC_POL[0]: Specifies the LVDS_TCON2 output value.
21 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	LVDS_SEL2 [3:0]	0011	R/W	TXOUT2P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT2P and TXOUT2M pins. Be sure to set these bits to 3 in this LSI.
7 to 4	LVDS_SEL1 [3:0]	0010	R/W	TXOUT1P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT1P and TXOUT1M pins. Be sure to set these bits to 2 in this LSI.
3 to 0	LVDS_SEL0 [3:0]	0001	R/W	TXOUT0P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT0P and TXOUT0M pins. Be sure to set these bits to 1 in this LSI.

Note: This register is updated by setting the LVDS_UPDATE bit in the LVDS register update control register (LVDS_UPDATE) to 1.

41.4.3 LVDS Clock Select Register (LCLKSELR)

LCLKSELR specifies the input clock and the frequency dividing values for frequency divider 2.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	LVDS_IN_CLK_SEL[1:0]		—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LVDSPLL_TST[5:0]						LVDS_ODIV_SET[1:0]		—	—	—	LVDS_CLK_EN	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 24	LVDS_IN_CLK_SEL[1:0]	All 0	R/W	These bits select the clock input to LVDSPLL. 0: DV0_CLK 1: LCD0_EXTCLK 2: Peripheral clock 1C (P1φ) 3: Setting prohibited
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 10	LVDSPLL_TST[5:0]	All 0	R/W	Internal Parameter Setting for LVDS PLL These bits specify the internal parameters for the LVDS PLL (the resistance of the LPF circuit and the current through the charge pump circuit). Note: Do not rewrite from 000000 in this LSI.
9, 8	LVDS_ODIV_SET[1:0]	All 0	R/W	These bits specify the frequency dividing value (NODIV) for frequency divider 2. NODIV = 1, 2, or 4 0: NODIV = 1 1: NODIV = 2 2: NODIV = 4 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	LVDS_CLK_EN	0	R/W	Enables the LVDS PLL output. 0: Output from the PLL is disabled. 1: Output from the PLL is enabled. Note: Be sure to clear this bit to 0 before making settings in any other register described in this section. In addition, before modifying this bit, be sure to clear the PANEL_ICKEN bits in SYSCNT_PANEL_CLK in video display controller 6 to 0.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

41.4.4 LVDS PLL Setting Register (LPLLSETR)

LPLLSETR specifies the frequency dividing value and controls power-down in the LVDS PLL.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	LVDSPLL_FD[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	LVDSPLL_RD[2:0]			—	—	LVDSPLL_OD[1:0]		—	—	—	LVDSPLL_PD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	LVDSPLL_FD[6:0]	All 0	R/W	These bits specify the frequency dividing value (NFD) for the feedback frequency in the LVDS PLL. NFD = 23 to 63 22 to 62: NFD = LVDSPLL_FD value + 1 0 to 21 and 63 to 127: Setting prohibited
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	LVDSPLL_RD[2:0]	All 0	R/W	These bits specify the frequency dividing value (NRD) for the input frequency in the LVDS PLL. NRD = 1 to 8 0 to 7: NRD = LVDSPLL_RD value + 1
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	LVDSPLL_OD[1:0]	All 0	R/W	These bits specify the frequency dividing value (NOD) for the output frequency in the LVDS PLL. NOD = 1, 2, 4, or 8 0 to 3: NOD = 2 ^ LVDSPLL_OD value Note: Be sure to set this bit to 1 in this LSI.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LVDSPLL_PD	1	R/W	Controls power-down for the LVDS PLL. 0: Normal operation 1: Power-down state

41.5 Operation

This module receives the RGB888 signals output from video display controller 6 and the SYNC signal, converts the video signals to the LVDS format, and outputs them. The precision of the RGB signals is reduced to six bits each. The operating clock is generated in the LVDS PLL.

41.5.1 LVDS PLL Settings

The input clock select circuit, frequency dividers 2 and 3, and LVDS PLL circuit are used to generate operating clocks. For input and output of each circuit, allowable frequency ranges are determined; be sure to make appropriate settings to generate input and output frequencies within the ranges.

Before modifying various setting registers, check that the panel clock operation in video display controller 6 is disabled (SYSCNT_PANEL_CLK.PANEL_ICKEN = 0) and the LVDS PLL output is disabled (LPLLSETR.LVDS_CLK_EN = 0).

Figure 41.3 shows a block diagram of the LVDS PLL and its peripheral circuits.

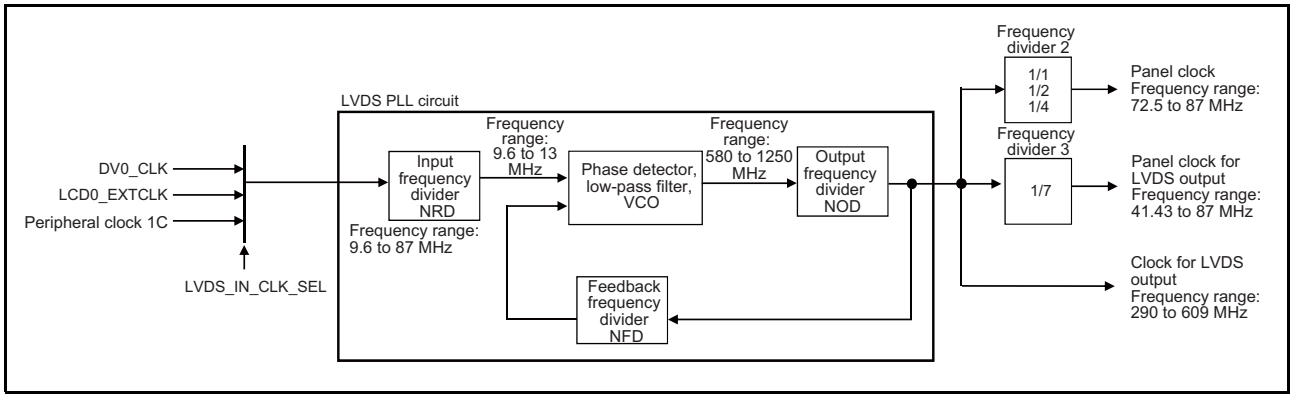

Figure 41.3 Block Diagram of LVDS PLL and Peripheral Circuits

(1) Clock Input to LVDS PLL

The clock input to the LVDS PLL can be selected from among DV0_CLK, LCD0_EXTCLK, and peripheral clock 1C (P1φ) clocks through the LVDS_IN_CLK_SEL bit setting in LVDS_CLKSELR.

The frequency of this input clock should be within the range from 9.6 to 87 MHz.

(2) LVDS PLL Frequency Setting

The LVDS PLL has three internal frequency dividers: input frequency divider NRD, feedback frequency divider NFD, and output frequency divider NOD.

The frequency of the clock output from the LVDS PLL is calculated by the following equations. Note that the reference frequency, VCO output frequency, LVDS PLL input frequency, and LVDS PLL output frequency should be within the respective ranges shown below the equations.

FREF = FIN / NRD (Reference frequency)
FVCO = FIN × NFD × NOD / NRD (VCO output frequency)
FOUT = FIN × NFD / NRD (LVDS PLL output frequency)

Note: FREF: Reference frequency. Frequency range = 9.6 MHz to 13 MHz
FVCO: VCO output frequency. Frequency range = 580 MHz to 1250 MHz
FIN: LVDS PLL input frequency. Frequency range = 9.6 MHz to 87 MHz
FOUT: LVDS PLL output frequency. Frequency range = 609 MHz max.

(3) LVDS PLL Frequency Setting Timing

Before making settings for each frequency divider in the PLL circuit described in (2), place the PLL in the power-down state (PD = 1) and wait for at least 0.5 µs. After making frequency divider settings, wait for a retention period of at least 0.5 µs and release the power-down state (PD = 0).

Figure 41.4 shows this timing.

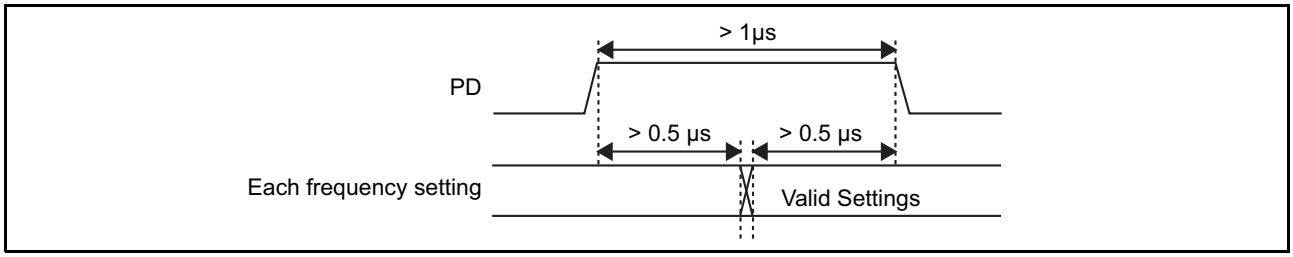

Figure 41.4 PLL Setting Timing

(4) LVDS PLL Output Enable Timing

Output of the clock from the LVDS PLL can be enabled or disabled through the LVDS_CLK_EN bit setting in LCLKSELR.

To allow time for stabilization of oscillation by the PLL, wait for at least 200 us after release from the power-down state before enabling the LVDS PLL output. The LVDS_CLK_EN bit in LCLKSELR should be modified only while the panel clock operation in video display controller 6 is disabled (SYSCNT_PANEL_CLK.PANEL_ICKEN = 0).

(5) LVDS PLL Output Clock Frequency Setting

When using the clock output from the LVDS PLL as the clock for the LVDS output interface, select the clock from frequency divider 3 (divided by 7) as the panel clock for video display controller 6.

When using the clock output from the LVDS PLL as the clock for digital RGB output, select the clock from frequency divider 2 as the panel clock for video display controller 6. In addition, make appropriate settings so that the clock frequency after frequency division is 87 MHz or lower. This limitation on the frequency is not applied when the clock is used for the LVDS output interface.

The panel clock can be selected through the PANEL_OCKSEL bits in SYSCNT_PANEL_CLK in video display controller 6.

41.5.2 LVDS Output Format

This module converts and then outputs the LCD data output from video display controller 6 and the timing signals generated by the LCD TCON.

(1) LVDS Output Format

(a) LCD data

After converted into the LVDS format, LCD data is output from LCD_DATA23 to LCD_DATA18, LCD_DATA15 to LCD_DATA10, and LCD_DATA7 to LCD_DATA2 pins.

(b) Timing signals generated by LCD TCON

After converted into the LVDS format, the timing signals are output from the LCD_TCON0, LCD_TCON2, and LCD_TCON3 pins.

Figure 41.5 shows the bit alignment in the LVDS output format.

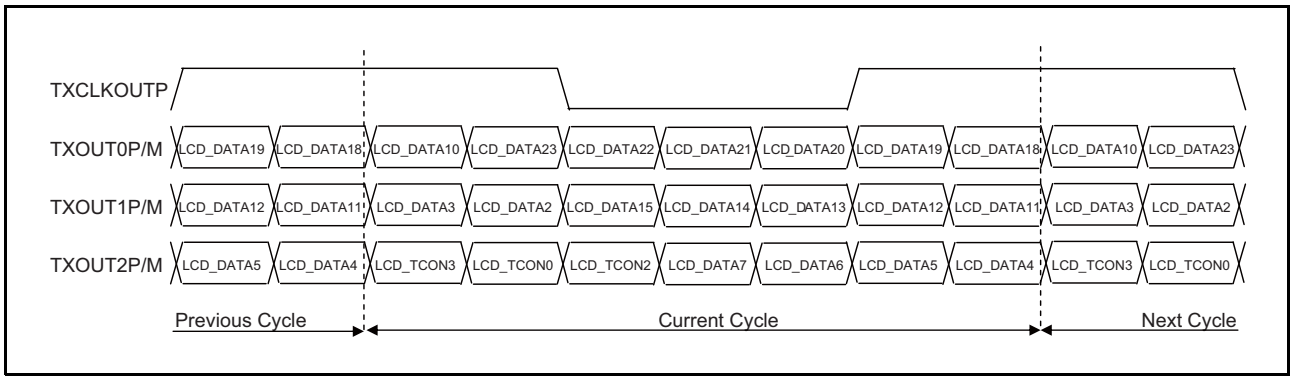

Figure 41.5 Data Map of LVDS Output Format

(2) Setting Example

The following is the setting example of the LVDS output format. The register the setting is applied is register in video display controller 6. For the details of the register, see section 39, Video Display Controller 6 (7): Output Controller.

Table 41.3 Setting Example of LVDS Output Format

Register	Bit	Value	Remark
OUT_SET	OUT_ENDIAN_ON	0	Bit endian change is off.
	OUT_SWAP_ON	0	B/R signal swap is off.
	OUT_FORMAT[1:0]	0	RGB888 is selected as an output format (the upper six-bit data is output in the LVDS format).
TCON_TIM_STVA2	TCON_TIM_STVA2	0	The VS signal is selected for the LCD_TCON0 pin.
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	Arbitrary	The VS signal timing is set.
	TCON_STVA_VW[10:0]	Arbitrary	The VS signal timing is set.
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	The HS signal is selected for the LCD_TCON2 pin.
TCON_TIM_STH1	TCON_STH_HS[10:0]	Arbitrary	The HS signal timing is set.
	TCON_STH_VS[10:0]	Arbitrary	The HS signal timing is set.
TCON_TIM_STB2	TCON_STB_SEL[2:0]	7	The DE signal is selected for the LCD_TCON3 pin.
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	Arbitrary	The DE signal timing is set.
	TCON_STVB_VW[10:0]	Arbitrary	The DE signal timing is set.
TCON_TIM_STB1	TCON_STB_HS[10:0]	Arbitrary	The DE signal timing is set.
	TCON_STB_HW[10:0]	Arbitrary	The DE signal timing is set.

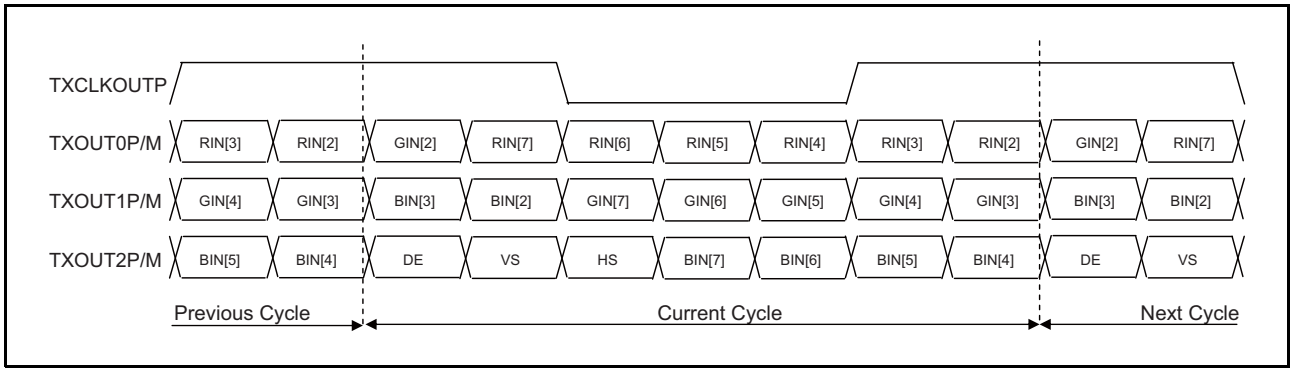

Figure 41.6 Data Map of Setting Example of LVDS Output Format

41.5.3 Procedures for Register Settings

(1) Initial Settings after Power-on Reset

The following shows an example of initial settings after a power-on reset.

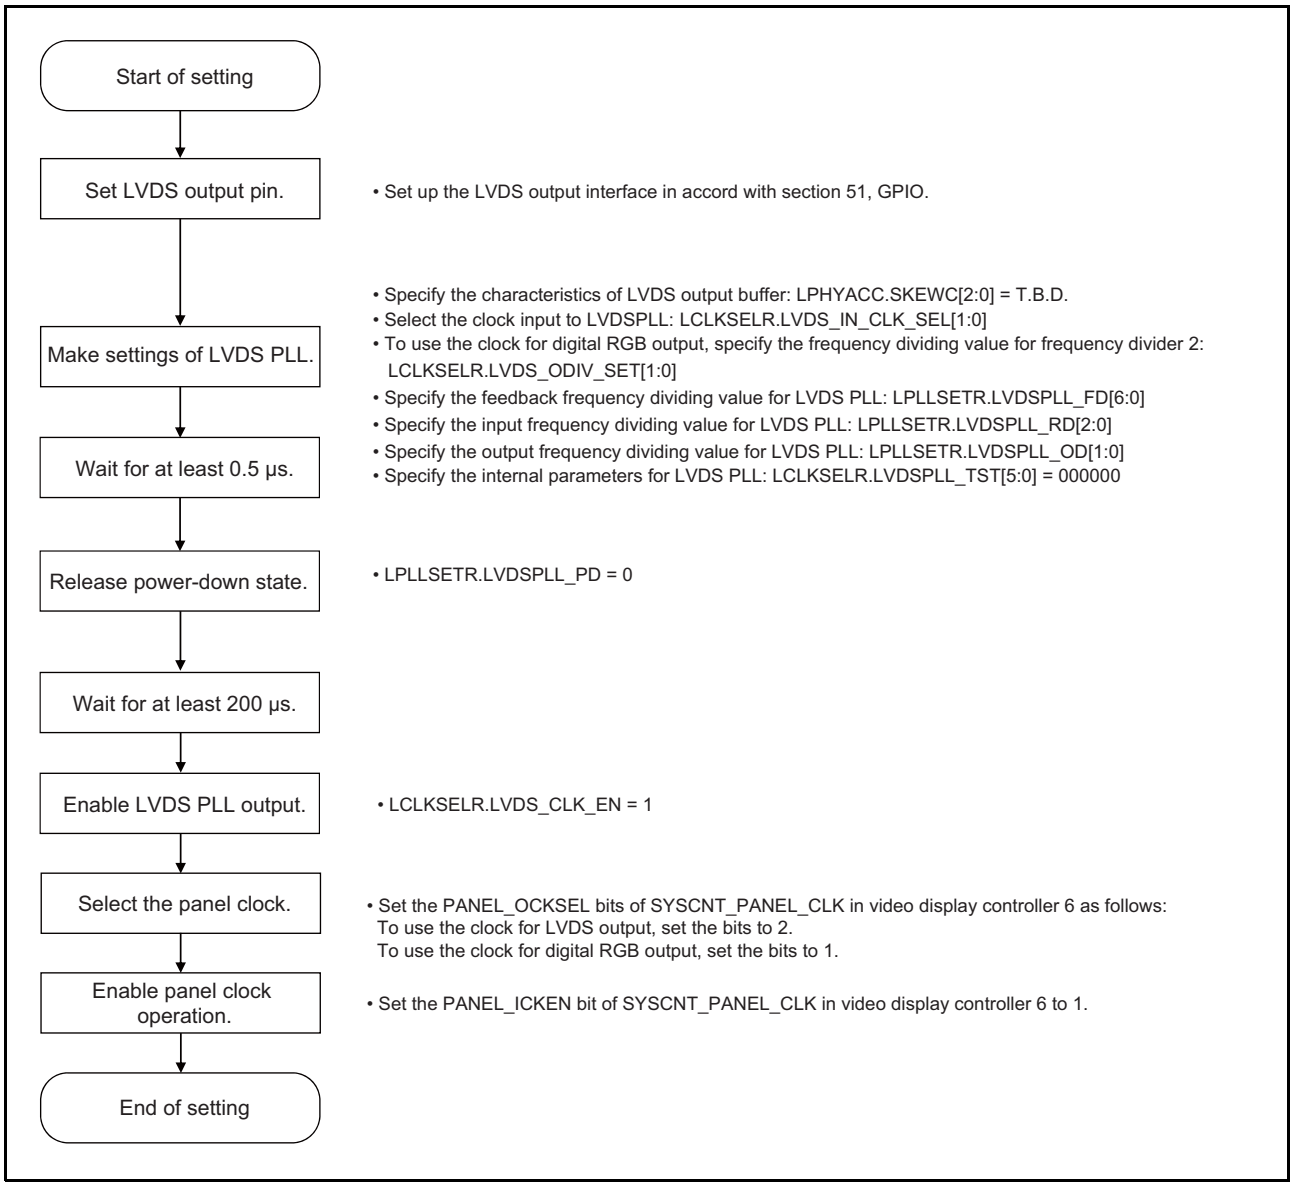

Figure 41.7 Example of Initial Settings after Power-On Reset

(2) Frequency Modification Settings

The following shows an example of modifying frequencies.

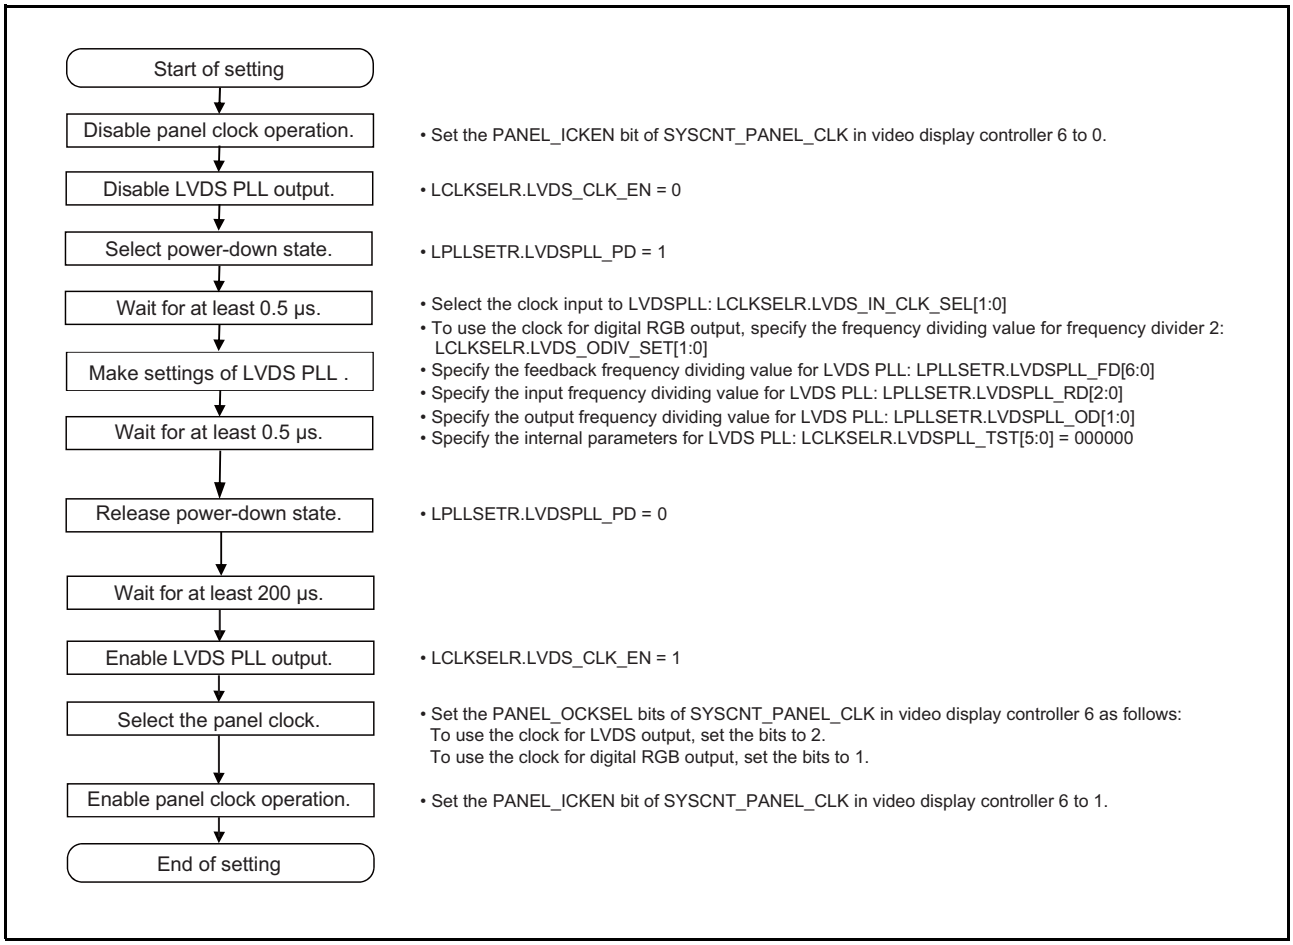

Figure 41.8 Example of Modifying Frequencies for LVDS Output

41.6 Notes

41.6.1 LVDS Output Pin Settings

The LVDS output buffers enter a low power consumption state, even if one of the eight differential output pins is set up other than for an LVDS output interface in accordance with section 51, GPIO. Although the LVDS output buffers return from the low power consumption state after pins are set to operate as an LVDS output interface, this requires up to 0.5 µs. Accordingly, at least 0.5 µs are required before actual LVDS output starts after pins have been set to operate as an LVDS output interface.

42. Image Renderer (IMR-LS2)

The distortion correction engine, image render-light SRAM 2 (IMR-LS2) is a drawing processor with a simple instruction system. The IMR-LS2 refers to captured video data as two-dimensional texture data and draws shapes by performing texture mapping to desired shapes divided into triangular objects. The IMR-LS2 is also capable of working with the video input interface in drawing in real time. Accordingly, the IMR-LS2 is usable in handling various functions such as for flattening the distortion of images from a camera with a fish-eye lens by processing the shape of the images and for correcting other desired types of images.
Details are available upon entry into a non-disclosure agreement.

43. 2D Drawing Engine (DRW)

43.1 Overview

The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry, rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or anti-aliased.
Rasterization is executed on the bounding box of an object from left to right and top to bottom at a rate of one pixel per clock cycle. The 2D Drawing Engine can also raster from bottom to top in certain cases, to optimize the performance. In addition, optimization methods are provided to avoid rasterization of many empty pixels of the bounding box.
The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box. These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering, and if it is outside it is discarded. If a pixel is on an edge, an alpha value for anti-aliasing is chosen proportional to the distance between the pixel (the edge) and another pixel nearest to the edge. Every pixel that is selected for rendering can be textured. The resulting aRGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The aRGB quadruple can then be blended with one of the multiple blend modes of the module.
The 2D Drawing Engine provides two inputs (texture read and framebuffer read) and one o
utput (framebuffer write). The internal color format is always aRGB (8888). The color formats from the inputs are converted to the internal format on read and converted back on write.
Figure 43.1 shows examples of objects that can be drawn in hardware with the 2D Drawing Engine, Figure 43.2 shows a simplified rendering pipeline setup, and Figure 43.3 shows the block diagram of the module.

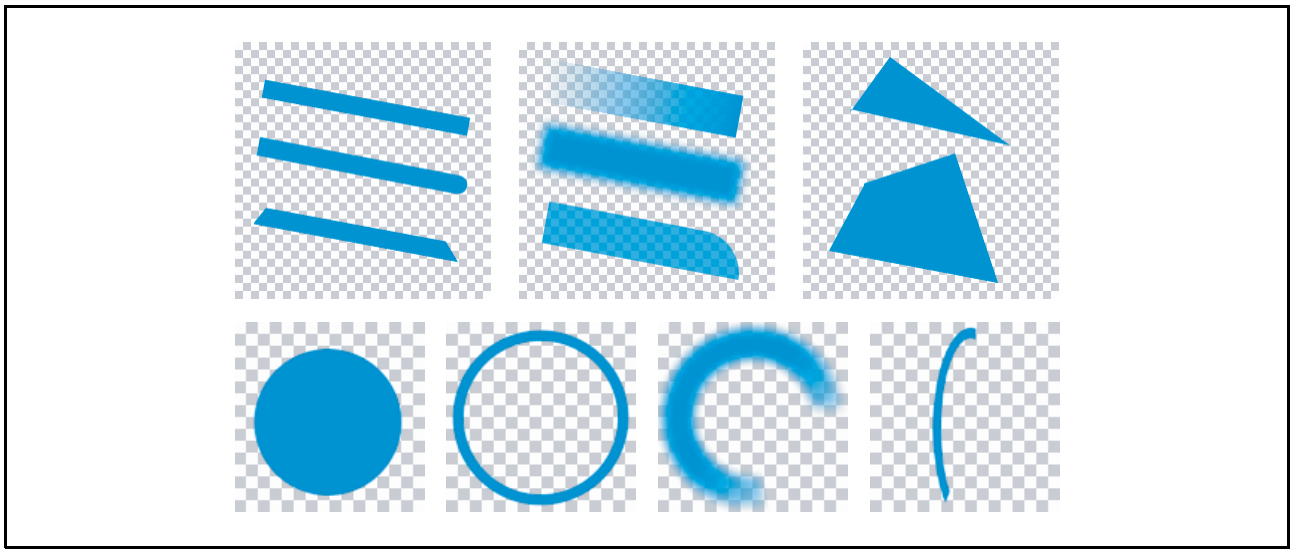

Figure 43.1 Examples of drawing objects

The 2D Drawing Engine also supports a display list mode, which efficiently decouples the CPU and graphics controller to enable rendering in parallel with other CPU activities.

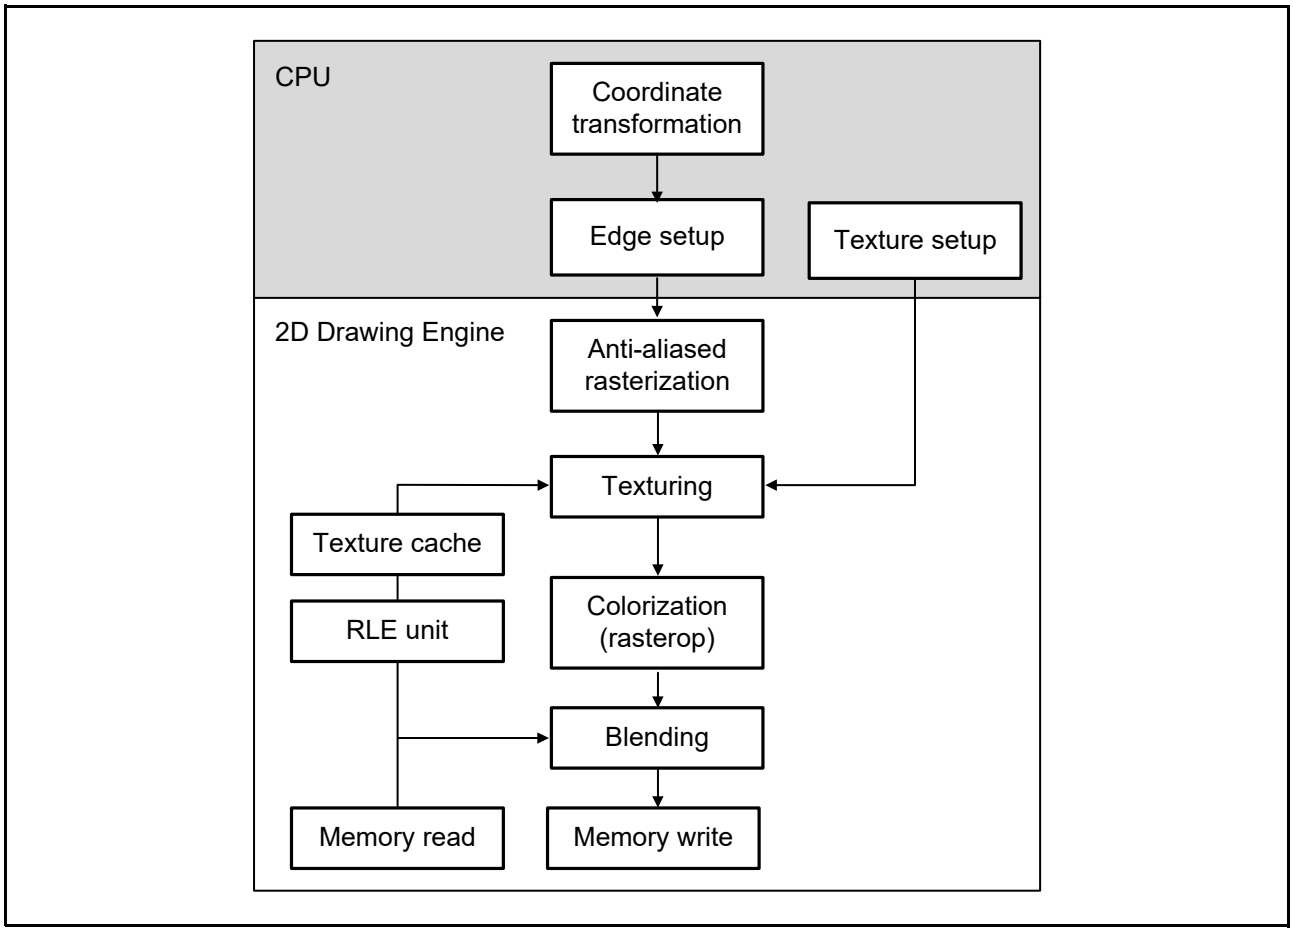

Figure 43.2 Simplified rendering pipeline setup

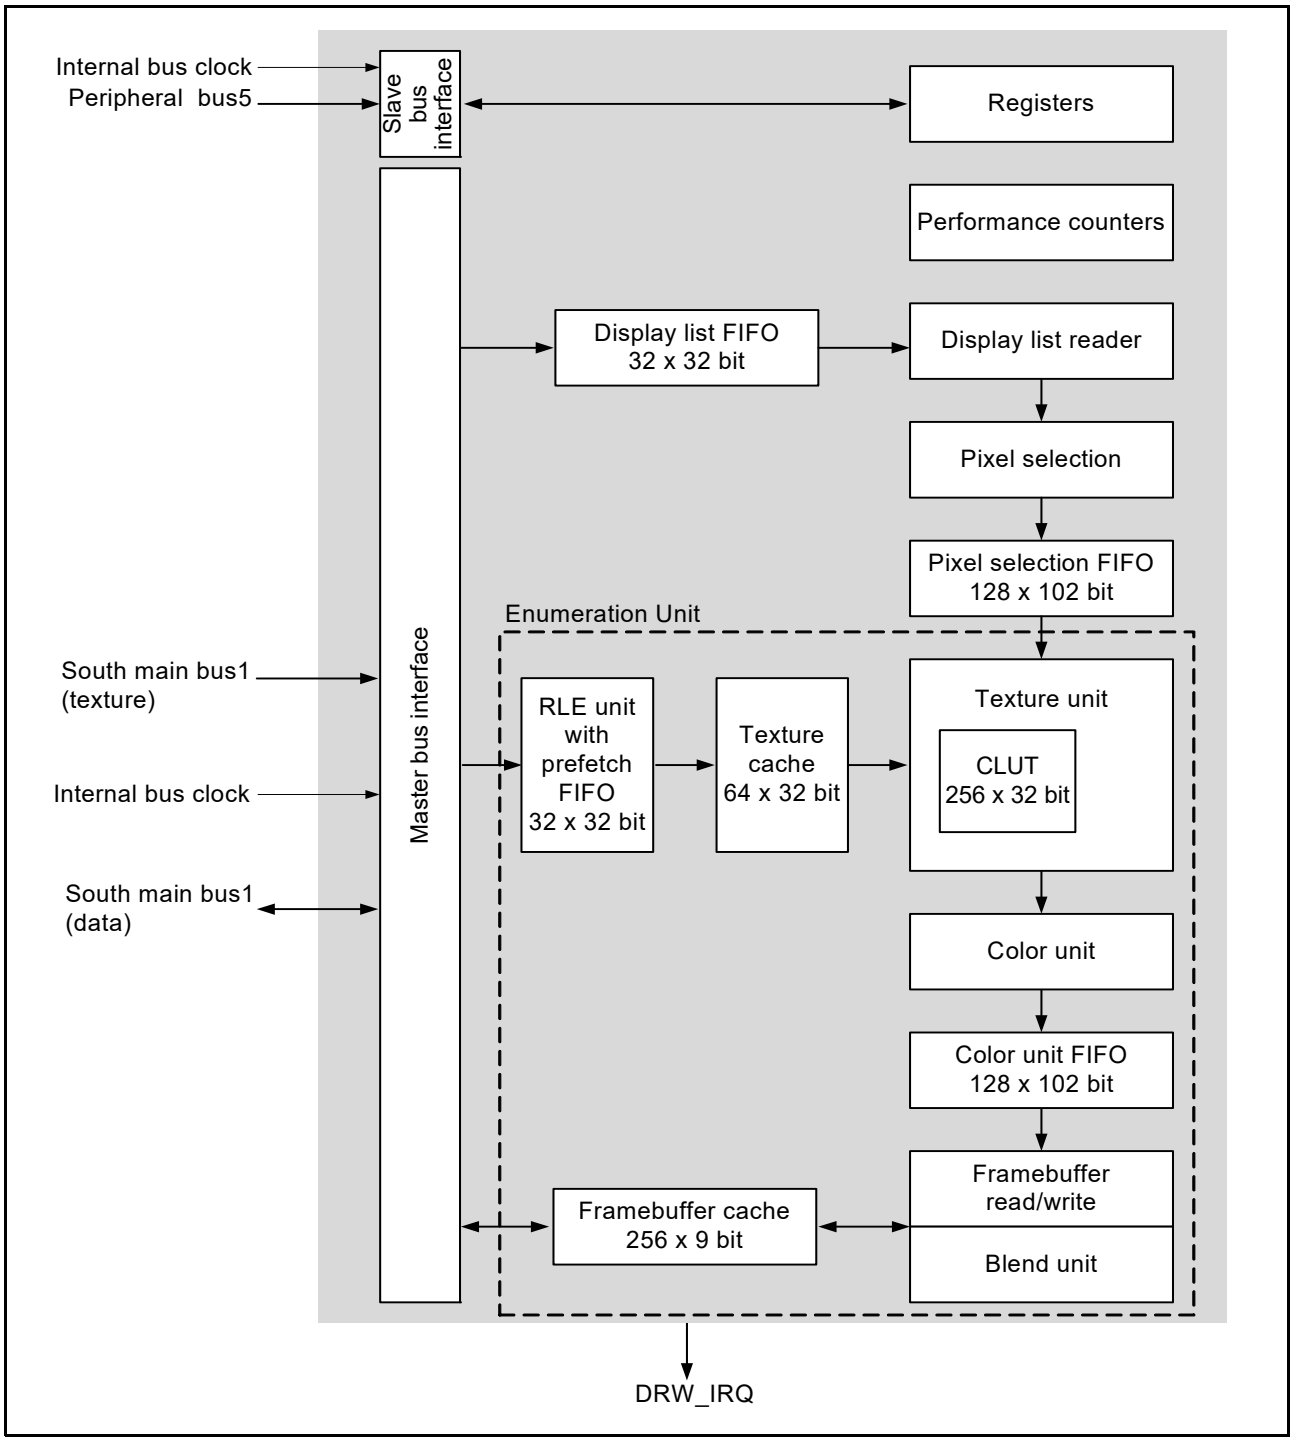

Figure 43.3 Block diagram of the 2D Drawing Engine

The 2D Drawing Engine accesses the South main bus1 as bus master through separate caches for:

- Reading and writing pixel data from and to the framebuffer
- Reading textures
- Reading display lists.

The control registers are accessed through the internal peripheral bus interface.

43.2 Register Descriptions

Symbols used in Register Descriptions:

Initial value: Register value after a power-on reset.
R/W: Readable/writable. The written value can be read.
R: Read-only.
W: Write-only.

Register Name	Abbreviation	R/W	Address	Initial value	Access Size
Geometry control register*	CONTROL	W	E820 A000h	0000 0000h	32
Status control register*	STATUS	R	E820 A000h	0000 0000h	32
Surface control register*	CONTROL2	W	E820 A004h	0000 0000h	32
Hardware version and feature set ID register*	HWREVISION	R	E820 A004h	0FBE 0107h	32

b22	SPANABORT	Spanabort	0: Disable 1: Enable. Shape is horizontally convex, only a single span per scan line. See section 43.6.2.6 (2), Spanabort.	W
b23	SPANSTORE	Spanstore	0: Disable 1: Enable. Next line span start is always equal to or right of current-line span start. See section 43.6.2.6 (1), Spanstore.	W
b31 to b24	—	Reserved	The write value should be 0.	W

43.2.2 Surface Control Register (CONTROL2)

Address(es): DRW.CONTROL2 E820 A004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RLEPIXEL WIDTH[1:0]		BDIA	BSIA	CLUT FORMAT	COLKEY ENABLE	CLUT ENABLE	RLE ENABLE	WRITEALPHA[1:0]		WRITEFORMAT [1:0]		READFORMAT [1:0]		TEXTURE FILTERY	TEXTURE FILTERX
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEXTURE CLAMPY	TEXTURE CLAMPX	BC2	BDI	BSI	BDF	BSF	WRITEFORMAT[2]	BDFA	BSFA	READ FORMAT[3:2]		USEACB	PATTERN SOURCE	TEXTURE ENABLE	PATTERN ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PATTERN ENABLE	Pattern Color Enable for Pixel Source	Pixel source is a pattern color (blend of COLOR1 and COLOR2 depending on PATTERN and pattern index). 0: Disable pattern 1: Enable pattern. When patterns are used to fill a primitive an index into the pattern bit mask is generated for each pixel with the U limiter. Depending on the pattern bits the color is selected from COLOR1 and COLOR2 registers. Fractional indices can be interpolated between those two values by using TEXTUREFILTERX = 1. The pattern can be wrapped by using TEXTURECLAMPX = 0, and the mask must be set in the TEXMASK register using the mask for u.	W
b1	TEXTURE ENABLE	Texture Enable for Pixel Source	Pixel source is read from texture and used as an alpha to blend between COLOR1 and COLOR2. 0: Disable texture 1: Enable texture.	W
b2	PATTERN SOURCEL5	Limiter 5 Enable for Pattern Index	Limiter 5 is used as pattern index instead of the default U limiter. Limiter 5 can be combined with limiter 6 to form a quadratic limiter that can be used to make quadratic pattern functions to draw radial patterns.	W
b3	USEACB	Alpha Blend Mode	0: Use WRITEALPHA[1:0] mode 1: Use full alpha channel blending mode.	W
b5, b4	READ FORMAT[3:2]	Texture Format Descriptor	Bits [3] and [2] of the texture buffer format. See the detailed description of the READFORMAT[1:0] bit in this section.	W
b6	BSFA	Blend Source Factor for Alpha Channel	Valid in alpha channel blending mode (USEACB = 1). 0: Use 1.0 as blend source factor for alpha channel 1: Use alpha as blend source factor for alpha channel.	W
b7	BDFA	Blend Destination Factor for Alpha Channel	Valid in alpha channel blending mode (USEACB = 1). 0: Use 1.0 as blend destination factor for alpha channel 1: Use alpha as blend destination factor for alpha channel.	W
b8	WRITE FORMAT[2]	Writeback Framebuffer Format	Bit [2] of framebuffer pixel format. See the description of WRITEFORMAT[1:0] in this section.	W
b9	BSF	Blend Source Factor	Source factor is alpha (factor is 1 per default). 0: Use 1.0 as blend source factor 1: Use alpha as blend source factor.	W
b10	BDF	Blend Destination Factor	Destination factor is alpha (factor is 1 per default). 0: Use 1.0 as blend destination factor 1: Use alpha as blend destination factor.	W
b11	BSI	Blend Source Factor Inverted	Source factor is inverted (meaning 1-a or 1-1 depending on BSF). 0: Use blend factor as specified through BSF 1: Invert blend source factor (1-x).	W
b12	BDI	Blend Destination Factor Inverted	Destination factor is inverted (meaning 1-a or 1-1 depending on BDF). 0: Use blend factor as specified through BDF 1: Invert blend destination factor (1-x).	W

Bit	Symbol	Bit name	Description	R/W
b13	BC2	Blend color 2	Select of blend color 2 instead of framebuffer pixel. 0: Use pixel from framebuffer as destination (DST) 1: Use color 2 as destination (DST).	W
b14	TEXTURE CLAMPX	Calculating U Limiter Outside Used Texture	This bit describes what happens when the U limiter (x direction in texture space) calculates a u value outside of the used texture. 0: Texture wrap mode: Integer part of the calculated value from the U limiter is AND gated with TEXUMASK, resulting in a repetition of texture in the x/u direction 1: Texture clamp mode: Texture color at the border of the texture is taken, resulting in a repetition of texture border color in the x/u direction.	W
b15	TEXTURE CLAMPY	Calculating V Limiter Outside Used Texture	This bit describes what happens when the V limiter (y direction in texture space) calculates a v value outside of the used texture. 0: Texture wrap mode: Integer part of the calculated value from the V limiter is AND gated with TEXVMASK, resulting in a repetition of texture in the y/v direction. 1: Texture clamp mode: Texture color at the border of the texture is taken, resulting in a repetition of texture border color in the y/v direction.	W
b16	TEXTURE FILTERX	Linear Filtering on Texture U Axis	0: No filtering on texture u axis 1: Linear filtering on texture u axis.	W
b17	TEXTURE FILTERY	Linear Filtering on Texture V Axis	0: No filtering on texture V axis 1: Linear filtering on texture V axis.	W
b19, b18	READ FORMAT[1:0]	Texture Format Descriptor	Pixel format of the texture buffer. b5 b4 b19 b18 0 0 0 0: 8 bpp a (8) 0 0 0 1: 16 bpp RGB (565) 0 0 1 0: 32 bpp aRGB (8888) 0 0 1 1: 16 bpp aRGB (4444) 0 1 0 0: 16 bpp aRGB (1555) 0 1 0 1: 8 bpp aCLUT (44), 4 bit alpha and 4 bit indexed color 1 0 0 1: 8 bpp CLUT (8)/I (8), 8 bit indexed color/luminance 1 0 1 0: 4 bpp CLUT (4)/I (4), 4 bit indexed color/luminance 1 0 1 1: 2 bpp CLUT (2)/I (2), 2 bit indexed color/luminance 1 1 0 0: 1 bpp CLUT (1)/I (1), 1 bit indexed color/luminance. Other settings are prohibited.	W
b21, b20	WRITE FORMAT[1:0]	Writeback Framebuffer Format	Pixel format of the framebuffer. b8 b21 b20 0 0 0: 8 bpp a (8) 0 0 1: 16 bpp RGB (565) 0 1 0: 32 bpp aRGB (8888) 0 1 1: 16 bpp aRGB (4444). Other settings are prohibited.	W
b23, b22	WRITE ALPHA[1:0]	Writeback Alpha Source for Framebuffer	• In non-alpha channel blending mode (USEACB = 0): Sets the alpha source for the framebuffer. b23 b22 0 0: Use alpha from color 2 0 1: Use source alpha (pixel coverage) 1 0: Use 0.0 as alpha 1 1: Use alpha from framebuffer. • In alpha channel blending mode (USEACB = 1): Blends alpha in color 2 instead of framebuffer alpha. b23 b22 00: BC2A = 1: Use alpha in color 2 as destination (DST_A). else: BC2A = 0: Use alpha from framebuffer as destination (DST_A)	W
b24	RLEENABLE	RLE Enable	0: Disable RLE 1: Enable RLE.	W
b25	CLUTENABLE	CLUT Enable	0: Disable CLUT 1: Enable CLUT. If CLUTENABLE = 0 (CLUT disabled), the index is directly put on the RGB channels.	W
b26	COLKEY ENABLE	Color Keying Enable	0: Disable color keying 1: Enable color keying.	W

Bit	Symbol	Bit name	Description	R/W
b27	CLUTFORMAT	CLUT Format	0: Format CLUT as aRGB (8888) 1: Format CLUT as RGB (565).	W
b28	BSIA	Blend Source Factor Inverted in Alpha Channel	• In alpha channel blending mode (USEACB = 1): 0: Use blend factor as specified through BSFA 1: Invert blend source factor (1-x).	W
b29	BDIA	Blend Destination Factor Inverted in Alpha Channel	• In alpha channel blending mode (USEACB = 1): 0: Use blend factor as specified through BDFA 1: Invert destination blend factor (1-x).	W
b31, b30	RLEPIXEL WIDTH[1:0]	Texel Width for RLE Unit	b31 b30 0 0: 1 byte per texel 0 1: 2 bytes per texel 1 0: 3 bytes per texel 1 1: 4 bytes per texel.	W

43.2.3 Interrupt Control Register (IRQCTL)

Address(es): DRW.IRQCTL E820 A0C0h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CENABLEFX	Framebuffer Cache Enable	0: Disable the framebuffer cache 1: Enable the framebuffer cache.	W
b1	CFLUSHFX	Flush Framebuffer Cache	0: Do not flush the framebuffer cache 1: Flush the framebuffer cache.	W
b2	CENABLETX	Texture Cache Enable	0: Disable the texture cache 1: Enable the texture cache.	W
b3	CFLUSHTX	Flush Texture Cache	0: Do not flush the texture cache 1: Flush the texture cache.	W
b31 to b4	—	Reserved	The write value should be 0.	W

43.2.5 Status Control Register (STATUS)

Address(es): DRW.STATUS E820 A000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	BUSERRMDL	BUSERRMTXMRL	BUSERRMFB	—	BUSIRQ	DLISTIRQ	ENUMIRQ	DLISTACTIVE	CACHEDIRTY	BUSYWRITE	BUSYENUM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BUSYENUM	Enumeration Unit Status	0: Enumeration unit idle 1: Enumeration unit busy, new primitive cannot be started.	R
b1	BUSYWRITE	Framebuffer Writeback Status	0: Framebuffer writeback finished 1: Framebuffer writeback busy, framebuffer type cannot be changed.	R
b2	CACHEDIRTY	Framebuffer Cache Status	0: Framebuffer cache is not dirty 1: Framebuffer cache is dirty, and frame should not be flipped.	R
b3	DLISTACTIVE	Display List Reader Status	0: Display list reader is idle 1: Display list reader busy, and no direct write access to registers allowed.	R
b4	ENUMIRQ	Enumeration Interrupt Triggered	0: Enumeration not finished or interrupt disabled 1: Enumeration finished interrupt triggered.	R
b5	DLISTIRQ	Display List Interrupt Triggered	0: Display list not finished or interrupt disabled 1: Display list finished interrupt triggered.	R
b6	BUSIRQ	Bus Error Interrupt Triggered	0: No bus error occurred or interrupt disabled 1: Bus error interrupt triggered.	R
b7	—	Reserved	This bit is read as 0.	R
b8	BUSERRMFB	Framebuffer Bus Error Interrupt Triggered	0: No framebuffer bus error occurred or interrupt disabled 1: Framebuffer bus error interrupt triggered.	R
b9	BUSERRMTXMRL	Texture Bus Error Interrupt Triggered	0: No texture bus error occurred or interrupt disabled 1: Texture bus error interrupt triggered*1.	R
b10	BUSERRMDL	Display List Bus Error Interrupt Triggered	0: No display list bus error occurred or interrupt disabled 1: Display list bus error interrupt triggered.	R
b31 to b11	—	Reserved	These bits are read as 0.	R

Note 1. Because the RLE unit is also reading data through the texture bus, an error during RLE data access is also reflected in this bit.

43.2.6 Hardware Version and Feature Set ID Register (HWREVISION)

Address(es): DRW.HWREVISION E820 A004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	ACBLEND	—	COLORKEY	TEXCLUT256	RLEUNIT	—	TEXCLU	PERFCOUNT	TXCACHE	FBCACHE	DLR	—
Value after reset:	0	0	0	0	1	1	1	1	1	0	1	1	1	1	1	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	REV[11:0]											
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b11 to b0	REV[11:0]	Revision Number	Revision number.	R
b16 to b12	—	Reserved	These bits are read as 0.	R
b17	DLR	Display List Reader Available	Display list reader is available.	R
b18	FBCACHE	Framebuffer Cache Available	Framebuffer cache is available.	R
b19	TXCACHE	Texture Cache Available	Texture cache is available.	R
b20	PERFCOUNT	Two Performance Counter Available	Two performance counter is available.	R
b21	TECLUT	Texture CLUT with 16 or 256 Entries Available	Texture CLUT with 16 or 256 entries is available.	R
b22	—	Reserved	This bit is read as 0.	R
b23	RLEUNIT	RLE Unit Available	RLE unit is available.	R
b24	TEXCLUT256	Texture CLUT Available	Texture CLUT is available.	R
b25	COLORKEY	Color Key Available	Color key is available.	R
b26	—	Reserved	This bit is read as 1.	R
b27	ACBLEND	Alpha Channel Blending Available	Alpha channel blending is available.	R
b31 to b28	—	Reserved	These bits are read as 0.	R

43.2.7 Base Color Register (COLOR1)

Address(es): DRW.COLOR1 E820 A064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	COLOR1A[7:0]								COLOR1R[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	COLOR1G[7:0]								COLOR1B[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	COLOR1B[7:0]	Blue Channel of Color 1	Specifies blue channel of color 1.	W
b15 to b8	COLOR1G[7:0]	Green Channel of Color 1	Specifies green channel of color 1.	W
b23 to b16	COLOR1R[7:0]	Red Channel of Color 1	Specifies red channel of color 1.	W
b31 to b24	COLOR1A[7:0]	Alpha Channel of Color 1	Specifies alpha channel of color 1. 00h: Transparent ... FFh: Opaque.	W

43.2.8 Secondary Color Register (COLOR2)

Address(es): DRW.COLOR2 E820 A068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	COLOR2A[7:0]								COLOR2R[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	COLOR2G[7:0]								COLOR2B[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	COLOR2B[7:0]	Blue Channel of Color 2	Specifies blue channel of color 2.	W
b15 to b8	COLOR2G[7:0]	Green Channel of Color 2	Specifies green channel of color 2.	W
b23 to b16	COLOR2R[7:0]	Red Channel of Color 2	Specifies red channel of color 2.	W
b31 to b24	COLOR2A[7:0]	Alpha Channel of Color 2	Specifies alpha channel of color 2. 00h: Transparent ... FFh: Opaque.	W

43.2.9 Pattern Register (PATTERN)

Address(es): DRW.PATTERN E820 A074h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PATTERN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	PATTERN[7:0]	Bitmap of the Pattern	Specifies bitmap of the pattern.	W
b31 to b8	—	Reserved	The write value should be 0.	W

43.2.10 Limiter N Start Value Register (LnSTART)

Address(es): DRW.L1START E820 A010h, DRW.L2START E820 A014h, DRW.L3START E820 A018h, DRW.L4START E820 A01Ch, DRW.L5START E820 A020h, DRW.L6START E820 A024h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LSTART[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LSTART[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LSTART[31:0]	Start Value of the nth Limiter	Specifies start value of the nth limiter.	W

43.2.11 Limiter N X-Axis Increment Register (LnXADD)

Address(es): DRW.L1XADD E820 A028h, DRW.L2XADD E820 A02Ch, DRW.L3XADD E820 A030h, DRW.L4XADD E820 A034h, DRW.L5XADD E820 A038h, DRW.L6XADD E820 A03Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LXADD[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LXADD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LXADD[31:0]	X-Axis Increment	Specifies x-axis increment.	W

43.2.12 Limiter N Y-Axis Increment Register (LnYADD)

Address(es): DRW.L1YADD E820 A040h, DRW.L2YADD E820 A044h, DRW.L3YADD E820 A048h, DRW.L4YADD E820 A04Ch, DRW.L5YADD E820 A050h, DRW.L6YADD E820 A054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LYADD[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LYADD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LYADD[31:0]	Y-Axis Increment	Specifies y-axis increment.	W

43.2.13 Limiter M Bandwidth Parameter Register (LmBAND)

Address(es): DRW.L1BAND E820 A058h, DRW.L2BAND E820 A05Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LBAND[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LBAND[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LBAND[31:0]	Limiter m Bandwidth Parameter	Specifies limiter m bandwidth parameter.	W

43.2.14 Texture Base Address Register (TEXORIGIN)

Address(es): DRW.TEXORIGIN E820 A0BCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TEXORIGIN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEXORIGIN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TEXORIGIN[31:0]	Texture Base Address	Specifies texture base address.	W

43.2.15 Texels Per Texture Line Register (TEXPITCH)

Address(es): DRW.TEXPITCH E820 A0B4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TEXPITCH[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	TEXPITCH[10:0]	Texels Per Texture Line	Specifies texels per texture line.	W
b31 to b11	—	Reserved	The write value should be 0.	W

43.2.16 Texture Size or Texture Address Mask Register (TEXMASK)

Address(es): DRW.TEXMASK E820 A0B8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TEXVMASK[20:5]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEXVMASK[4:0]					TEXUMASK[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	TEXUMASK[10:0]	U Mask in Texture Mode	Specifies the U mask. Set to texture_width-1. • In texture wrapping mode (CONTROL2.TEXTURECLAMPX = 0): Texture_width must be a power of 2 • In texture clamping mode (CONTROL2.TEXTURECLAMPX = 1): All widths up to 2048 are allowed.	W
b31 to b11	TEXVMASK[20:0]	V Mask in Texture Mode	Specifies the V mask. Set to TEXPITCH × (texture_height - 1) • In texture wrapping mode (CONTROL2.TEXTURECLAMPY = 0): Texture_height must be a power of 2 • In texture clamping mode (CONTROL2.TEXTURECLAMPY = 1): All heights up to 1024 are allowed.	W

43.2.17 U Limiter Start Value Register (LUSTART)

Address(es): DRW.LUSTART E820 A090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LUSTART[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LUSTART[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LUSTART[31:0]	U Limiter Start Value	Specifies U limiter start value.	W

43.2.18 U Limiter X-Axis Increment Register (LUXADD)

Address(es): DRW.LUXADD E820 A094h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LUXADD[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LUXADD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LUXADD[31:0]	U Limiter X-Axis Increment	Specifies U limiter x-axis increment.	W

43.2.19 U Limiter Y-Axis Increment Register (LUYADD)

Address(es): DRW.LUYADD E820 A098h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LUYADD[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LUYADD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LUYADD[31:0]	U Limiter Y-Axis Increment	Specifies U limiter y-axis increment.	W

43.2.20 V Limiter Start Value Integer Part Register (LVSTARTI)

Address(es): DRW.LVSTARTI E820 A09Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LVSTARTI[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LVSTARTI[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LVSTARTI[31:0]	V Limiter Start Value Integer Part	Specifies integer part of V limiter start value.	W

43.2.21 V Limiter Start Value Fractional Part Register (LVSTARTF)

Address(es): DRW.LVSTARTF E820 A0A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LVSTARTF[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	LVSTARTF[15:0]	V Limiter Start Value Fractional Part	Specifies fractional part of V limiter start value.	W
b31 to b16	—	Reserved	The write value should be 0.	W

43.2.22 V Limiter X-Axis Increment Integer Part Register (LVXADDI)

Address(es): DRW.LVXADDI E820 A0A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LVXADDI[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LVXADDI[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LVXADDI[31:0]	V Limiter X-Axis Increment Integer Part	Specifies integer part of V limiter x-axis increment.	W

43.2.23 V Limiter Y-Axis Increment Integer Part Register (LVYADDI)

Address(es): DRW.LVYADDI E820 A0A8h

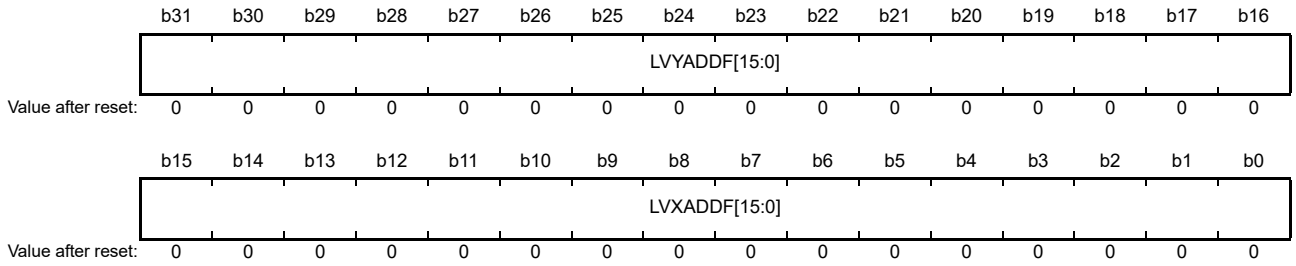
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LVYADDI[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LVYADDI[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LVYADDI[31:0]	V Limiter Y-Axis Increment Integer Part	Specifies integer part of V limiter y-axis increment.	W

43.2.24 V Limiter Increment Fractional Parts Register (LVYXADDF)

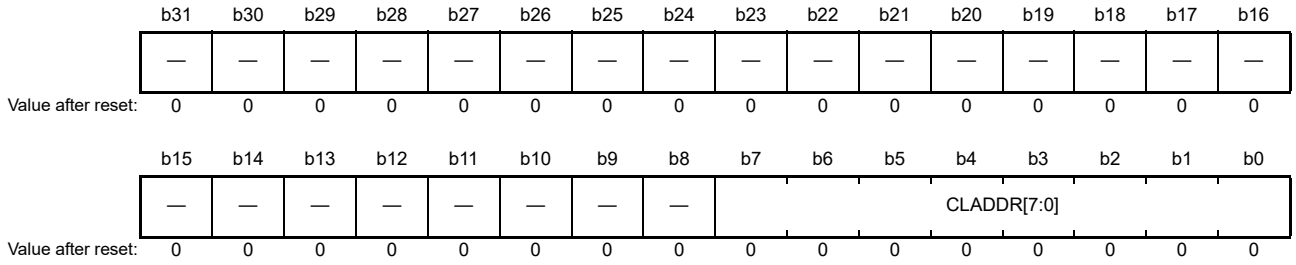
Address(es): DRW.LVYXADDF E820 A0ACh



Bit	Symbol	Bit name	Description	R/W
b15 to b0	LVXADDF[15:0]	V Limiter X-Axis Increment Fractional Part	Specifies fractional part of V limiter x-axis increment.	W
b31 to b16	LVYADDF[15:0]	V Limiter Y-Axis Increment Fractional Part	Specifies fractional part of V limiter y-axis increment.	W

43.2.25 CLUT Start Address Register (TEXCLADDR)

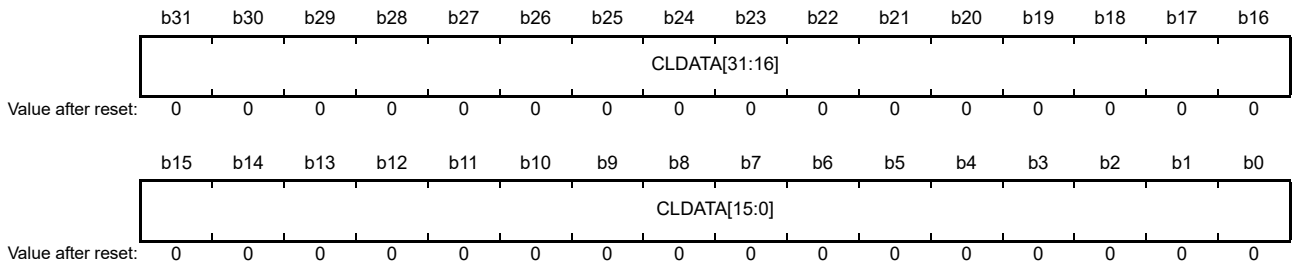
Address(es): DRW.TEXCLADDR E820 A0DCh



Bit	Symbol	Bit name	Description	R/W
b7 to b0	CLADDR[7:0]	Texture CLUT Start Address	Specifies texture CLUT start address.	W
b31 to b8	—	Reserved	The write value should be 0.	W

43.2.26 CLUT Data Register (TEXCLDATA)

Address(es): DRW.TEXCLDATA E820 A0E0h



Bit	Symbol	Bit name	Description	R/W
b31 to b0	CLDATA[31:0]	Texture CLUT Data	Specifies texture CLUT data.	W

43.2.27 CLUT Offset Register (TEXCLOFFSET)

Address(es): DRW.TEXCLOFFSET E820 A0E4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CLOFFSET[7:0]	Texture CLUT Offset	Specifies texture CLUT offset. CLOFFSET[7:0] is OR gated with the original index.	W
b31 to b8	—	Reserved	The write value should be 0.	W

43.2.28 Color Key Register (COLKEY)

Address(es): DRW.COLKEY E820 A0E8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	COLKEYR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	COLKEYG[7:0]								COLKEYB[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	COLKEYB[7:0]	Blue Channel of Color Key	Specifies blue channel of color key.	W
b15 to b8	COLKEYG[7:0]	Green Channel of Color Key	Specifies green channel of color key.	W
b23 to b16	COLKEYR[7:0]	Red Channel of Color Key	Specifies red channel of color key.	W
b31 to b24	—	Reserved	The write value should be 0.	W

43.2.29 Bounding Box Dimension Register (SIZE)

Address(es): DRW.SIZE E820 A078h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SIZEY[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SIZEX[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	SIZEX[15:0]	Bounding Box Width	Specifies width of bounding box in pixels. Valid range: 0 to 1024.	W
b31 to b16	SIZEY[15:0]	Bounding Box Height	Specifies height of bounding box in pixels. Valid range: 0 to 1024.	W

43.2.30 Framebuffer Pitch And Spanstore Delay Register (PITCH)

Address(es): DRW.PITCH E820 A07Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SSD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PITCH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PITCH[15:0]	Pitch of the Framebuffer	A negative width can be used to render bottom-up instead of top-down.	W
b31 to b16	SSD[15:0]	Spanstore Delay	Specifies number of scan lines to delay spanstore operations.	W

43.2.31 Framebuffer Base Address Register (ORIGIN)

Address(es): DRW.ORIGIN E820 A080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ORIGIN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ORIGIN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	ORIGIN[31:0]	Address of the First Pixel in Framebuffer	Writing to ORIGIN triggers the start of rendering.	W

43.2.32 Display List Start Address Register (DLISTSTART)

Address(es): DRW.DLISTSTART E820 A0C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DLISTSTART[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DLISTSTART[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	DLISTSTART[31:0]	Display List Start Address	Setting a new display list base address triggers execution of the new display list. Execution stops only when a new list is set or the current list terminates.	W

43.2.33 Performance Counters Control Register (PERFTRIGGER)

Address(es): DRW.PERFTRIGGER E820 A0D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	PERFTRIGGER2[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	PERFTRIGGER1[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	PERFTRIGGER1[4:0]	Trigger of Performance Counter 1	Selects the internal event that increments the PERFCOUNT1 register. 0: Disable performance counter 1: Select 2D Drawing Engine active cycles 2: Select framebuffer read access 3: Select framebuffer write access 4: Select texture read access 5: Select invisible pixels (enumerated but selected with alpha 0%) 6: Select invisible pixels while internal FIFO is empty (lost cycles) 7: Select display list reader active cycles 8: Select framebuffer read hits 9: Select framebuffer read misses 10: Select framebuffer write hits 11: Select framebuffer write misses 12: Select texture read hits 13: Select texture read misses 31: Select every clock cycle (for use as timer).	W
b15 to b5	—	Reserved	The write value should be 0.	W
b20 to b16	PERFTRIGGER2[4:0]	Trigger of Performance Counter 2	Same as for PERFTRIGGER1, but for performance counter 2.	W
b31 to b21	—	Reserved	The write value should be 0.	W

43.2.34 Performance Counter k (PERFCOUNTk) (k = 1, 2)

Address(es): DRW.PERFCOUNT1 E820 A0CCh, DRW.PERFCOUNT2 E820 A0D0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PERFCOUNT[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PERFCOUNT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	PERFCOUNT[31:0]	Performance Counter k Value	Specifies counter k value. The counter is reset by writing PERFCOUNTk = 0000 0000h.	R/W

43.3 Drawing Features

43.3.1 Drawing Features Summary

43.3.1.1 Color Formats

Supported color formats are:

Framebuffer formats

- 8-bit: a (8)
- 16-bit: RGB (565), aRGB (4444)
- 32-bit: aRGB (8888).

Texture formats

- 1-bit: CLUT (1)/I (1)
- 2-bit: CLUT (2)/I (2)
- 4-bit: CLUT (4)/I (4)
- 8-bit: a (8), CLUT (8)/I (8), aCLUT (44)
- 16-bit: aRGB (4444), aRGB (1555), RGB (565)
- 24-bit: RGB (888) (run length encoded (RLE) unit)
- 32-bit: aRGB (8888).

CLUT formats use a 256-entry color lookup table.

43.3.1.2 BitBLT Features

The 2D Drawing Engine supports the BitBLT features using its vector drawing function to draw a rectangle and texture it based on the selected BitBLT function. This approach results in the following BitBLT features:

- Fill
- Copy
- Stretch BitBLT
- Rotate and scale
- Alpha blending
- Bilinear filtering
- Color conversion
- Subpixel exact placement.

43.3.1.3 Vector Drawing Features

The 2D Drawing Engine for vectors uses a half-plane rendering approach, which simplifies the implementation of the edge antialiasing and blurring features without much overhead.
When combining some of its functional units, this module can draw not only linear primitives such as lines or polygons but also quadratic equation-based primitives such as circles and ellipsoids.

The following primitives are supported:

- Lines
- Polygons
- Circles and ellipses
- Quadratic curves (software driver support)
- 2D texture mapping
- Bilinear filtering of the textures.

43.3.2 Vector Drawing

For a detailed explanation of the algorithms, see section 43.6, Rendering Pipeline. Supported vector drawing includes:

Lines

- Arbitrary width
- Round endpoints
- Truncated endpoints
- Alpha gradients
- Soft edges (blurring)
- Render attribute: color, pattern, or texture.

Polygons

- Triangles and quadrangles (complex polygons are tessellated by software)
- Alpha gradients
- Soft edges (blurring)
- Per edge controls for anti-aliasing
- Render attribute: color, pattern, or texture.

Circles and ellipses

- All conic sections
- Filled or with arbitrary width
- Arcs of 0° to 360°
- Soft edges
- Alpha gradients
- Render attribute: color, pattern, or texture.

Quadratic Bézier

- Approximated by circle arcs
- Arbitrary width
- Round or truncated endpoints
- Outlines, blurring
- Alpha gradients
- Render attribute: color.

Texture mapping

- 2D array of pixels that can be mapped implicitly or explicitly on all primitives provided by the 2D Drawing Engine
- Translation, rotation, and scaling/shearing
- Bilinear filtering of the textures
- 3D-like texturing accomplished with line-by-line mapping if either the x or y coordinate value is a constant.

43.3.3 BitBLT

A dedicated BitBLT unit is not required in the 2D Drawing Engine. The rendering pipeline described for vector drawing is used as the BitBLT unit and already provides a 1 pixel/cycle throughput. For details, see section 43.6, Rendering Pipeline.

43.3.3.1 Fill

Any rectangle in the framebuffer can be filled with any value. Possible color formats are any 8-, 16-, or 32-bpp format. The driver optimizes the fill to gain the full benefit of 32-bit parallel rasterization. If the color depth of the selected color format is less than 32 bpp, the driver corrects the alignment and fills 32 bits per clock cycle, resulting in two to four times faster fill performance in 8- and 16-bpp formats.

43.3.3.2 Copy

Any rectangle in the framebuffer can be filled with any rectangular data from the texture input. When the texture input points to the framebuffer, copying from framebuffer to framebuffer is possible. To avoid copy problems because of overlapping source and destination areas, the copy start point can be selected from top left to bottom right. Possible color formats are any 8-, 16-, or 32-bpp format.
The driver optimizes the copy to gain the full benefit of 32-bit parallel rasterization. If the color depth of the selected color format is less than 32 bpp, the driver corrects the alignment and copies 32 bits per clock cycle, resulting in two to four times faster copy performance in 8-and 16-bpp formats.

43.3.3.3 Stretch BitBLT

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full texture mapping feature set can be used. Any scaling ratios in the x and y directions is selectable, and filtering can be enabled independently for each axis.

43.3.3.4 Rotate and Scale

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full set of texture mapping features can be used. Any scaling ratio in the x and y directions and any rotation angle are selectable. The user can enable or disable filtering for the scalers independently for each of the x and y directions.

43.3.3.5 Alpha Blending

Alpha blending is a fundamental block in the rendering pipeline, so the full set of alpha blend features is available for any BitBLT operation. It is possible to copy an area and blend it over the destination by using any constant global alpha value (register value) or by using an alpha mask. The alpha mask is part of the texture data and can be either a per-pixel value together with a pixel color (aRGB formats) or an alpha-only format using a register color.
In addition to the color channels, the alpha channel can be blended. The formula for the alpha channel can be set independently from the formula for the color channels.

43.3.3.6 Bilinear Filtering

The texture unit can be used to scale, rotate, or shear images. The texturing result can be filtered in the x and y directions independently. When selecting both filters, the result is a bilinear filtered texture. Using the unit twice with two independent textures would generate trilinear filtered bitmaps, improving the visual impression for high dynamic scale ratios.

43.3.3.7 Color Conversion

Color conversion is required when using different texture formats than the framebuffer format. To save texture memory, formats having less bpp than that of the framebuffer are supported. The 2D Drawing Engine always operates internally with the 32-bpp aRGB (8888) format. All input data is converted into 32 bpp and is finally converted back into the framebuffer format.

43.4 Input and Output Data Formats

43.4.1 Source and Destination Data

There are two possible inputs, the framebuffer and the texture or pattern input. The output is always the framebuffer. Every drawing operation is internally rendered in 32 bpp aRGB (8888). If the input color does not provide an alpha channel, the blue channel is taken as the alpha channel. This alpha can be substituted with any alpha (for example, by an external constant) during the colorization step in the 2D Drawing Engine.

43.4.2 Framebuffer Color Formats

Table 43.1 shows the supported framebuffer color formats.

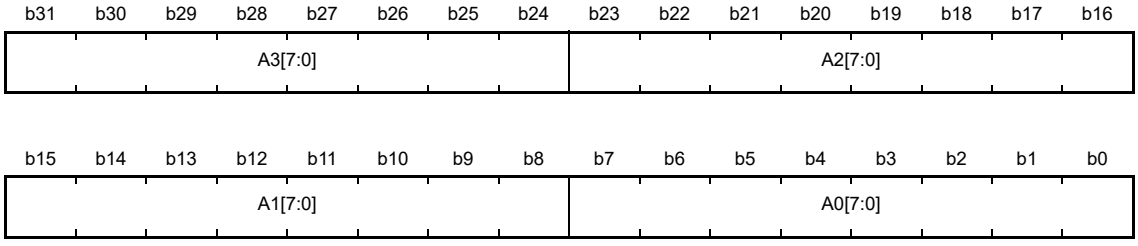
Table 43.1 Framebuffer color formats

Framebuffer memory occupation	Format	Remarks
8 bpp	a (8)	This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the color step in the 2D Drawing Engine.
16 bpp	RGB (565)	This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine.
	aRGB (4444)	This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel.
32 bpp	aRGB (8888)	This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel.

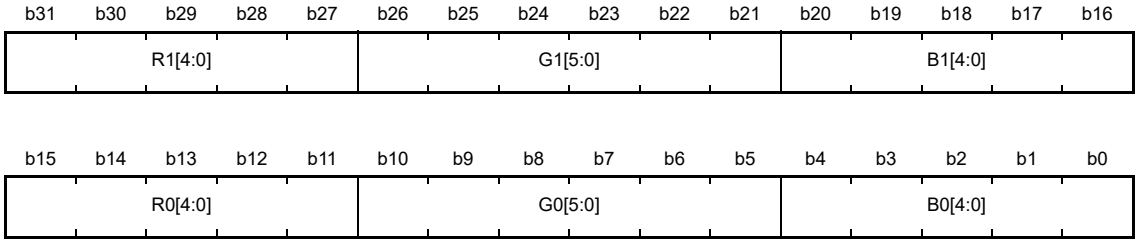
The framebuffer color format is selected in the Surface Control Register bits, CONTROL2.WRITEFORMAT[2:0].

The data allocation of the frame buffer format is as follows.

- a(8) (WRITEFORMAT[2:0]=0)

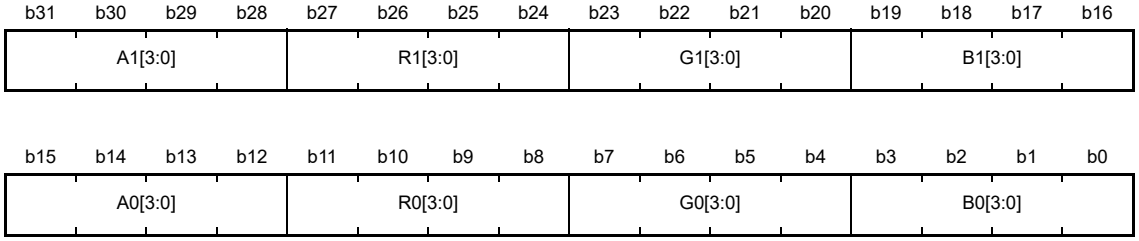


- RGB(565) (WRITEFORMAT[2:0]=1)



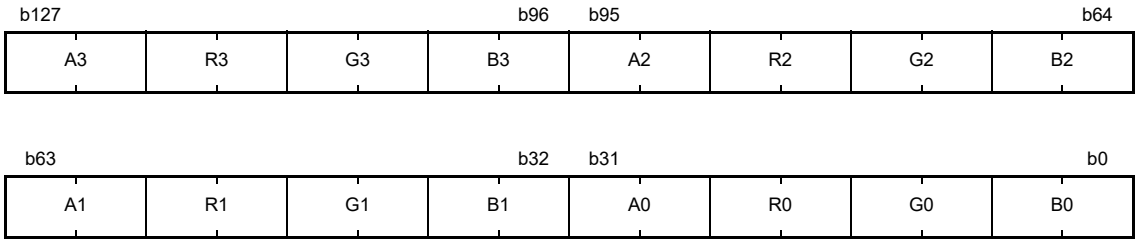
- aRGB(8888) (WRITEFORMAT[2:0]=2)

- aRGB(4444) (WRITEFORMAT[2:0]=3)



The data allocation on the 128-bit South main bus is little-endian as shown below.

- aRGB(8888)



Other formats are also little-endian.

43.4.3 Texture Color Formats

Table 43.2 shows the supported texture color formats.

Table 43.2 Texture color formats

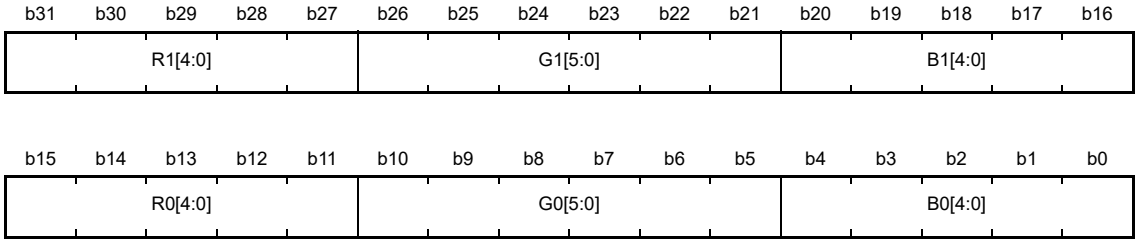
Texture memory occupation	Format	Remarks
1 bpp	CLUT (1)/I (1)	In this mode, a 1-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
2 bpp	CLUT (2)/I (2)	In this mode, a 2-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
4 bpp	CLUT (4)/I (4)	In this mode, a 4-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
8 bpp	CLUT (8)/I (8)	In this mode, an 8-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
	a (8)	This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the colorization step in the 2D Drawing Engine.
	aCLUT (44)	This color format uses 1 byte per pixel. 4 bits are used as an alpha value and 4 bits are used as an index to a color palette. This approach saves space if 16 colors are sufficient to describe the image, because the next bigger alpha format would be 2-byte aRGB (4444).
16 bpp	RGB(565)	This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine.
	aRGB (4444)	This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel.
	aRGB (1555)	This color format uses 2 bytes per pixel. Every color channel has 5 bits and the topmost single bit is taken as an alpha value. This can be used to hold an image with a transparency mask.
24 bpp	RGB (888)	This color format uses 3 bytes per pixel with 8 bits for each color channel. This format is only available as run length encoded data (RLE compression).
32 bpp	aRGB (8888)	This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel.

The texture color format is selected in the Surface Control Register bits, CONTROL2.READFORMAT[3:0] .

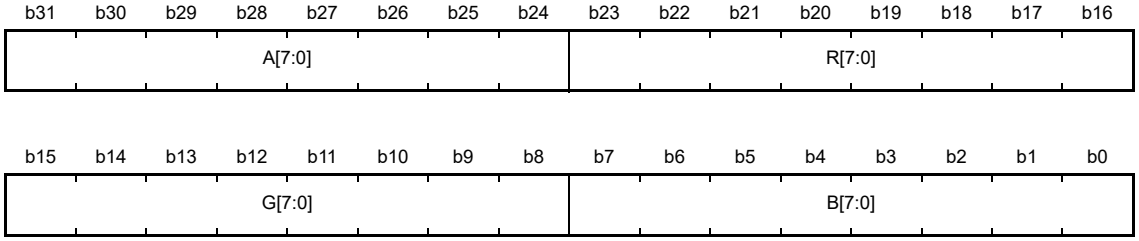
The data allocation of the texture format is as follows.

- a(8) (READFORMAT[3:0]=0h)

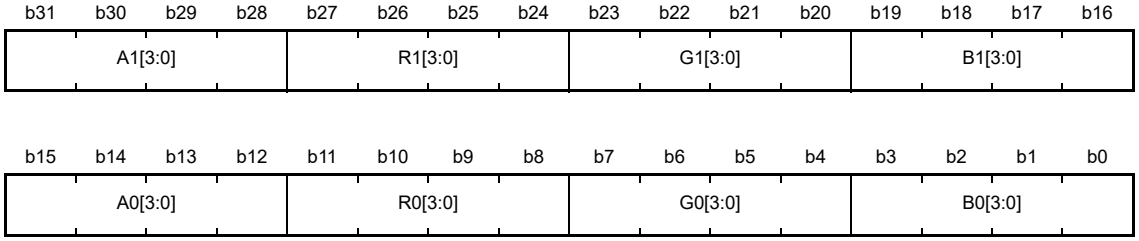
- RGB(565) (READFORMAT[3:0]=1h)



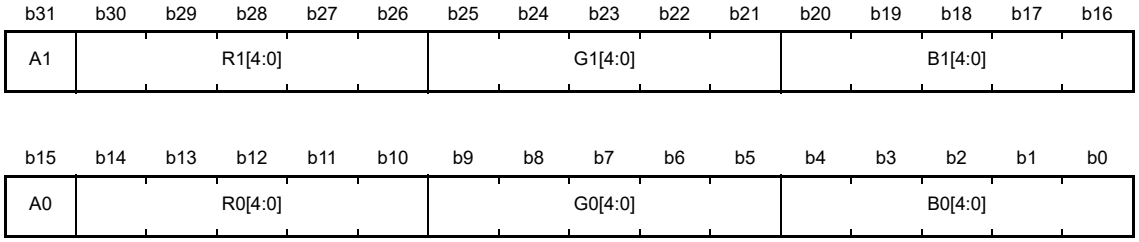
- aRGB(8888) (READFORMAT[3:0]=2h)



- aRGB(4444) (READFORMAT[3:0]=3h)

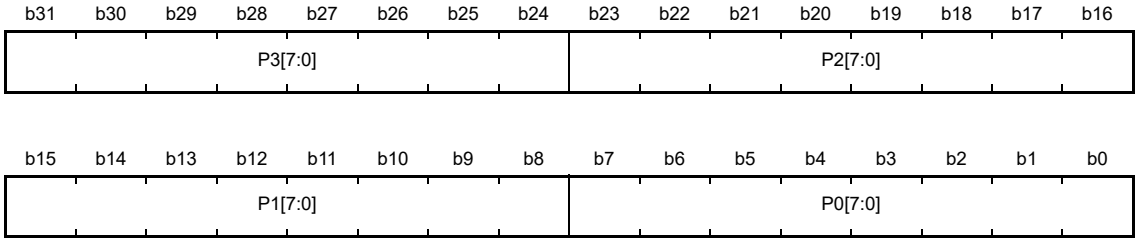


- aRGB(1555) (READFORMAT[3:0]=4h)

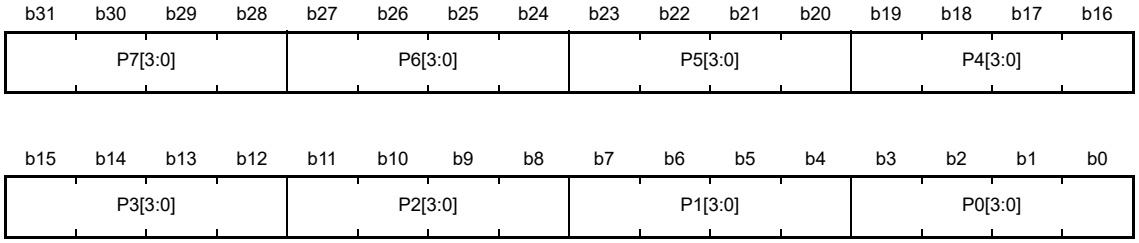


- aCLUT(44) (READFORMAT[3:0]=5h)

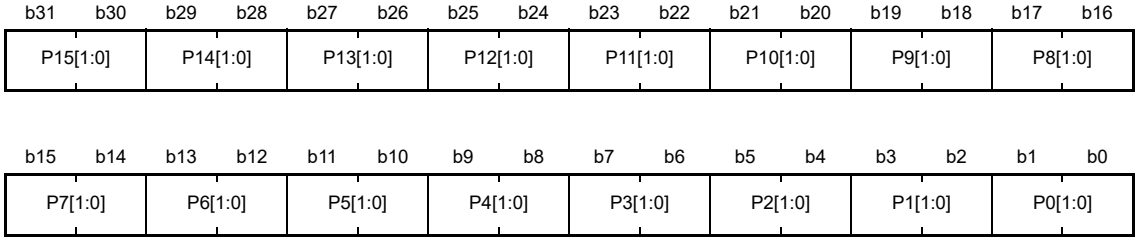
- CLUT(8) (READFORMAT[3:0]=9h)



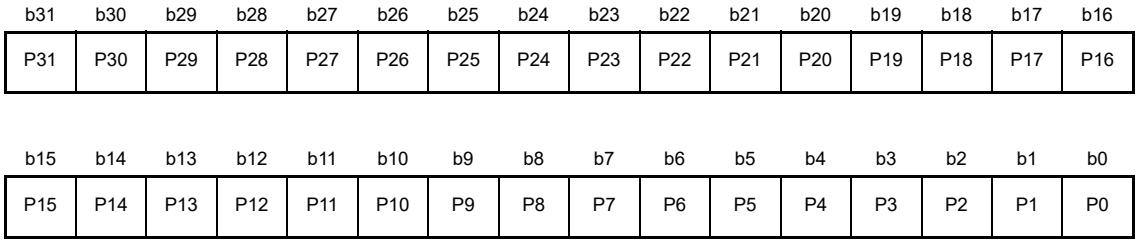
- CLUT(4) (READFORMAT[3:0]=Ah)



- CLUT(2) (READFORMAT[3:0]=Bh)



- CLUT(1) (READFORMAT[3:0]=Ch)



The data allocation on the 128-bit South main bus is the same little-endian as the frame buffer.

43.5 Texture Data Processing

Figure 43.4 shows the processing of texture data.

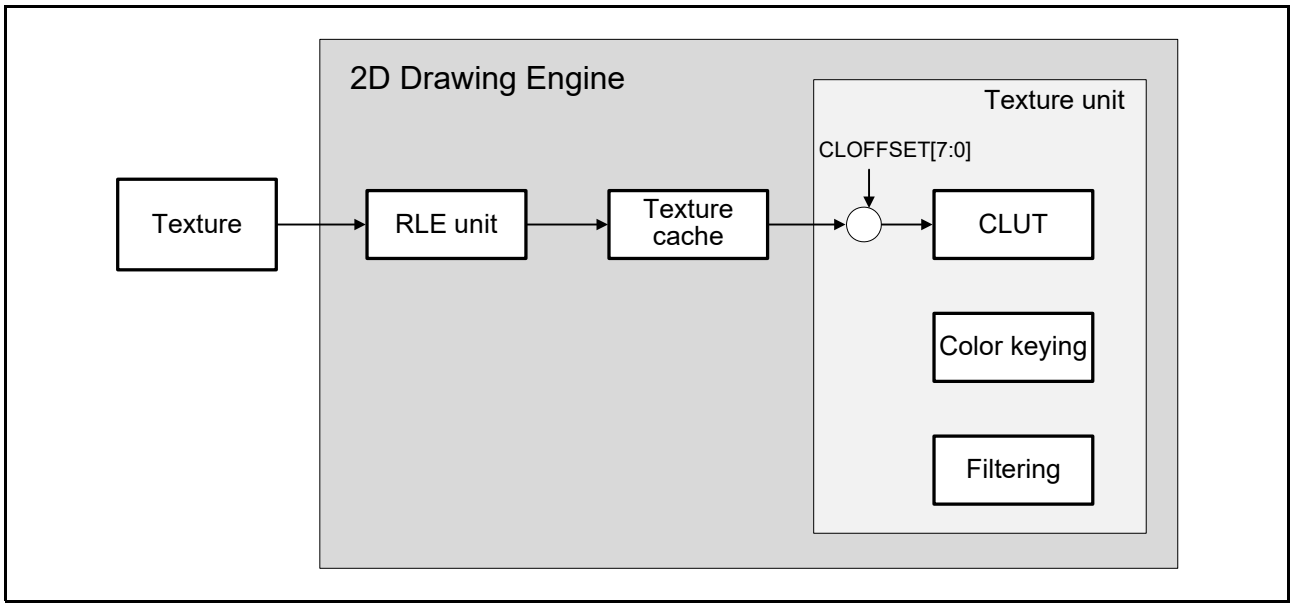


Figure 43.4 Texture data processing

43.5.1 Texture Color Format

Table 43.3 shows the supported texture data formats.

Table 43.3 Texture color formats

Texel bit width	Texel format
32 bits	aRGB (8888)
24 bits	RGB (888)
16 bits	aRGB (4444), aRGB (1555), RGB (565)
8 bits	CLUT (8)/I (8), a (8), aCLUT (44)
4 bits	CLUT (4)/I (4)
2 bits	CLUT (2)/I (2)
1 bit	CLUT (1)/I (1)

43.5.2 Run Length Encoded (RLE) Unit

The RLE unit decompresses Targa-like compressed textures and hands the decompressed texel data over to the texture unit. The key features are:

- Support for Targa format
- Avoids the additional Targa limitation to scan lines
- Support for clipping of compressed images, in which the 2D Drawing Engine is allowed to copy only a portion of a larger original texture
- Control of the RLE unit in display list operation
- Bypassing of the RLE unit logic if uncompressed textures are fetched.

Texture cache

- The RLE unit feeds the texture cache. The texture cache can be disabled by setting CACHECTL.CENABLETX = 0.

Note: A texture cache flush operation (CACHECTL.CFLUSHTX = 1) is necessary at the beginning and end of every new RLE texture.

The texture cache and the RLE unit can be bypassed by setting CONTROL2.RLEENABLE = 0.

43.5.2.1 RLE Texel Formats

Table 43.4 lists the data formats supported by the RLE unit.

Table 43.4 Texel formats supported by the RLE unit

Memory texel format	RLE parameters	RLE coded unit format (CONTROL2.RLEPIXELWIDTH[1:0])	Delivered format
32-bit aRGB (8888)	Included in Targa and RLE formats	32 bits (11b)	32 bits
24-bit RGB (888)		24 bits (10b)	32 bits *1
16-bit aRGB (4444), aRGB (1555), RGB (565)		16 bits (01b)	16 bits
8-bit CLUT (8)/I (8), a (8), aCLUT (44)		8 bits (00b)	8 bits
4-bit CLUT (4)/I (4)	Optional for RLE *2	8 = 2 x 4 bits	4 + 4 bits
2-bit CLUT (2)/I (2)	No RLE		
1-bit CLUT (1)/I (1)			

Note 1. 24-bit RGB (888) encoded texels are delivered as aRGB (8888) with Alpha set to 1.
Note 2. Encoding of textures with 4 bits per texel is not defined by the Targa specification but can be done by:
- Combining two 4-bit texels to one byte
- Padding with 4 zero bits at the end of the file, if the number of texels is odd
- Encoding as with 8-bit texels.

Texel addressing for RLE textures

The address of a texel is the byte address of the first byte of the texel. The origin of the texture is given by the register TEXORIGIN.

Note: The RLE code must begin at a word boundary of the memory.
When the FIFO is filled, there is no provision to inhibit read access beyond the end of the RLE code. To avoid memory access violations, the RLE code must be padded by 32 memory words, where every bit of each word is set to 1.

43.5.2.2 Targa RLE Format

Run-length encoded (RLE) images include two types of data elements:

- Run-length packets
- Raw packets.

The first field (1 byte) of each packet is called the "repetition count field". The second field is called the "pixel value field" (1, 2, 3, or 4 bytes per pixel).
For run-length packets, the pixel value field contains a single pixel value.
For raw packets, this field holds a variable number of pixel values.
The highest order bit of the repetition count indicates whether the packet is a raw packet or a run-length packet, as follows:

- If bit [7] of the repetition count is set to 1, the packet is a run-length packet
- If bit [7] of the repetition count is set to zero, the packet is a raw packet.

The lower 7 bits of the repetition count specify how many pixel values are represented by the packet. For a run-length packet, this count indicates how many successive pixels have the pixel value specified in the pixel value field. For raw packets, this count specifies how many pixel values are actually contained in the next field. This 7-bit value is actually encoded as 1 less than the number of pixels in the packet (a value of 0 implies 1 pixel while a value of 7Fh implies 128 pixels).

Run-length packet

Run-length packets are composed of two parts. The first is a repetition count and the second is the pixel value to repeat.

Table 43.5 Run-length packet

Field name	Repetition count field		Pixel value field
Contents	Packet type (must be 1 for run-length)	Pixel count (number of pixels encoded in this packet - 1)	Pixel data (the shared pixel value to be used)
Field size	1 bit	7 bits	Pixel depth (Table 43.4)

Raw packet

The raw packet always includes two fields. The first field is the repetition count and the second field is the pixel value field.

Table 43.6 Raw packet

Field name	Repetition count field		Pixel value field
Contents	Packet type (must be 0 for raw packet)	Pixel count (number of pixels encoded by this packet - 1)	Pixel data
Field size	1 bit	7 bits	Pixel depth × pixel count

43.5.3 Color Lookup Table (CLUT)

The color lookup table receives an index that addresses one out of the 256 predefined colors.
The predefined color format can be selected as:

- CONTROL2.CLUTFORMAT = 0: aRGB (8888)
- CONTROL2.CLUTFORMAT = 1: RGB (565).

The CLUT is filled by the use of two registers:

- TEXCLDATA
  The aRGB (8888) color definition is written to this register, while the CLUT address is taken from TEXCLADDR.
- TEXCLADDR.
  This is set to the first address of the CLUT to write to and is automatically incremented after each write to TEXCLDATA.

An offset for indexed formats (CLUT (1), CLUT (2), CLUT (4), and CLUT (8)) can be set up in the TEXCLOFFSET register to allow selecting an offset part of the CLUT. The CLUT index is calculated by CLUT (x) or TEXCLOFFSET.CLOFFSET[7:0].

43.5.3.1 CLUT/I Pixel Data Formats

The following tables explain in which order the pixels are stored within the byte. The left-most pixel is stored at the lowest bit of the memory byte.

CLUT (1)/I (1) format

The CLUT (1)/I (1) format expresses 1 pixel by using a total of 1 bit.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P7	P6	P5	P4	P3	P2	P1	P0

The left-most pixel is stored at lowest bit of the memory byte.

CLUT (2)/I (2) format

The CLUT (2)/I (2) format expresses 1 pixel by using a total of 2 bits.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P3		P2		P1		P0	

The left-most pixel is stored at lowest 2 bits of the memory byte.

CLUT (4)/I (4) format

The CLUT (4)/I (4) format expresses 1 pixel by using a total of 4 bits.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P1				P0			

The left-most pixel is stored at lowest 4 bits of the memory byte.

43.5.4 Color Keying

The 2D Drawing Engine provides a color keying unit in front of the texture unit. It operates as follows:

1. When color keying is enabled (CONTROL2.COLKEYENABLE = 1), the incoming color is compared with the transparent color defined by COLKEY.
2. If the colors match, the alpha and color values are set to 0 to mark the incoming color as transparent, and the color is handled as if the alpha value were pre-multiplied.
3. If the value does not match, alpha is set to 1.
4. Additional operations such as alpha_in × alpha_const are still possible.

With this approach, an object such as a round icon can be cut out from a rectangular texture and can be faded by a constant alpha over the background.

43.6 Rendering Pipeline

43.6.1 Coordinate Transformation

Coordinate transformation such as rotation, translation, projection, and scaling must be done on the application side. This is not part of the 2D Drawing Engine hardware or driver. Because all coordinates fed into the 2D Drawing Engine are in fixed point format, these calculations can be made in fixed point format and do not require a floating point unit.

43.6.2 Rasterization

During rasterization, the vector data of the object must be converted to pixel data. To convert the data, the program sets up the edge interpolation hardware, called a limiter, for each edge of the object that calculates a decision value. The limiter determines which side of the edge the pixel is positioned on. The 2D Drawing Engine includes six internal hardware limiters. In principle, the limiter registers contain the distance between the pixel being processed and the edge. In the linear setup, a limiter describes a half plane. The intersection of all half planes is the object. If three half planes intersect, a triangle is created as shown in Figure 43.5.

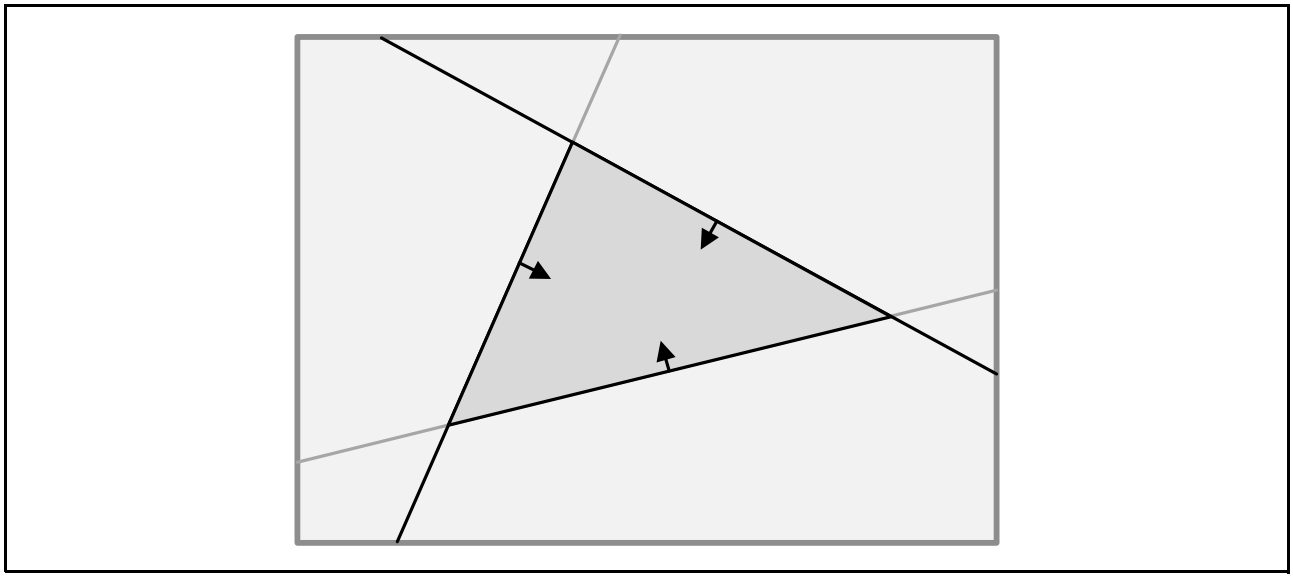

Figure 43.5 Intersection of half planes

The limiter output is clamped to an interval of [0:1]. In limiters 1 and 2 it is possible to apply a band filter before the clamping operation. In this case, the limiter is not describing a half plane but a small band. With this approach, a single limiter can describe a thick line of infinite length.
The output of the different limiters can be combined by the combiner units with a maximum or minimum operation. Maximum operation describes the union of both half planes, and minimum operation describes the intersection of both half planes. The final output is then used as an alpha value. Edge anti-aliasing can be done with no additional effort with this hardware.
To calculate the decision value for each possible pixel with a limiter, the bounding box of the object must be calculated. Then, the decision value for the top left corner of the bounding box must be calculated for each edge. Finally, the increments for a step in the x direction and a step in the y direction must be calculated. This is done by the CPU in the driver.
With this information, the 2D Drawing Engine scans the whole bounding box and calculates the decision value for every pixel incrementally. For a block diagram of the entire rasterization unit, see Figure 43.6.

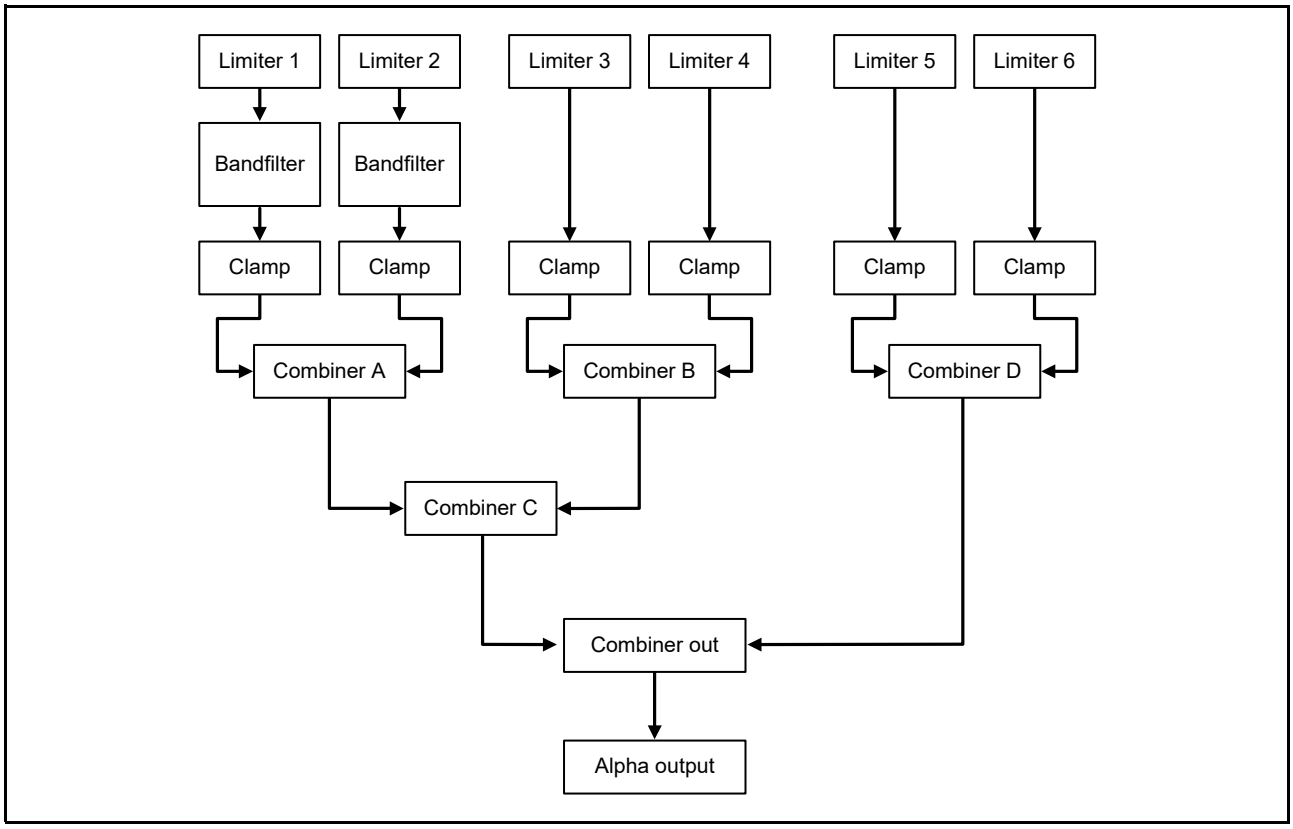

Figure 43.6 Block diagram of rasterization unit

The limiters calculate distances and the combiner units combine them to an alpha value. The combiner units define the conditions for whether or not a pixel is in the bounding box. The alpha value must be greater than 0.

Note: It is possible to have all limiters switched off.

43.6.2.1 Edge Setup Linear Case

(1) Mathematical background

To setup a linear edge, consider the line equation in the classical form:
This can be written as:

$$y = \tilde{a}x + \tilde{b}$$

This can be rewritten as:

$$0 = f(x, y) = \tilde{a}x - y + \tilde{b} = ax + by + c$$

with $a = \tilde{a}, b = -1, c = \tilde{b}$

This is a more general form. Consider a vector form of this equation:

$$\vec{p} = \begin{pmatrix} x \\ y \end{pmatrix}, \vec{n} = \begin{pmatrix} a \\ b \end{pmatrix} \Rightarrow f(x, y) = ax + by + c = \vec{p} \cdot \vec{n} + c$$

If a point $\vec{p}_0$ is on the line:

$$0 = f(x, y) = \vec{p}_0 \cdot \vec{n} + c \Rightarrow c = -\vec{p}_0 \cdot \vec{n}$$

Rewriting the constant, the equation becomes:

$$c = -\vec{p}_0 \cdot \vec{n} \Rightarrow f(x, y) = (\vec{p} - \vec{p}_0) \cdot \vec{n}$$

The vector $\vec{n}$ is called the normal vector and is perpendicular to the line. The setup can be seen in Figure 43.7.

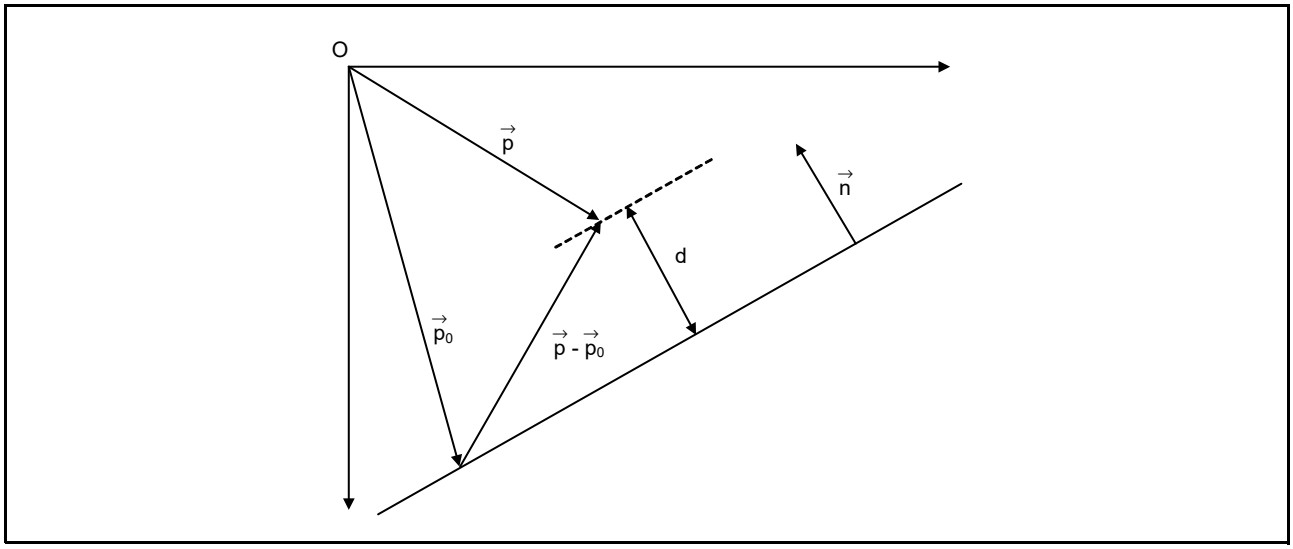

Figure 43.7 Distance of a point to a line

The projection of $\vec{p} - \vec{p}_0$ to $\vec{n}$ is the distance d of the point P to the line. In this case, f (x, y) describes the distance to the line of the pixel with coordinates (x, y).
To calculate the distance of every pixel of the bounding box incrementally, first the distance to the line at origin must be calculated:

$$f(0, 0) = -\vec{p}_0 \cdot \vec{n} = c$$

Next the increments for a step in the x direction and a step in the y direction must be calculated:

$$f(\vec{p} + \vec{e}_x) = (\vec{p} + \vec{e}_x - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_x \cdot \vec{n} = f(\vec{p}) + a$$

$$f(\vec{p} + \vec{e}_y) = (\vec{p} + \vec{e}_y - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_y \cdot \vec{n} = f(\vec{p}) + b$$

with $\vec{e}_x = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \vec{e}_y = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

Consequently, the new distance can be calculated from the old distance with the increments a and b. A step in the x direction changes the distance by a, and a step in the y direction changes the distance by b. The distance of the origin to

the line is c.
With this information, the entire bounding box can be scanned. If the bounding box top left corner is not at the origin, an offset must be added.

(2) Limiter operation

The 2D Drawing Engine contains six limiters. Each limiter contains three registers:

- LnSTART
- LnXADD
- LnYADD.

See Figure 43.8 for details. The limiters can be used in threshold mode, in which all values above 0.5 are set to 1 and all values below or equal to 0.5 are set to 0.
This feature is used when anti-aliasing is not wanted.

Note: In Figure 43.8, the following abbreviations are used:
start = LnSTART
xadd = LnXADD
yadd = LnYADD

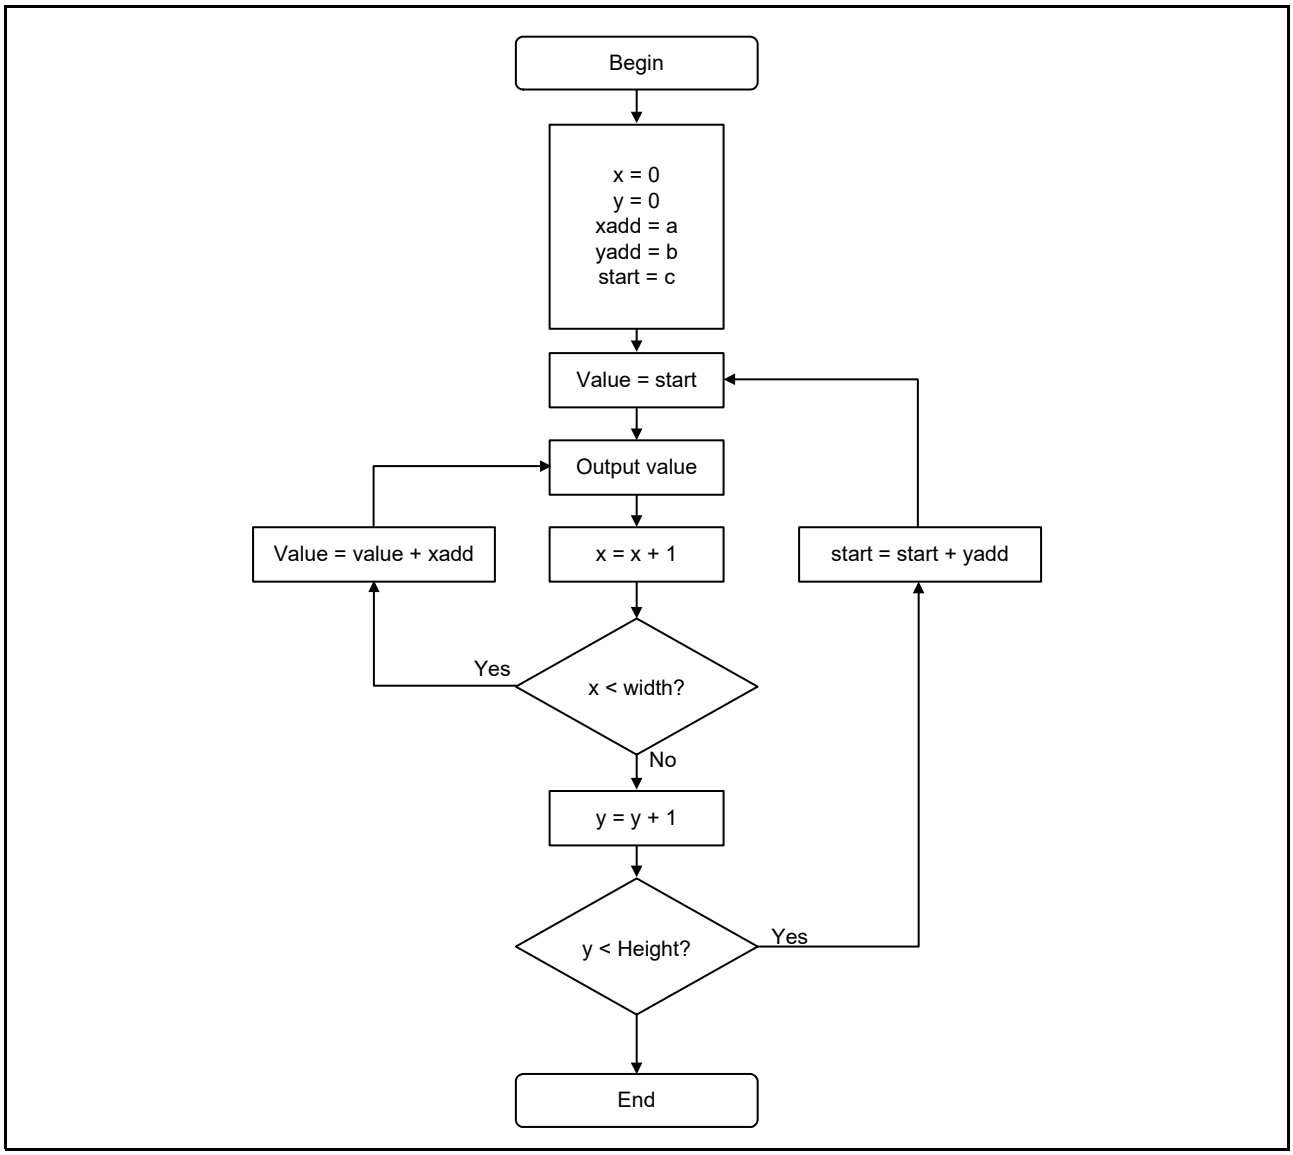

Figure 43.8 Operation flow of the linear limiter

(3) Example

If a straight line is given by the points P0 and P1, then the values are calculated as follows:

$$\Delta\vec{p} = \vec{p}_1 - \vec{p}_0 = \begin{pmatrix} x_1 - x_0 \\ y_1 - y_0 \end{pmatrix} = \begin{pmatrix} \Delta x \\ \Delta y \end{pmatrix}$$

The normal vector (perpendicular but not unit size) is then:

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix}$$

The not normalized distance between edge and origin is then:

$$\vec{p}_0 \cdot \vec{n} = -x_0\Delta y + y_0\Delta x$$

The limiter parameters would be:

$$\begin{aligned} start &= -x_0\Delta y + y_0\Delta x \\ xadd &= -\Delta y \\ yadd &= \Delta x \end{aligned}$$

In the normalized case, the normal vector is:

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix} / (\sqrt{\Delta x^2 + \Delta y^2})$$

The distance between edge and origin is:

$$\vec{p}_0 \cdot \vec{n} = (-x_0 \cdot \Delta y + y_0 \cdot \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$$

The limiter parameters would be:

$$start = (-x_0\Delta y + y_0\Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$$

$$xadd = -\Delta y / (\sqrt{\Delta x^2 + \Delta y^2})$$

$$yadd = \Delta x / (\sqrt{\Delta x^2 + \Delta y^2})$$

Normalization is only required if anti-aliasing is used. The driver contains an optimized inverse square root function to speed up the normalization process.

43.6.2.2 Edge Setup Quadratic Case

(1) Mathematical background

It is also possible to set up the limiters to incrementally calculate the following equation:

$$f(x, y) = ax^2 + by^2 + cx + dy + f$$

At the origin, the value is:

$$f(0, 0) = f$$

The step in the x direction is:

$$f(x + 1, y)$$
$$= a(x + 1)^2 + by^2 + c(x + 1) + dy + f$$
$$= ax^2 + 2ax + a + by^2 + cx + c + dy + f$$
$$= f(x, y) + 2ax + c + a$$
$$dx(x) = f(x + 1, y) - f(x, y) = 2ax + c + a$$

The step in the y direction is:

$$f(x, y + 1)$$
$$= ax^2 + b(y + 1)^2 + cx + d(y + 1) + f$$
$$= ax^2 + by^2 + 2by + b + cx + d(y + 1) + f$$
$$= f(x, y) + 2by + d + b$$
$$dy(y) = f(x, y + 1) - f(x, y) = 2by + d + b$$

In the quadratic case, the increments dx and dy depend on x and y and are not constant. They can be calculated incrementally:

$$d^2x = dx(x + 1) - dx(x) = 2a(x + 1) + c + 1 - (2ax + c + 1) = 2a$$
$$d^2y = dy(y + 1) - dy(y) = 2b(y + 1) + d + 1 - (2by + d + 1) = 2b$$

At the origin, the increments are:

$$dx(0) = c + 1 \text{ and } dy(0) = d + 1$$

By incrementing the value by dx and dy for every step in the x and y direction and incrementing dx, dy by d^2x, and d^2y for every step in the x and y direction, the quadratic equation can be easily calculated for the whole bounding box.

(2) Limiter operation

In the quadratic case, two linear limiters are combined to operate as one quadratic limiter, called limiter 1 and limiter 2. The registers are:

- L1START, L1XADD, L1YADD
- L2START, L2XADD, L2YADD.

See Figure 43.9 for details. The gray box is an addition that performs a different operation, as in the linear setup.
The limiters can be used in threshold mode, in which all values above 0.5 are set to 1 and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted.

Note: In Figure 43.9, the following abbreviations are used:

- start1 = L1START, start2 = L2START
- xadd1 = L1XADD, xadd2 = L2XADD
- yadd1 = L1YADD, yadd2 = L2YADD.

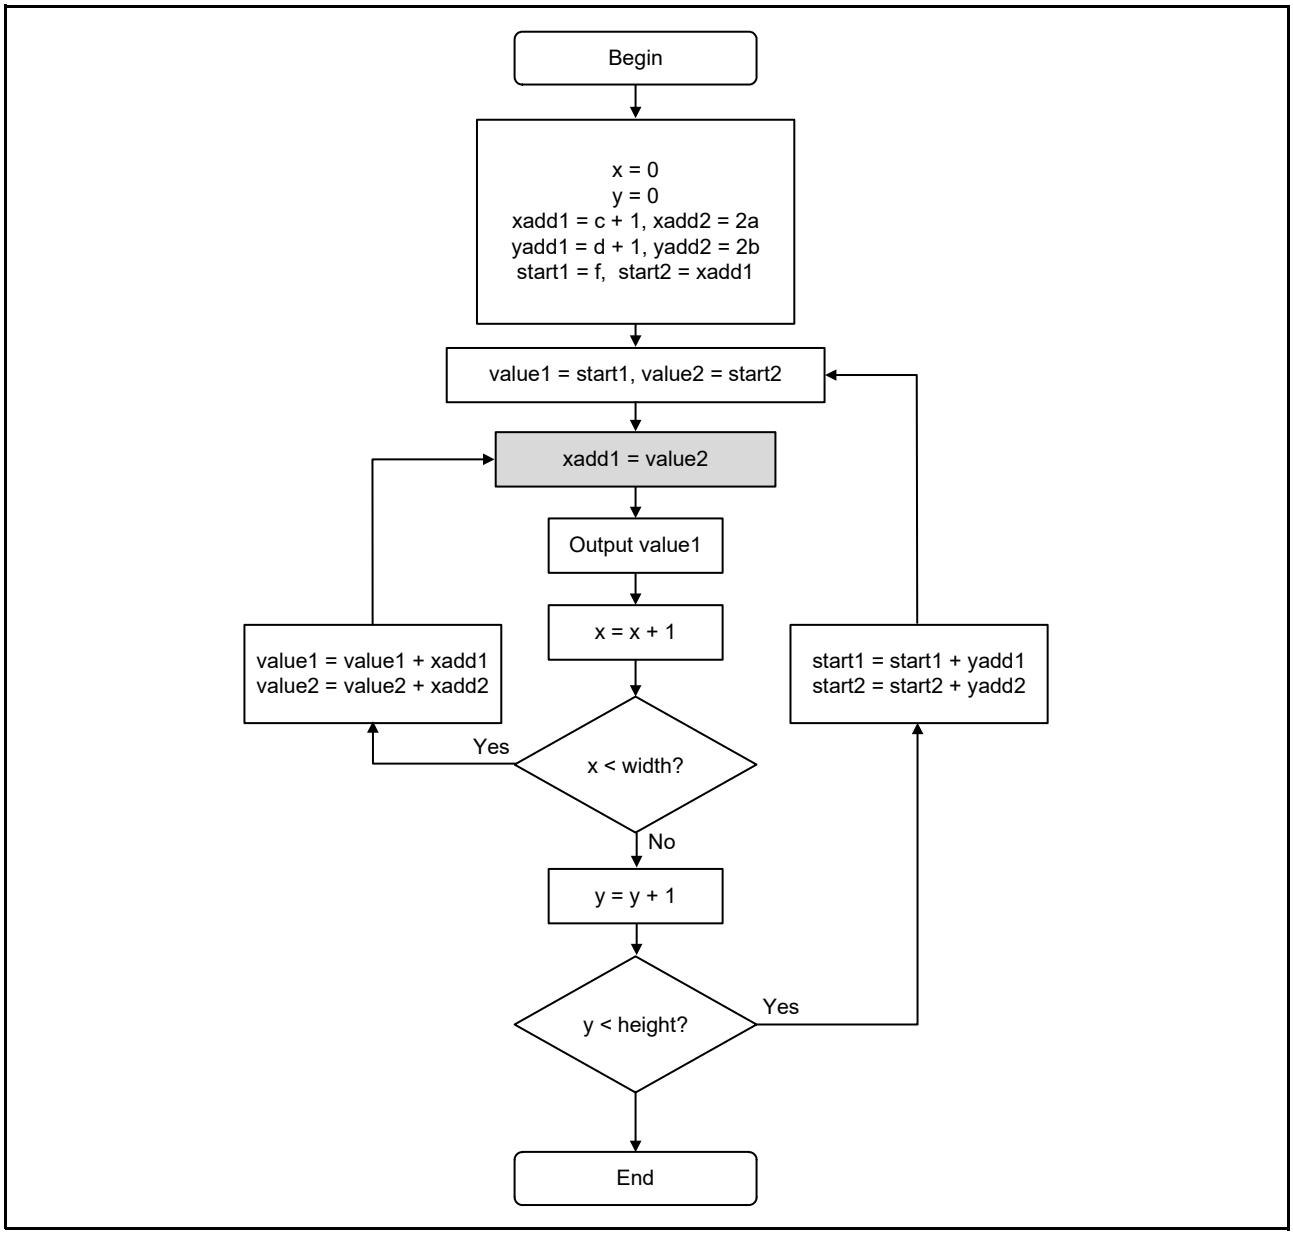

Figure 43.9 Operation flow of the quadratic limiter

(3) Example

Consider the equation for a circle with the center at $\vec{c} = \begin{pmatrix} s \\ t \end{pmatrix}$ and radius r:

$$0 = f(x, y) = (x - s)^2 + (y - t)^2 - r^2$$

This equation can be rewritten as:

$$f(x, y) = x^2 - 2xs + s^2 + y^2 - 2yt + t^2 - r^2$$

This can be sorted to fit to the original equation:

$$f(x, y) = x^2 + y^2 - 2sx - 2ty + (s^2 + t^2 - r^2)$$

With the following assignments, the circle equation can be calculated incrementally:

$$a = 1$$
$$b = 1$$
$$c = -2s$$
$$d = -2t$$
$$f = s^2 + t^2 - r^2$$

For the limiters with the results calculated in (1), Mathematical background, this would result in:

$$start1 = f = s^2 + t^2 - r^2$$
$$xadd1 = c + 1 = -2s + 1$$
$$yadd1 = d + 1 = -2t + 1$$
$$start2 = xadd1$$
$$xadd2 = 2a = 2$$
$$yadd2 = 2b = 2$$

43.6.2.3 Band Filter

The output of limiters 1 and 2 can be modified through a band filter. The band filter has a single filter parameter w.

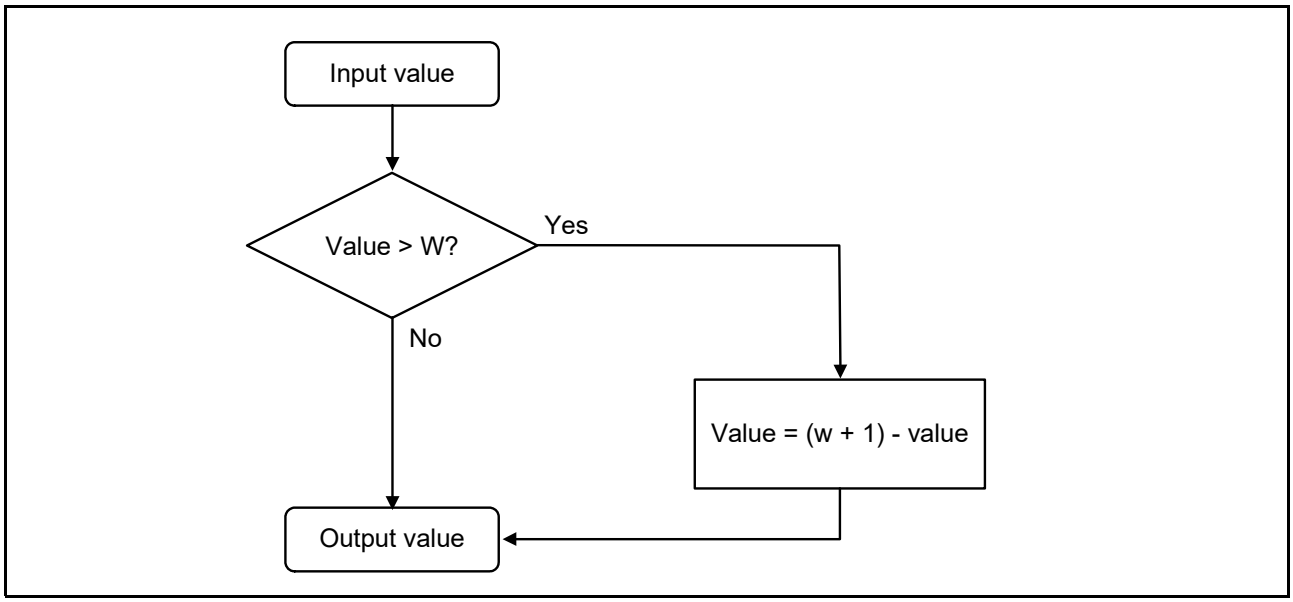

Figure 43.10 Band filter

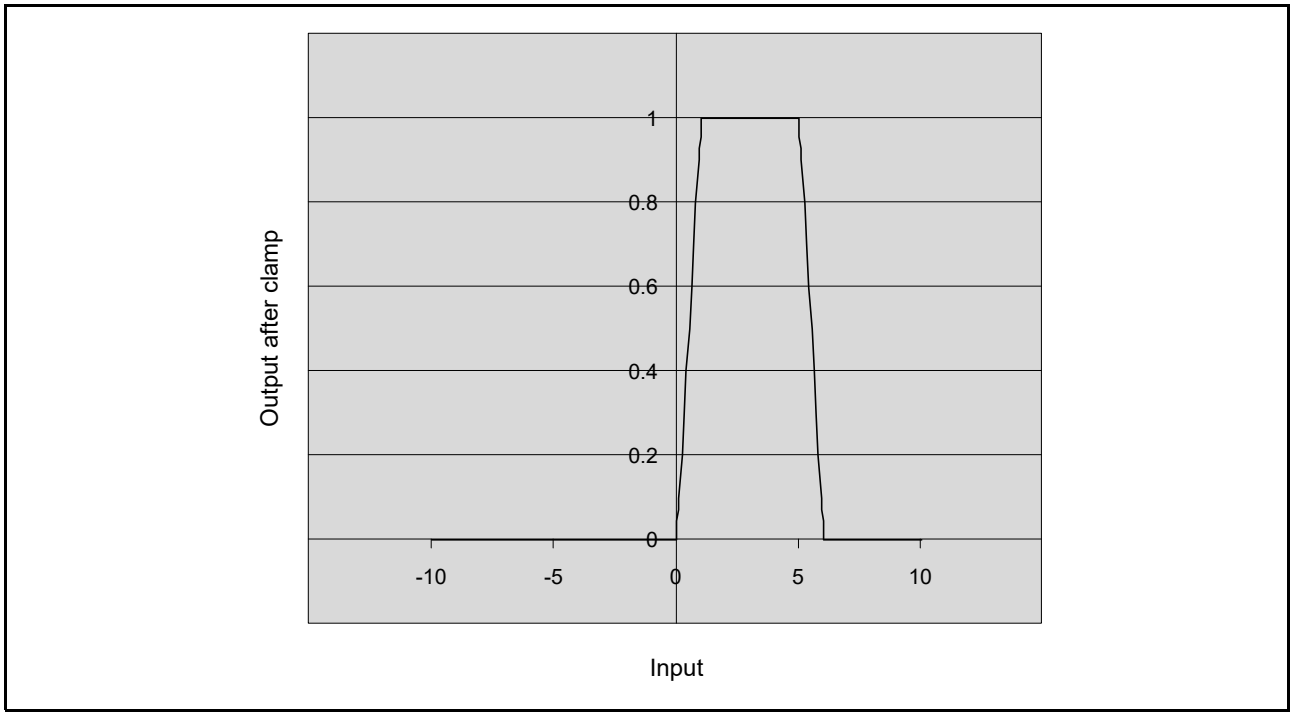

Figure 43.11 Band filter output after clamp with w = 7

43.6.2.4 Clamping Unit

The clamping unit cuts the limiter output to the interval [0:1].

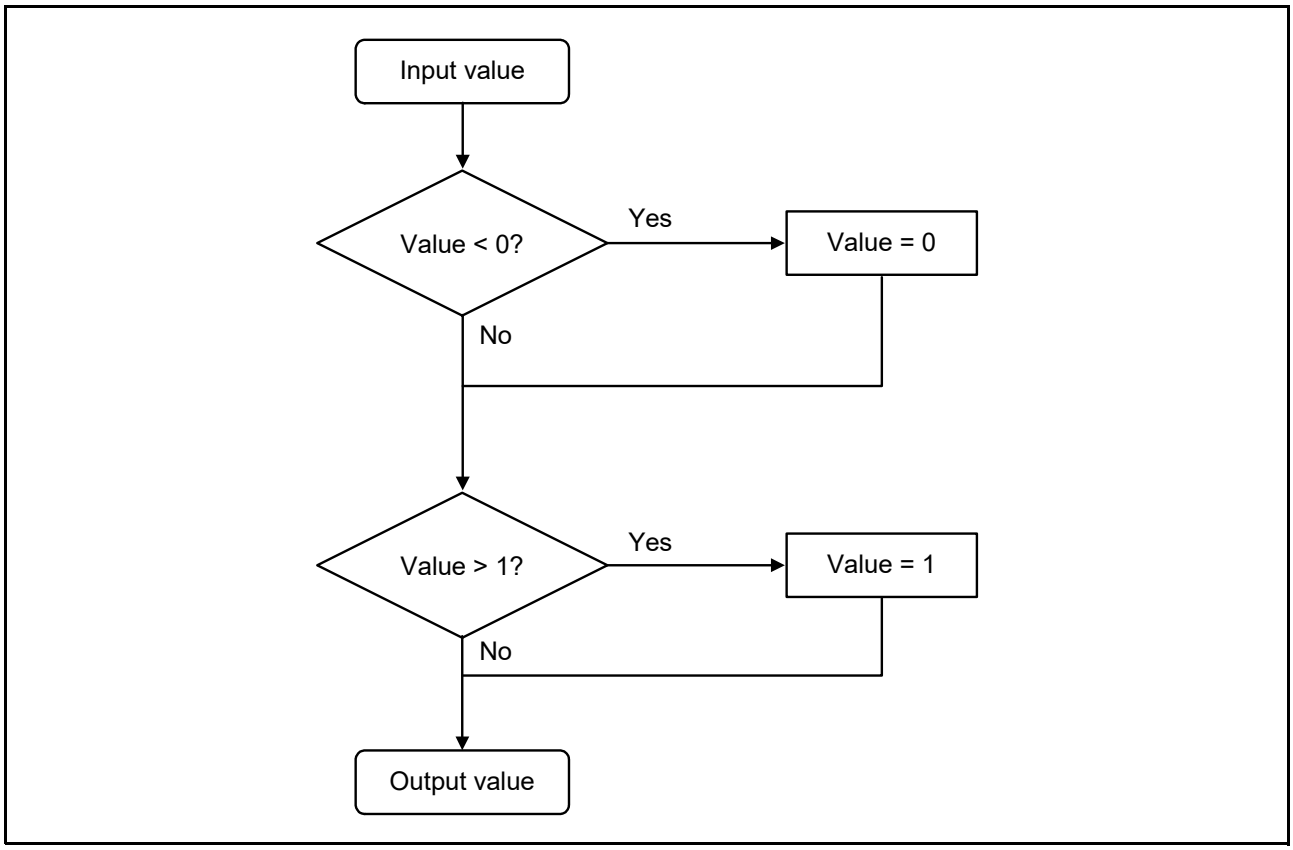

Figure 43.12 Clamping unit

The clamping unit can be put into threshold mode, in which all values greater than 0.5 are set to 1, and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted, such as for shared edges.

43.6.2.5 Combiner Unit

The combiner unit can be operated in minimum mode and in maximum mode. In minimum mode the smaller value is output, and in maximum mode the larger value is output. The minimum mode represents the intersection, and the maximum mode represents the union of the two regions.

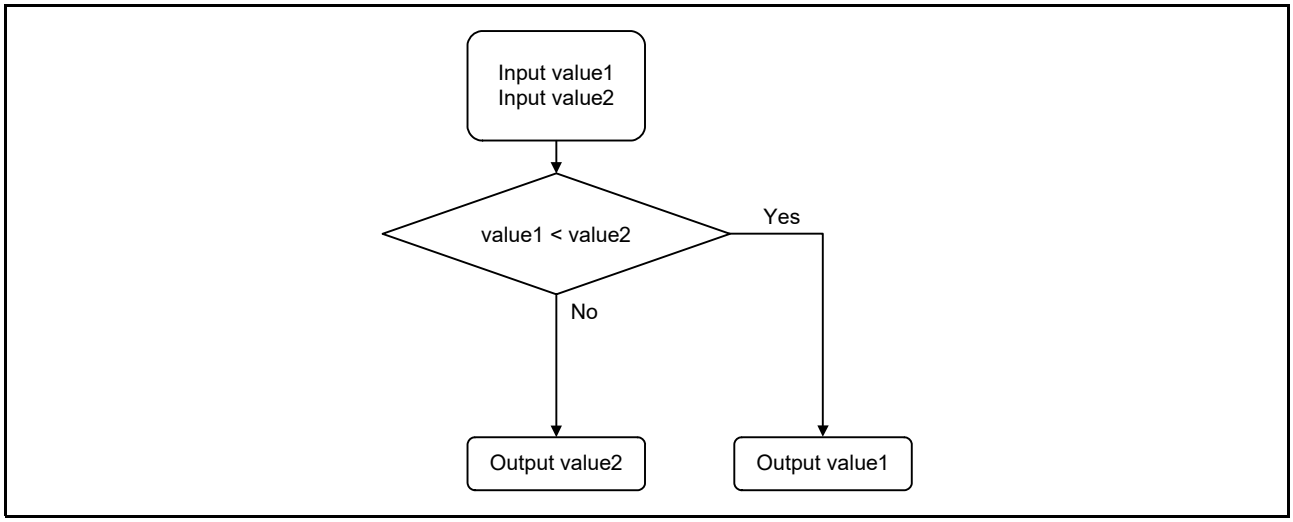

Figure 43.13 Combiner operated in minimum mode with intersection

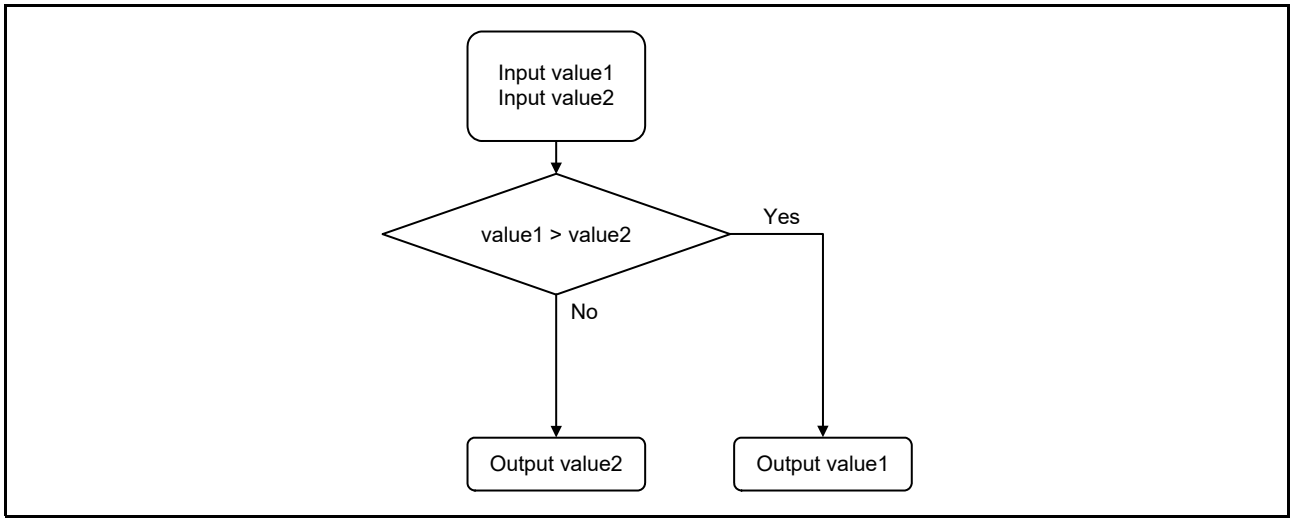

Figure 43.14 Combiner operated in maximum mode with union

43.6.2.6 Rasterization Optimization

During rasterization, it is necessary to step through the whole bounding box one pixel at a time. This requirement can lead to an unnecessary number of steps for pixels that are not drawn. The 2D Drawing Engine provides optimization methods designed to reduce the number of steps required during rasterization. One optimization relies on the fact that any convex primitive can have only one span per line (a span is a contiguous horizontal line). This form of optimization detects a span start and saves the information for the next line. Another optimization is to detect a span end and stop rasterization for the current line.

(1) Spanstore

Consider the case in Figure 43.15.

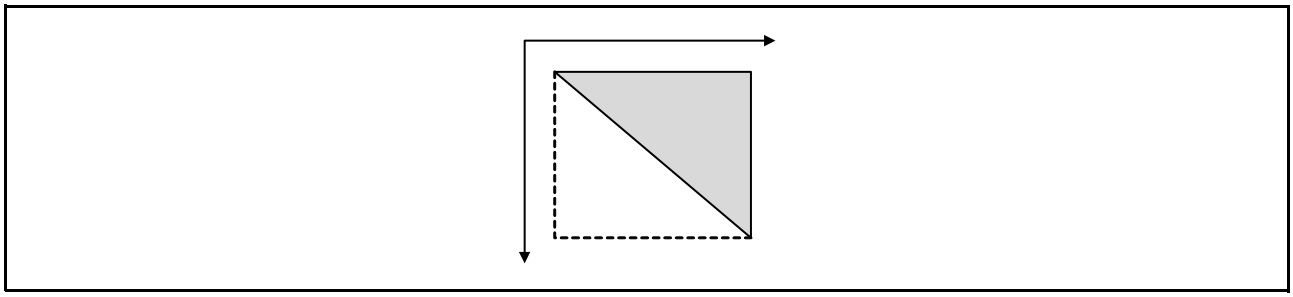

Figure 43.15 Triangle where the first edge is monotone growing

If the gray triangle must be rendered, half of the pixels processed by the rendering engine in the dotted bounding box would not be drawn. This situation can be optimized with the spanstore operation. When this operation is activated and a span start is detected, the x position of the start is detected.
In the next line the rendering starts with the stored x position. This only works if the edge is monotonically increasing ($y_1 > y_2 \Rightarrow x_1 \geq x_2$).
Consider the case in Figure 43.16.

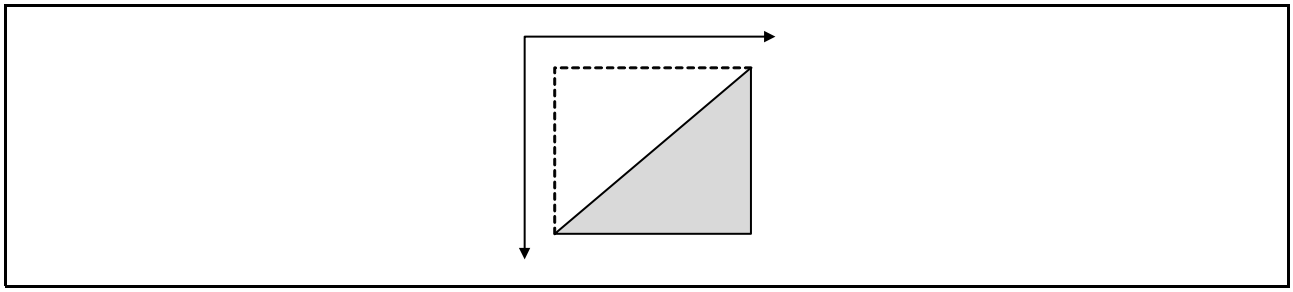

Figure 43.16 Triangle where the first edge is monotone falling

In this case, the normal spanstore operation cannot be performed. For this, the y direction of the rendering is reversed, and spanstore can operate again.

Consider the last case in Figure 43.17.

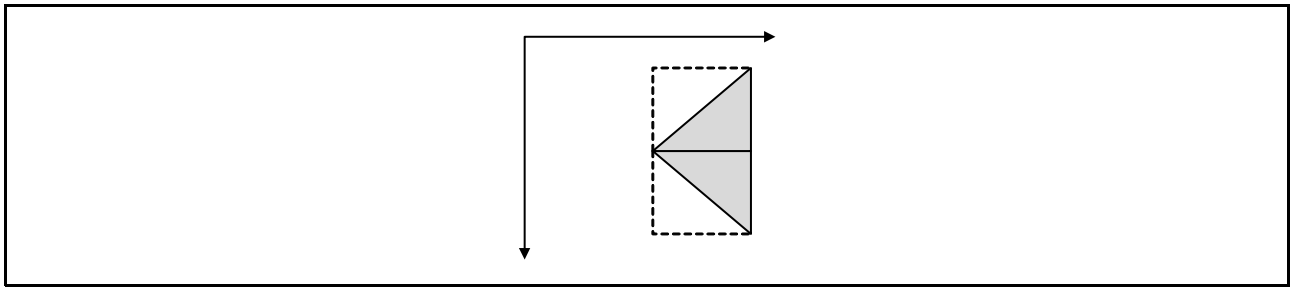

Figure 43.17 Triangle where the first edge is first monotone falling and then monotone growing

In this case, the triangle must be split and rendered as two parts for the spanstore optimization to work.
It is also possible to delay spanstore activation for a number of lines. This approach is used for rasterizing circles, as shown in Figure 43.18.

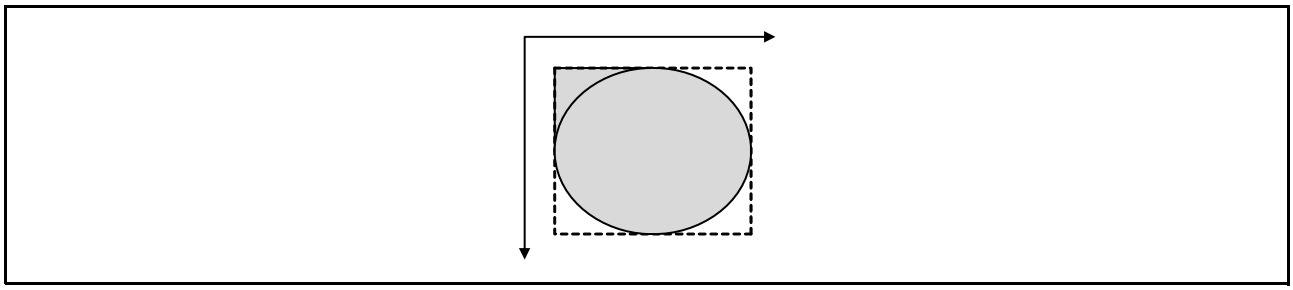

Figure 43.18 Full circle where the first edge is monotone falling for the first half and monotone growing for the second half

In this case, spanstore cannot be activated in the top left corner but can be activated in the bottom left corner. The empty corners in the top right and the bottom right cannot be rasterized because of the spanabort optimization.

(2) Spanabort

The second optimization assumes that the object that must be drawn is convex, which means there is only one span per scan line to be drawn. A non-convex object includes an object such as a triangle that is not filled and only consists of a thick border.
For a convex object, the rasterization can be stopped when the end of the first span is detected. No other constraints apply to this optimization for convex objects.

(3) Optimization efficiency

The efficiency of the optimizations can be seen for a typical case in Figure 43.19. In this case, a triangle is always rendered as a single piece and is not separated into multiple triangles for higher optimizations. For this, the spanstore delay is used.

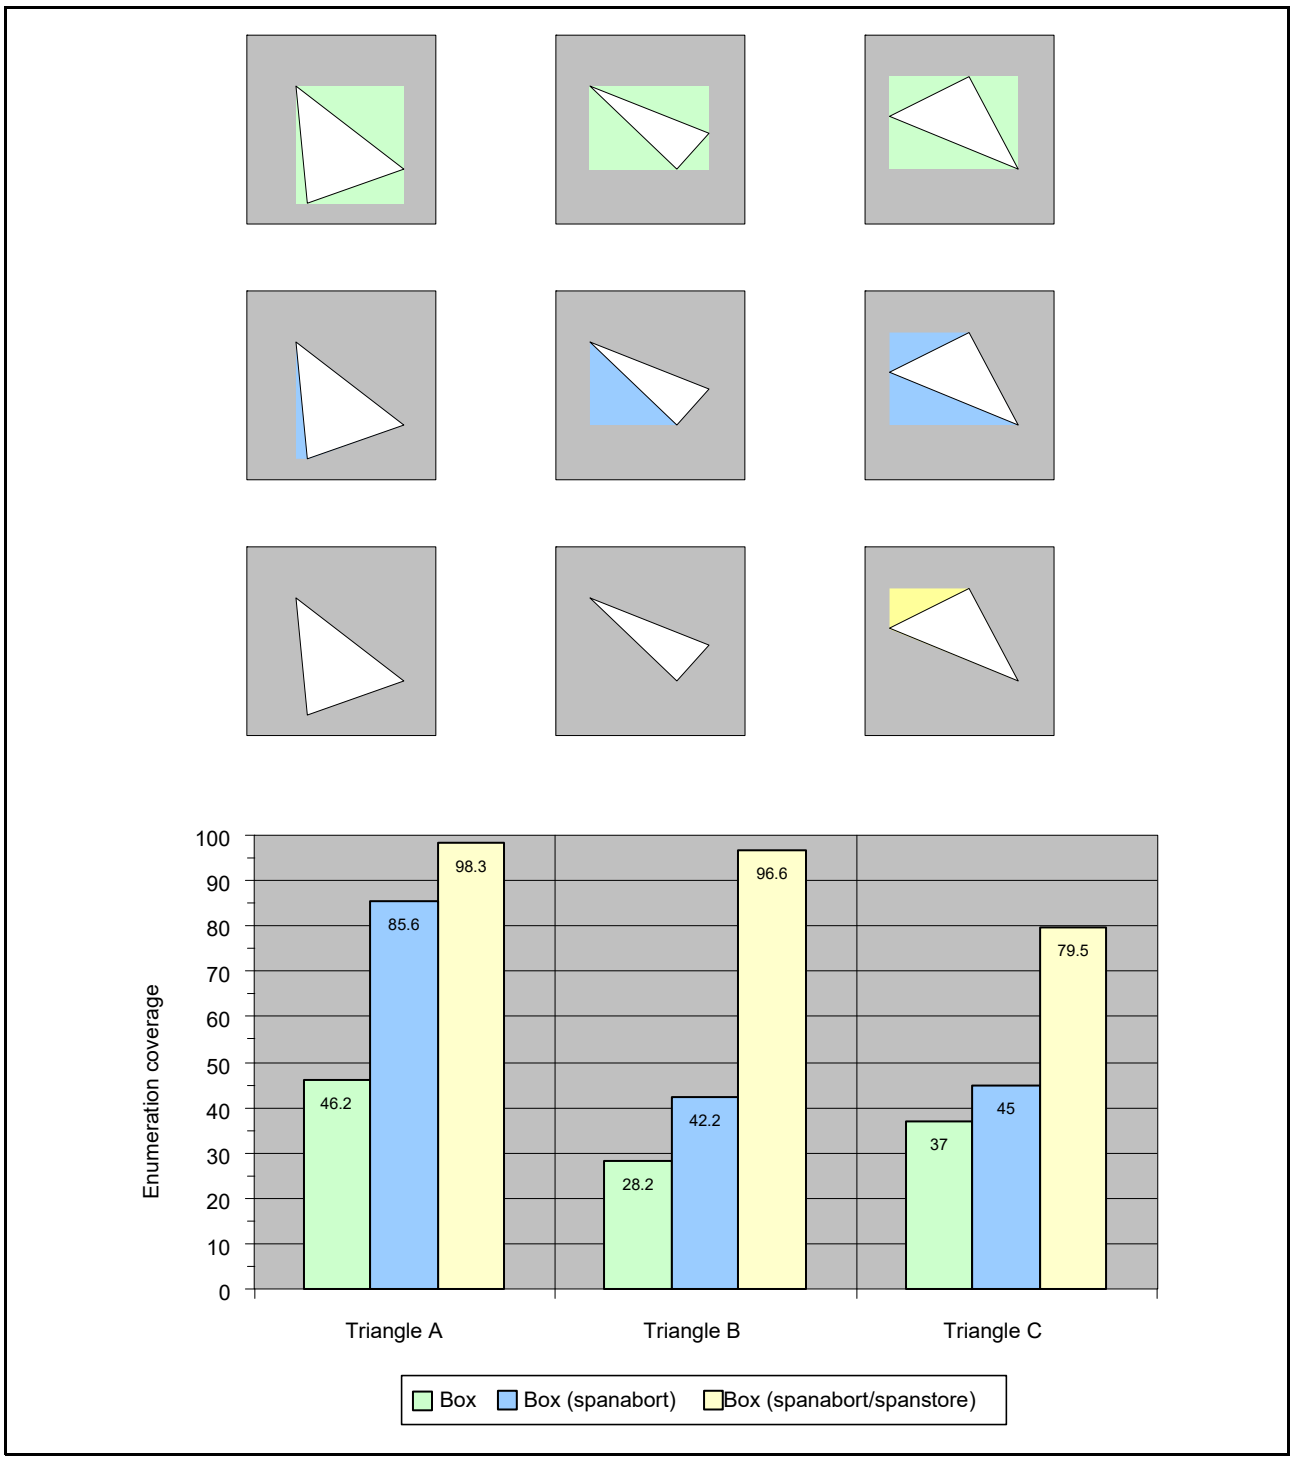

Figure 43.19 Efficiency of spanstore and spanabort optimizations with enumeration coverage equal to {pixels of primitive/pixels of bounding box}

43.6.3 Texturing

The texture unit can cover any primitive with a picture. The picture can be stretched, sheared, rotated, and translated in one step. To avoid aliasing, the result can be filtered bilinear in the u and v directions.

43.6.3.1 Mathematical Background

The arbitrary mapping problem is completely determined by a mapping from 3 points in the object space (x, y) to 3 points in the texture space (u, v).
Consider the following mapping:

$$\vec{p}_0 = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\vec{p}_1 = \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix}$$

$$\vec{p}_2 = \begin{pmatrix} x_2 \\ y_2 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}$$

where w is the width of the texture and h is the height of the texture.
Examine Figure 43.20 in the object space. To simplify calculations the difference vectors are taken as calculations:

$$\vec{d}_1 = \vec{p}_1 - \vec{p}_0$$
$$\vec{d}_2 = \vec{p}_2 - \vec{p}_0$$

This is equivalent to transforming from coordinate system O to coordinate system O'.

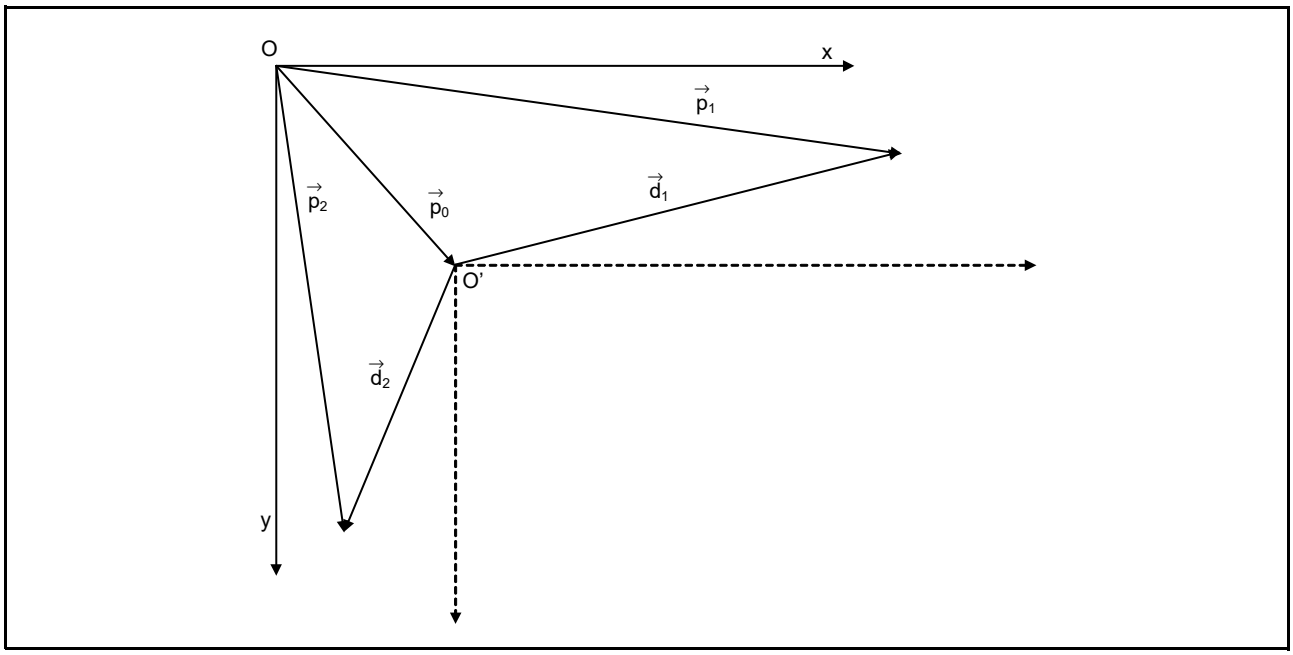

Figure 43.20 Texture mapping, object space, and transformation from coordinate system O to O' to simplify calculations

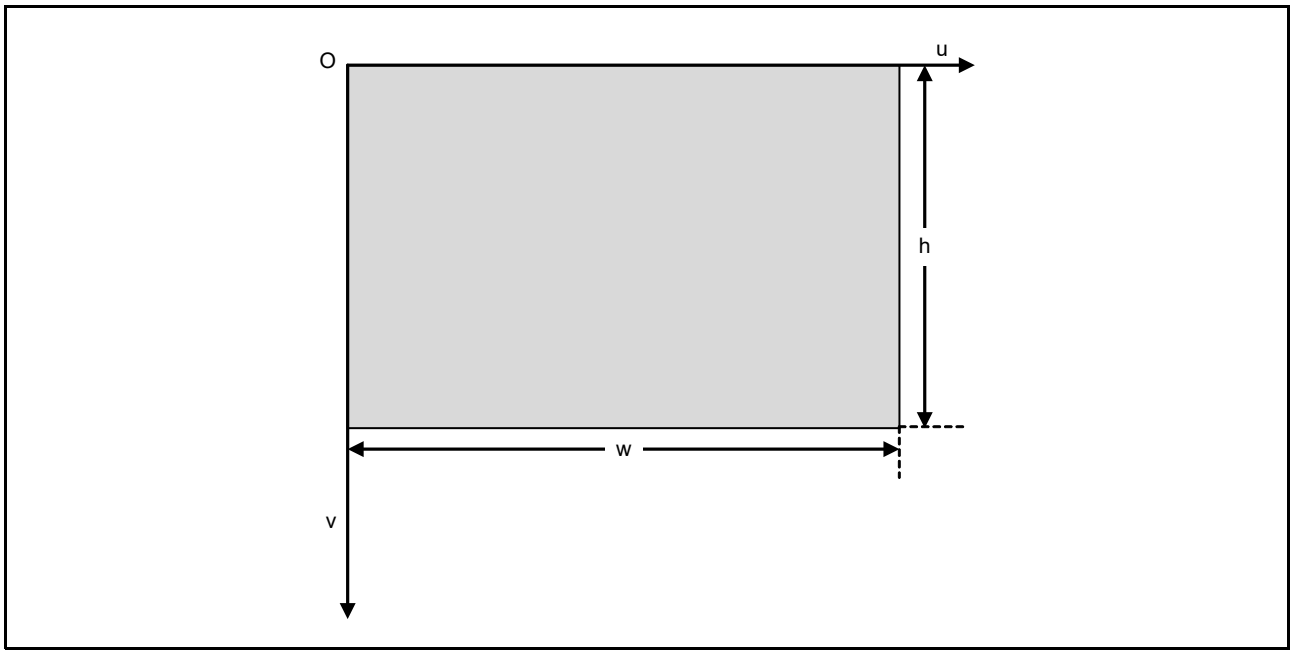

Figure 43.21 Texture mapping, texture space, and texture with width w and height h

In O', the mapping is:

$$\vec{p}'_0 = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\vec{d}_1 = \begin{pmatrix} dx_1 \\ dy_1 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix}$$

$$\vec{d}_2 = \begin{pmatrix} dx_2 \\ dy_2 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}$$

This is a linear mapping that can be described by a 2 x 2 matrix.

$$(\tilde{\vec{p}}) = M \cdot \vec{p}' = \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \cdot \vec{p}'$$

$$\Rightarrow \begin{pmatrix} w \\ 0 \end{pmatrix} = M \cdot \vec{d}_1 \wedge \begin{pmatrix} 0 \\ h \end{pmatrix} = M \cdot \vec{d}_2$$

If the equations are expanded and sorted, the result is two equation systems each with two unknowns. These can be described more easily with a new matrix.

Let $A = \begin{bmatrix} dx_1 & dy_1 \\ dx_2 & dy_2 \end{bmatrix}$ then the equation system can be rewritten as:

$$\begin{pmatrix} w \\ 0 \end{pmatrix} = A \cdot \begin{pmatrix} m_{11} \\ m_{12} \end{pmatrix} \wedge \begin{pmatrix} 0 \\ h \end{pmatrix} = A \cdot \begin{pmatrix} m_{21} \\ m_{22} \end{pmatrix}$$

This can be easily solved with determinants.

$$\text{Let } c = \frac{1}{\det A} = \frac{1}{dx_1 \cdot dy_2 - dx_2 \cdot dy_1}$$

The resulting constants are:

$$m_{11} = c \cdot w \cdot dy_2 = \frac{du}{dx}$$
$$m_{12} = -c \cdot w \cdot dx_2 = \frac{du}{dy}$$
$$m_{21} = c \cdot h \cdot dx_1 = \frac{dv}{dx}$$
$$m_{22} = -c \cdot h \cdot dx_2 = \frac{dv}{dy}$$

To calculate the start values for u and v at the top of the bounding box, the transformation from O' to O must be reversed. Let us and vs be the start values, then:

$$\begin{pmatrix} u_s \\ v_s \end{pmatrix} = M \cdot (-\vec{p}_0) = c \cdot \begin{pmatrix} -w \cdot (x_0 \cdot dy_2 - y_0 \cdot dx_2) \\ h \cdot (x_0 \cdot dy_1 - y_0 \cdot dx_1) \end{pmatrix}$$

Examples

U and v are in the texture space. Enter the following into any case:

- Copy case:
  dx1 = 1, dx2 = 0, dy1 = 0, dy2 = 1
- Scaling case x scaling copy case:
  dx1 = f, dx2 = 0, dy1 = 0, dy2 = 1
  with f being the scaling factor in the x direction similar for the y direction
- Rotation case:
  dx1 = cosa, dx2 = -sina, dy1 = sina, dy2 = cosa
  with the angle between d1 and the x axis in the clockwise direction.

43.6.3.2 Limiter Operation

The texture limiters operate exactly in the same way as the linear limiters shown in Figure 43.8.
The register layout for the u limiter is the same:

- LUSTART = us
- LUXADD = du/dx
- LUYADD = du/dy.

The register layout for the v limiter is slightly different. TEXPITCH is multiplied to save one hardware multiplier.

- LVSTARTI = floor (vs) • TEXPITCH
  Contains the integer part of the start value.
- LVSTARTF = (vs-floor (vs)) • TEXPITCH
  Contains the fractional part of the start value.
- LVXADDI = floor (dv/dx) • TEXPITCH
  Contains the integer part of dv/dx.
- LVYADD = floor (dv/dy) • TEXPITCH
  Contains the integer part of dv/dy.
- LVYXADDF.LVXADDF = (dv/dx - floor (dv/dx)) • TEXPITCH
  Contains the fractional part of dv/dx
- LVYXADDF.LVYADDF = (dv/dy - floor (dv/dy)) • TEXPITCH
  Contains the fractional part of dv/dy
- TEXMASK.TEXUMASK, TEXMASK.TEXVMASK
  Contains a mask for u and v separately to wraparound values of u and v. This is useful for staying inside the limits of the texture or repeat a texture. Wrap around textures have to have a size multiple of 2.
- TEXPITCH
  Contains the width of the texture in pixels in framebuffer memory. This information is required to calculate the new address if stepping to a new line.
- TEXORIGIN.
  Contains the base address of the texture.

43.6.4 Colorization

After a pixel is found to be part of the geometry, its color is calculated. The 2D Drawing Engine supports a very general color calculation scheme, allowing support for several color modes. This color scheme uses an interpolation between two color registers, COLOR1 and COLOR2. See Figure 43.22 for details. COLOR1 and COLOR2 are marked as A, B in the figure for clarity.

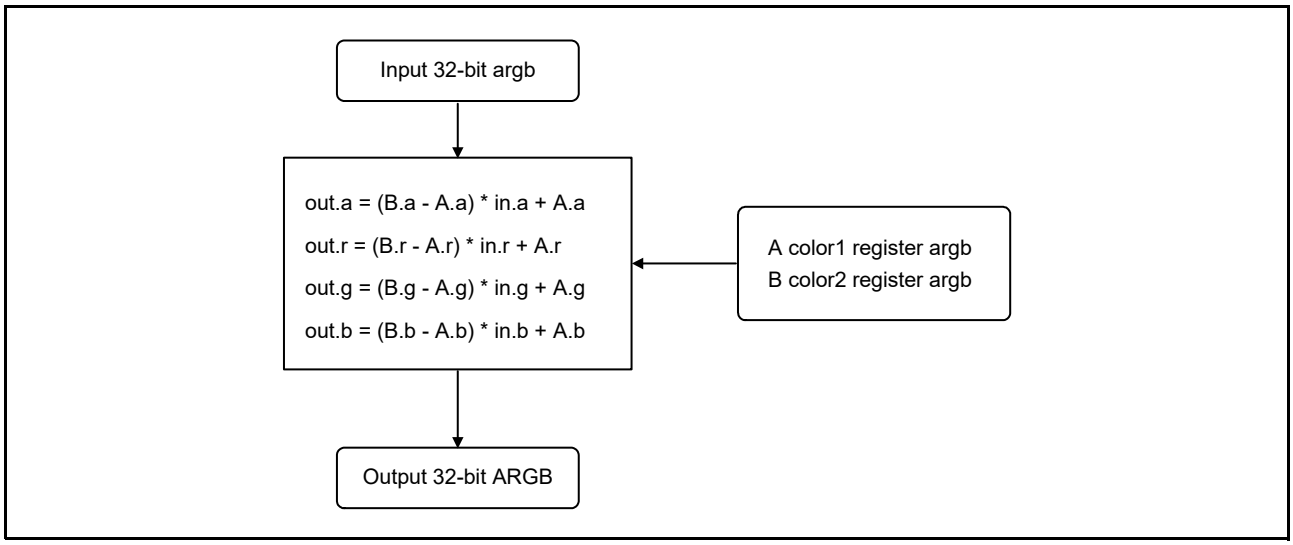

Figure 43.22 Colorization step and interpolation between the two color registers, A (COLOR1) and B (COLOR2)

This general approach can be used to support several different color modes that can be individually applied to any color or alpha channel of the input.

Table 43.7 Colorization operations

Operation	Settings for A and B *1
Copy	A = 0, B = ffh
Replace with a constant value v	A = v, B = v
Multiply by a constant value v	A = 0, B = v
Colorize an alpha texture with the RGB value v	A.a = 0, A.r = B.r, A.g = B.g, A.b = B.b, B.a = ffh, B.r = v.r, B.g = v.g, B.b = v.b
Invert a channel	A = ffh, B = 0
Invert multiply with v	A = v, B = 0
Interpolate between color v and color u	A = v, B = u

Note 1. A = COLOR1, B = COLOR2

43.6.5 Blending

43.6.5.1 Color Channel Blending

The last step before the pixel is written to the framebuffer is to blend the pixel with the data that is already written to the framebuffer. If blending is activated, the framebuffer, referred to as DST, must be read. SRC is the output from the colorization unit.

The following color blend modes are supported:

- SRC_ZERO
- SRC_ONE
- SRC_ALPHA
- SRC_ONE_MINUS_ALPHA
- DST_ZERO
- DST_ONE
- DST_ALPHA
- DST_ONE_MINUS_ALPHA.

The selection of the color channel blend modes is performed with the following flags:

- BSF: blend source factor is alpha
- BSI: blend source factor invert
- BDF: blend destination factor is alpha
- BDI: blend destination factor invert.

The formula for the blending is:
$dst = src \cdot f_S + dst \cdot f_D$
where:
BSF = 0, BSI = 0 $\Rightarrow f_S = 1$
BSF = 1, BSI = 0 $\Rightarrow f_S = \alpha$
BSF = 0, BSI = 1 $\Rightarrow f_S = 0$
BSF = 1, BSI = 1 $\Rightarrow f_S = 1 - \alpha$
BDF = 0, BDI = 0 $\Rightarrow f_D = 1$
BDF = 1, BDI = 0 $\Rightarrow f_D = \alpha$
BDF = 0, BDI = 1 $\Rightarrow f_D = 0$
BDF = 1, BDI = 1 $\Rightarrow f_D = 1 - \alpha$.

Table 43.8 lists all possible color channel blend modes.

Table 43.8 Color channel blend modes

Mode	BSF	BSI	BDF	BDI	Blend equation
SRC_ONE DST_ONE	0	0	0	0	SRC + DST
SRC_ONE	0	0	0	1	SRC
SRC_ONE DST_ALPHA	0	0	1	0	SRC + DST × ALPHA
SRC_ONE DST_ONE_MINUS_ALPHA	0	0	1	1	SRC + DST × (1 – ALPHA)
SRC_ZERO DST_ONE	0	1	0	0	DST
SRC_ZERO DST_ZERO	0	1	0	1	0
SRC_ZERO DST_ALPHA	0	1	1	0	DST × ALPHA
SRC_ZERO DST_ONE_MINUS_ALPHA	0	1	1	1	DST × (1 - ALPHA)
SRC_ALPHA DST_ONE	1	0	0	0	SRC × ALPHA + DST
SRC_ALPHA	1	0	0	1	SRC × ALPHA
SRC_ALPHA DST_ALPHA	1	0	1	0	SRC × ALPHA + DST × ALPHA
SRC_ALPHA DST_ONE_MINUS_ALPHA	1	0	1	1	SRC × ALPHA + DST × (1 - ALPHA)
SRC_ONE_MINUS_ALPHA DST_ONE	1	1	0	0	SRC × (1 – ALPHA) + DST
SRC_ONE_MINUS_ALPHA	1	1	0	1	SRC × (1 – ALPHA)
SRC_ONE_MINUS_ALPHA DST_ALPHA	1	1	1	0	SRC × (1 – ALPHA) + DST × ALPHA
SRC_ONE_MINUS_ALPHA DST_ONE_MINUS_ALPHA	1	1	1	1	SRC × (1 – ALPHA) + DST × (1 – ALPHA)

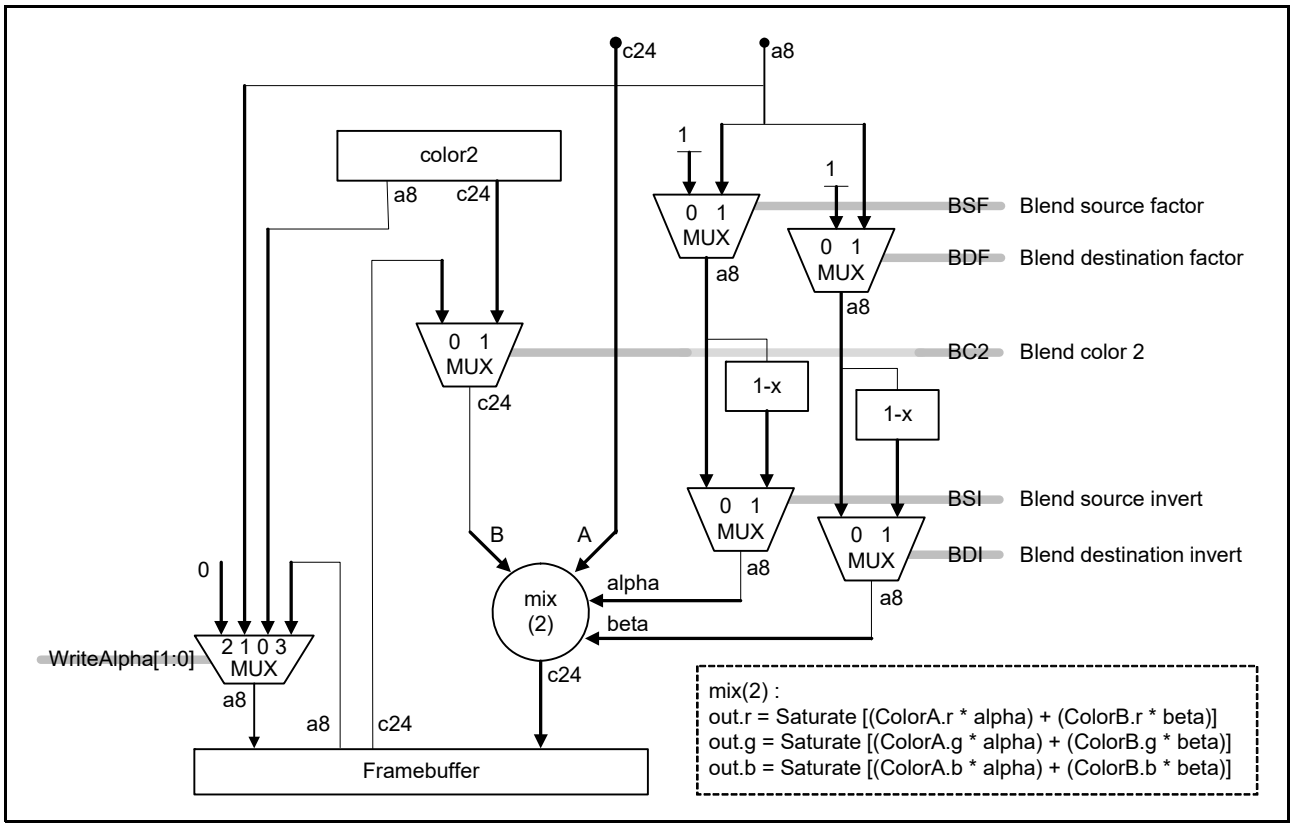

Figure 43.23 Color channel blend unit when CONTROL2.USEACB = 0

43.6.5.2 Alpha Channel Blending

The alpha channel can be blended in addition to the color channels. Alpha channel blending is enabled by setting CONTROL2.USEACB = 1. Alpha channel blending uses the same formulas and same blend modes as for the color channels. The alpha channel formulas can be set independently from the color channels.

The following alpha channel blend modes are supported:

- SRC_A_ZERO
- SRC_A_ONE
- SRC_A_SRC_A
- SRC_A_ONE_MINUS_SRC_A
- DST_A_ZERO
- DST_A_ONE
- DST_A_SRC_A
- DST_A_ONE_MINUS_SRC_A.

The alpha channel blend modes selected with the following flags:

- BSFA: blend source factor is SRC_A
- BSIA: blend source factor invert
- BDFA: blend destination factor is SRC_A
- BDIA: blend destination factor invert.

The formula for the blending is:
$dst\_alpha = src\_a \cdot f_{S\_a} + dst\_a \cdot f_{D\_a}$
where:
BSFA = 0, BSIA = 0 $\Rightarrow f_{S\_a} = 1$
BSFA = 1, BSIA = 0 $\Rightarrow f_{S\_a} = src\_a$
BSFA = 0, BSIA = 1 $\Rightarrow f_{S\_a} = 0$
BSFA = 1, BSIA = 1 $\Rightarrow f_{S\_a} = 1 - src\_a$
BDFA = 0, BDIA = 0 $\Rightarrow f_{D\_a} = 1$
BDFA = 1, BDIA = 0 $\Rightarrow f_{D\_a} = src\_a$
BDFA = 0, BDIA = 1 $\Rightarrow f_{D\_a} = 0$
BDFA = 1, BDIA = 1 $\Rightarrow f_{D\_a} = 1 - src\_a$.

Table 43.9 lists all possible alpha channel blend modes.

Table 43.9 Alpha channel blend modes

Mode	BSF	BSI	BDF	BDI	Blend equation
SRC_A_ONE DST_A_ONE	0	0	0	0	SRC_A + DST_A
SRC_A_ONE	0	0	0	1	SRC_A
SRC_A_ONE DST_A_SRC_A	0	0	1	0	SRC_A + DST_A × SRC_A

SRC_A_SRC_A DST_A_ONE_MINUS_SRC_A	1	0	1	1	SRC_A × SRC_A + DST_A × (1 - SRC_A)
SRC_A_ONE_MINUS_SRC_A DST_A_ONE	1	1	0	0	SRC_A × (1 – SRC_A) + DST_A
SRC_A_ONE_MINUS_SRC_A	1	1	0	1	SRC_A × (1 – SRC_A)
SRC_A_ONE_MINUS_SRC_A DST_A_SRC_A	1	1	1	0	SRC_A × (1 – SRC_A) + DST_A × SRC_A
SRC_A_ONE_MINUS_SRC_A DST_A_ONE_MINUS_SRC_A	1	1	1	1	SRC_A × (1 – SRC_A) + DST_A × (1 – SRC_A)

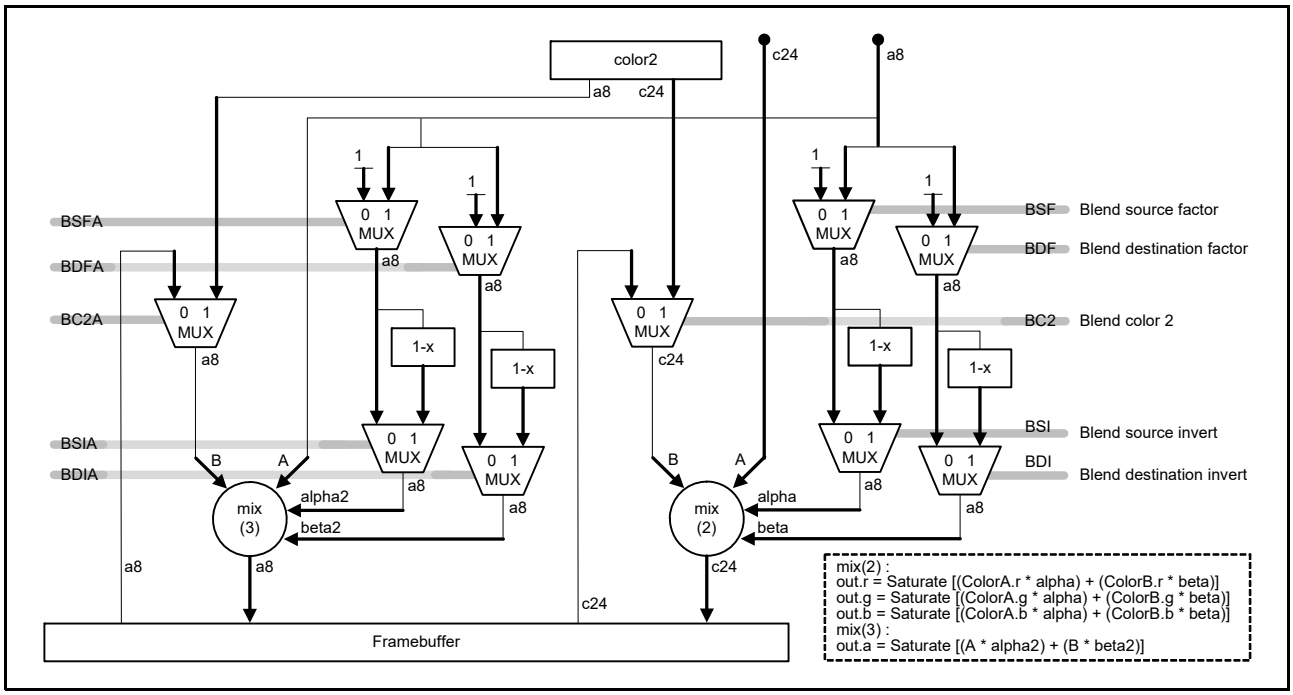

Figure 43.24 Alpha- and color-channel blend unit when CONTROL2.USEACB = 1

43.7 Rendering Modes

The rendering process can be performed in two different modes, register mode and display list mode.

43.7.1 Register Mode

In register mode, when operation is based on register settings, the host CPU configures and initiates each render process separately. To start a new render process, the host CPU must wait until the previous one is completed. In this mode, the host CPU is heavily engaged throughout the entire drawing procedure and is consequently to a large extent unavailable for other tasks.
The host CPU must set up all registers for performing a certain drawing operation before it can start the rendering process. A new register setup can only be started when the previous render process has completed. Before starting a new register setup, make sure that:

- STATUS.DLISTACTIVE = 0: Display list reader is idle
- STATUS.BUSYENUM = 0: Pixel selection unit is idle.

Lastly, write the framebuffer start address to the ORIGIN register. This write triggers the 2D Drawing Engine to start rendering.

43.7.2 Display List Mode

In display list mode, the host CPU creates a display list in memory prior to starting the 2D Drawing Engine. A display list contains a bundle of render operations. When started, the 2D Drawing Engine executes the display list autonomously, and the host CPU is not involved with drawing operations most of the time. Use of a display list allows for fully asynchronous operation of the host CPU and the 2D Drawing Engine and offers the best possible system performance. In this mode, the display list reader reads a memory block containing instructions on how to set the 2D Drawing Engine control registers and executes these control register writes accordingly.

Display list start

To start execution of a display list, which already resides in memory, the start address of the display list is written to the display list start address register DLISTSTART. Because rewriting DLISTSTART also stops any ongoing display list execution, make sure that the previous display list process is completed by either of the following two methods:

- Check that STATUS.DLISTACTIVE = 0, which indicates idle status of the display list reader
- Wait for the display list interrupt DRWDLISTIRQ, which indicates completion of the previous display list process.

Note: Direct writing to 2D Drawing Engine registers while the display list mode is active (STATUS.DLISTACTIVE = 1) might lead to a 2D Drawing Engine hang-up. To prevent this, always check that the display list reader is idle (STATUS.DLISTACTIVE = 0) before writing to any 2D Drawing Engine register.

Display list format

Display lists are stored using direct register-to-value mappings, which means that a display list contains a one-byte index that addresses a certain register and the value to be written to the register. The register index is derived from the address offset of the register address and can be calculated by dividing the address offset by 4. For the index of each register, see Table 43.11.
As the 2D Drawing Engine registers are always 32 bits wide, each data unit (called a data word) to be written to a register is of the same size. An address word that contains the indices of the register to be written is stored in a packed notation with up to four indices stored in one 32-bit address word.
A display list command always starts with an address word, followed by up to four data words, one for each register. The indices are read and interpreted from LSB to MSB, so the register of the low byte index is written first.

Example

In the following example:

- DWORD 201A 1930h // start of list address word
- DWORD 0000 0013h // data word 1 (for register 30h)
- DWORD FFFF FFAAh // data word 2 (for register 19h)
- DWORD 4033 6480h // data word 3 (for register 1Ah)
- DWORD 0001 0000h // data word 4 (for register 20h)
- DWORD... // next address word.

This stream of dwords updates the DRW registers as follows:

- Write 0000 0013h to register 30h = 48, which is IRQCTL
- Write FFFF FFAAh to register 19h = 25, which is COLOR1
- Write 4033 6480h to register 1Ah = 26, which is COLOR2
- Write 0001 0000h to register 20h = 32, which is ORIGIN.

Address word indices

Besides referencing a register, the indices of an address word can also have other meanings, depending on their value.

Table 43.10 Indices function

Index	Function	
00h to 7Fh	Register indices Two register indices trigger additional actions:	
	- 20h = 32:	A write to ORIGIN to set a new frame buffer address is delayed until the ongoing frame buffer write-back is complete, when STATUS.BUSYWRITE = 0.
	- 32h = 50:	A write to DLISTSTART sets a new display list start address stops the current display list and starts the new one.
80h	Gap index, which is used to fill unused bytes of an address word. For example, if fewer than four indices are required, the remaining bytes are filled with 80h. In this case, the number of the subsequent data words must be reduced accordingly.	
FFh	If the first index of an address word contains the special index FFh, the subsequent (second) index is interpreted as follows:	
	- Bit [0] set:	Display list end.
	- Bit [1] set:	Issue a full pipeline flush and wait (necessary before flip).
	- Bit [2] set:	Wait for writeback complete (necessary before framebuffer format change).
	- Bits [7:3]	Set all to 0s.
	Bit [1] and [2] settings are mutually exclusive. All indices after the special index FFh are ignored, and the next address word is read, if no display list end (bit [0] = 1) was set.	
	The remaining two indices must be set to 00h.	

Note: Gap indices 80h must not be placed between other indices, for example as “index1 - 80h - index3 - index4”. Always fill all indices after 80h with the gap index.
If any of the special indices 80h and FFh are used, no register index can follow after them in the same address word.

Table 43.11 2D Drawing Engine registers overview

Register function	Symbol	Index
Control registers:

Table 43.11 2D Drawing Engine registers overview

Register function	Symbol	Index
Color lookup table start address	TEXCLADDR	55
Write Data to TEXCLADDR; after each data write, TEXCLADDR is incremented by 1.	TEXCLDATA	56
Offset to the index for the indexed texture formats i8, i4, i2, and i1	TEXCLOFFSET	57
Compare value for R,G, B components of internal texel color representation.	COLKEY	58
Miscellaneous registers:		
Bounding box dimension	SIZE	30
Framebuffer pitch and spanstore delay	PITCH	31
Address of the first pixel in framebuffer	ORIGIN	32
Display list start address	DLISTSTART	50
Performance counters control	PERFTRIGGER	53
Performance counter 1	PERFCOUNT1	51
Performance counter 2	PERFCOUNT2	52

Note 1. These registers are read-only and cannot be accessed in display list mode, and they therefore have no index.

43.7.3 Stopping the Render Process

Stopping an ongoing render process requires a specific procedure, which is described in section 43.10, Stopping the 2D Drawing Engine Render Process.

43.8 Interrupts

The 2D Drawing Engine generates three interrupts:

- DRWBUSIRQ
- DRWENUMIRQ
- DRWDLISTIRQ.

43.8.1 Interrupt sources

DRWBUSIRQ

This is the 2D Drawing Engine bus error interrupt. It occurs when the 2D Drawing Engine attempts to access an undefined address range through the following:

- Framebuffer Base Address Register (ORIGIN)
- Texture Base Address Register (TEXORIGIN)
- Display List Start Address Register (DLISTSTART)

The interrupt source can be determined by the BUSERRMFB, BUSERRMTXMRL, and BUSERRMDL bits of the STATUS register.

Note: After a DRWBUSIRQ occurrence, you must apply a software reset.
For a software reset, see section 52, Power-Down Modes.

DRWENUMIRQ

This is the current render process finished interrupt.

DRWDLISTIRQ

This is the display list interrupt. It is asserted on completion of a display list process. DRWDLISTIRQ is activated if one of the following is true:

- The entire display list is complete
- The display list processing stops because a new display list start is triggered by a write to the Display List Start Address Register (DLISTSTART).

43.8.2 Interrupt Control

The three 2D Drawing Engine interrupts are combined into a single shared interrupt, DRW_IRQ, to the CPU. Each interrupt can be masked (disabled), or unmasked (enabled) by setting its associated enable bit in the Interrupt Control Register (IRQCTL).
The occurrence of an enabled interrupt (one with its mask bit set to 1 in IRQCTL) is monitored in the Status Control Register (STATUS) with its associated interrupt status bit is set to 1. The shared 2D Drawing Engine interrupt DRW_IRQ is then generated.
To clear the interrupt, the host CPU must write 1 to the interrupt clear bit in IRQCTL. The interrupt clear bit returns to 0 automatically.

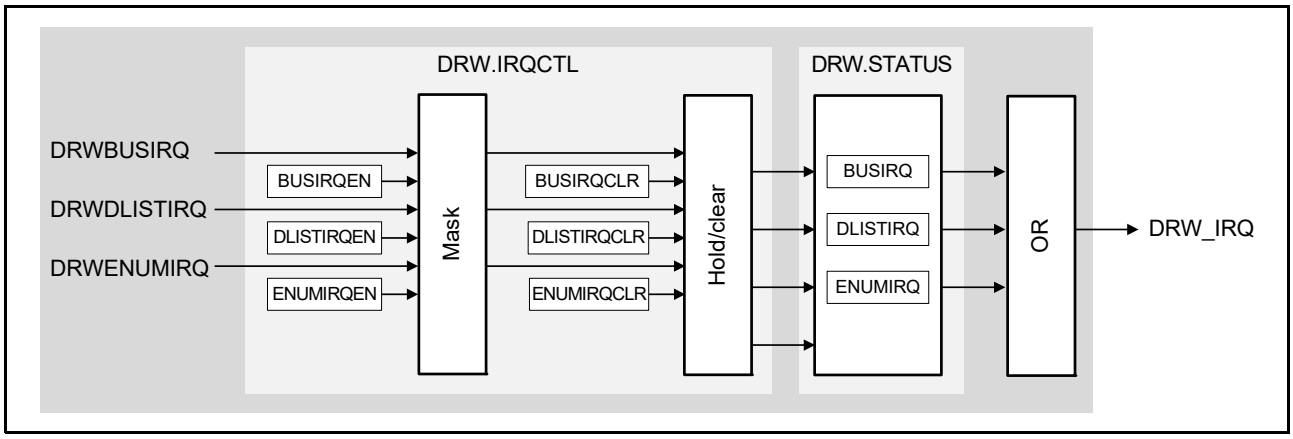

Figure 43.25 Interrupt Controller Unit (ICU)

43.9 Performance Counters

The 2D Drawing Engine features two independent 32-bit performance counter registers (PERFCOUNTk (k = 1, 2)) to count the number of occurrences of a certain event. The events to be counted can be set up independently for each performance counter register with the Performance Counter Control Registers, PERFTRIGGER.PERFTRIGGER2 for PERFCOUNT2 and PERFTRIGGER.PERFTRIGGER1 for PERFCOUNT1.
Table 43.12 lists the performance counter trigger events that can be selected.

Table 43.12 Performance counter trigger events

PERFTRIGGER.PERFTRIGGERk	Event
0	Disable performance counter
1	2D Drawing Engine active cycles
2	Framebuffer read access
3	Framebuffer write access
4	Texture read access
5	Invisible pixels (enumerated but selected with alpha 0%)
6	Invisible pixels while internal FIFO is empty (lost cycles)
7	Display list reader active cycles
8	Framebuffer read hits
9	Framebuffer read misses
10	Framebuffer write hits
11	Framebuffer write misses
12	Texture read hits
13	Texture read misses
31	Every clock cycle (for use as timer)

43.10 Stopping the 2D Drawing Engine Render Process

If a render process has started either in register or display list mode, the 2D Drawing Engine processes the data autonomously until the render process is finished. Depending on the rendering, this process might take several milliseconds.

If the 2D Drawing Engine is to be disabled because, for example, this LSI enters a low-power mode, proceed as follows to stop the ongoing rendering:

1. Set the following registers as follows:
   SIZE = 0001 0001h
   Set bounding box dimensions to 1 pixel x 1 line.
   CONTROL2 = 0000 0000h
   Color format a (8), no texture, CLUT.
   ORIGIN = UnmappedAddress
   The UnmappedAddress is an address that is not available for 2D Drawing Engine access.
   The recommended UnmappedAddress is given here under the key word “UnmappedAddress”.
   Alternatively do the same in display list mode:

```
DWORD 8020 011Eh          // start of list address word
DWORD 0001 0001h          // SIZE = 0001 0001h
DWORD 0000 0000h          // CONTROL2 = 0000 0000h
DWORD UnmappedAddress     // ORIGIN = UnmappedAddress
```

2. Wait for the Bus Error corresponding to the unmapped address violation, which indicates access to an unmapped address and the stop of the render process.
   UnmappedAddress = D000 0000h
3. Disable the 2D Drawing Engine, if wanted.

44. Sprite Engine (SPEA)

44.1 Overview of the Sprite and RLE Units

44.1.1 Units

This LSI has the following number of units of the Sprite Engine.

Table 44.1 Units

Sprite Engine (SPEA)	RZ/A2M
Units	1
Names	SPEA0

Unit index n

Throughout this section, the individual units of the Sprite Engines are identified by the index “n” (n = 0), for example SPEAnPHAi for the SPEAn physical address register of RLE Unit i.

44.1.2 Sprite and RLE Units indices

In this section following indices are used:

RLE Unit number index i

The one units of the RLE Units are identified by the index “i” (i = 0), for example SPEAnPHAi for the physical address register of RLE Unit i.

Sprite Unit number index k

The two units of the Sprite Units are identified by the index “k” (k = 0 to 1), for example SPEAnSkEN for the enable register of Sprite Unit k.

Sprite index m

The 16 sprites of a Sprite Unit k are identified by the index “m” (m = 0 to 15), for example SPEAnSkDAm for the destination address register of Sprite Unit k’s sprite m.

44.1.3 Register addresses

All Sprite Engines register addresses are given as address offsets from the individual base addresses <SPEAn_base>. The <SPEAn_base> addresses of each SPEAn are listed in the following table:

Table 44.2 Register base addresses <SPEAn_base>

SPEAn unit	<SPEAn_base> address
SPEA0	E803 E000H

44.2 Functional Overview

The video display controller 6 can select different ways to acquire their data from the memory for adding a layer to the image to be displayed:

- Direct access
  The color data to be processed by an The video display controller 6 is read directly in the correct format out of the memory.
  The graphics blocks (0), (2), and (3) of the video display controller 6 can directly access the memory.
- RLE (run-length encoded) layer
  RLE compressed color data in the memory is expanded and delivered to the video display controller 6 as separate pixel color data.
  The graphics block (0) of the video display controller 6, which determines the background layer, can uses an RLE layer.
- Sprite layer
  A layer with up to 16 rectangle areas, which can be placed anywhere on the layer area.
  Since only the color data for these rectangles - and not for the entire layer - need to be stored in memory, required memory occupation and bandwidth is minimized.
  The graphics blocks (2) and (3) of the video display controller 6 can use Sprite layers.

Features summary

- RLE Units
  - The RLE unit can cooperate with the graphics block (0) of the video display controller 6
  - RLE compressed data in Targa format
  - RLE compressed color data formats: 24 bpp
- Sprite Units
  - The two Sprite units can cooperate with graphics blocks (2) and (3) of the video display controller 6.
  - up to 16 separate sprites processed by each Sprite Unit

Indices

Throughout this section following indices are used:

- i = 0: RLE Unit number
- k = 0 to 1: Sprite Unit number
- m = 0 to 15: sprite number for each Sprite Unit

44.3 RLE Units Functional Description

The following figure shows the block diagram of the RLE Units.

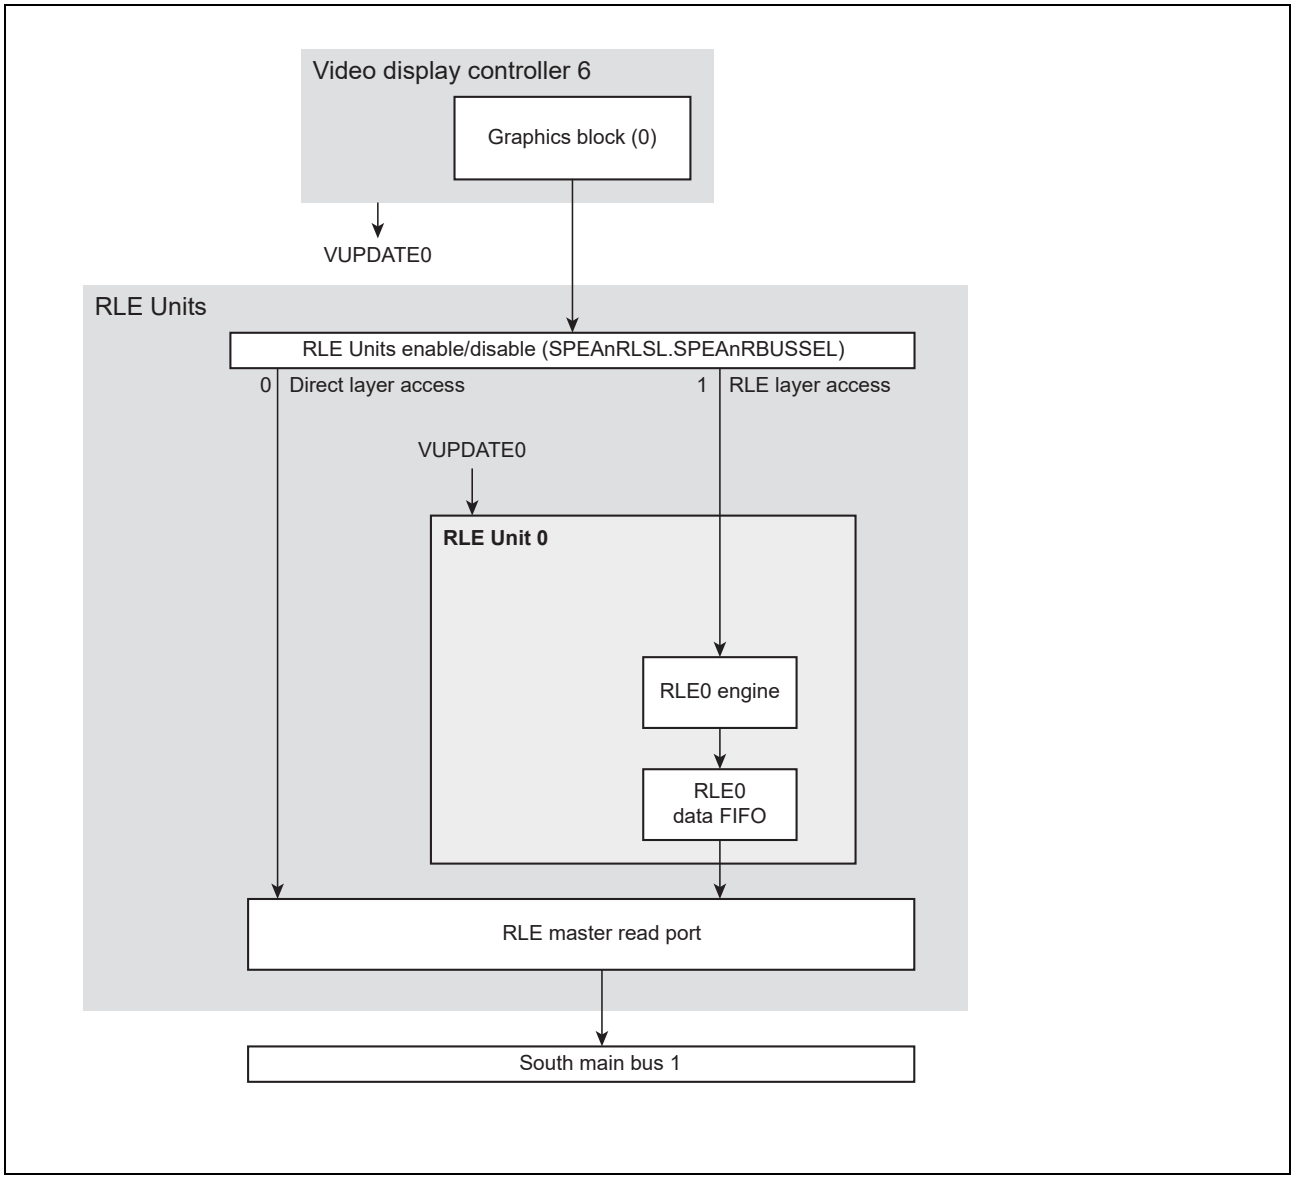

Figure 44.1 RLE Engines block diagram

The graphics block (0) of the video display controller 6 can read RLE compressed color data from the memory via an RLE Unit.
If the graphics block (0) of the video display controller 6 does not read RLE data, it accesses the physical memory for reading frame buffer data directly.

RLE Units enable

The RLE Units can be enabled and disabled:
RLE or direct layer selection is done by a bypass switch:

- SPEAnRLSL.SPEAnRBUSSEL = 0: RLE Units disabled
  The graphics block (0) of the video display controller 6 performs direct layer accesses to the memory.
- SPEAnRLSL.SPEAnRBUSSEL = 1: RLE Units enabled
  The graphics block (0) of the video display controller 6 performs RLE layer accesses.

RLE Units data FIFO

The data read from the memory by an RLE Unit is stored in a RLE data FIFO, that allows prefetching of memory data. The prefetching of data can be influenced by the FIFO fill stage and the length of the red bursts, the RLE issues read accesses towards the memory via the south main bus.
The size of RLE data FIFO is 1024 bit, organized as 16 x 64 bit.
Two values in the RLE prefetch configuration register SPEAnRCFG allow to configure the FIFO fill threshold when a new read burst is issued and the length of the burst:

- SPEAnRDTH[2:0] set the FIFO fill threshold for the next data prefetch
- SPEAnRLEN[2:0] set the burst length for the next data prefetch

Note: The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.
The RLE data FIFO size is 1024 bit.
When operating the RLE unit, always set the GR0_BST_MD bit of the video display controller 6 to 1.

44.3.1 RLE layer definition

The RLE Unit i identifies a RLE layer read access of the video display controller 6 by the graphics block (0)'s read address of the first layer pixel.
The valid address is defined in the start address register SPEAnSTAi, that marks the virtual frame start address.

If the graphics block (0) of the video display controller 6 read access matches address, the RLE Unit reads RLE data from the memory address, defined by the physical address register SPEAnPHAi.
Since the entire graphics block (0) of the video display controller 6 layer data is read via the RLE Unit, the RLE Unit reads data from the memory consecutively, until the graphics block (0) of the video display controller 6 issues the start address SPEAnSTAi again. This causes the RLE Unit to restart data read from address SPEAnPHAi.

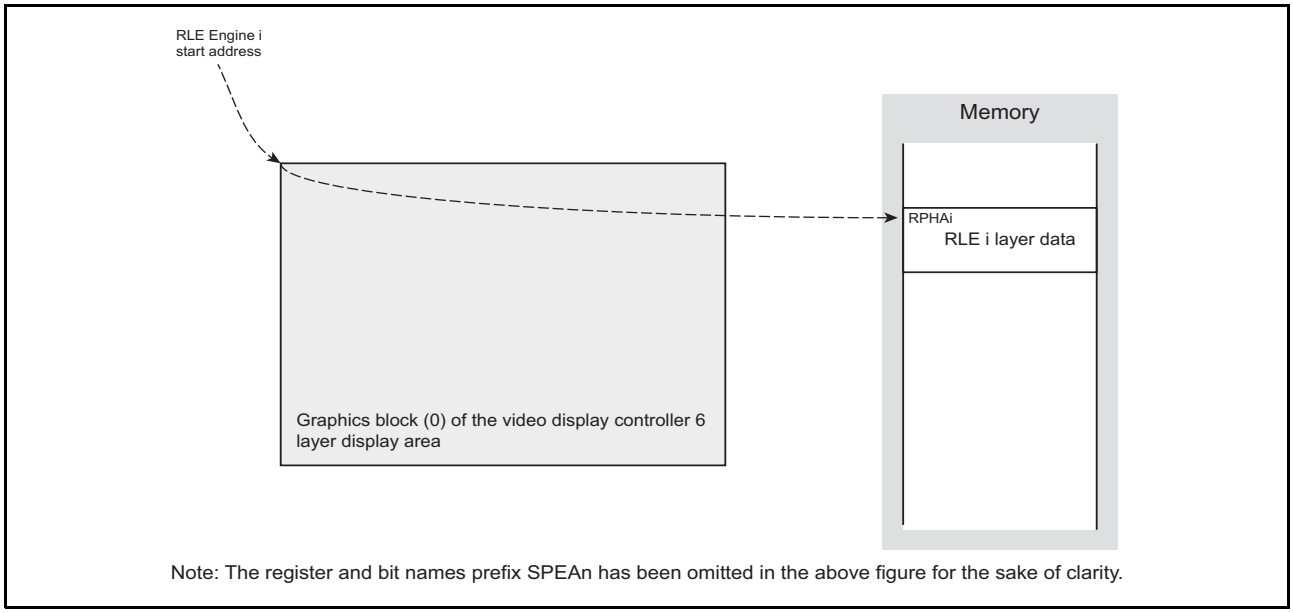

Figure 44.2 RLE definitions

As the RLE unit is reading the memory consecutively, the following graphics block (0) of the video display controller 6 restrictions need to be considered:

Note 1. Always set '1' to the GR0_BST_MD bit of the GR0_FLM1 register of the video display controller 6. If an image data size in the horizontal direction does not fit to 128 bytes alignment, some dummy data in each line needs to be added.
2. After completion of the reading of each line, the RLE unit reads additional 128 bytes. For this reason, 128 bytes of additional dummy data must be inserted in each line.

Example: Dummy data insertion required for each line in the horizontal 240 pixel image of 32bpp:
64- and 128-byte of dummy data are required to satisfy the restrictions of the Note 1 and Note 2, respectively. Dummy data insertion of 192 bytes in total is required. The number of horizontal pixels after dummy data insertion is 288 pixels.

44.3.2 Color modes

The following table lists the possible combinations of the

- color data formats selectable in the graphics block (0) of the video display controller 6
- RLE color mode selection and the data format delivered to the graphics block (0) of the video display controller 6
- color data format in the memory

when RLE data is used for the background layer.

Table 44.3 RLE Units supported color formats

	RLE Unit configuration		
Graphics block (0) of the video display controller 6 color format selection	Color mode selection	Graphics block (0) of the video display controller 6 data	Color data in the memory
32 bpp αRGB8888	SPEAnRCMi = 2: 24 bpp	RGB888 with α = 1	RGB888
24 bpp RGB888	SPEAnRCMi = 2: 24 bpp	RGB888	RGB888
Other	not supported	–	–

Color expansion

Depending on the color format the graphics block (0) of the video display controller 6 is expecting, the color data read from the memory is expanded to fit a 32-bit word.

The following diagrams show how memory data in different formats are passed to the graphics block (0) of the video display controller 6.

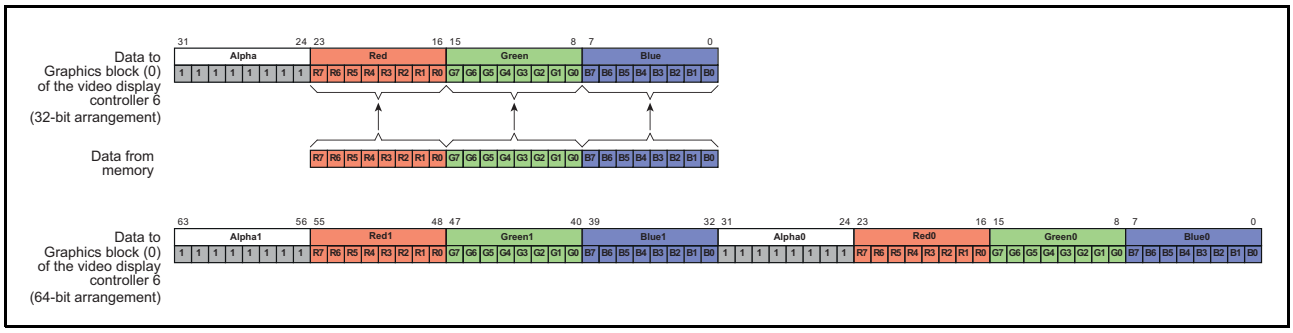

Figure 44.3 24 bpp color expansion to 32 bpp

44.3.3 RLE data packets in the memory

The RLE Units support Targa RLE data packet formats.
The Targa RLE packets comprise two types of data elements:

- run-length packets
- raw packets

The packet consists of two fields:

- Control byte: defines the type of data and the number of pixels covered by the packet
- Data field: defines the pixels color data

Table 44.4 RLE Targa packets

Packet type	Control byte		Data field
Run-length	• Packet type = 1 for run-length packet • Size: 1 bit	• Pixel count = (number of pixel repetitions with color of data field) - 1 • Size: 7 bit	• Pixel color • Size: pixel bpp
Raw	• Packet type = 0 for raw packet • Size: 1 bit	• Pixel count = (number of pixels in following data field) - 1 • Size: 7 bit	• Pixels color • Size: pixel bpp x pixel count

44.3.4 Packet arrangement in the memory

Padding bits

A data packet must always start at a byte boundary. Thus it may be necessary to add padding bits to the previous packet. The following diagrams show the arrangement of run-length and raw packets with different color format in the memory.

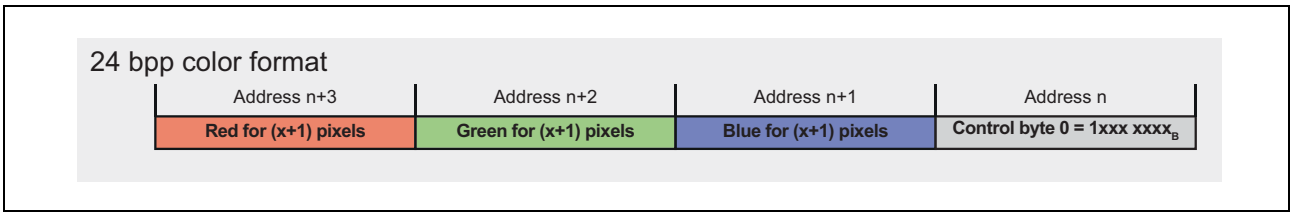

Figure 44.4 Run-length data packets in the memory

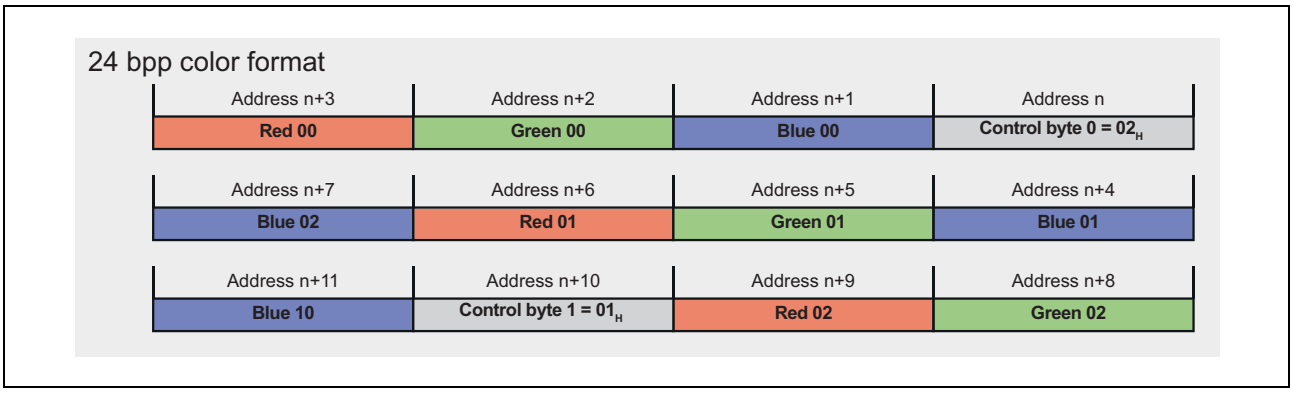

Figure 44.5 Raw data packets in the memory

44.3.5 RLE definition registers modification

The RLE definition registers are buffered.
While the RLE definition registers are in operation, the buffer registers can be modified without disturbing the video output.

The buffered RLE Unit i definition registers are:

- Start address register SPEAnSTAi
- physical address register SPEAnPHAi
- color mode register SPEAnRMCi

When setup of new RLE definitions is completed, the update of all definition registers of RLE Unit i must be requested via the SPEAnRUP register:

- SPEAnRUP.SPEAnRUP0 = 1: initiates update of all RLE Unit 0 definition registers with the next VUPDATE0

Caution: Caution: ?????LE definition buffer registers must not be modified while SPEAnRUPi = 1.

44.4 Sprite Units functional description

The graphics blocks (2) and (3) of the video display controller 6 read accesses to the memory are performed via the Sprite Units of the Sprite Engine.
The assignment of the graphics blocks (2) and (3) of the video display controller 6 to the two Sprite Units is determined, as shown in the figure below.
The graphics blocks (2) and (3) of the video display controller 6 can use a sprite layer, through access to a virtual frame buffer, the sprite virtual frame.
If the graphics blocks (2) and (3) of the video display controller 6 does not implement a sprite layer, it accesses the physical memory for reading frame buffer data directly.

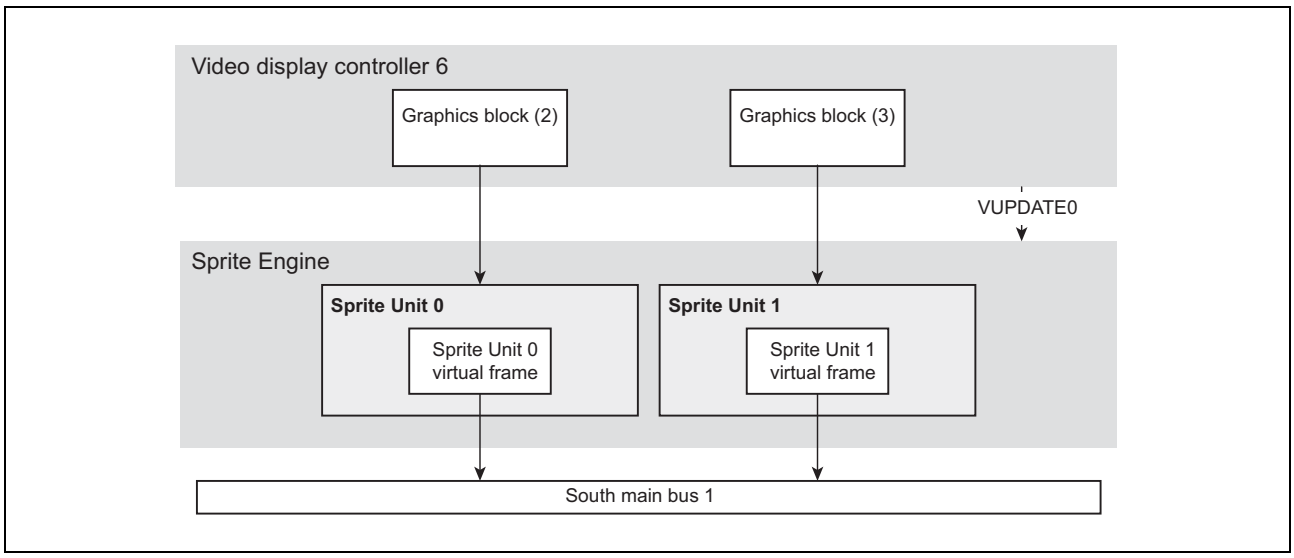

Figure 44.6 Sprite Units block diagram

44.4.1 Sprite virtual frame

The size of the sprite virtual frame is fixed to 8192 x 8192 byte.
Its address is mapped outside of any physical address space, that is used to access the physical memory directly.
The address of the first pixel of the virtual frame is the virtual frame base address

Virtual frame base address = $3000\ 0000_H$

44.4.2 Sprite activation

Each sprite m of a Sprite Unit k can be enabled or disabled separately:

- Sprite enable/disable registers
  - SPEAnSkEN.SPEAnSkENm = 1 enables sprite k
  - SPEAnSkDS.SPEAnSkDSm = 1 disables sprite k

The enable/disable status of each sprite can be read via the SPEAnSkEN register.

44.4.3 Color modes

The Sprite unit supports the following color formats.

Table 44.5 Sprite unit supported color format

Read formats of the graphics blocks (2) and (3) of the video display controller 6	Sprite unit support
αRGB8888	○
RGBα8888	○
Other	–

44.4.4 Sprite definition

A sprite m of Sprite Unit k is defined by several register settings:

Sprite X/Y position

Sprite X/Y position register SPEAnSkPSm: X/Y position on the sprite virtual frame, with respect to its virtual frame base address.

(a) SPEAnSkPSm.SPEAnSkPSXm: X position
The X position is defined as multiple of 64 bit and thus depends on the sprite color format.
The corresponding pixel position depends on the color format and the amount of pixels fitting into 64 bits.

- 32 bpp color formats: 64 bit / 32 = 2 pixel units
  - possible X positions at a multiple of 2 = 0, 2, 4, 6, 8, ...
  - SPEAnSkPSX[9:0] = X position in pixel / 2

(b) SPEAnSkPSm.SPEAnSkPSYm: Y position
The Y position is defined in pixels.

Sprite width and height

Sprite size register SPEAnSkLYm: width SPEAnSkLYWm and height SPEAnSkLYHm

(a) SPEAnSkLYm.SPEAnSkLYWm: width
The width is defined as multiple of 64 bit.

- 32 bpp color formats: 64 bit / 32 = 2 pixel units
  - possible X widths: multiple of 2 = 0, 2, 4, 6, 8, ...
  - SPEAnSkLYW[9:0] = width in pixel / 2

(b) SPEAnSkLYm.SPEAnSkLYHm: height
The height is defined in pixels.

Destination address

Destination address register SPEAnSkDAm: address of 1st pixel color data of sprite m in the memory
The destination address must be aligned to 64 bit.

Graphics blocks (2) and (3) of the video display controller 6 line offset

Since the Sprite Unit calculates the address of each new line with respect to the fixed virtual frame width of 8192 Byte, the graphics blocks (2) and (3) of the video display controller 6 must define the same line offset, when reading layer data via a Sprite Unit.
Note that the maximum number of pixels per line in the virtual frame depends on the color format:

- 32 bpp: max. 2048 pixels

The figure below shows an example with two enabled sprites.

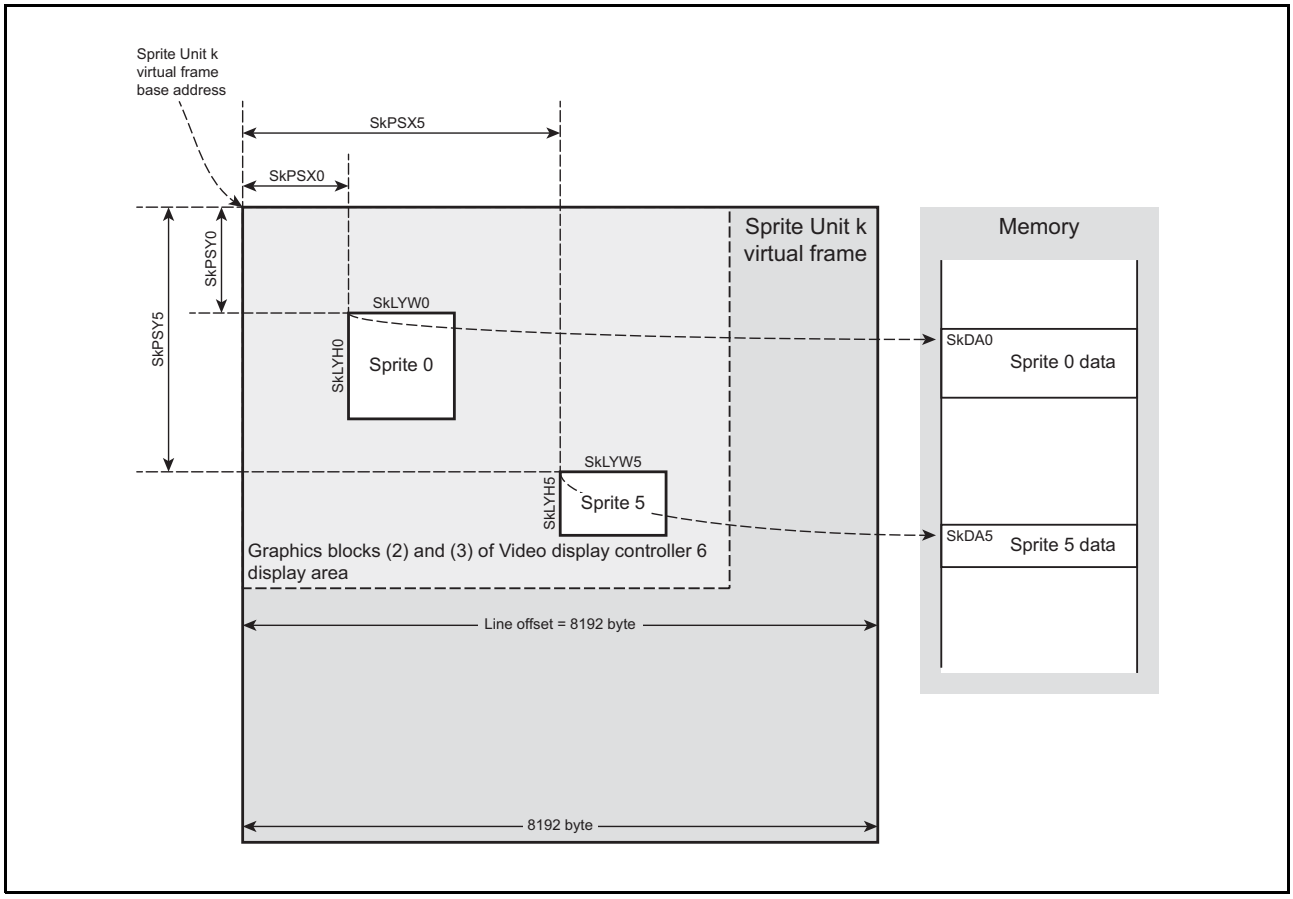

Figure 44.7 Sprite definitions

44.4.5 Overlapping sprites

Sprites can be also placed overlapping.
In such case a fixed priority order rules which sprite data is forwarded to the graphics blocks (2) and (3) of the video display controller 6:

- Sprite m = 0: highest priority
- ...
- Sprite m = 15: lowest priority

The color data of the sprite with the highest priority is forwarded to the graphics blocks (2) and (3) of the video display controller 6.

44.4.6 Sprite layer areas without active sprites

Areas of the sprite layer without active sprites return color data with value 0.

44.4.7 Sprite definition registers modification

The sprite definition registers are buffered.
While the sprite definition registers are in operation, the buffer registers can be modified without disturbing the video output.
The buffered Sprite Unit k sprite m definition registers are:

- Sprite Unit k enable registers SPEAnSkEN
- Sprite Unit k disable registers SPEAnSkDS
- Destination address registers SPEAnSkDAm
- Width/height registers SPEAnSkLYm
- X/Y position registers SPEAnSkPSm

All sprite definitions of the VUPDATE0 update group are updated simultaneously with the respective VUPDATE0 signal.
When setup of new sprite definitions is completed, the update of all sprite definition registers of Sprite Unit k must be requested via the SPEAnSkUP register:

- SPEAnSkUP.SPEAnSkUP0 = 1: initiates update of all Sprite Unit k sprite definition registers of update group VUPDATE0 with the next VUPDATE0

Caution: All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1.

44.4.8 Color Data Arrangement

The following diagram shows how color data are passed to the graphics blocks (2) and (3) of the video display controller 6 when a sprite is used.

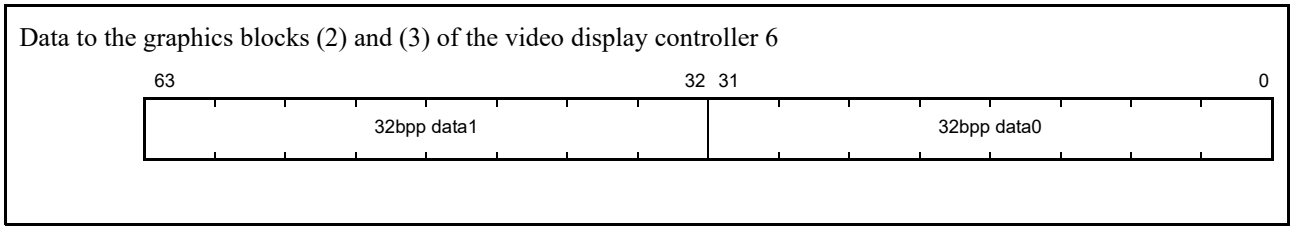

Figure 44.8 Sprite data arrangement

44.5 Sprite and RLE Units Registers

This section contains a description of all registers of the Sprite and RLE Units.
The Sprite and RLE Units are controlled and operated by the following registers:

Table 44.6 Sprite and RLE Units registers overview

Register name	Shortcut	Address
RLE Units registers		
RLE enable control register	SPEAnRLSL	<SPEAn_base> + 10_H
RLE Unit i start address register	SPEAnSTAi	<SPEAn_base> + 20_H + i x 10_H
RLE Unit i physical address register	SPEAnPHAi	<SPEAn_base> + 24_H + i x 10_H
RLE Unit i color mode register	SPEAnRCMi	<SPEAn_base> + $2C_H$ + i x 10_H
RLE register update request register	SPEAnRUP	<SPEAn_base> + 40_H
RLE configuration register	SPEAnRCFG	<SPEAn_base> + 48_H
Sprite Unit k registers		
Sprite Unit k enable register	SPEAnSkEN	<SPEAn_base> + 100_H + k x 10_H
Sprite Unit k disable register	SPEAnSkDS	<SPEAn_base> + 104_H + k x 10_H
Sprite Unit k update request register	SPEAnSkUP	<SPEAn_base> + 108_H + k x 10_H
Sprite Unit k sprite m destination address register	SPEAnSkDAm	<SPEAn_base> + 400_H + k x 400_H + m x 20_H
Sprite Unit k sprite m width/height register	SPEAnSkLYm	<SPEAn_base> + 408_H + k x 400_H + m x 20_H
Sprite Unit k sprite m X/Y position register	SPEAnSkPSm	<SPEAn_base> + $40C_H$ + k x 400_H + m x 20_H

<SPEAn_base>

The base addresses <SPEAn_base> of the SPEAn is defined in section 44.1.3, Register addresses.

44.5.1 RLE Units registers

44.5.1.1 SPEAnRLSL - RLE Units enable control register

The RLE Units can be enabled and disabled via this register.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 10_H
Initial value: 0000 0000H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	SPEAn RBUS SEL
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.7 SPEAnRLSL register contents

Bit position	Bit name	Function
31 to 1	–	Reserved bits The write value should always be 0.
0	SPEAn RBUSSEL	RLE Units enable control 0: RLE Units are disabled (direct layer access) 1: RLE Units are enabled (RLE layer access)

44.5.1.2 SPEAnSTAi - RLE Unit i start address register

This register defines the virtual frame start address when the graphics block (0) of the video display controller 6 reads via the REL unit i.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 20_H + i x 10_H
Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPEAnRSTAi[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPEAnRSTAi[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.8 SPEAnSTAi register contents

Bit position	Bit name	Function
31 to 0	SPEAn RSTAi[31:0]	RLE Unit i start address The address must be 128-byte aligned, so the lower 7 bits SPEAnRSTAi[6:0] of the address are always 000 0000_B.

44.5.1.3 SPEAnPHAi - RLE Unit i physical address register

This register defines the address of the RLE Unit i first data in the memory.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 24_H + i x 10_H
Initial value: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPEAnRPHAi[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPEAnRPHAi[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.9 SPEAnPHAi register contents

Bit position	Bit name	Function
31 to 0	SPEAn RPHAi[31:0]	RLE Unit i data memory address The address must be 64-bit aligned, so the lower 3 bits SPEAnRPHAi[2:0] of the address are always 000_B.

44.5.1.4 SPEAnRCMi - RLE Unit i color mode selection register

This register selects the color format of data in memory for RLE Unit i.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + $2C_H$ + i x 10_H
Initial value: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	SPEAnRCMi [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.10 SPEAnRCMi register contents

Bit position	Bit name	Function
31 to 2	–	Reserved bits The write value should always be 0.
1, 0	SPEAn RCMi[1:0]	RLE Unit i color mode selection 00_B: setting prohibited 01_B: setting prohibited 10_B: 24 bpp 11_B: setting prohibited

44.5.1.5 SPEAnRUP - RLE registers update request register

This register controls the update of the RLE Unit's registers.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 40_H
Initial value: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	SPEAn RUP0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.11 SPEAnRUP register contents

Bit position	Bit name	Function
31 to 1	–	Reserved bits The write value should always be 0.
0	SPEAn RUP0	RLE Unit 0 register update request 0: no function 1: update RLE Unit 0 register with the next VUPDATE0

Note 1. The update request bit SPEAnRUPi remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.
Note 2. All RLE definition buffer registers must not be modified while SPEAnRUPi = 1.
Refer to section 44.3.5, RLE definition registers modification for details.

44.5.1.6 SPEAnRCFG - RLE prefetch configuration register

This register controls the size and timing for the RLE data stream prefetching

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 48_H
Initial value: 0000 0044_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	SPEAnRLEN[2:0]			–	SPEAnRDTH[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 44.12 SPEAnRCFG register contents

Bit position	Bit name	Function
31 to 7	–	Reserved bits The write value should always be 0.
6 to 4	SPEAn RLEN[2:0]	Burst size of the RLE unit next data prefetching. RLE unit prefetches next data every burst length x 64 bit. 0: Burst length = 1 1: Burst length = 2 2: Burst length = 4 3: Burst length = 6 4: Burst length = 8 (default) 5: Burst length = 10 6: Burst length = 12 7: Burst length = 14
3	–	Reserved bit The write value should always be 0.
2 to 0	SPEAn RDTH[2:0]	Prefetch timing. RLE unit prefetches next data when remaining amount of the data in the RLE FIFO is less than threshold x 64 bit. 0: setting prohibited 1: threshold = 2 2: threshold = 4 3: Burst length = 6 4: threshold = 8 (default) 5: threshold = 10 6: threshold = 12 7: threshold = 14

Note: The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.
The RLE data FIFO size is 1024 bit.

44.5.2 Sprite Units registers

44.5.2.1 SPEAnSkEN - Sprite Unit k enable register

Each sprite of Sprite Unit k can be enabled by this register.
The enabled/disabled status of the sprites on Sprite Unit k can be checked by reading this register.
Disabling a sprite is done via the Sprite Unit k disable register SPEAnSkDS.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 100_H + k x 10_H
Initial value: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPEAn SkEN15	SPEAn SkEN14	SPEAn SkEN13	SPEAn SkEN12	SPEAn SkEN11	SPEAn SkEN10	SPEAn SkEN9	SPEAn SkEN8	SPEAn SkEN7	SPEAn SkEN6	SPEAn SkEN5	SPEAn SkEN4	SPEAn SkEN3	SPEAn SkEN2	SPEAn SkEN1	SPEAn SkEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.13 SPEAnSkEN register contents

Bit position	Bit name	Function
31 to 16	–	Reserved bits The write value should always be 0.
15 to 0	SPEAn SkENm	Register write: Sprite m enable 0: at write: no function 1: at write: enable sprite m Register read: Sprite m status 0: at read: sprite m is disabled 1: at read: sprite m is enabled

44.5.2.2 SPEAnSkDS - Sprite Unit k disable register

Each sprite of Sprite Unit k can be disabled by this register.
Enabling a sprite is done via the Sprite Unit k enable register SPEAnSkEN.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 104_H + k x 10_H
Initial value: Reading this register returns an undefined value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 44.14 SPEAnSkDS register contents

Bit position	Bit name	Function
31 to 16	–	Reserved bits The write value should always be 0.
15 to 0	SPEAn SkDSm	Sprite m disable 0: no function 1: disable sprite m Note that reading of this register returns an undefined value. The enable/disable status of each sprite can be evaluated by reading the Sprite Unit k enable register SPEAnSkEN.

44.5.2.3 SPEAnSkUP - Sprite Unit k update request register

This register controls the update of the Sprite Unit k registers.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 108_H + k x 10_H
Initial value: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	SPEAn SkUP0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.15 SPEAnSkUP register contents

Bit position	Bit name	Function
31 to 1	–	Reserved bits The write value should always be 0.
0	SPEAn SkUP0	Update request of all sprite definition registers of Sprite Unit k, which are assigned to VUPDATE0 0: no function 1: update VUPDATE0 assigned registers with next VUPDATE0

Note 1. The update request bit SPEAnSkUP0 remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.
Note 2. All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1.
Refer to section 44.4.7, Sprite definition registers modification for details.

44.5.2.4 SPEAnSkDAm - Sprite Unit k sprite m destination address register

This register defines the address of the 1st pixel's color data in the memory of the sprite m of the Sprite Unit k.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 400_H + k x 400_H + m x 20_H
Initial value: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPEAnSkDAm[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	SPEAnSkDAm[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.16 SPEAnSkDAm register contents

Bit position	Bit name	Function
31 to 0	SPEAn SkDAm[31:0]	Sprite Unit k sprite m color data address The address must be 64-bit aligned, so the lower 3 bits SPEAnSkDAm[2:0] of the address are always 000_B.

44.5.2.5 SPEAnSkLYm - Sprite Unit k sprite m width/height register

This register defines the width and height of the Sprite Unit k sprite m.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + 408_H + k x 400_H + m x 20_H
Initial value: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	SPEAn SkLYWm[9:0]										–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	SPEAn SkLYHm[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.17 SPEAnSkLYm register contents

Bit position	Bit name	Function
31 to 27	–	Reserved bits The write value should always be 0.
26 to 17	SPEAn SkLYWm[9:0]	Sprite Unit k sprite m width The width is defined as multiple of 64 bit and thus depends on the sprite pixel color format. • 32 bpp color formats: 64 bit / 32 = 2 pixel units - possible X widths: multiple of 2 = 0, 2, 4, 6, 8, ... - SPEAnSkLYW[9:0] = width in pixel / 2
16 to 11	–	Reserved bits The write value should always be 0.
10 to 0	SPEAn SkLYHm[10:0]	Sprite Unit k sprite m layer height in pixels

44.5.2.6 SPEAnSkPSm - Sprite Unit k sprite m X/Y position register

This register defines the position of the Sprite Unit k sprite m.

Access: This register can be accessed in 32-bit units.
Address: <SPEAn_base> + $40C_H$ + k x 400_H + m x 20_H
Initial value: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	SPEAn SkPSXm[9:0]										–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.18 SPEAnSkPSm register contents

Bit position	Bit name	Function
31 to 27	–	Reserved bits The write value should always be 0.
26 to 17	SPEAn SkPSXm[9:0]	Sprite Unit k sprite m X position The X position is defined as multiple of 64 bit and thus depends on the sprite color format. • 32 bpp color formats: 64 bit / 32 = 2 pixel units - possible X positions at a multiple of 2 = 0, 2, 4, 6, 8, ... - SPEAnSkPSX[9:0] = X position in pixel / 2
16 to 13	–	Reserved bits The write value should always be 0.
12 to 0	SPEAn SkPSYm[12:0]	Sprite Unit k sprite m Y position in pixels

45. JPEG Codec Unit

The JPEG codec unit (JCU) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

45.1 Features

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
  This module does not support the following basic features:
  Scanning with two elements
  Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
  Pixel format:
  Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
  Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1),
  YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
  Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- Image data rate: Max. 132 Mbytes/s (at 66-MHz operation)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

Note: Compression and decompression processing of images in unsupported pixel formats or unsupported image sizes should be avoided.

Figure 45.1 shows a block diagram.

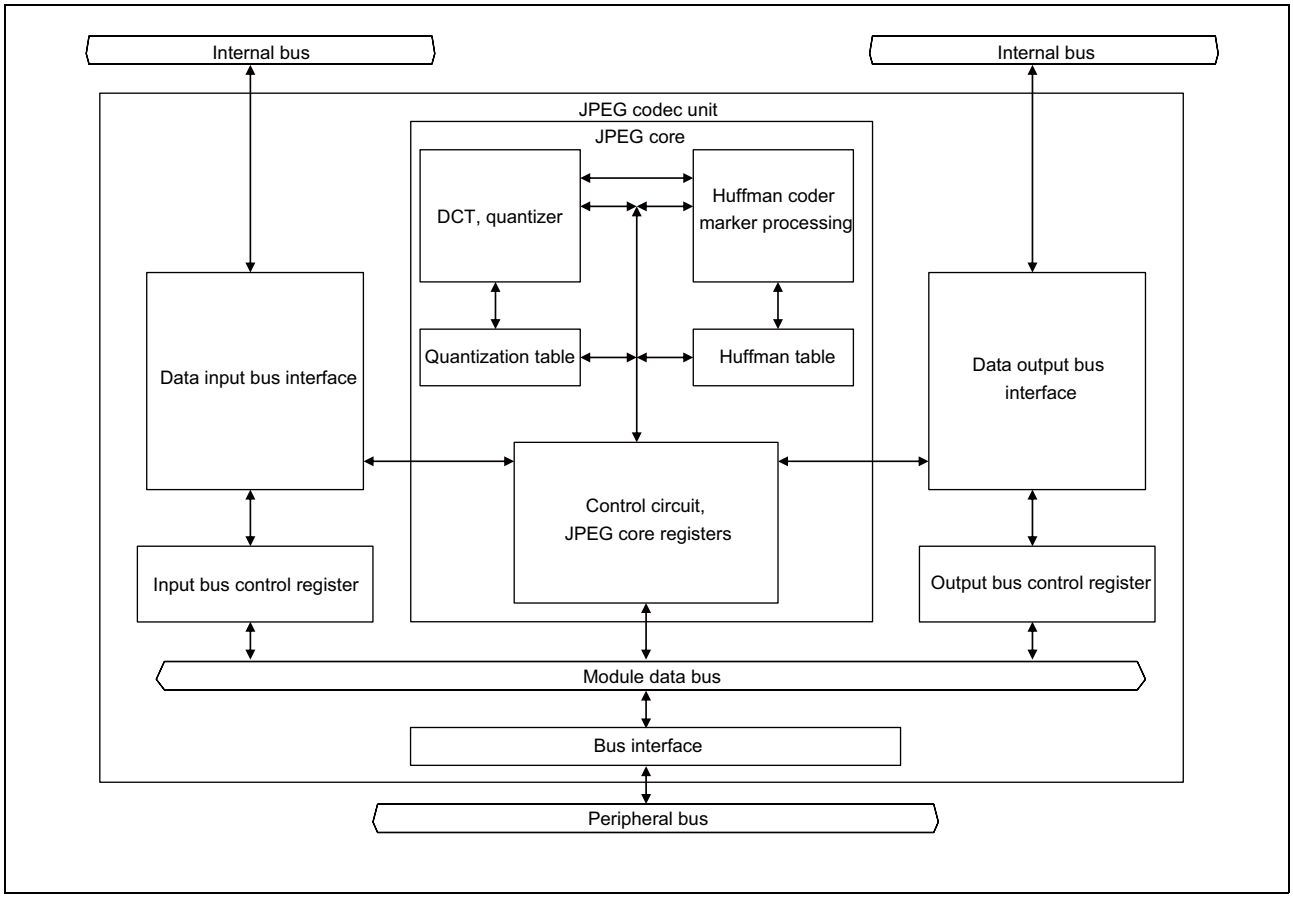

Figure 45.1 Block Diagram

45.2 Register Descriptions

Table 45.1shows the JCU registers.

Table 45.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code mode register	JCMOD	R/W	H'E801 7000	8
JPEG code command register	JCCMD	R/W	H'E801 7001	8
JPEG code quantization table number register	JCQTN	R/W	H'E801 7003	8
JPEG code Huffman table number register	JCHTN	R/W	H'E801 7004	8
JPEG code DRI upper register	JCDRIU	R/W	H'E801 7005	8
JPEG code DRI lower register	JCDRID	R/W	H'E801 7006	8
JPEG code vertical size upper register	JCVSZU	R/W	H'E801 7007	8
JPEG code vertical size lower register	JCVSZD	R/W	H'E801 7008	8
JPEG code horizontal size upper register	JCHSZU	R/W	H'E801 7009	8
JPEG code horizontal size lower register	JCHSZD	R/W	H'E801 700A	8
JPEG code data count upper register	JCDTCU	R	H'E801 700B	8
JPEG code data count middle register	JCDTCM	R	H'E801 700C	8
JPEG code data count lower register	JCDTCD	R	H'E801 700D	8
JPEG interrupt enable register 0	JINTE0	R/W	H'E801 700E	8
JPEG interrupt status register 0	JINTS0	R/W	H'E801 700F	8
JPEG code decode error register	JCDERR	R/W	H'E801 7010	8
JPEG code reset register	JCRST	R	H'E801 7011	8
JPEG interface compression control register	JIFECNT	R/W	H'E801 7040	32
JPEG interface compression source address register	JIFESA	R/W	H'E801 7044	32
JPEG interface compression line offset register	JIFESOFST	R/W	H'E801 7048	32
JPEG interface compression destination address register	JIFEDA	R/W	H'E801 704C	32
JPEG interface compression source line count register	JIFESLC	R/W	H'E801 7050	32
JPEG interface compression destination register	JIFEDDC	R/W	H'E801 7054	32
JPEG interface decompression control register	JIFDCNT	R/W	H'E801 7058	32
JPEG interface decompression source address register	JIFDSA	R/W	H'E801 705C	32
JPEG interface decompression destination offset register	JIFDDOFST	R/W	H'E801 7060	32
JPEG interface decompression destination address register	JIFDDA	R/W	H'E801 7064	32
JPEG interface decompression source count register	JIFDSDC	R/W	H'E801 7068	32
JPEG interface decompression destination line count register	JIFDDLC	R/W	H'E801 706C	32
JPEG interface decompression α setting register	JIFDADT	R/W	H'E801 7070	32
JPEG interrupt enable register 1	JINTE1	R/W	H'E801 708C	32
JPEG interrupt status register 1	JINTS1	R/W	H'E801 7090	32
JPEG input image data CbCr range setting register	JIFESVSZ	R/W	H'E801 7094	32
JPEG output image data CbCr range setting register	JIFESHSZ	R/W	H'E801 7098	32
JPEG code quantization table 0 register	JCQTBL0	R/W	H'E801 7100 to H'E801 713F	8
JPEG code quantization table 1 register	JCQTBL1	R/W	H'E801 7140 to H'E801 717F	8
JPEG code quantization table 2 register	JCQTBL2	R/W	H'E801 7180 to H'E801 71BF	8
JPEG code quantization table 3 register	JCQTBL3	R/W	H'E801 71C0 to H'E801 71FF	8

Table 45.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code Huffman table DC0 register	JCHTBD0	W	H'E801 7200 to H'E801 721B	8
JPEG code Huffman table AC0 register	JCHTBA0	W	H'E801 7220 to H'E801 72D1	8
JPEG code Huffman table DC1 register	JCHTBD1	W	H'E801 7300 to H'E801 731B	8
JPEG code Huffman table AC1 register	JCHTBA1	W	H'E801 7320 to H'E801 73D1	8

Note: For the settings of the JPEG code quantization table and JPEG code Huffman table, see section 45.3.1 (4), Table Setting.

45.2.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCU starts operation.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	DSP	REDU[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
3	DSP	0	R/W		Compression/Decompression Set 0: Compression process 1: Decompression process When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the SRST11 bit in the software reset control register 1 (SWRSTCR1) of the power-down modes.
2 to 0	REDU[2:0]	000	R/W	R	Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 110: YCbCr411 010: YCbCr420 Other than above: Error (JCU cannot process normally.)

45.2.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command.
Multiple commands must not be set simultaneously.

Bit:	7	6	5	4	3	2	1	0
	BRST	—	—	—	—	JEND	JRST	JSRT
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R*/W	R	R	R	R	R*/W	Invalid	R*/W
R/W(De-compression):	R*/W	R	R	R	R	R*/W	R*/W	R*/W

Note: *Values read from these bits are undefined.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	BRST	0	R*/W		Bus Reset Setting this bit to 1 resets the internal circuits. While the JCU is in operation (from setting the JPEG core process start command to writing the last output coded/image data), do not set this bit to 1. For the bus reset processing, see section 45.5, Bus Reset Processing.
6 to 3	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
2	JEND	0	R*/W		Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1.
1	JRST	0	Invalid	R*/W	JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1.
0	JSRT	0	R*/W		JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCU is in operation.

Note: * Values read from these bits are undefined.

45.2.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1 to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1 to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1 to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1 to B'11

Bit:	7	6	5	4	3	2	1	0
	—	—	QT3[1:0]		QT2[1:0]		QT1[1:0]	
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5, 4	QT3[1:0]	00	R/W	R	Quantization table number for the third color component
3, 2	QT2[1:0]	00	R/W	R	Quantization table number for the second color component
1, 0	QT1[1:0]	00	R/W	R	Quantization table number for the first color component

45.2.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

Bit:	7	6	5	4	3	2	1	0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5	HTA3	0	R/W	R	Huffman table number (AC) for the third color component
4	HTD3	0	R/W	R	Huffman table number (DC) for the third color component
3	HTA2	0	R/W	R	Huffman table number (AC) for the second color component
2	HTD2	0	R/W	R	Huffman table number (DC) for the second color component
1	HTA1	0	R/W	R	Huffman table number (AC) for the first color component
0	HTD1	0	R/W	R	Huffman table number (DC) for the first color component

45.2.5 JPEG Code DRI Upper Register (JCDRIU)

JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRIU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRIU[7:0]	H'00	R/W	Invalid	Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

45.2.6 JPEG Code DRI Lower Register (JCDRID)

JCDRID sets the lower bytes of MCUs preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRID[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRID[7:0]	H'00	R/W	Invalid	Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

45.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

JCVSZU sets the upper bytes of the vertical image size.

Bit:	7	6	5	4	3	2	1	0
	VSZU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZU[7:0]	H'00	R/W	R	Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

JCVSZD sets the lower bytes of the vertical image size.

Bit:	7	6	5	4	3	2	1	0
	VSZD[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZD[7:0]	H'00	R/W	R	Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

JCHSZU sets the upper bytes of the horizontal image size.

Bit:	7	6	5	4	3	2	1	0
	HSZU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZU[7:0]	H'00	R/W	R	Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

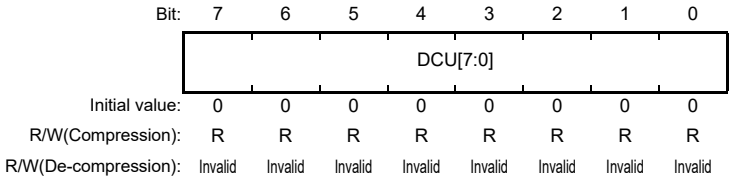
JCHSZD sets the lower bytes of the horizontal image size.

Bit:	7	6	5	4	3	2	1	0
	HSZD[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZD[7:0]	H'00	R/W	R	Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.11 JPEG Code Data Count Upper Register (JCDTCU)

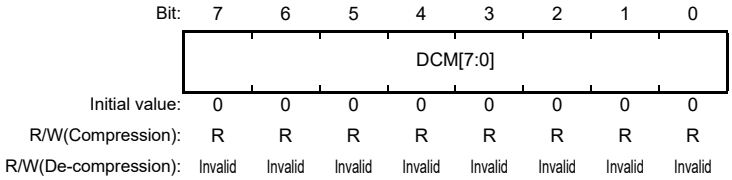
The upper bytes for the counted amount of data to be compressed are set to JCDTCU. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCU[7:0]	H'00	R	Invalid	Upper bytes of the counted amount of data to be compressed

45.2.12 JPEG Code Data Count Middle Register (JCDTCM)

The middle bytes for the counted amount of data to be compressed are set to JCDTCM. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	DeCompression	
7 to 0	DCM[7:0]	H'00	R	Invalid	Middle bytes of the counted amount of data to be compressed

45.2.13 JPEG Code Data Count Lower Register (JCDTCD)

The lower bytes for the counted amount of data to be compressed are set to JCDTCD. The values of this register are reset before compression starts.

Bit:	7	6	5	4	3	2	1	0
	DCD[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCD[7:0]	H'00	R	Invalid	Lower bytes of the counted amount of data to be compressed

45.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR bit in JCDERR indicates the particular error code.

Bit:	7	6	5	4	3	2	1	0
	INT7	INT6	INT5	—	INT3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	Invalid	Invalid	R	Invalid	R	R	R
R/W(De-compression):	R/W	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	INT7	0	Invalid	R/W	This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
6	INT6	0	Invalid	R/W	This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
5	INT5	0	Invalid	R/W	This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
4	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
3	INT3	0	Invalid	R/W	This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data.
2 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

45.2.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.
The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

Bit:	7	6	5	4	3	2	1	0
	—	INS6	INS5	—	INS3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R/W*	Invalid	R	Invalid	R	R	R
R/W(De-compression):	R	R/W*	R/W*	R	R/W*	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	INS6	0	R/W∗		This bit is set to 1 when the JCU completes compression process normally.
5	INS5	0	Invalid	R/W∗	This bit is set to 1 when a compressed data error occurs.
4	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
3	INS3	0	Invalid	R/W∗	This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCU resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
2 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

Note: ∗ Clear this bit by writing 0 to it. Do not write 1 to this bit.

45.2.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCU starts decompression.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	ERR[3:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0	R		Reserved These bits are always read as 0.
3 to 0	ERR[3:0]	1010	Invalid	R/W	Error Code (See Table 45.3 and Table 45.4)

45.2.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	RST
Initial value:	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	Invalid
R/W(De-compression):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 1	—	All 0	R		Reserved These bits are always read as 0.
0	RST	0	Invalid	R/W	Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0

45.2.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	JOUTRINI	JOUTRCMD	JOUTC	—	JOUTSWAP[2:0]			—	DINRINI	DINRCMD	DINLC	—	DINSWAP[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W
R/W(De-compression):	R	Invalid	Invalid	Invalid	R	Invalid	Invalid	Invalid	R	Invalid	Invalid	Invalid	R	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
14	JOUTRINI	0	R/W	Invalid	Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted.
13	JOUTRCMD	0	R/W	Invalid	Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0.
12	JOUTC	0	R/W	Invalid	Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on.
11	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	JOUTSWAP[2:0]	000	R/W	Invalid	Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
6	DINRINI	0	R/W	Invalid	Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted.
5	DINRCMD	0	R/W	Invalid	Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0.
4	DINLC	0	R/W	Invalid	Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DINSWAP [2:0]	000	R/W	Invalid	Byte/Word Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

45.2.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ESA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ESA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	ESA[31:3]	H'0000	R/W	Invalid	Input Image Data Source Address (in 8-byte units)
2 to 0	ESA[2:0]	0000	R		The lower three bits should be set to 0.

45.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ESMW[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W(De-compression):	R	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
14 to 3	ESMW[14:3]	H'0000	R/W	Invalid	Input Image Data Lines Offset (in 8-byte units)
2 to 0	ESMW[2:0]		R		The lower three bits should be set to 0.

45.2.21 JPEG Interface Compression Destination Address Register (JIFEDA)

JIFEDA sets the destination address of the output coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EDA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	EDA[31:3]	H'0000	R/W	Invalid	Output Coded Data Destination Address (in 8-byte units)
2 to 0	EDA[2:0]	0000	R		The lower three bits should be set to 0.

45.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LINES[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	LINES[15:3]	H'FFF8	R/W	Invalid	Number of Input Image Data Lines to be Read (in 8-line units)
2 to 0	LINES[2:0]		R		The lower three bits should be set to 0.

45.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0
R/W(Compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
R/W(De-compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R	Invalid	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	R/W	Invalid	Amount of Output Coded Data to be Written (in 8-byte units)
2 to 0	JDATAS[2:0]		R		The lower three bits should be set to 0.

45.2.24 JPEG Interface Decompression Control Register (JIFDCNT)

JIFDCNT controls the decompression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VINTER[1:0]		HINTER[1:0]		OPF[1:0]		—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	JINR INI	JINR CMD	JINC	—	JINSWAP[2:0]			—	DOUT RINI	DOUT RCMD	DOUT LC	—	DOUTSWAP[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W(De-compression):	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31, 30	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VINTER[1:0]	00	Invalid	R/W	Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
27, 26	HINTER[1:0]	00	Invalid	R/W	Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
25, 24	OPF[1:0]	00	Invalid	R/W	Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited
23 to 15	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
14	JINRINI	0	Invalid	R/W	Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted.
13	JINRCMD	0	Invalid	R/W	Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0.
12	JINC	0	Invalid	R/W	Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on.
11	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
10 to 8	JINSWAP [2:0]	000	Invalid	R/W	Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	DOUTRINI	0	Invalid	R/W	Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted.
5	DOUTRCMD	0	Invalid	R/W	Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0.
4	DOUTLC	0	Invalid	R/W	Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DOUTSWAP [2:0]	000	Invalid	R/W	Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

45.2.25 JPEG Interface Decompression Source Address Register (JIFDSA)

JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 3	DSA[31:3]	H'0000	Invalid	R/W	Input Coded Data Source Address (in 8-byte units)
2 to 0	DSA[2:0]	0000		R	The lower three bits should be set to 0.

45.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DDMW[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 15	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
14 to 3	DDMW[14:3]	H'0000	Invalid	R/W	Output Image Data Lines Offset (in 8-byte units)
2 to 0	DDMW[2:0]			R	The lower three bits should be set to 0.

45.2.27 JPEG Interface Decompression Destination Address Register (JIFDDA)

JIFDDA sets the destination address of the output image data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DDA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
R/W(De-compression):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W Compression	R/W De-compression	Description
31 to 3	DDA[31:3]	H'0000	Invalid	R/W	Output Image Data Destination Address (in 8-byte units)
2 to 0	DDA[2:0]	0000		R	The lower three bits should be set to 0.

45.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	Invalid	R/W	Amount of Input Coded Data to be Read (in 8-byte units).
2 to 0	JDATAS[2:0]			R	The lower three bits should be set to 0.

45.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLC)

JIFDDLC sets the number of lines of output image data when the count mode for stopping the output of image data lines is on (the DOUTLC bit in JIFECNT is set to 1). This register is used to set the number of lines of output image data in MCU units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3 2 to 0	LINES[15:3] LINES[2:0]	H'FFF8	Invalid	R/W R	Specify the number of lines of output image data to be written. The setting is in MCU units. When data are to be output in YCbCr444, YCbCr422 or YCbCr411 format, the number of lines of output image data is <this setting> x 1. When data are to be output in YCbCr420 format, the number of lines of output image data is <this setting> x 2. The lower three bits should be set to 0.

45.2.30 JPEG Interface Decompression α Set Register (JIFDADT)

JIFDADT is used to set the α value when output is in ARGB8888 format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W(De-compression):	R	R	R	R	R	R	R	R	R	Invalid	Invalid	Invalid	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the CBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
5	DINLEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the DINLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
4	JOUTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the JOUTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
1	JINEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the JINF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
0	DOUTLEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DOUTLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

45.2.32 JPEG Interrupt Status Register 1 (JINTS1)

JINTS1 indicates the interrupt sources.

The interrupt sources of this register should be cleared by writing 0 to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CBTF	DINLF	JOUTF	—	DBTF	JINF	DOUTLF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R	Invalid	Invalid	Invalid
R/W(De-compression):	R	R	R	R	R	R	R	R	R	Invalid	Invalid	Invalid	R	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTF	0	R/W*	Invalid	This bit is set to 1 when the last output coded data is written in compression.
5	DINLF	0	R/W*	Invalid	This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1.
4	JOUTF	0	R/W*	Invalid	This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTF	0	Invalid	R/W*	This bit is set to 1 when the last output image data is written in decompression.
1	JINF	0	Invalid	R/W*	This bit is set to 1 when the amount of input coded data indicated by JIFDSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1.
0	DOUTLF	0	Invalid	R/W*	In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDLC have been written. This bit is only valid when the DOUTLC bit in JIFDCNT is set to 1.

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

45.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUTY CHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(Compression):	Invalid	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(De-compression):	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
15	DOUTYCHG	0	Invalid	R/W	Output Image Data CbCr Range Setting 0: Range from -128 to 127 1: Range from 0 to 255
14 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

45.3 Operation

45.3.1 Compression

(1) Overview of Processing

The compression process flows are described below.

1. The JPEG core is activated.
   A marker is output. (After a marker is output, image data can be input.)
   Approximately 30,000 cycles (necessary for making SOI to SOS markers)
2. Image data is transferred in MCUs from the external buffer to the JCU.
   If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.
   When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the DINRINI bit is one, the address set in JIFESA is used on resumption.
   Reading is also stopped when one frame of image data is completely transferred.
   If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.
3. Image data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Coded data is transferred from the JCU to the external buffer.
   When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.
   When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.
   Writing is also stopped when one frame of coded data is completely transferred.
   If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.
5. Compression is completed after one frame of data is processed completely.

(2) Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCU has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.

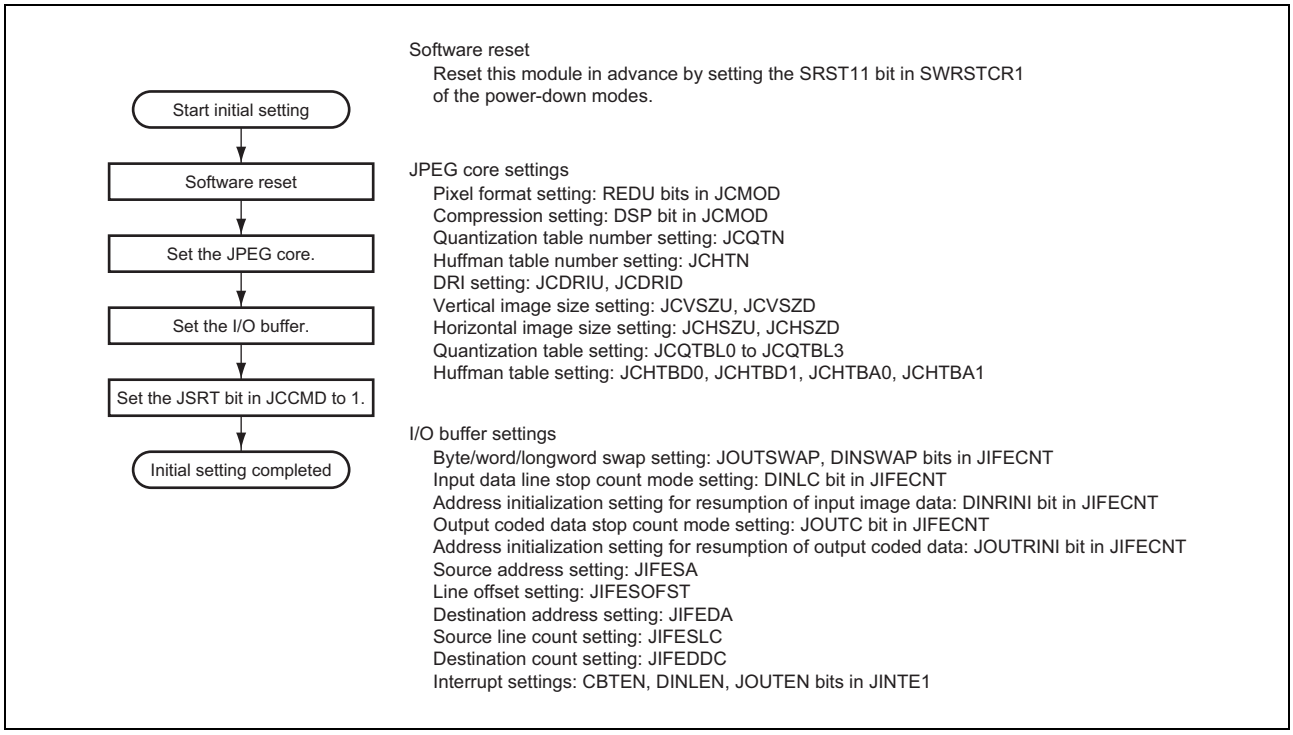

Figure 45.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
  When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the DINRINI bit is one, the address set in JIFESA is used on resumption.

- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.
  When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
  When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

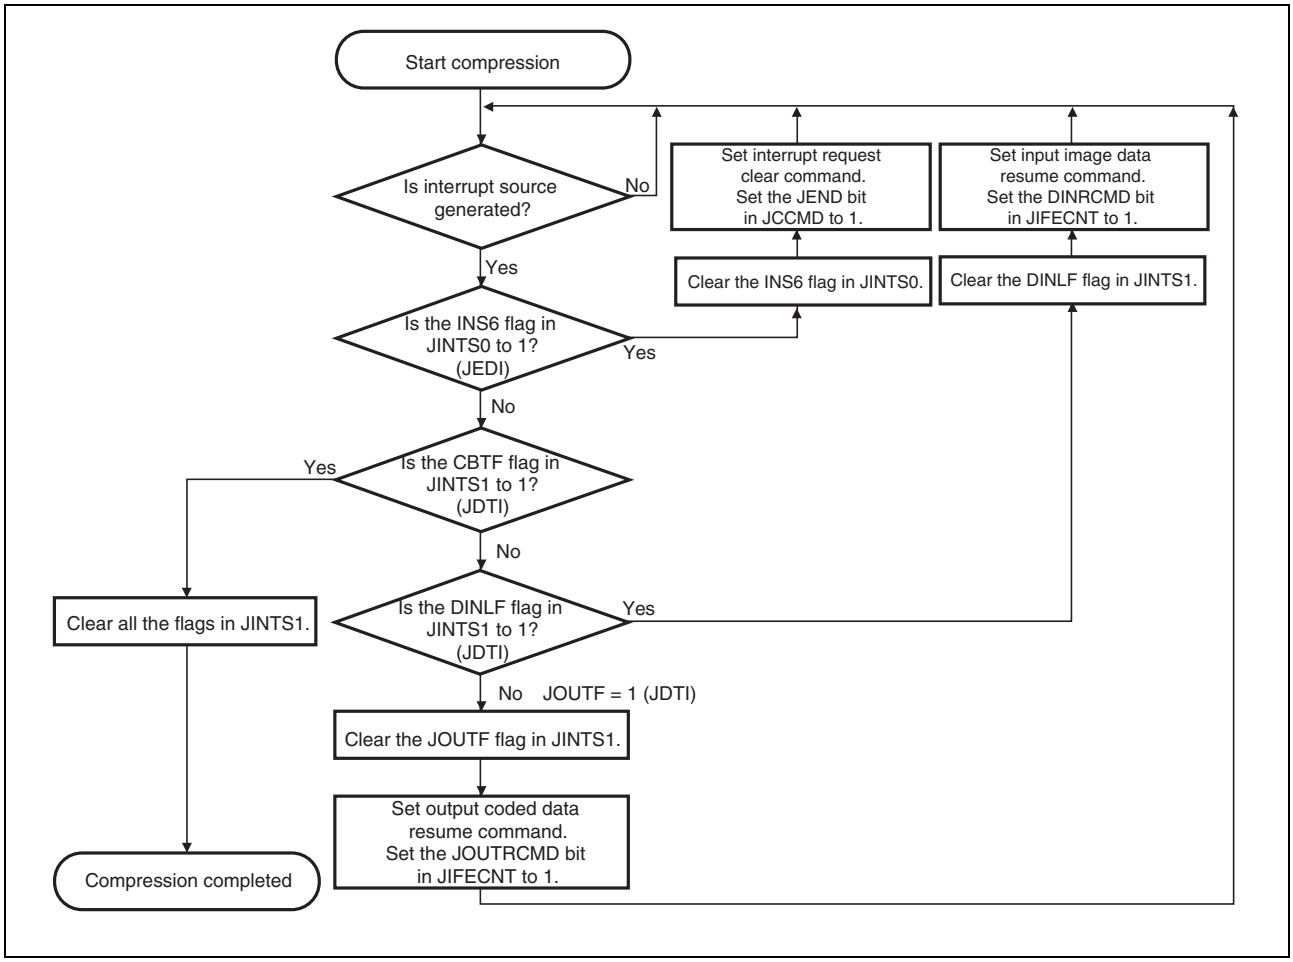

Figure 45.3 Compression Process Flow

(3) JPEG Coded Data Format

Figure 45.4 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'0000 0000, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

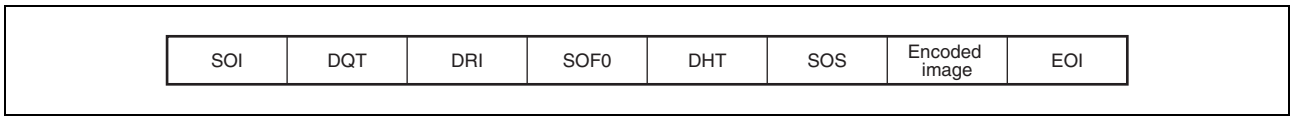

Figure 45.4 JPEG Coded Data Format

DQT: Not output for unused table.
DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.
SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.
SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (±65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9)

(4) Table Setting

(a) Quantization Table Specification

The order of addresses shown in 8 × 8 blocks corresponds to that of the register addresses. Do not access this table while the JCU is in processing.

Table 45.2 Quantization Table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F
10	11	12	13	14	15	16	17
18	19	1A	1B	1C	1D	1E	1F

28	29	2A	2B	2C	2D	2E	2F
30	31	32	33	34	35	36	37
38	39	3A	3B	3C	3D	3E	3F

JCQTBL0 (H'E801 7100) = H'00
JCQTBL0 (H'E801 7101) = H'01
JCQTBL0 (H'E801 7102) = H'02
JCQTBL0 (H'E801 7103) = H'03
:
JCQTBL0 (H'E801 713F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table:The number of codes for each code length is 12.
  The group numbers in order of frequency of occurrence are 12.
- AC Huffman table:The number of codes for each code length is 162.
  The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCU is in processing. In particular, read access is prohibited.

- Table K.3/T81
  JCHTBD0 (H'E801 7200) = H'00
  JCHTBD0 (H'E801 7201) = H'01
  JCHTBD0 (H'E801 7202) = H'05
  JCHTBD0 (H'E801 7203) = H'01
  :
  JCHTBD0 (H'E801 721B) = H'0B
- Table K.4/T81
  JCHTBD1 (H'E801 7300) = H'00
  JCHTBD1 (H'E801 7301) = H'03

  JCHTBA0 (H'E801 7223) = H'03
  :
  JCHTBA0 (H'E801 72D1) = H'FA

- Table K.6/T81
  JCHTBA1 (H'E801 7320) = H'00
  JCHTBA1 (H'E801 7321) = H'02
  JCHTBA1 (H'E801 7322) = H'01
  JCHTBA1 (H'E801 7323) = H'02
  :
  JCHTBA1 (H'E801 73D1) = H'FA

(5) Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP bits in JIFECNT as shown below.

- When the DINSWAP bits = 000

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits

- When the DINSWAP bits = 001

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- When the DINSWAP bits = 010

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits

- When the DINSWAP bits = 100

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits

- When the DINSWAP bits = 101

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits

- When the DINSWAP bits = 110

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits

- When the DINSWAP bits = 111

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

(6) Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.
The JOUTSWAP bits in JIFECNT can be used to alter the arrangement of coded data in the output.

45.3.2 Decompression

(1) Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCU.
   If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSLC is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.
   If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected. With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JCU to the external buffer.
   When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDLC is written. Writing is resumed by setting the DOUTRCMD bit in JIFECNT to 1. When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.
   If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
  After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
  After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
  When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
  After the image size and pixel format have been read, set the output buffer.
  Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

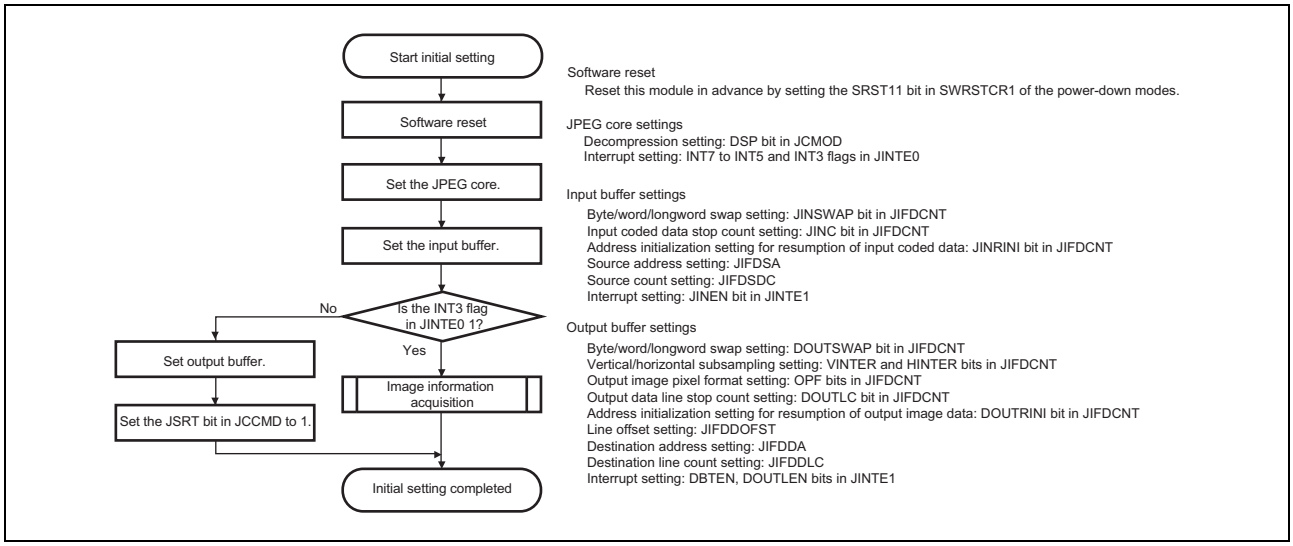

Figure 45.5 Decompression Initial Setting Flow

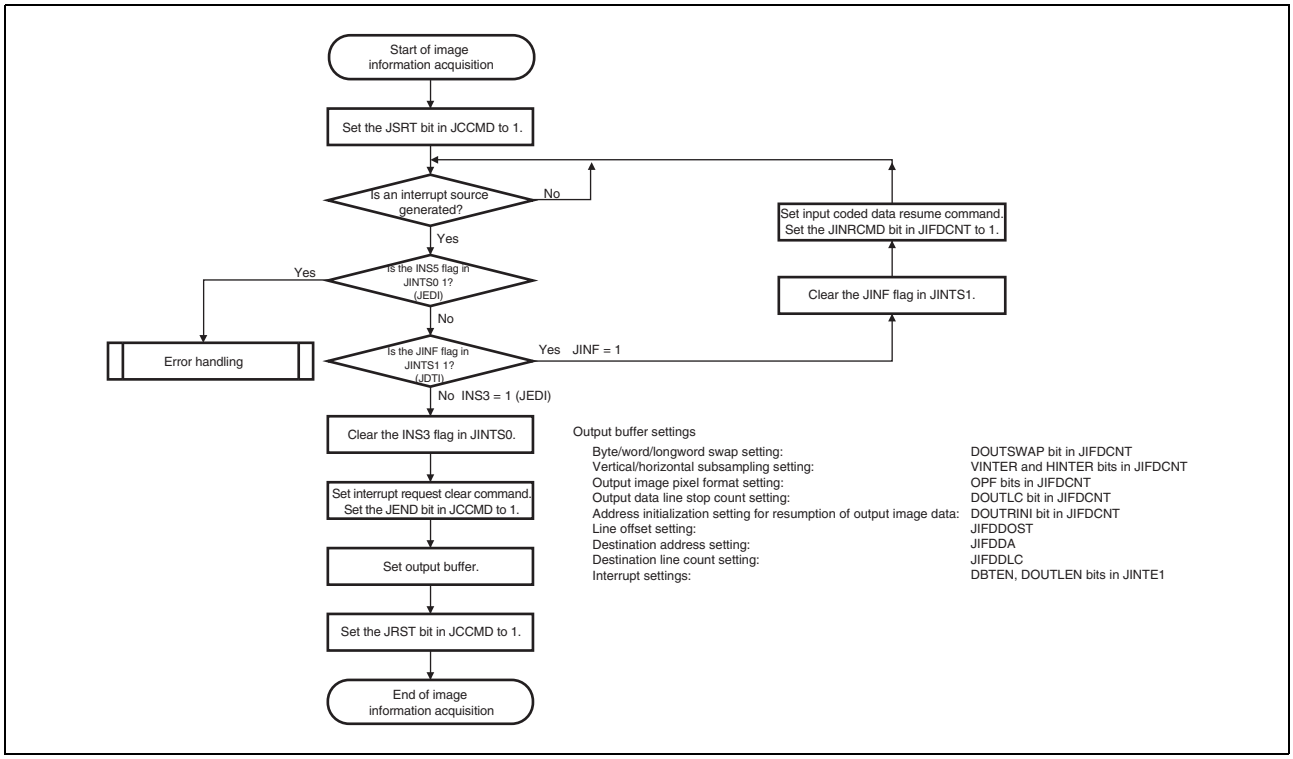

Figure 45.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFDSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.
  When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the JINRINI bit is one, the address set in JIFDSA is used on resumption.
- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDLC have been written, the DOUTLF flag in JINT1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.
  When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
  When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

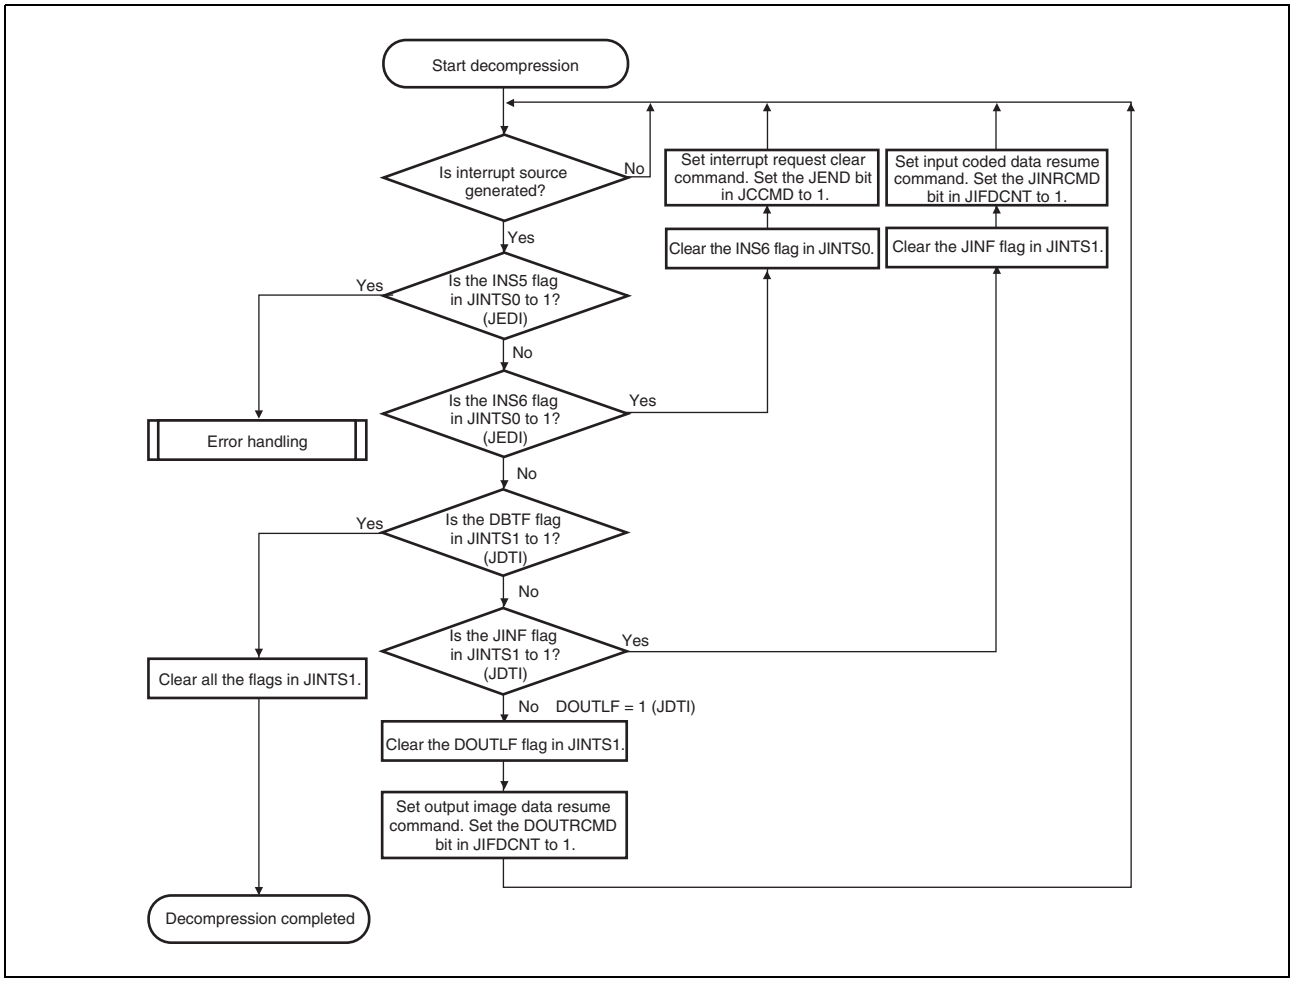

Figure 45.7 Decompression Process Flow

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).
If decompression or compression is to proceed after error handling is completed, start by making the initial settings.

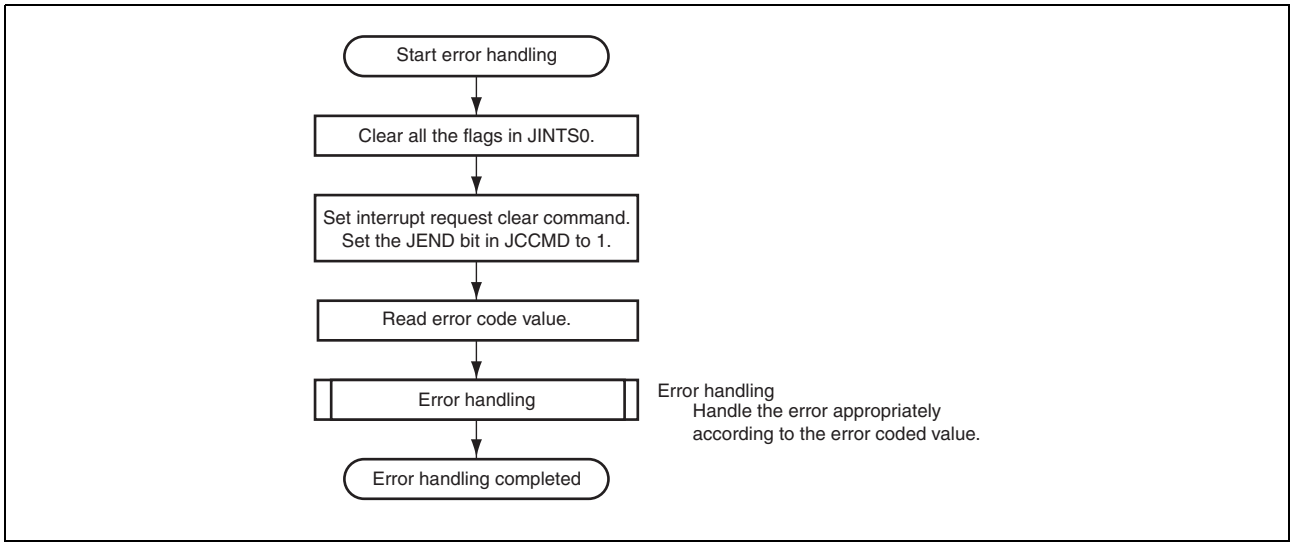

Figure 45.8 Error Handling Flow

(2) Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read.
The JINSWAP bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in Table 45.3) is set to ERR bits in JCDERR. When an error is detected, the JCU generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 45.3 Decompression Error Codes

Code	Description
B'0000	Normal
B'0001	SOI not detected: SOI not detected until EOI detected
B'0010	SOF1 to SOFF detected
B'0011	Unprovided pixel format detected
B'0100	SOF accuracy error: Other than 8 detected
B'0101	DQT accuracy error: Other than 0 detected
B'0110	Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4
B'0111	Component error 2: The number of components differs between SOF0 header and SOS
B'1000	SOF0, DQT, and DHT not detected when SOS detected
B'1001	SOS not detected: SOS not detected until EOI detected
B'1010	EOI not detected (default)
B'1011	Restart interval data number error detected
B'1100	Image size error detected
B'1101	Last MCU data number error detected
B'1110	Block data number error detected

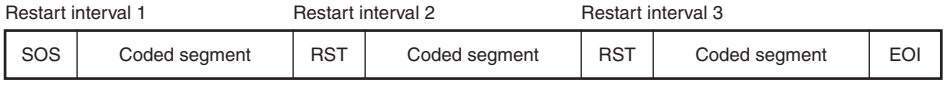
(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR bit in JCDERR. Table 45.4 lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a bus reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels



- Number of data in the last MCU: Pixel format setting is YCbCr422, the number of data to be decoded in each MCU is 256.
- Number of data in the restart interval: In restart intervals 1 and 2, there are data of two MCUs; the number of data to be decoded is 512.
- Image size: The total number of data to be decoded is 1280.

Figure 45.9 Huffman Coded Segment

Table 45.4 Segment Error Codes

Code	Description
B'0000	Normal
B'1011	Restart interval data number error: The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data that is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also an m which indicates the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 is set to 0, this error is not detected.
B'1100	Image size error: The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.
B'1101	Last MCU data number error: Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.
B'1110	Block data number error: Whether a block is an 8×8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.

45.3.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

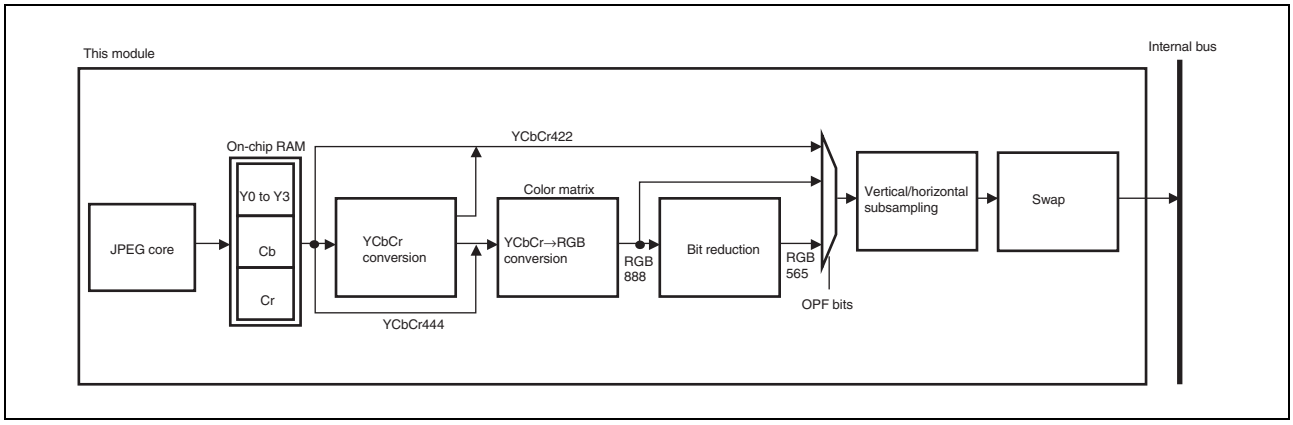


Figure 45.10 Block Diagram of Output Pixel Format Conversion in Decompression

(1) On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

(2) YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411 or YCbCr420 format are first converted to the YCbCr444 format.
When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.
Conversion is performed using simple interpolation.

(3) YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.
R = 1.000Y + 1.402Cr
G = 1.000Y - 0.344Cb - 0.714Cr
B = 1.000Y + 1.772Cb

(4) Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

(5) Output Pixel Format Selection

The pixel format to be output is selected by the OPF bit in JIFDCNT.
Allocation of data (while the DOUTSWAP bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
Y0 8 bits	Cb 8 bits	Y1 8 bits	Cr 8 bits

- ARGB8888 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
*	Red 8 bits	Green 8 bits	Blue 8 bits

Note: * This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

b15 – b11	b10 – b5	b4 – b0
Red 5 bits	Green 6 bits	Blue 5 bits

(6) Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER and HINTER bit setting in JIFDCNT.
Figure 45.11 to Figure 45.13 show line subsampling modes.
For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures.
For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.
As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.
Table 45.5 and Table 45.6 show the values of n and m in the figures.

Horizontal:

Table 45.5 Number of Horizontal Blocks

Compression Format	Output Format	n
YCbCr444	YCbCr422	1/2
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	2
YCbCr411	YCbCr422	2
YCbCr411	ARGB8888, RGB565	4
YCbCr420	YCbCr422	1
YCbCr420	ARGB8888, RGB565	2

Vertical:

Table 45.6 Number of Vertical Blocks

Compression Format	Output Format	m
YCbCr444	YCbCr422	1
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	1
YCbCr411	YCbCr422	1
YCbCr411	ARGB8888, RGB565	1
YCbCr420	YCbCr422	2
YCbCr420	ARGB8888, RGB565	2

- Subsampling into 1/2
  Even lines are skipped by subsampling.

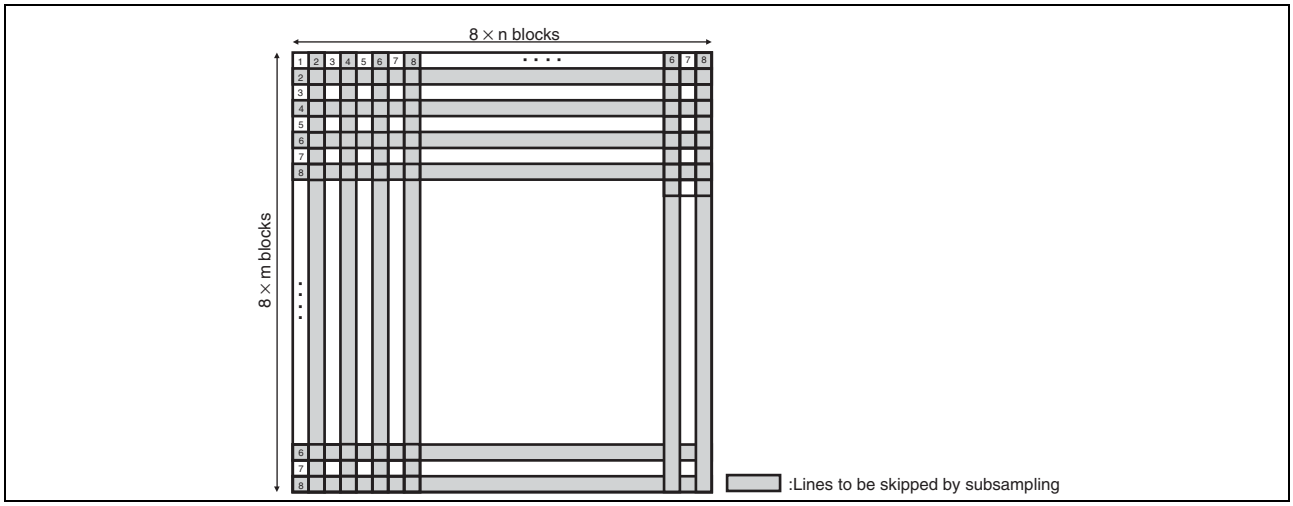

Figure 45.11 MCU when subsampling into 1/2 is selected

- Subsampling into 1/4
  The second, third, and fourth lines are skipped by subsampling.

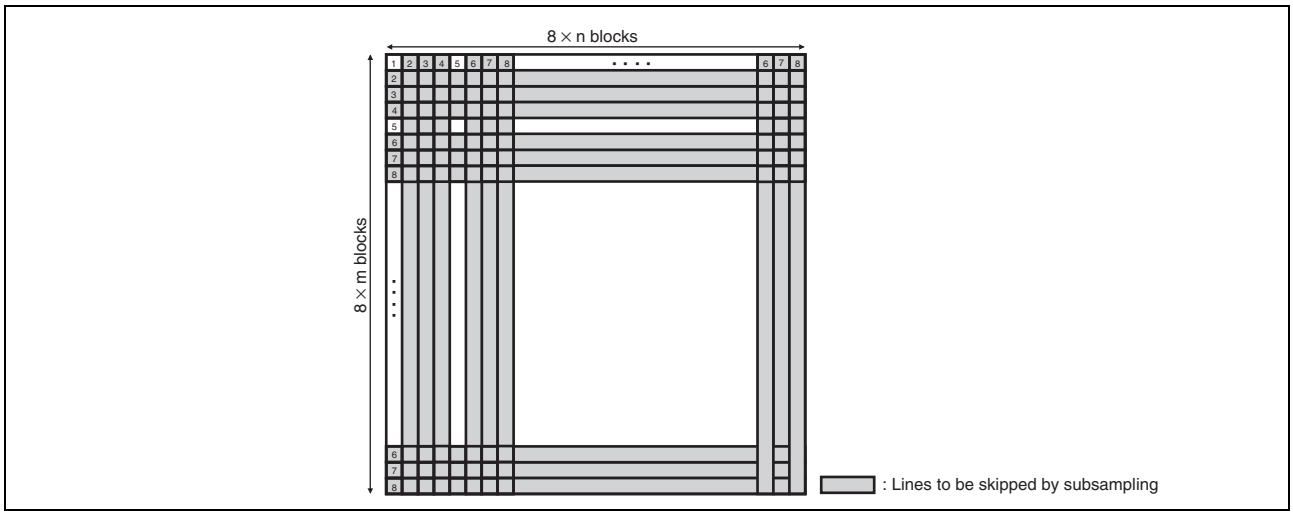

Figure 45.12 MCU when subsampling into 1/4 is selected

- Subsampling into 1/8
  The second, third, fourth, fifth, sixth, seventh, and eighth lines are skipped by subsampling.

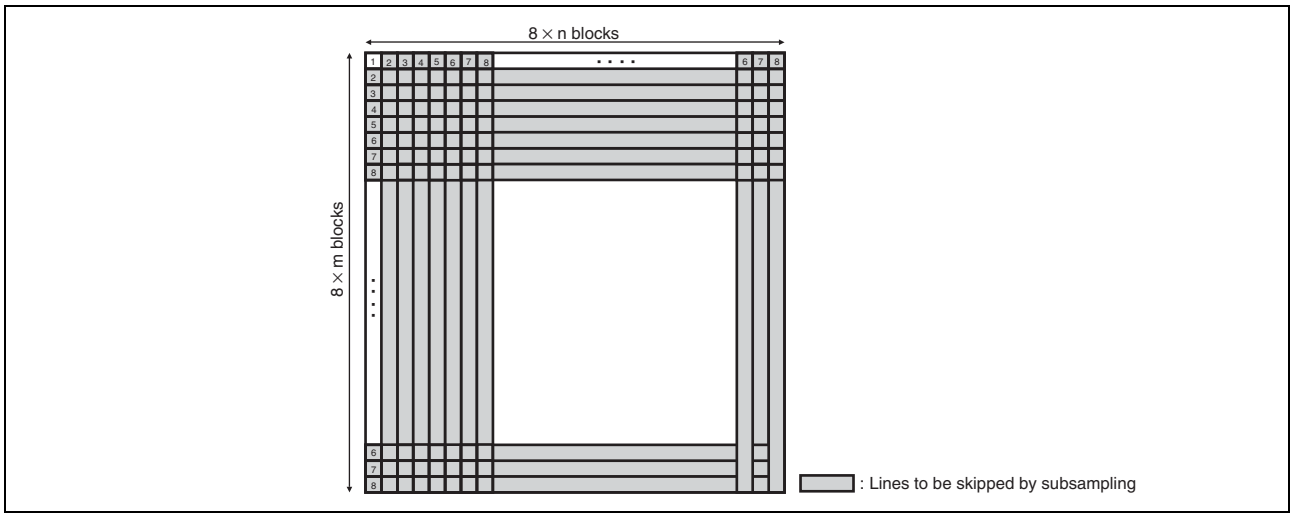

Figure 45.13 MCU when subsampling into 1/8 is selected

(7) Swap

Allocation of data can be changed by the DOUTSWAP bits in JIFECNT.

45.3.4 Storing Image Data

Figure 45.14 shows the buffer area for storing the image data.

- Start address
  Compression: JIFESA
  Decompression: JIFDDA
- Horizontal size
  Compression, decompression: JCHSZU, JCHSZD
- Vertical size
  Compression, decompression: JCVSAU, JCVSZD
- Offset
  Compression: JIFESOFST
  Decompression: JIFDDOFST

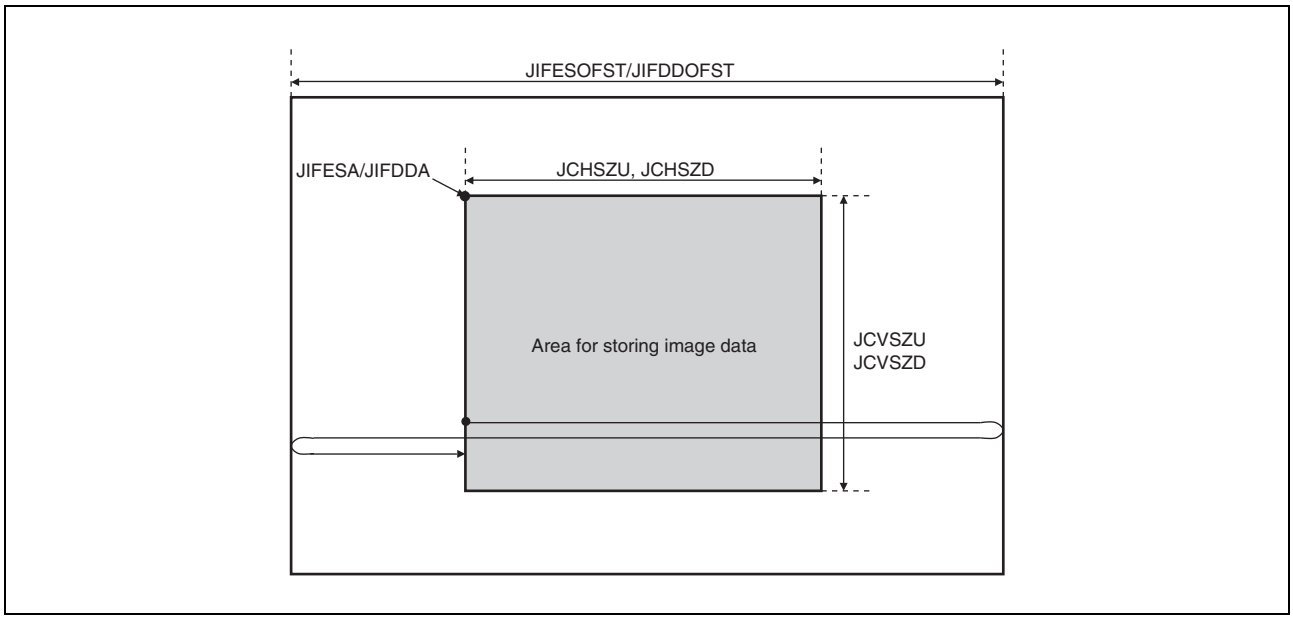

Figure 45.14 Image of Storing Image Data

45.4 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

45.4.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

(1) Compression

- JPEG compression process end
  When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCU completes compression.
-

(2) Decompression

- JPEG decompression process end
  When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCU completes decompression.
- JPEG decompression error occurrence
  When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCU has stopped the decompression process. Read the error code (ERR bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.
- Request for reading the image size and pixel format
  When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

45.4.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines has been read
  When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of output coded data have been written to
  When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  When the CBTF bit in JINTS1 is 1, the JCU has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines has been written to
  When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDLC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read
  The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  The DBTF bit in JINTS1 becomes 1 when the JCU has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

45.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset.
When the JCU is in operation, the bus reset command should not be issued. Registers below are initialized by a bus reset.

- JPEG code data count upper register (JCDTCU)
- JPEG code data count middle register (JCDTCM)
- JPEG code data count lower register (JCDTCD)
- JPEG interrupt status register 0 (JINTS0)
- JPEG code decode error register (JCDERR)
- JPEG code reset register (JCRST)

46. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

46.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

46.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 46.1, and the main functions and their details are shown in Table 46.2.

Table 46.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Connectable camera	Size	5 megapixels	2,560 pixels × 1,920 lines	Horizontal: 4-pixel units Vertical: 4-line units The range of the image size that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 lines to 96 lines [Note] This depends on the AC characteristics of the device to be connected, frame rate of the connected device, and transfer speed to the destination RAM.
		3 megapixels	2,048 pixels × 1,536 lines	
		2 megapixels	1,632 pixels × 1,224 lines	
		UXGA	1,600 pixels × 1,200 lines	
		SXGA (1)	1,280 pixels × 1,024 lines	
		SXGA (2)	1,280 pixels × 960 lines	
		WXGA	1,280 pixels × 768 lines	
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
		QQVGA	160 pixels × 120 lines	
		Sub-QCIF	128 pixels × 96 lines	
	Input format	YCbCr422 8 bits	Cb_0, Y_0, Cr_0, $Y_{1...}$	Supports clock ratio of 1:1
			Cr_0, Y_0, Cb_0, $Y_{1...}$	
			Y_0, Cb_0, Y_1, $Cr_{0...}$	
			Y_0, Cr_0, Y_1, $Cb_{0...}$	
		YCbCr422 16 bits	{Y0, Cb0}, {Y1, Cr0}, …	
			{Y0, Cr0}, {Y1, Cb0}, …	
		Binary data	Specified amount to be fetched on edges of the sync signal	Written sequentially
			Data is fetched with the horizontal sync signal as an enable signal.	
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 4-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image	Capture: 2-VD (vertical sync signal) units
			Stored as a frame image	
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr422 YCbCr420	YCbCr420 is realized by simple skipping	

Table 46.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction

Table 46.2 Main Functions of CEU and Their Details

Main Function	Detailed Description
Image data fetch	• Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.
Format conversion	Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

Figure 46.1 shows a block diagram of the CEU.

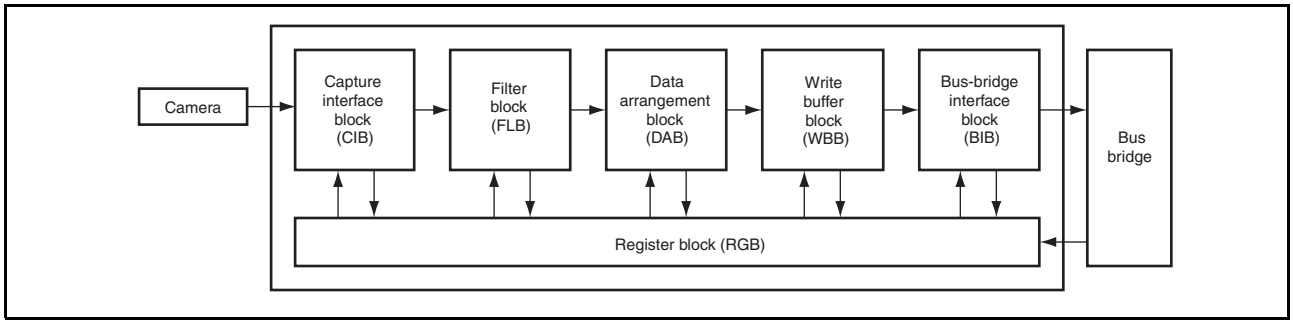

Figure 46.1 Block Diagram of CEU

46.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 46.3.

Table 46.3 Pin Configuration of CEU

Pin Name	Function	I/O	Description
VIO_D15 to VIO_D0*	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD	Field signal	Input	Field identification signal to the CEU

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D15 to VIO_D0 are used.

46.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 46.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 46.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 46.4 Register Configuration of CEU

			Addresses			
Register Name	Abbr.	R/W	Address (Plane A)	Address (Plane B)	Mirror Address	Access Size
CEU Capture start register	CAPSR	R/W	H'E821 0000	—	—	32
CEU Capture control register	CAPCR	R/W	H'E821 0004	—	—	32
CEU Capture interface control register*	CAMCR	R/W	H'E821 0008	—	—	32
CEU Capture interface cycle register*	CMCYR	R/W	H'E821 000C	—	—	32

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPKIL	0	R/W	Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 46.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CE	0	R/W	• Single-capture This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 46.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted. As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0. The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode. Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR. • Continuous capture When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 46.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed. Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame. 0: Stops capturing 1: Starts capturing

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 46.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

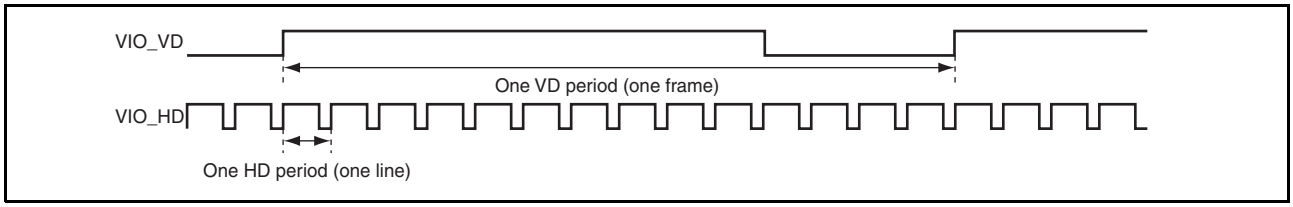

Figure 46.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 46.4 shows the timing of one field (when both the VD and HD polarities are high-active).

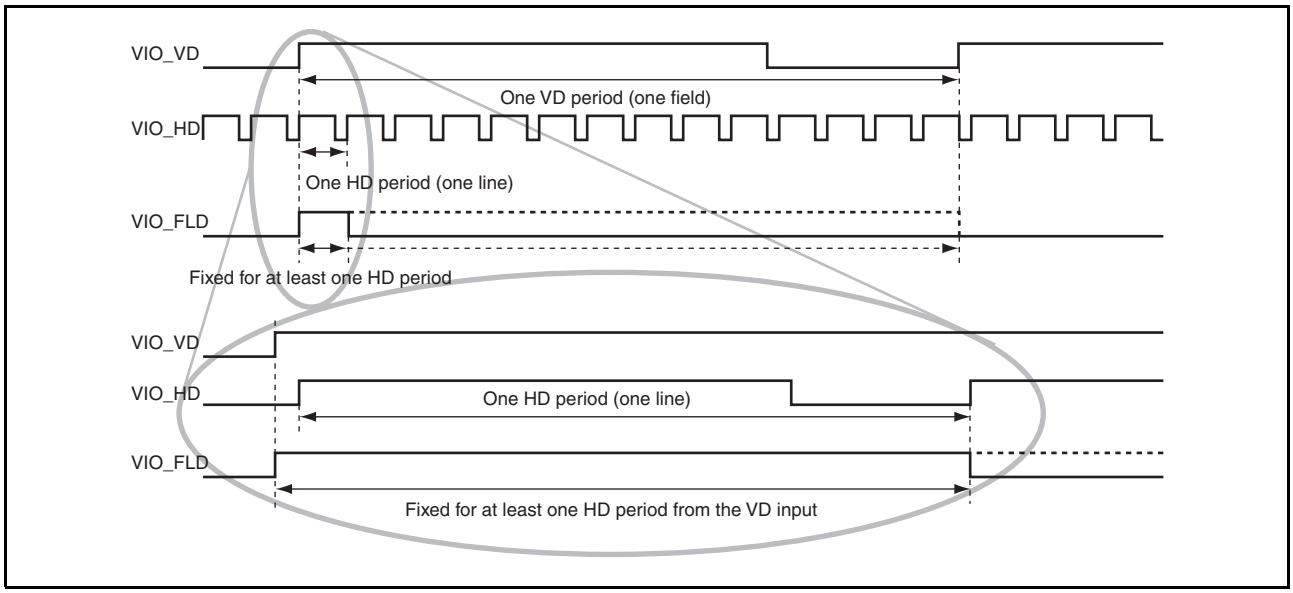

Figure 46.4 One Field Timing

In data enable fetch, one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 46.5 shows the timing of one frame for data enable fetch.

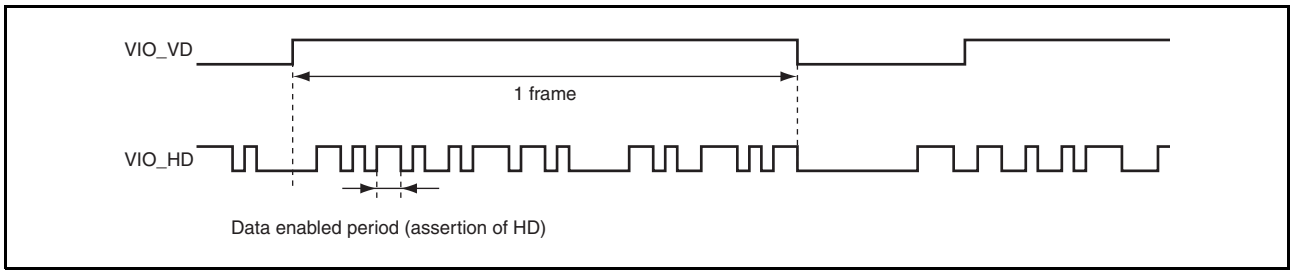

Figure 46.5 Frame Timing (Data Enable Fetch)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FDRP[7:0]	H'00	R/W	These bits set the frame drop interval in continuous-frame capture. When these bits are cleared to 0, frame drop is not performed, and all frames are captured. Figure 46.9 shows the value set in these bits and the timing of captured frames. The frame drop interval unit differs according to the capture setting. Table 46.5 shows the relationship between the capture setting and frame drop interval unit. The image of the frame drop timing for each capture setting when these bits are set to 2 is shown in Figure 46.10. In both-field capture, capturing is performed continuously for 2-VD periods, regardless of whether the second field is the top field or bottom field. In addition, in both-field capture, the frame drop counter is incremented when the first field has been identified as the top field or bottom field, regardless of whether the second field is the top field or bottom field. When 0 is written to the CE bit in CAPSR, capturing terminates after the current frame has been captured for a capture frame. However, for a drop frame, capturing is forcibly terminated in the CEU so no capture end interrupt (CPE bit in CETCR) is output. While CE bit is 1, do not change the setting of these bits. Note: Do not change the setting of these bits during continuous capture operations. To change the setting of these bits, stop continuous capture (CE bit = 0), clear the CTNCP bit (continuous capture) in CAPCR to 0, and then restart continuous capture. Continuous capture is performed during the period of CAPSR.CE = 1 shown in Figure 46.9.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	MTCM[1:0]	00	R/W	These bits specify the unit for transferring data to a bus bridge module. The efficiency of writing image data can be improved by continuously accessing the addresses. To improve the write efficiency, set these bits to 11. The setting of these bits appear to be unchanged from the outside. 00: Transferred to the bus in 32-byte units 01: Transferred to the bus in 64-byte units 10: Transferred to the bus in 128-byte units 11: Transferred to the bus in 256-byte units (1) Image capture 00: Y data and C data are transferred in 32-byte units 01: Y data and C data are transferred in 64-byte units 10: Y data and C data are transferred in 128-byte units 11: Y data and C data are transferred in 256-byte units (2) Data fetch 00: Data is transferred in 32-byte units 01: Data is transferred in 64-byte units 10: Data is transferred in 128-byte units 11: Data is transferred in 256-byte units

Bit	Bit Name	Initial Value	R/W	Description
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CTNCP	0	R/W	When capturing is started with this bit set to 1, capturing continues until the CE bit in CAPSR is cleared to 0 or a software reset is initiated by the CPKIL bit in CAPSR (see Figure 46.8). Continuous capture must be set before capturing is started. This bit is modified only after 0 is written to the CE bit to stop capturing. If this bit is modified during capturing, correct operation cannot be guaranteed. In data fetch mode, clear this bit to 0. 0: One-frame capture when the CE bit is 1 1: Continuous capture until the CE bit is cleared to 0
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

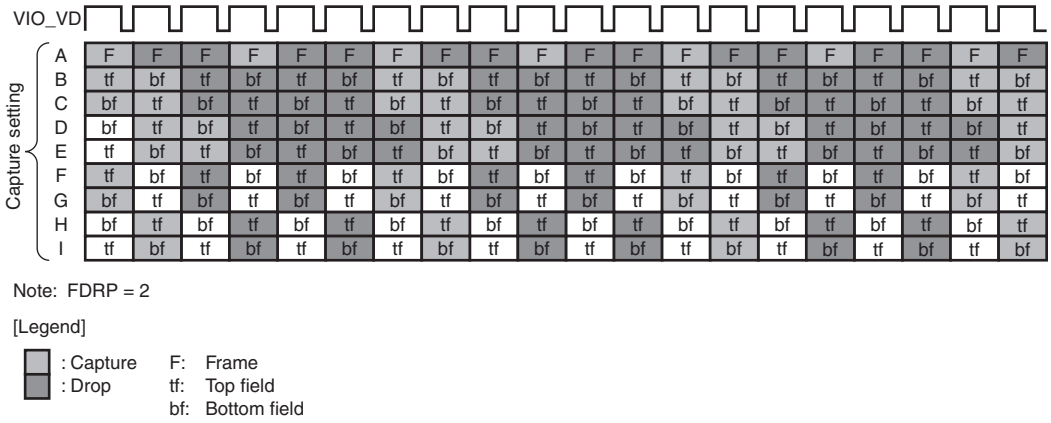

Figure 46.10 Image of Frame Drop Timing for Capture Settings (FDRP Bits = 2)

46.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between the rising edge or falling edge of the camera clock for signal capture or data fetch operation
- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits or 16 bits)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	VDSEL	0	R/W	Sets the edge for capturing the vertical sync signal (VD) from an external module. 0: VD is captured at the rising edge of the camera clock. 1: VD is captured at the falling edge of the camera clock.
26	HDSEL	0	R/W	Sets the edge for capturing the horizontal sync signal (HD) from an external module. 0: HD is captured at the rising edge of the camera clock. 1: HD is captured at the falling edge of the camera clock.
25	FLDSEL	0	R/W	Sets the edge for capturing the field identification signal (FLD) from an external module. 0: FLD is captured at the rising edge of the camera clock. 1: FLD is captured at the falling edge of the camera clock.
24	DSEL	0	R/W	Sets the edge for fetching the image data (D7 to D0) from an external module. 0: D7 to D0 are fetched at the rising edge of the camera clock. 1: D7 to D0 are fetched at the falling edge of the camera clock.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	FLDPOL	0	R/W	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTIF	0	R/W	Sets the digital image input pins from which data is to be captured. 0: Data input to 8-bit digital image input pins is captured 1: Data input to 16-bit digital image input pins is captured
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	DTARY[1:0]	00	R/W	These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 46.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. (1) 8-bit interface 00: Image input data is fetched in the order of Cb_0, Y_0, Cr_0, and Y_1 01: Image input data is fetched in the order of Cr_0, Y_0, Cb_0, and Y_1 10: Image input data is fetched in the order of Y_0, Cb_0, Y_1, and Cr_0 11: Image input data is fetched in the order of Y_0, Cr_0, Y_1, and Cb_0 (2) 16-bit interface 00: Image input data is fetched in the order of {Cb0, Y0} and {Cr0, Y1} 01: Image input data is fetched in the order of {Cr0, Y0} and {Cb0, Y1} 10: Image input data is fetched in the order of {Y0, Cb0} and {Y1, Cr0} 11: Image input data is fetched in the order of {Y0, Cr0} and {Y1, Cb0}
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	JPG[1:0]	00	R/W	These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 10: Data enable fetch mode (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VDPOL	0	R/W	Sets the polarity for detection of the vertical sync signal input from an external module. Figure 46.14 and Figure 46.15 show the relationship between the VIO_VD and VIO_HD signals and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active
0	HDPOL	0	R/W	Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 46.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active

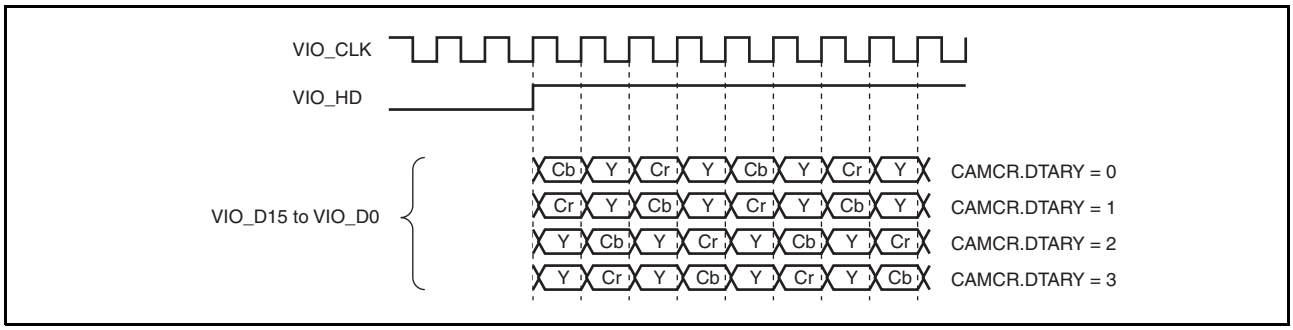

Figure 46.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled.

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.
This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.
Figure 46.12 and Figure 46.13 show the interface timing in data enable fetch mode.

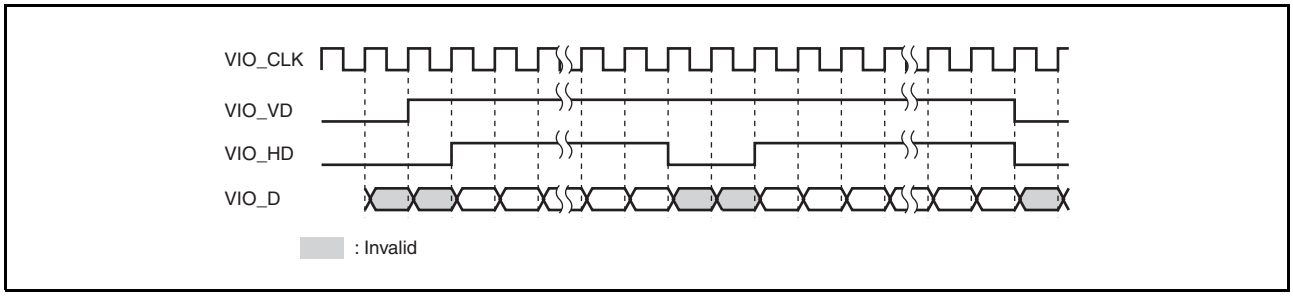

Figure 46.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

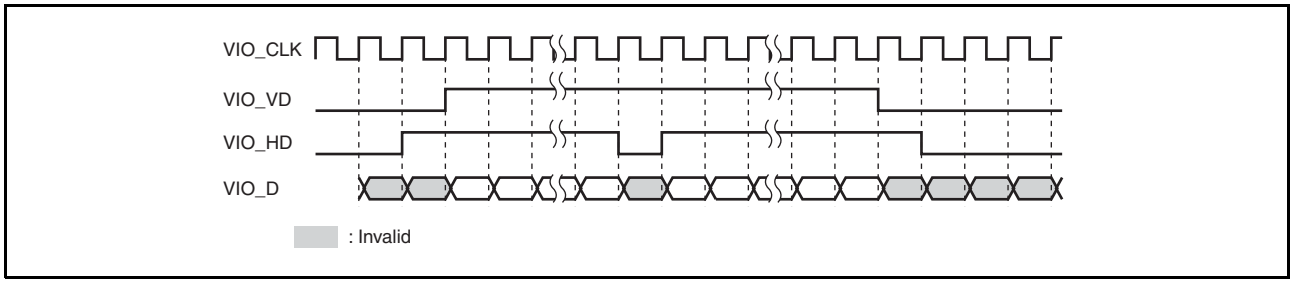

Figure 46.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.
Figure 46.14 to Figure 46.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

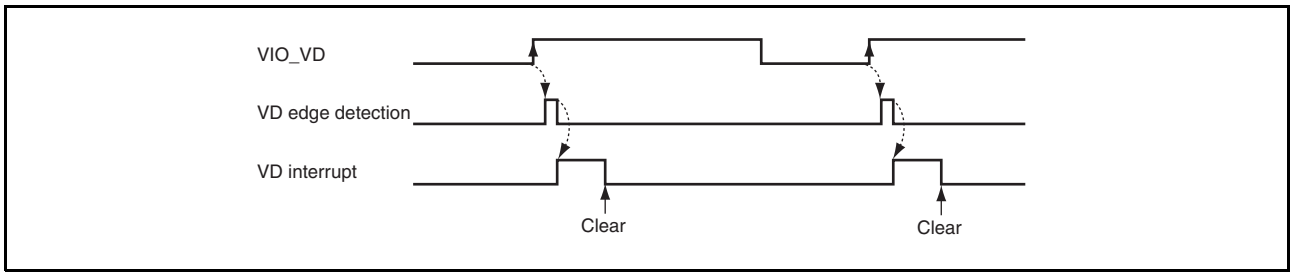

Figure 46.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode)

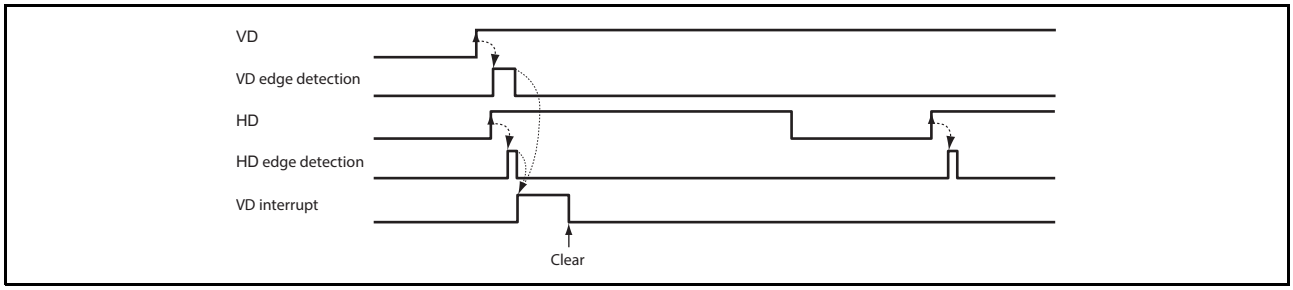

Figure 46.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode)

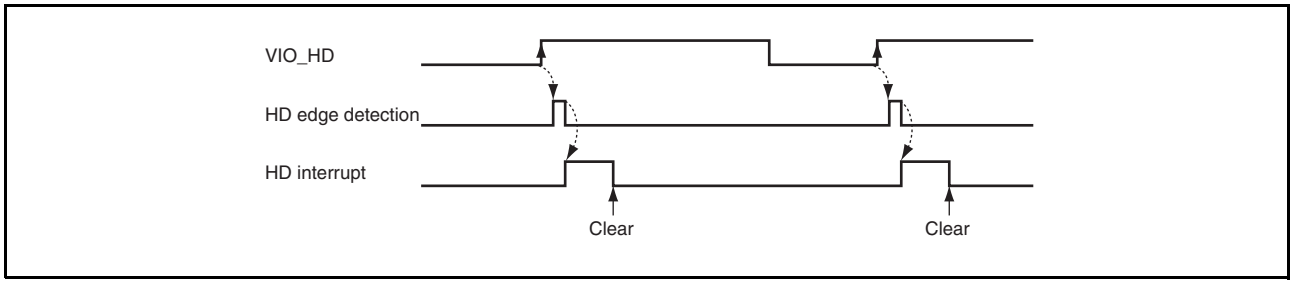

Figure 46.16 Relationship between VIO_HD and HD Interrupt when HD is High-Active

46.4.4 Capture Interface Cycle Register (CMCYR)

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VCYL[13:0]	H'0000	R/W	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HCYL[13:0]	H'0000	R/W	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.

46.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	VOFST[11:0]	H'000	R/W	These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 46.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.18).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HOFST[12:0]	H'0000	R/W	These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 46.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).

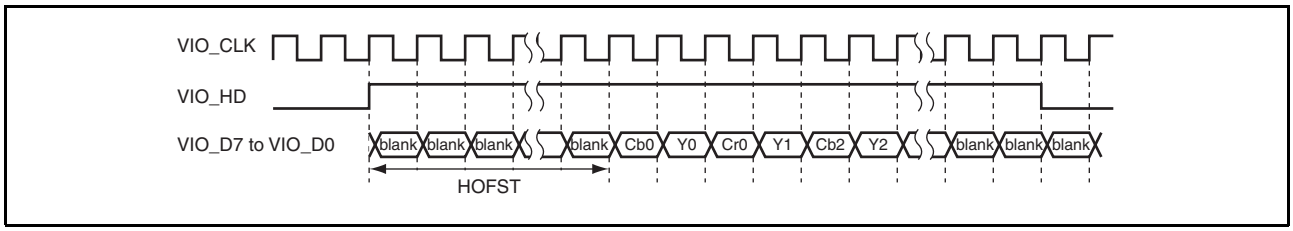

Figure 46.19 Horizontal Offset

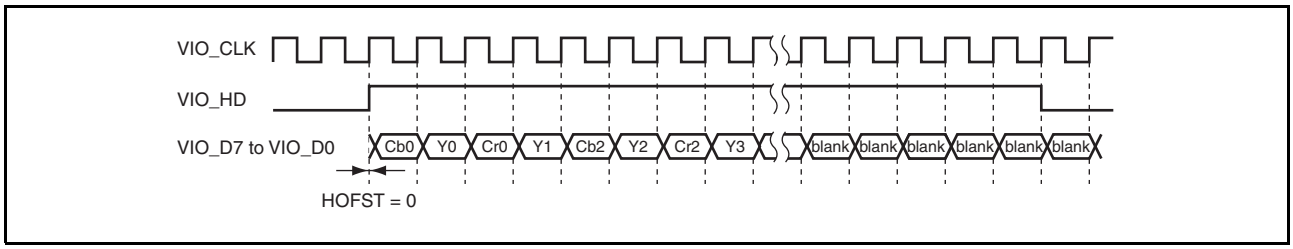

Figure 46.20 Timing when HD is Data Enable Signal (8-bit Interface)

46.4.6 Capture Interface Width Register (CAPWR)

CAPWR sets the fetch (capture) cycle width when capturing images.

The cycle width unit differs according to the interface and the data type to be captured. For each setting unit, see Table 46.6.

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VWDTH[11:2] VWDTH[1:0]	H'000	R/W R	These bits specify the vertical capture period (4-HD units). These bits specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 46.21 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 1,920 HD (5 megapixels).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HWDTH[12:1] HWDTH[0]	H'0000	R/W R	These bits specify the horizontal capture period. These bits specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 46.22 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: • 8-bit interface Image capture (8-cycle units) : 5,120 cycles (2,560 pixels) Data synchronous fetch (4-cycle units) : 2,560 cycles (2,560 bytes) • 16-bit interface Image capture (4-cycle units) : 2,560 cycles (2,560 pixels) Data synchronous fetch (2-cycle units) : 1,280 cycles (2,560 bytes) Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.

Table 46.6 Unit for Setting Fetch (Capture) Cycle Width

46.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), the image from which capturing starts (top field or bottom field), etc. CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 46.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IFS	0	R/W	Sets the input mode for capturing images. 0: Progressive 1: Interlace
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CIM	0	R/W	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	FCI[1:0]	00	R/W	These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited

Table 46.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 46.23 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

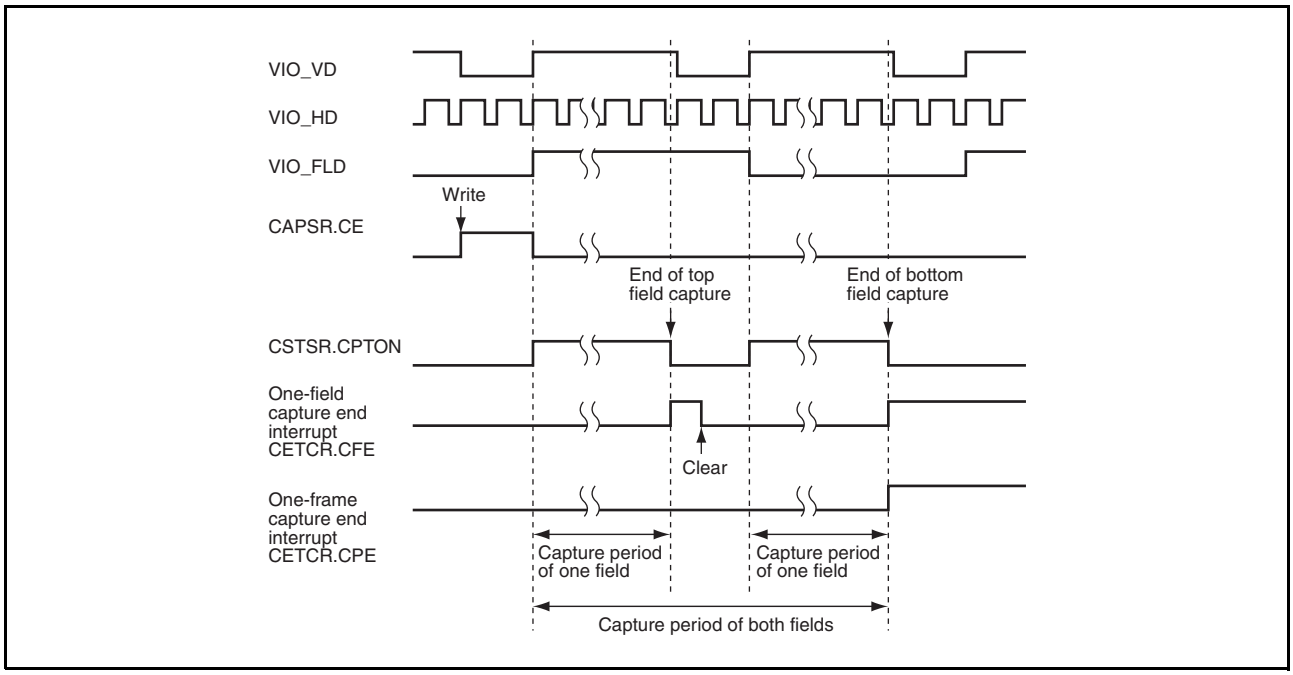

Figure 46.23 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 46.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 46.25).

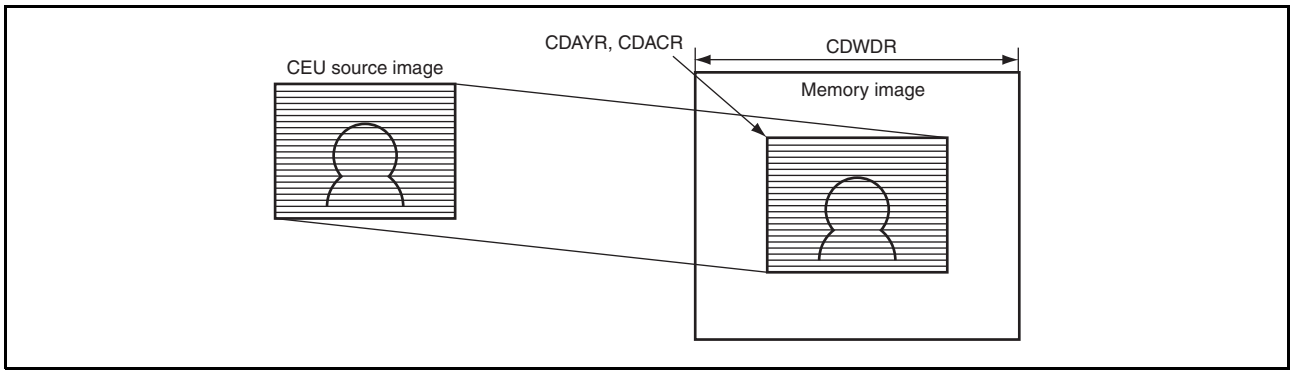

Figure 46.24 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

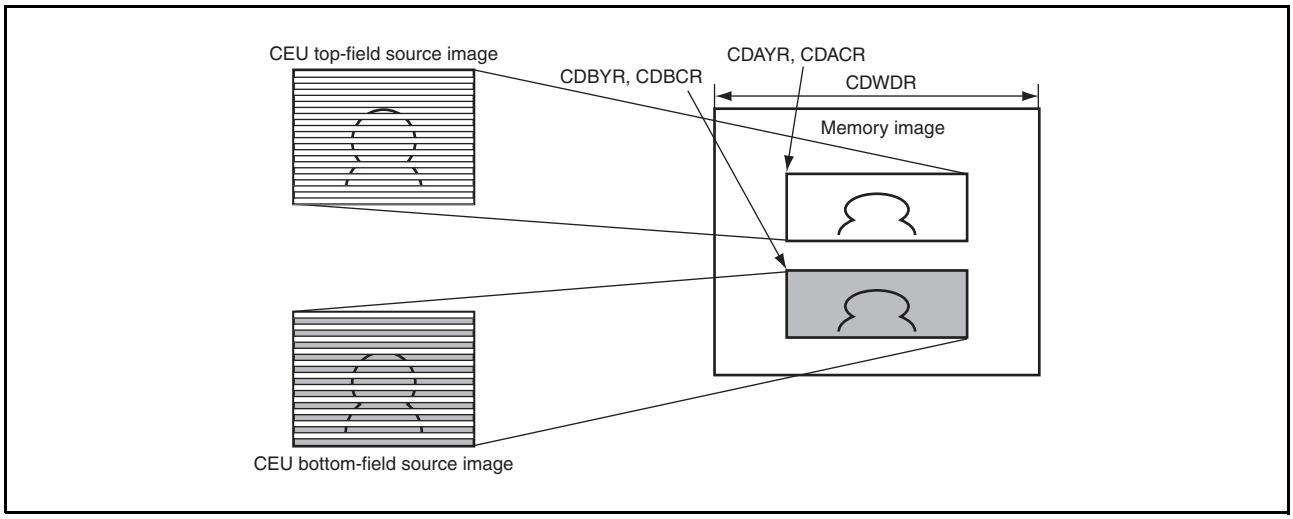

Figure 46.25 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 46.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 46.27).

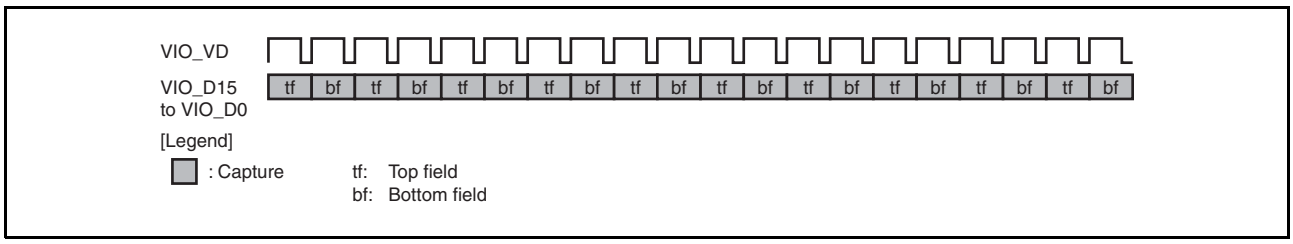

Figure 46.26 Continuous Both-Field Capture in Interlace Mode
(Image Immediately after Activation is Top Field (FCI Bits = B'00))

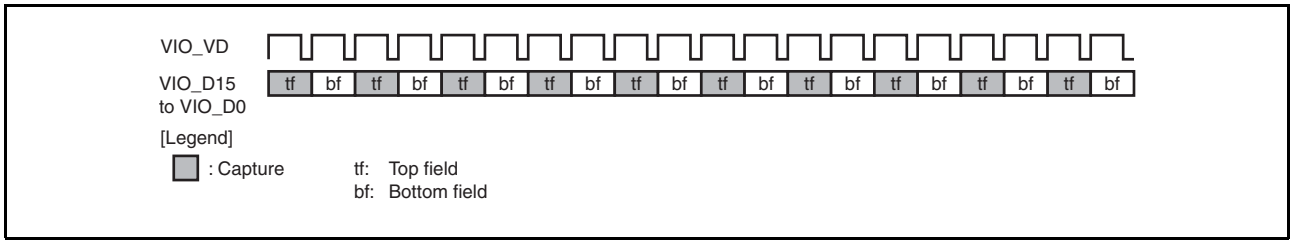

Figure 46.27 Continuous One-Field Capture in Interlace Mode
(Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)
Capture image: Both-field (CIM bit = B'0)
Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 46.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 46.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 46.28 at CDWDR/2 is shown in Figure 46.29. Setting the registers to form the image in Figure 46.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 46.29.

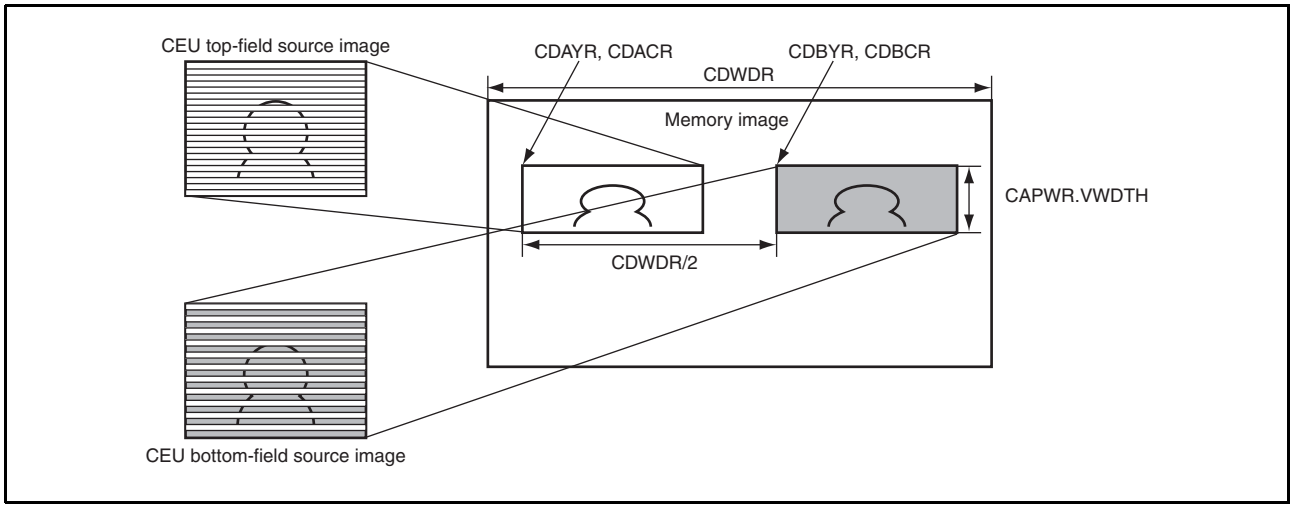

Figure 46.28 Image of Storing Captured Both-Fields of Interlace Input in Memory

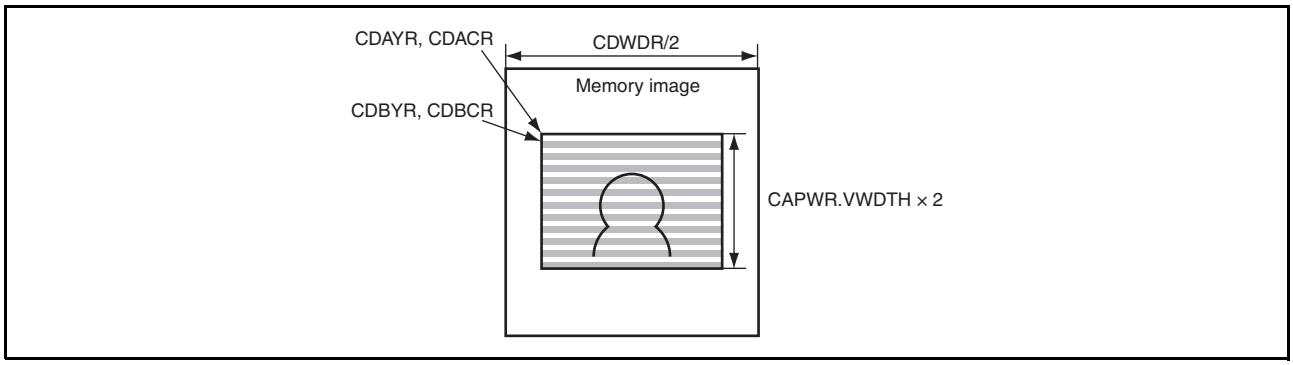

Figure 46.29 Image of Storing Interlace Input as Frame Image in Memory

46.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RVS	0	R/W	Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when the RC bit is 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RS	0	R/W	Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when the RC bit is 0. 0: Uses plane A of the register 1: Uses plane B of the register
0	RC	0	R/W	Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD

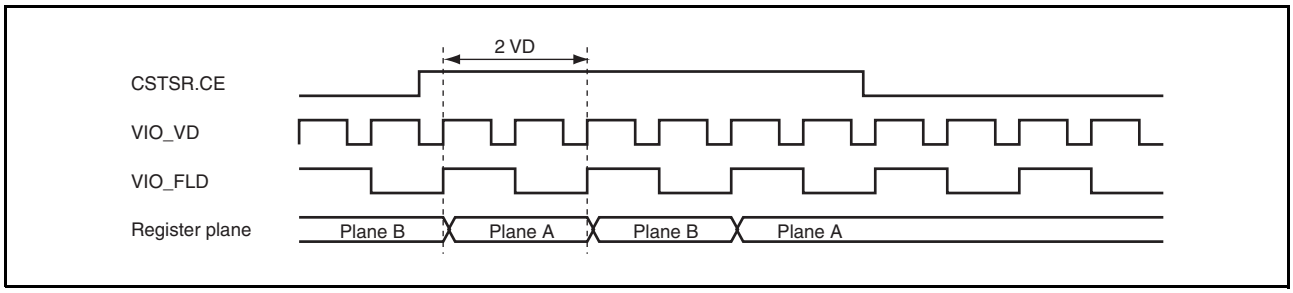

Figure 46.30 Timing for Register Plane Switching when RVS Bit is B'0

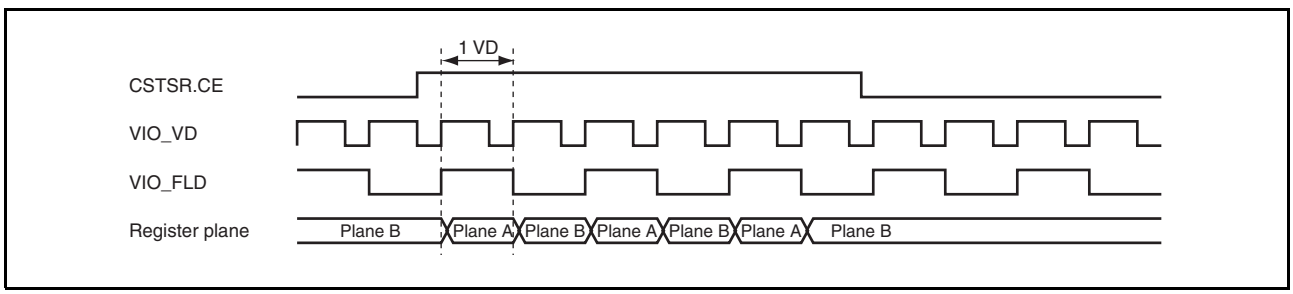

Figure 46.31 Timing for Register Plane Switching when RVS Bit is B'1

46.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RA	0	R/W	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register

46.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VMANT[3:0]				VFRAC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HMANT[3:0]				HFRAC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VMANT[3:0]	H'0	R/W	Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used.
27 to 19 18 to 16	VFRAC[11:3] VFRAC[2:0]	H'000	R/W R	Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits.
15 to 12	HMANT[3:0]	H'0	R/W	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used.
11 to 3 2 to 0	HFRAC[11:3] HFRAC[2:0]	H'000	R/W R	Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

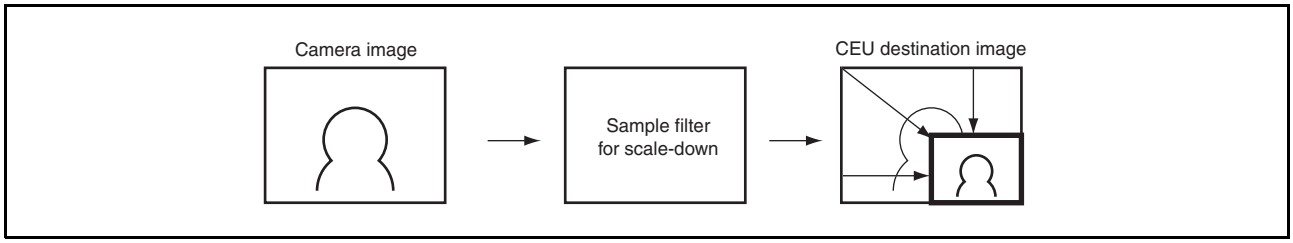

Figure 46.32 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \text{... Formula 1}$$

$$SCL \text{ (scaling factor)} = \frac{4096}{\alpha} \quad \text{... Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x, the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (8-bit interface: half of the CAPWR setting, 16-bit interface: CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{... Formula 3}$$

$$\begin{bmatrix} MANT_{pre} = 1 \longrightarrow (0 \le MANT < 2) \\ MANT_{pre} = 2 \longrightarrow (2 \le MANT < 4) \\ MANT_{pre} = 4 \longrightarrow (4 \le MANT < 8) \\ MANT_{pre} = 8 \longrightarrow (8 \le MANT\ ) \end{bmatrix}$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

SCL = 480/640 = 3/4, and the preliminary settings of MANT = 1, $MANT_{pre}$ = 1, and FRAC = H'550 are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{... Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as MANT = 1 and FRAC = H'548.

Table 46.8 Setting Examples for Each Scale-Down Filter Factor

Scale-Down Factor	FRAC		MANT	Input Pixel Count	Output Pixel Count	Clipping Size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	H'240	1	640	560	560
3/4	1352	H'548	1	640	480	480
5/8	2448	H'990	1	640	400	400
1/2	0	H'0	2	640	320	320
3/8	2728	H'AA8	2	640	240	240
1/3	0.0	H'0	3	640	213	212
1/4	0.0	H'0	4	640	160	160
1/5	0.0	H'0	5	640	128	128
1/6	0.0	H'0	6	640	107	104
1/7	0.0	H'0	7	640	91	88
1/8	0.0	H'0	8	640	80	80
1/16	4088	H'FF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

46.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VFCLP[11:0]

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HFCLP[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VFCLP[11:2] VFCLP[1:0]	H'000	R/W R	These bits set the vertical clipping value of the filter output size (4-pixel units).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 2 1, 0	HFCLP[11:2] HFCLP[1:0]	H'000	R/W R	These bits specify the horizontal clipping value of the filter output size (4-pixel units).

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 46.33. The clipping size must be specified vertically and horizontally in 4-pixel units.

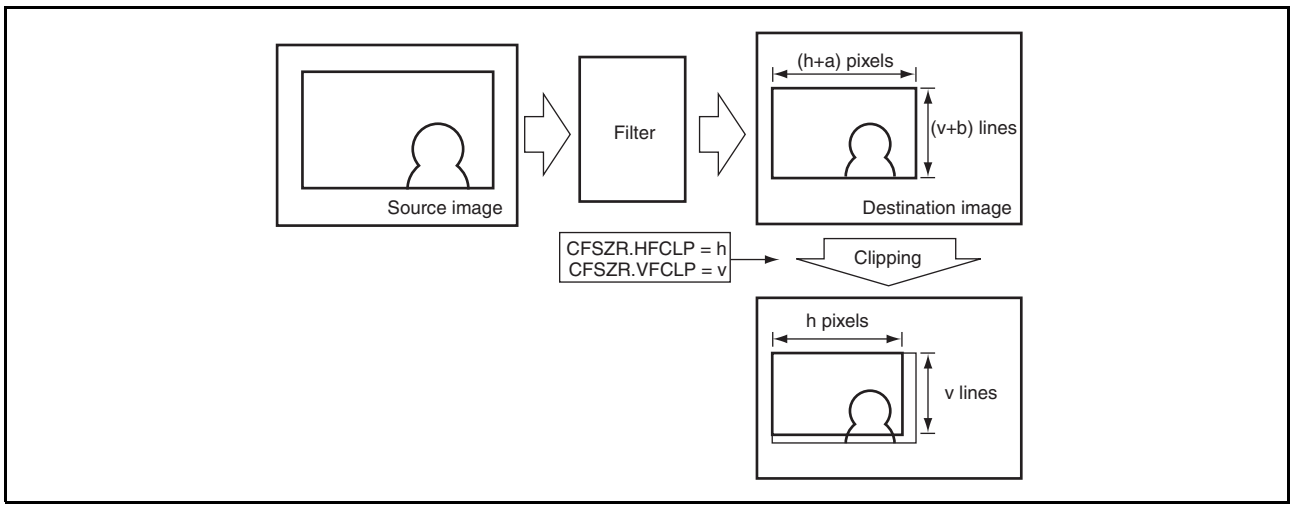

Figure 46.33 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.

· 8-bit interface:
  VFCLP = CAPWR.VWDTH
  HFCLP = CAPWR.HWDTH/2

· 16-bit interface:
  VFCLP = CAPWR.VWDTH
  HFCLP = CAPWR.HWDTH

46.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 2 1, 0	CHDW[12:2] CHDW[1:0]	H'0000	R/W R	These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 46.34, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: 8-bit interface: CHDW = CAPWR.HWDTH 16-bit interface: CHDW = CAPWR.HWDTH × 2

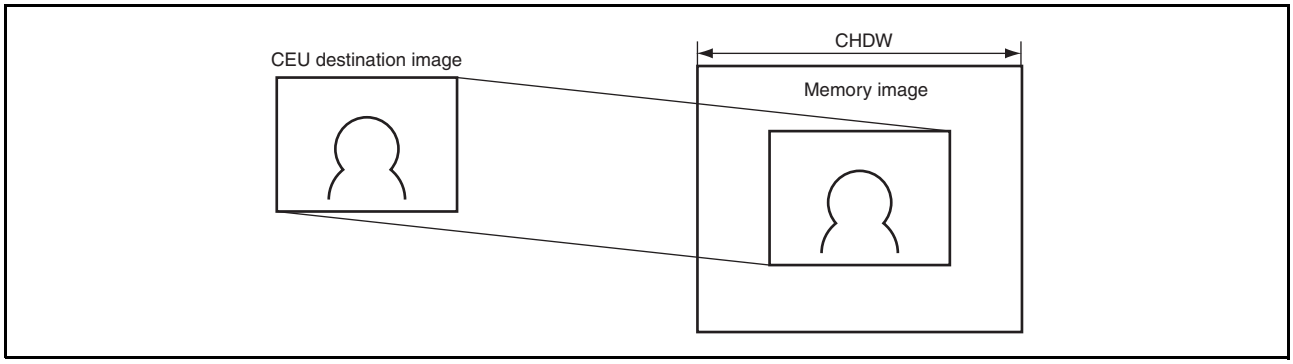

Figure 46.34 Captured Image and Memory Area Image

46.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units). • Data fetch: These bits set the address for storing data (4-byte units). • Data enable fetch bundle write: These bits set the address for storing data (32-byte units).
1, 0	CAYR[1:0]		R	

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 46.35.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

  End address = CDAYR + number of fetched bytes
- Data enable fetch bundle write: Set the address in 32-byte units.

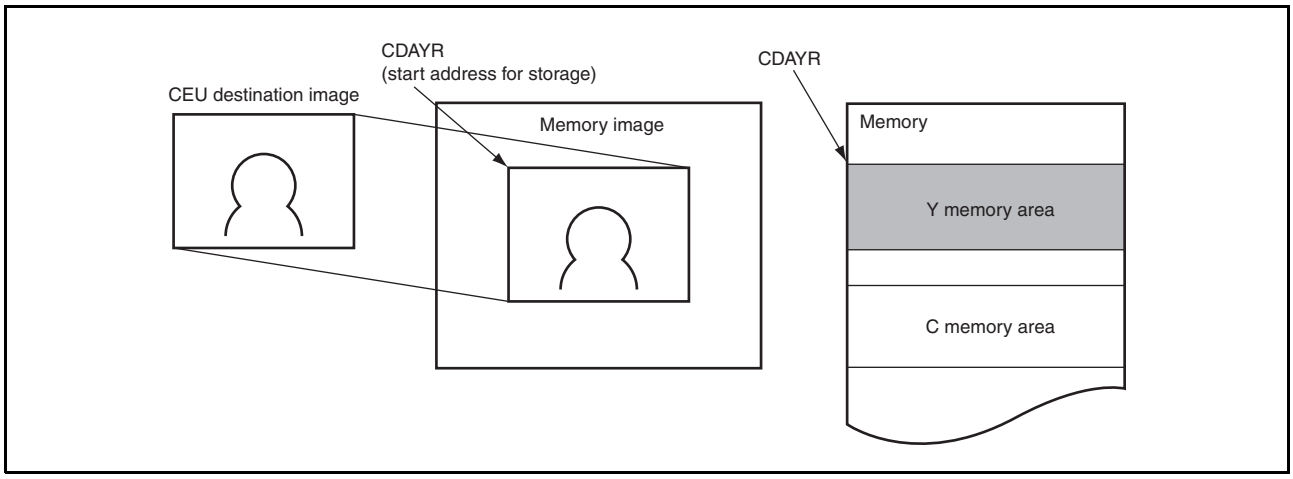

Figure 46.35 Relationship between Captured Image and Y Component Memory Area

46.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

31 to 2	CACR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units).
1, 0	CACR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 46.36. The C component has an output data format like that in Figure 46.37, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

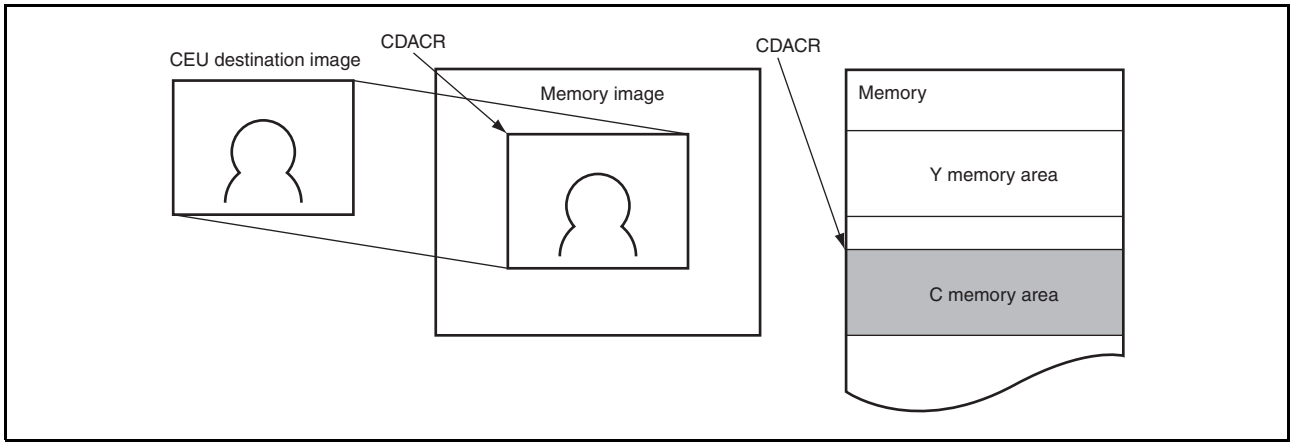

Figure 46.36 Relationship between Captured Image and C Component Memory Area

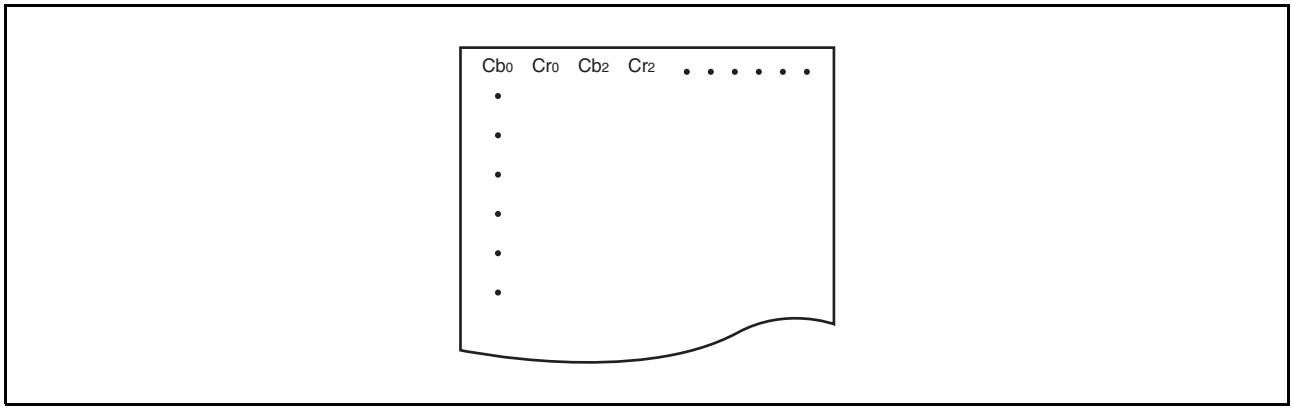

Figure 46.37 Image of Storing C Components in Memory

46.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 46.38.

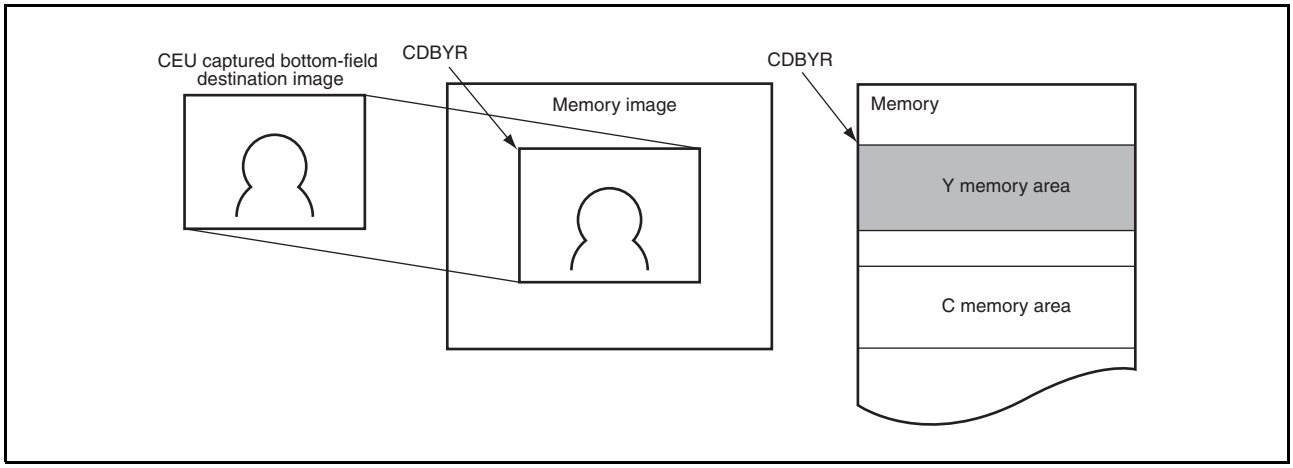

Figure 46.38 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

1, 0	CBCR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in this register, as shown in Figure 46.39. The C component has an output data format like that in Figure 46.40, and is saved in the memory in this format.

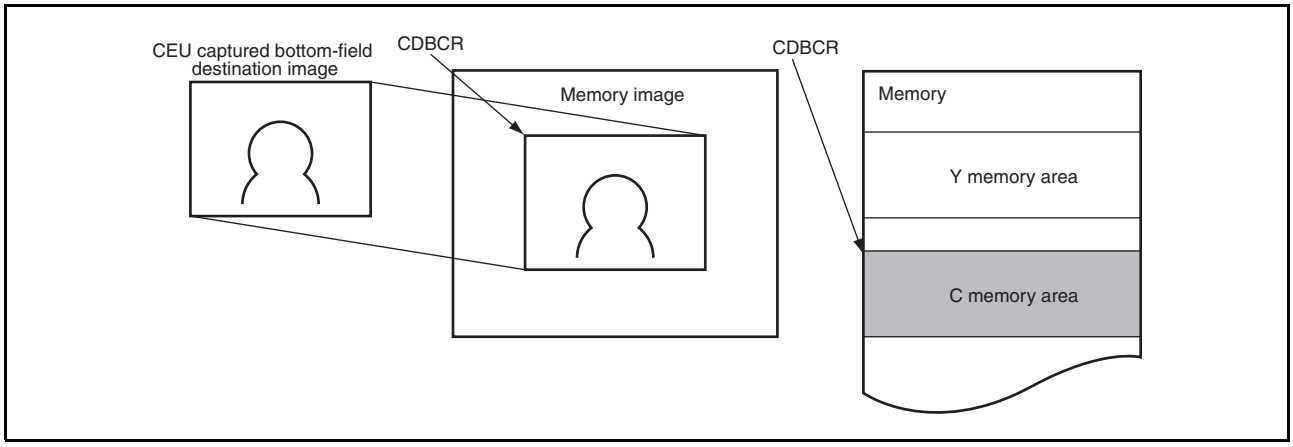

Figure 46.39 Relationship between Captured Bottom-Field Image and C Component Memory Area

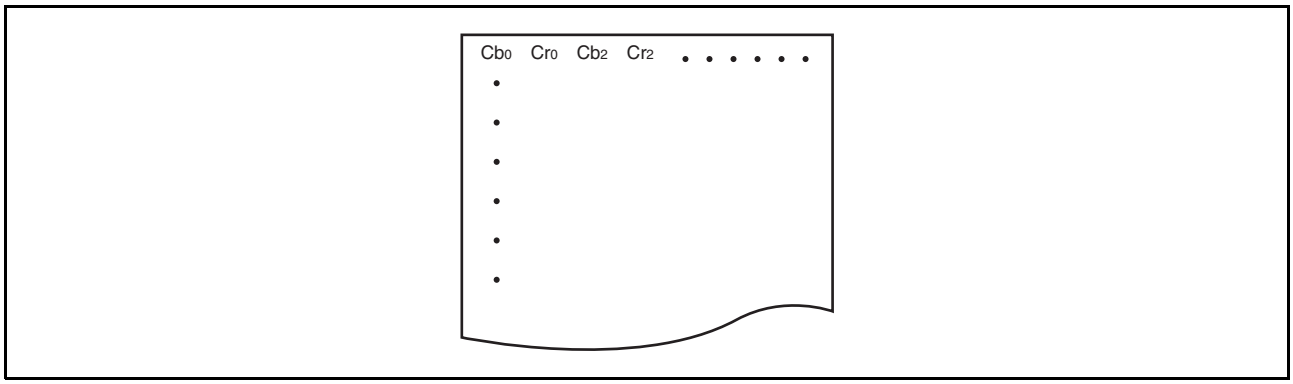

Figure 46.40 Image of Storing C Components in Memory

46.4.17 Capture Bundle Destination Size Register (CBDSR)

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CBVS[22:16]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	CBVS[22:3] CBVS[2:0]	H'000	R/W R	These bits select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (H'780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000)

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (H'780). Only bits CBVS[11:3] are valid.

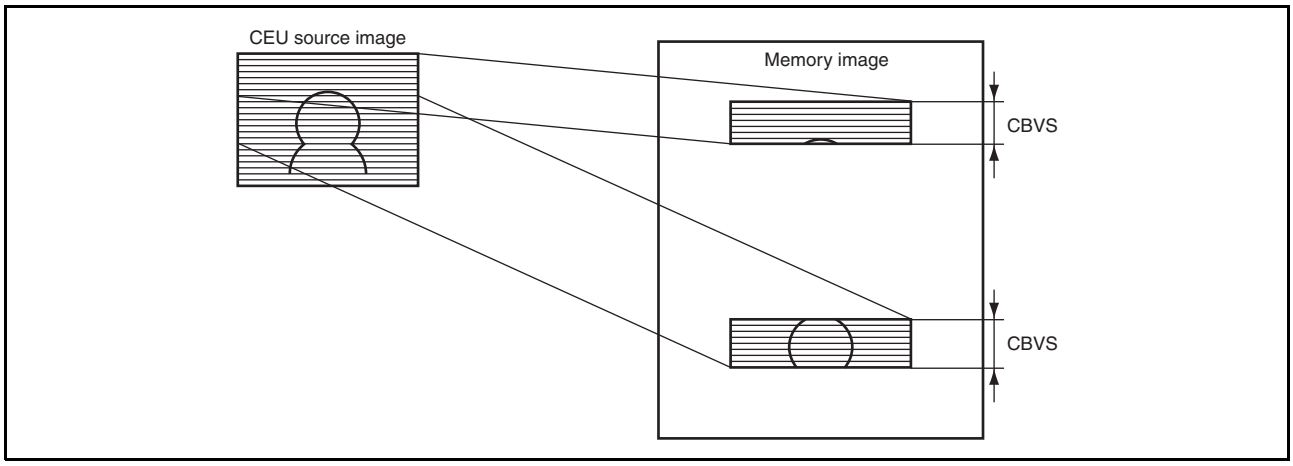

Figure 46.41 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

46.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LPF	0	R/W	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)

46.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module dose not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CBE	0	R/W	Controls the number of lines of captured data to be written to the memory. • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 46.42). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 46.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 46.43 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 46.44 shows the timing of write end interrupts in data enable fetch. 0: Normal write 1: Bundle write
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CDS	0	R/W	Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion

Bit	Bit Name	Initial Value	R/W	Description
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	COLS	0	R/W	Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units
1	COWS	0	R/W	Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units
0	COBS	0	R/W	Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units

CDBYR2, CDBCR2	CPBE4 bit in CETCR

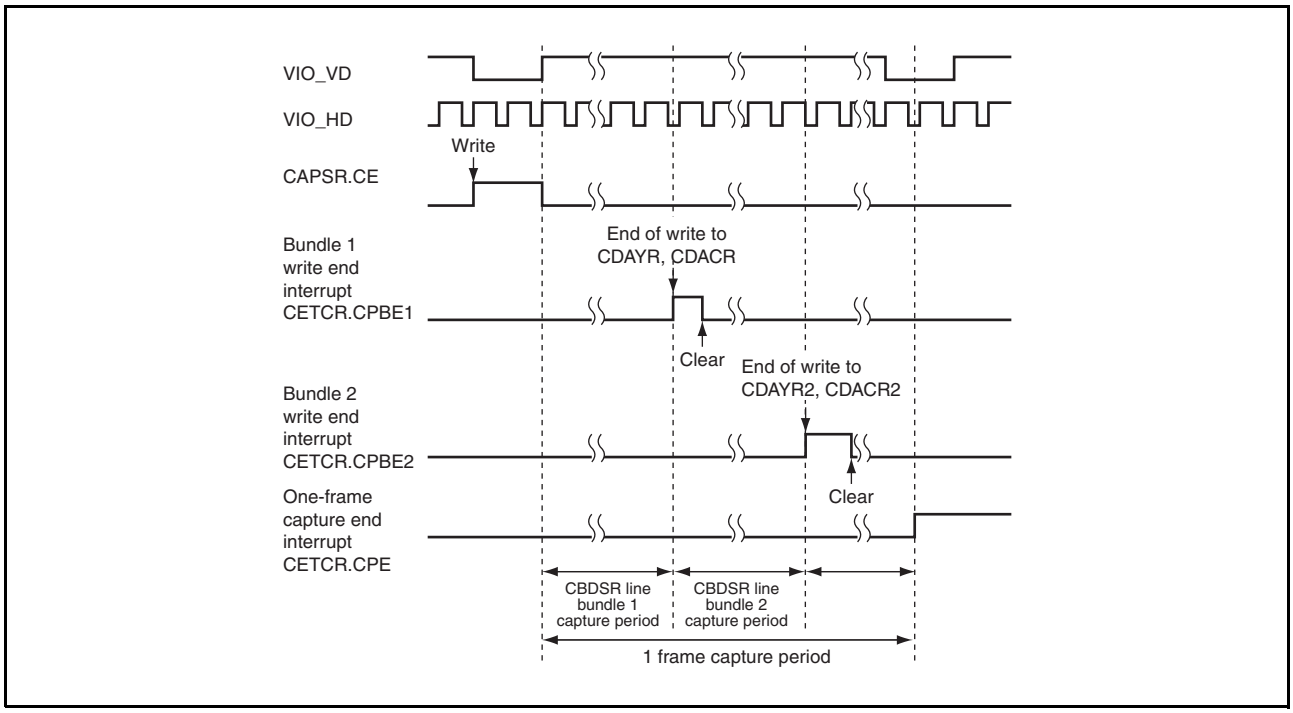

Figure 46.43 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

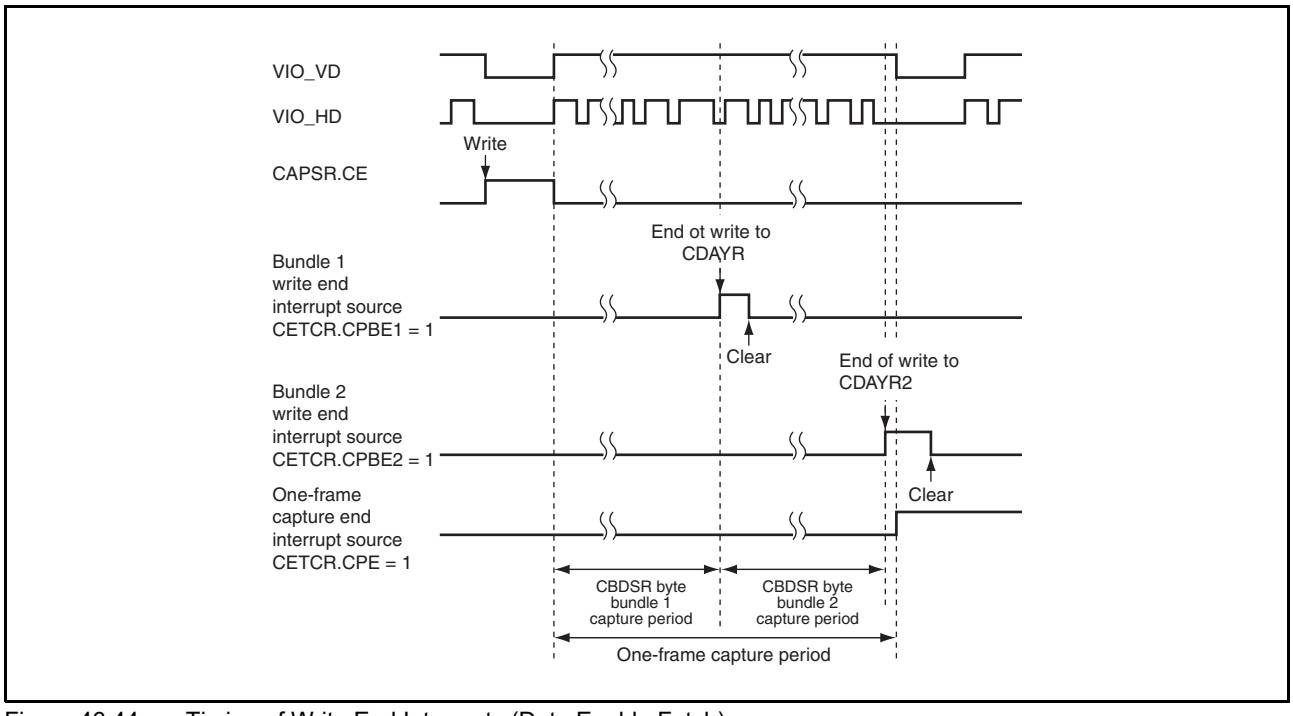

Figure 46.44 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 46.45. To enable data swapping, set the corresponding control bit to B'1.

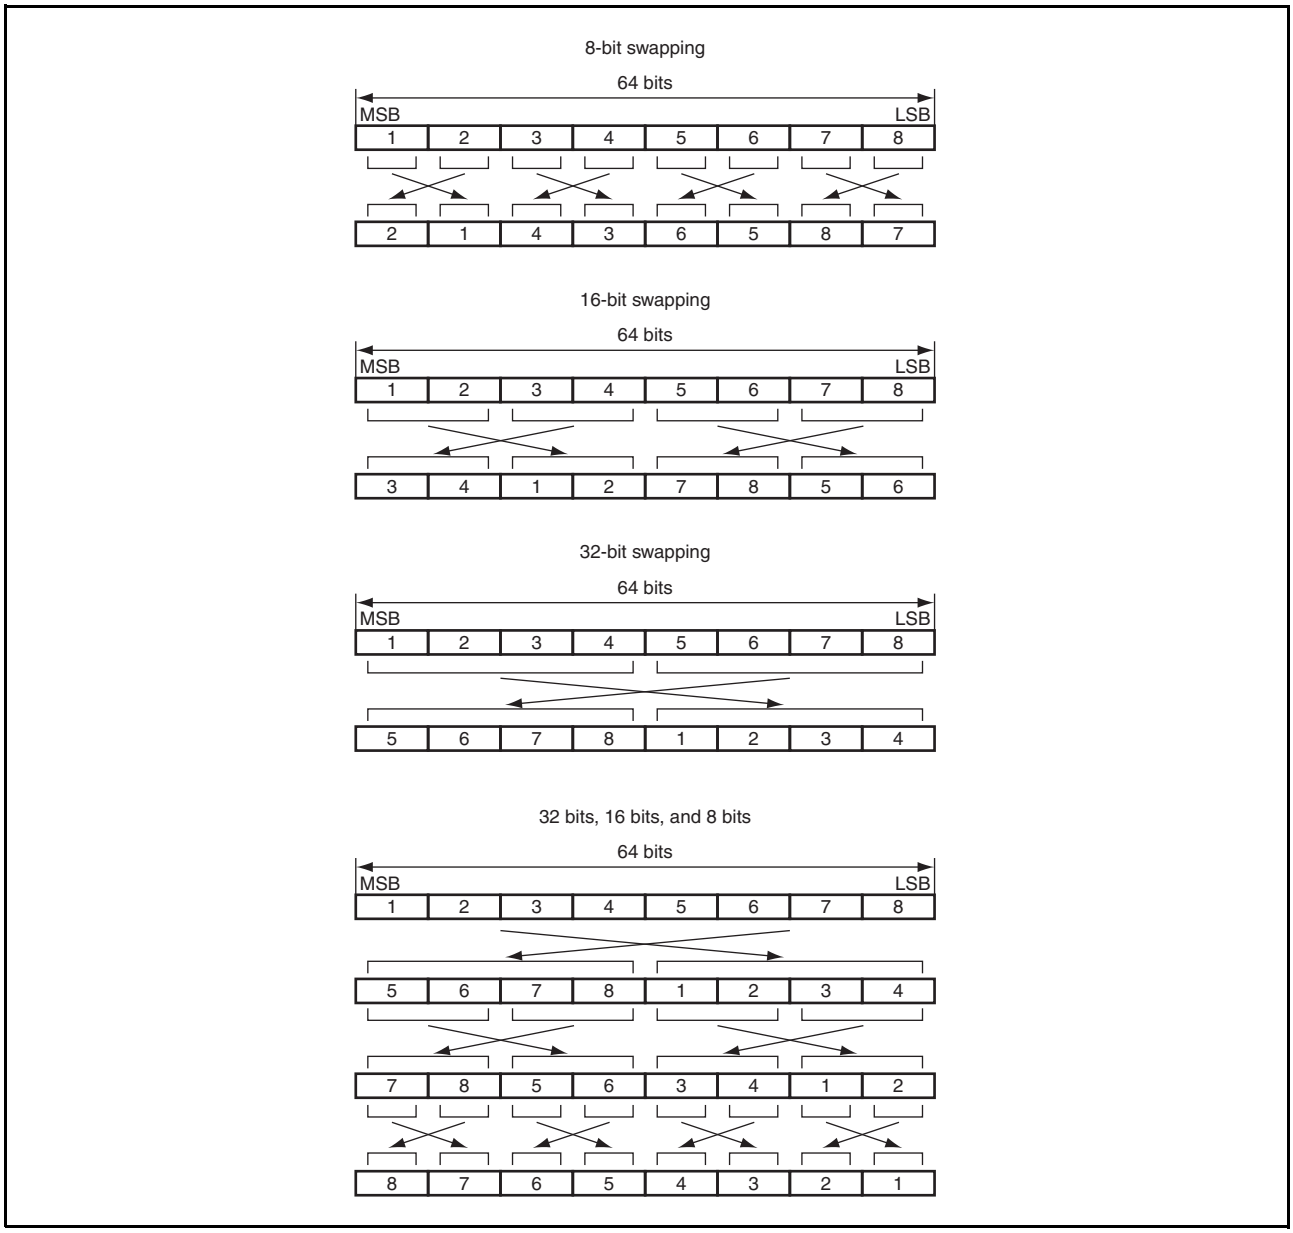

Figure 46.45 Data Swapping by Data Aligner

46.4.21 Capture Event Interrupt Enable Register (CEIER)

CEIER enables or disables interrupts of the event flag register that generates CEU interrupts.

46.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- All bits after the software standby or module standby mode is entered
- VD and HD bits after the polarities of the capture interface sync signals are changed

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NVD	0	R/W	This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.
24	NHD	0	R/W	This bit is used for an interrupt indicating that no HD was input. The timing for a non-HD interrupt to occur differs depending on the bit width of the digital image input pins. 8-bit digital image input pins: Occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. 16-bit digital image input pins: Occurs when the 12-bit internal counter that is incremented every four cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,380 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.
23	FWF	0	R/W	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.
22, 21	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
20	VBP	0	R/W	This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: • Condition 1 VD is input when there is captured data within the CEU • Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	IGVS	0	R/W	This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.
17	IGHS	0	R/W	This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.
16	CDTOF	0	R/W	This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer. Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.
15	CPBE4	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
14	CPBE3	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).

Bit	Bit Name	Initial Value	R/W	Description
13	CPBE2	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR2 and CDACR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
12	CPBE1	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR and CDACR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	VD	Undefined	R/W	This bit is used for an interrupt indicating that VD (vertical sync signal) was input from an external module. In data enable fetch mode, this bit is set to 1 when a VD input from an external module is detected. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD from an external module. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time. Immediately after the VDPOL bit in CAMCR is modified, a pseudo VD is input and this bit is set to 1. The VD interrupt after the VDPOL bit is modified should be ignored.
8	HD	Undefined	R/W	This bit is used for an interrupt indicating that HD (horizontal sync signal) was input from an external module. This bit is set to 1 when an HD input from an external module is detected. Immediately after the HDPOL bit in CAMCR is modified, a pseudo HD is input and this bit is set to 1. The HD interrupt after the HDPOL bit is modified should be ignored.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	IGRW	0	R/W	This bit is used for an interrupt indicating that during capturing, access was attempted to a register to which writing during operation is prohibited. Among the CEU registers, writing during capturing is prohibited for some registers. Table 46.10 shows which registers can/cannot be written to during capturing. This bit is set to 1 when a register to which writing during capturing is prohibited has been written to.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CFE	0	R/W	This bit is used for an interrupt indicating that capturing of one field from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input (see Figure 46.46). This interrupt occurs only in both-field capture mode.
0	CPE	0	R/W	This bit is used for an interrupt indicating that capturing of one frame from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input. This interrupt indicates that capturing of one frame has finished. This bit is set to 1 when the image of the size set in CAPWR is captured and the last data transfer to the bus finished (see Figure 46.47).

46.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CRST	0	R	Indicates which register plane is currently used. 0: Plane A of the register is being used 1: Plane B of the register is being used
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPFLD	0	R	Indicates which field is being captured. 0: Bottom field is being captured 1: Top field is being captured
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CPTON	0	R	Indicates that the CEU is operating. This bit retains 1 during the period that starts from the internal VD at capture start and ends when a one-frame capture end interrupt occurs. Figure 46.48 shows the CEU operating period.

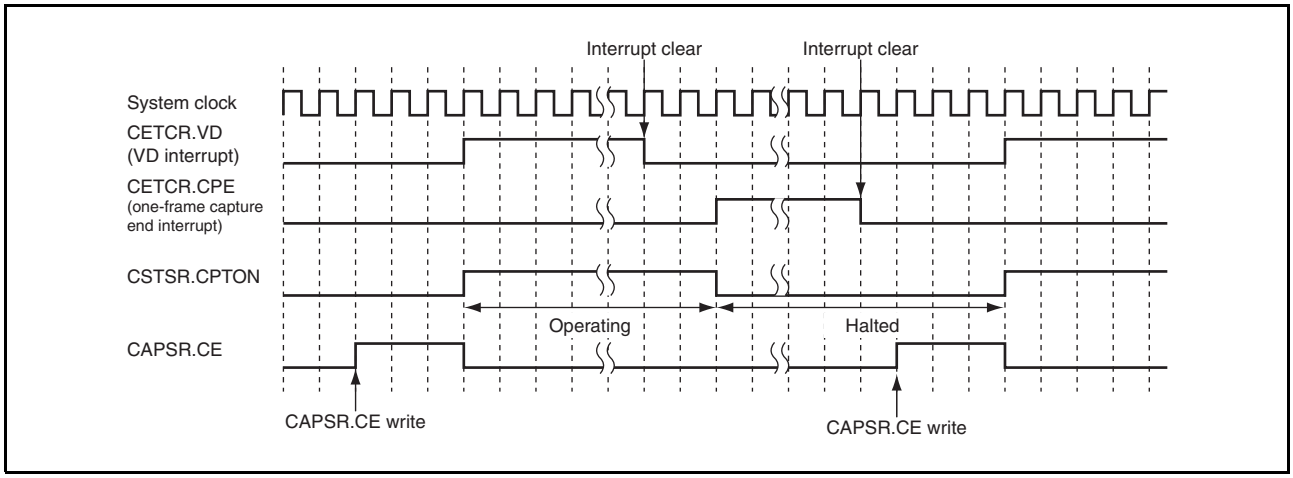

Figure 46.48 Operating Status during Capturing

46.4.24 Capture Data Size Register (CDSSR)

CDSSR indicates the size of data written to the memory in data enable fetch. As this register indicates a correct value at the end of capture, confirm this register when capture is completed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDSS[31:0]	H'0000 0000	R	Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched. Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates H'0000 0000. Figure 46.49 and Figure 46.50 show the overall timing of the CDSSR operation in a bundle write.

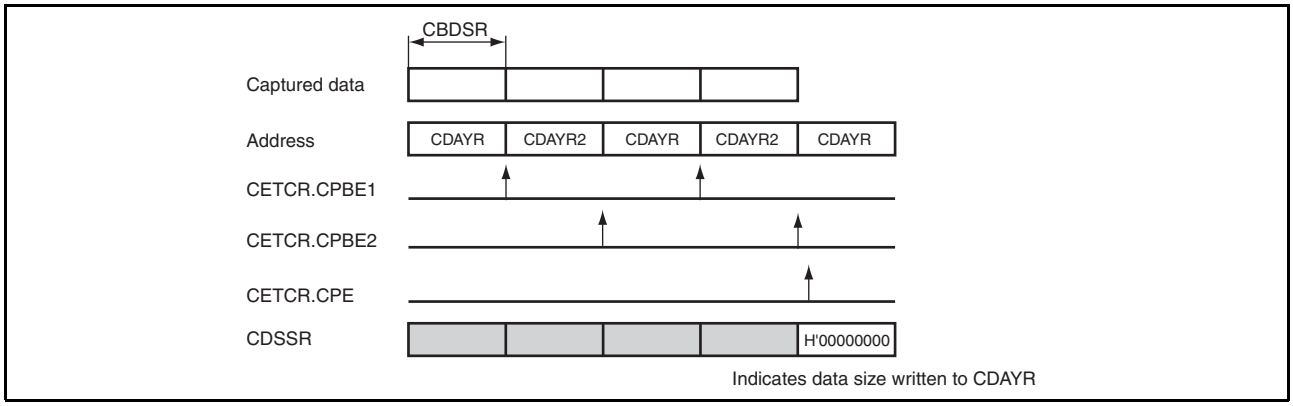

Figure 46.49 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Coincide)

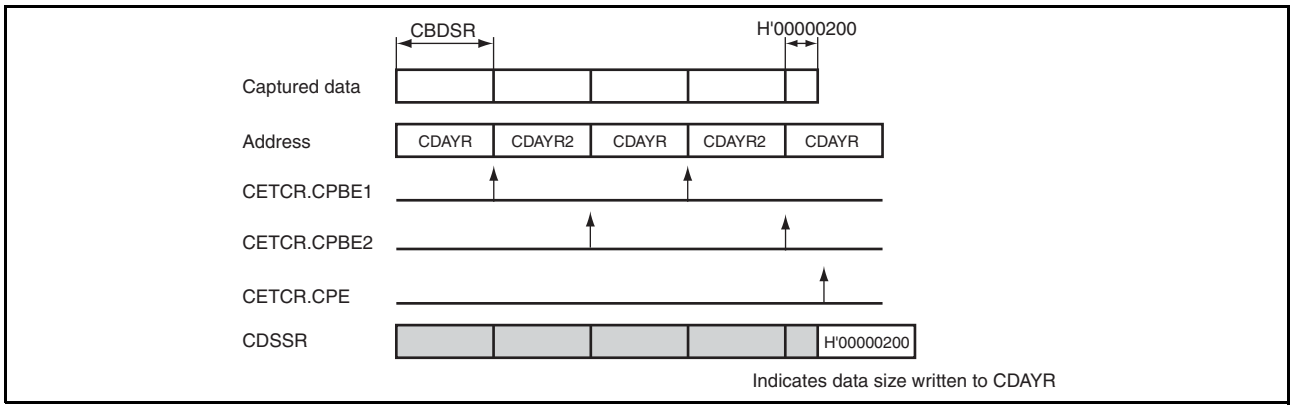

Figure 46.50 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Do Not Coincide)

46.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2 1, 0	CAYR2[31:2] CAYR2[1:0]	H'0000 0000	R/W R	• Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units). • Data synchronous fetch: These bits set the address for storing data (4-byte units). • Data enable fetch: These bits set the address for storing data (32-byte units).

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 46.51.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data synchronous fetch: Set the address of the starting point of the memory area where the captured data is to be stored.
- Data enable fetch: Set the address of the starting point of the memory area where the captured data is to be stored in 32-byte units.

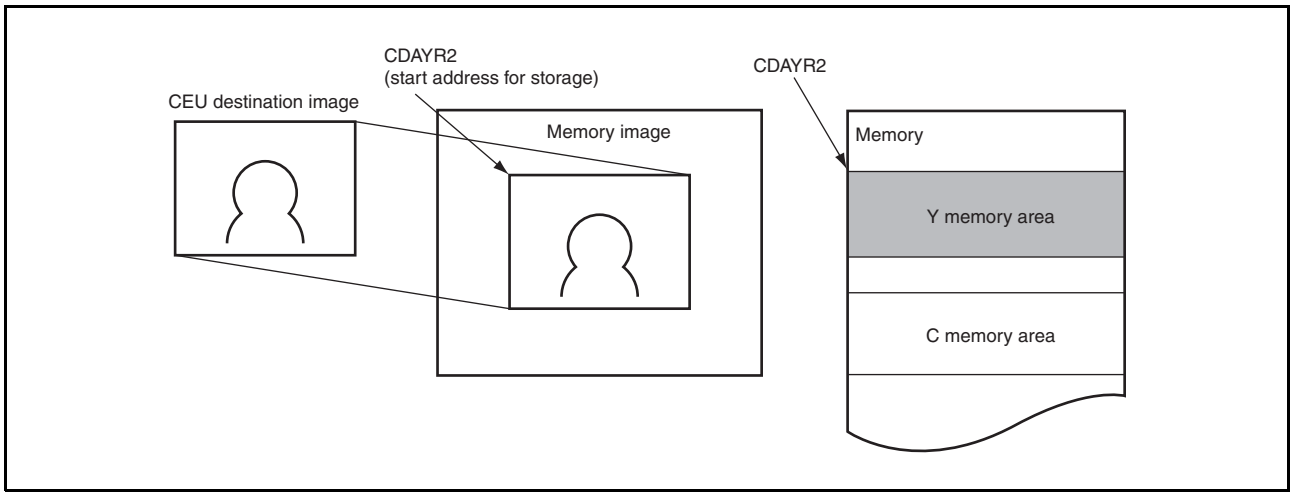

Figure 46.51 Relationship between Captured Image and Y Component Memory Area

46.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR2[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units).
1, 0	CACR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 46.52.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 46.53, and is saved in the memory in this format.

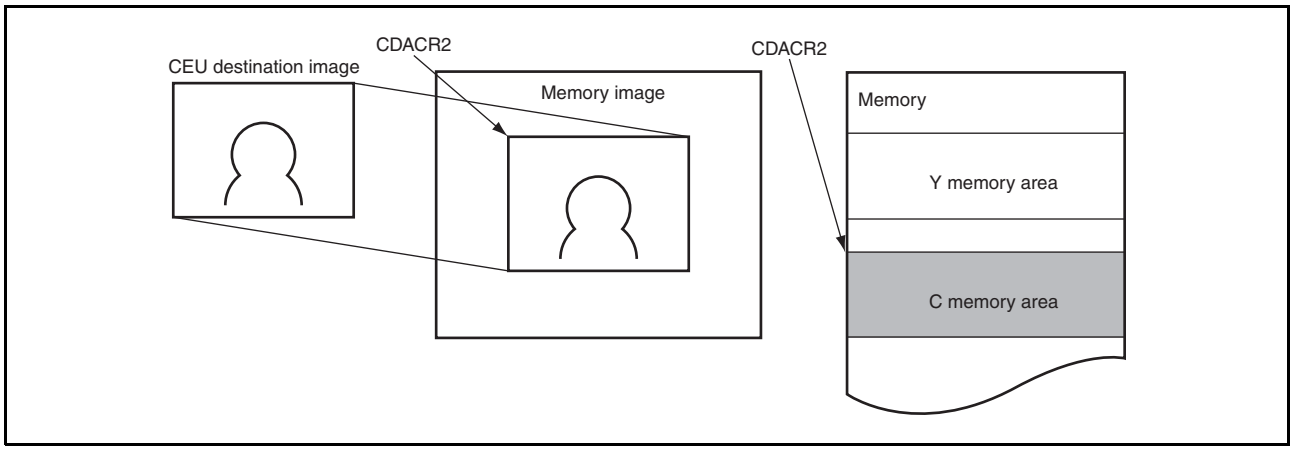

Figure 46.52 Relationship between Captured Image and C Component Memory Area

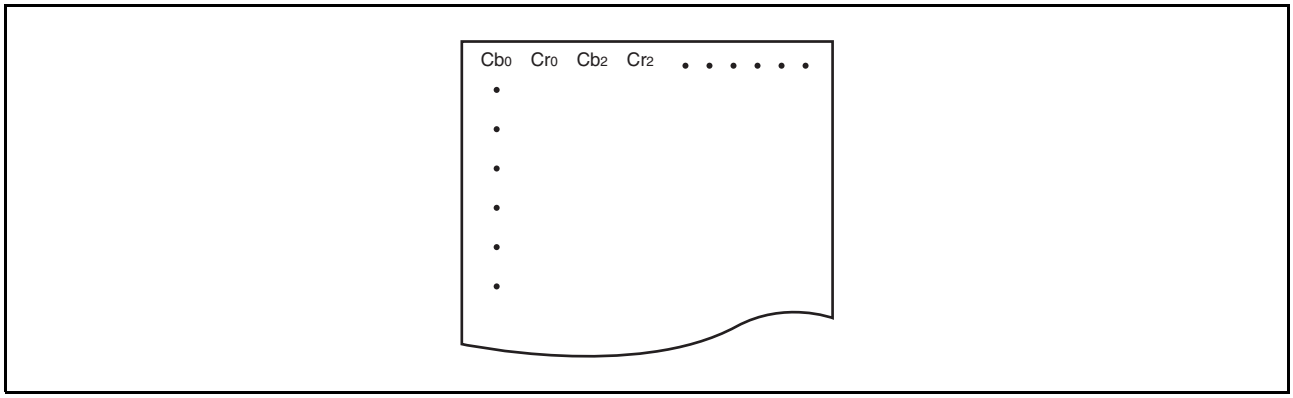

Figure 46.53 Image of Storing C Components in Memory

46.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBYR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units).
1, 0	CBYR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.54.

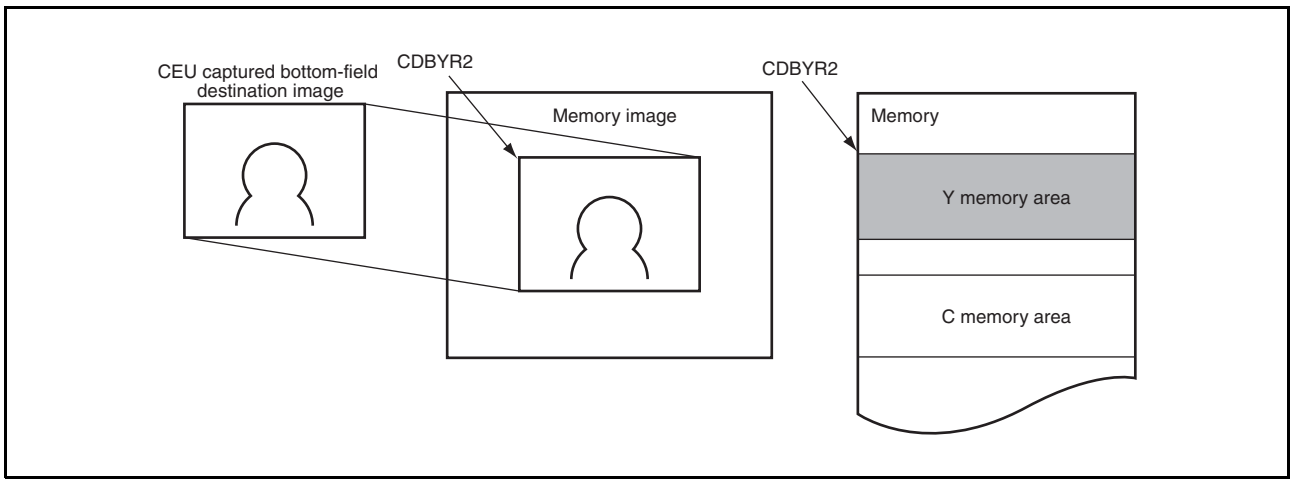

Figure 46.54 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.55. The C component has an output data format as shown in Figure 46.56, and is saved in the memory in this format.

46.5 Usage Notes for CEU

46.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at most the same as the CEU operating clock frequency (Bφ), with jitter on both sides included.

CEU operating clock frequency (Bφ) ≥ External input clock frequency

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input

46.5.2 Restrictions on Input/Output Functions

Table 46.11 lists the restrictions regarding the CEU input/output functions.

Table 46.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock (Bφ), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	The capture horizontal size in image capture must be specified as follows: 8-bit interface: 8-cycle units 16-bit interface: 4-cycle units
	The capture horizontal size in data fetch must be specified as follows: 8-bit interface: 4-cycle units 16-bit interface: 2-cycle units
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock for 8-bit digital image input pins, or 16,379 cycles of external input clock for 16-bit digital image input pins.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920).
	Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 4-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

46.5.3 Display in the Video Display Controller 6

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 6.

46.5.4 Software Reset

For transitions to the software reset state by the CPKIL bit in the CAPSR register, see section 52.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the CPKIL bit in the CAPSR register.

47. MIPI CSI2 Interface

47.1 Overview

The CSI2 module is a MIPI (Mobile Industry Processor Interface Alliance) CSI-2 (Camera Serial Interface 2) receiver module. It supports MIPI CSI-2 V1.1 and MIPI D-PHY V2.0. It includes the PHY and LINK blocks. The PHY block incorporates a DPHY. This LSI chip has one CSI2 set, which has two lanes.

The received signals are input to the PHY block; the LINK block receives the bytes of data output by the PHY block; and the PHY block extracts the image data, data type, and channel information before it outputs the data to the subsequent VIN module. Here, the LINK block generates the vertical sync signals (VD), field signals (FLD), horizontal sync signals (HD), data enable signals (PE), and byte enable signals (PEB) for each channel, and outputs them to the VIN module. The LINK registers are used to control the PHY block and monitor its state.

47.1.1 Features

The CSI2 module has the following features.

(1) Transfer rates from 80 Mbps to 1.0 Gbps for MIPI CSI-2 data (refer to section 47.3.1)
(2) ECC 1-bit error correction and 2-bit or more error detection for packet headers (refer to section 47.3.2)
(3) CRC error detection for payload data (refer to section 47.3.3)
(4) Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) signals (refer to section 47.3.4)
(5) Interrupts (refer to section 47.3.6)
(6) Lane swapping (refer to section 47.3.7)
(7) Initial settings of PHY (refer to section 47.3.9)
(8) PHY control and monitoring through register settings (refer to section 47.3.10)
(9) Interrupt generation in response to the ultra-low-power (ULP) state and reception error state (refer to section 47.3.11)
(10) Supported data type (refer to section 48, Video Input Module (VIN))

47.1.2 Block Diagram

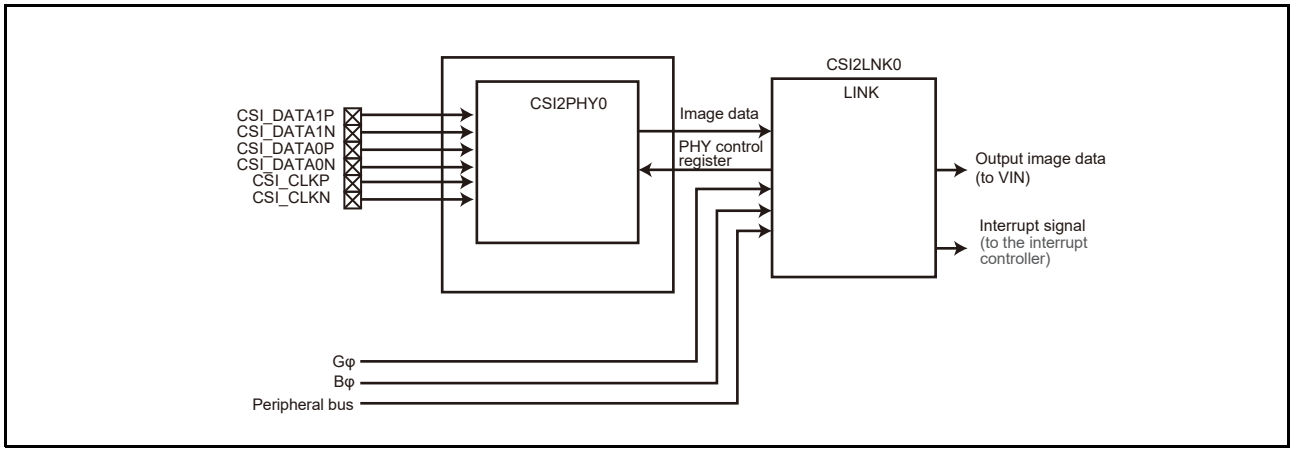

Figure 47.1 CSI2 Block Diagram

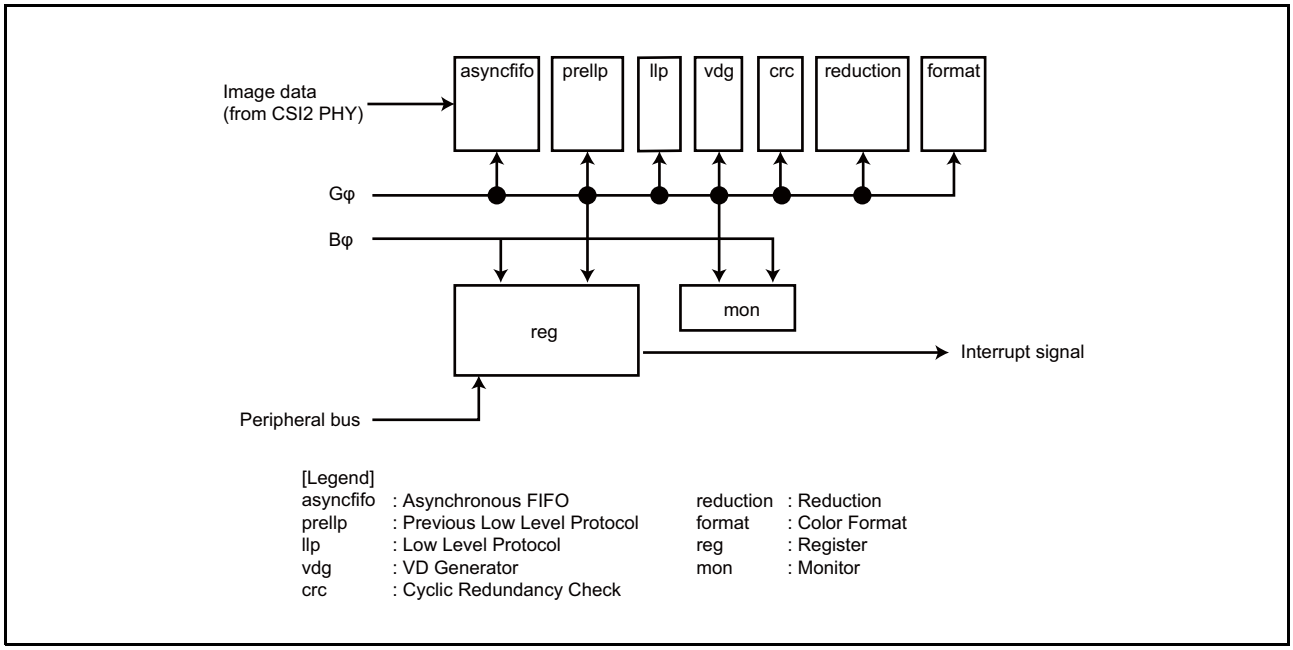

Figure 47.2 CSI2 LINK Block Diagram

47.1.3 External Pins

Table 47.1 External Pins

Pin Name	Abbreviation	I/O	Function
Lane 0 positive data pin	CSI_DATA0P	Input	Differential positive receive data input on CSI2 lane 0
Lane 0 negative data pin	CSI_DATA0N	Input	Differential negative receive data input on CSI2 lane 0
Lane 1 positive data pin	CSI_DATA1P	Input	Differential positive receive data input on CSI2 lane 1
Lane 1 negative data pin	CSI_DATA1N	Input	Differential negative receive data input on CSI2 lane 1
Clock lane positive data pin	CSI_CLKP	Input	Differential positive reception input on CSI2 clock lane
Clock lane negative data pin	CSI_CLKN	Input	Differential negative reception input on CSI2 clock lane

47.1.4 Register Configuration

The following lists the base address of this module.

Module Name	Address
CSI2LNK0	H'E820 9000

Table 47.2 Register Configuration

Note 1. Only 1 can be written to clear the flag; bits 27, 4, and 3 are read-only bits and any value cannot be written to.
Note 2. Only 1 can be written to clear the flag.
Note 3. Access to these registers is only possible in 32-bit units.

47.2 Register Description

[Legend]

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/WB: Write-only. The read value is undefined.

47.2.1 Control Timing Select Register (TREF)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TREF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TREF	1	R/W	Register value reflection timing selection 1: Immediately Do not change this bit from its initial value.

47.2.2 Software Reset Register (SRST)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0	R/W	Software reset control 0: Normal 1: Reset This bit resets the control circuit in the CSI2 block. To reset the circuit, set this bit to 1. Be sure to set this bit to 0 to cancel a reset. A software reset does not initialize the CSI2 registers.

Note: The setting of the effective bit of this register becomes applicable the instant the register is set.

47.2.3 PHY Operation Control Register (PHYCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHUTDOWNZ	RSTZ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENABLECLK	—	—	ENABLE_1	ENABLE_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	SHUTDOWNZ	0	R/W	Setting this bit to 0 shuts down the PHY block.
16	RSTZ	0	R/W	Setting this bit to 0 initializes the PHY block.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENABLECLK	0	R/W	Clock lane operation enable 0: Disables operation. 1: Enables operation. When any of the ENABLE_1 to ENABLE_0 bits is set to 1, be sure to set the ENABLECLK bit to 1.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENABLE_1	0	R/W	Data lane 1 operation enable 0: Disables operation. 1: Enables operation. Note: When 1- lane PHY is connected, this setting has no effect.
0	ENABLE_0	0	R/W	Data lane 0 operation enable 0: Disables operation. 1: Enables operation. Always set this bit to 1.

Note: The setting of the effective bit of this register becomes applicable the instant the register is set. Set this register while data input is suspended (the sensor is halted); never change the settings of this register during operation.

47.2.4 Checksum Control Register (CHKSUM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_EN	CRC_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ECC_EN	0	R/W	ECC process control 0: Disabled 1: Enabled This bit controls ECC process of the packet header (PH) for Low Level Protocol (LLP). Set this bit to 1 to use ECC. When set to 0, data is always processed assuming it has no errors and thus no errors are corrected.
0	CRC_EN	0	R/W	CRC checksum process control 0: Disabled 1: Enabled This bit controls checksum process of the long packet data for Low Level Protocol (LLP). Set this bit to 1 to use CRC checksum. When set to 0, data is always processed assuming it has no errors.

Note: The settings of the effective bits of this register become applicable the instant the register is set. Set this register while data input is suspended (the sensor is halted); never change the settings of this register during operations.

47.2.5 Channel Data Type Select Register (VCDT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCDT_EN	—	—	—	—	—	SEL_VC		—	SEL_DT_ON	SEL_DT					
Initial value:	1	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0
R/W:	R/W	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	H'1E	R	Reserved These bits are always read as H’1E. The write value should always be H’1E.
15	VCDT_EN	1	R/W	Channel enable 0: Disabled 1: Enabled This bit enables or disables channel. When set to 0, VD and FLD are fixed to low and TAG = 0 is not generated.
14 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SEL_VC	H'0	R/W	Channel select channel H'0 to H'3 These bits specify the virtual channels for channel to capture. Channels can be selected from among four channels from H'0 to H'3. Data is output from the channel when the value of this register matches the received virtual channel.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	SEL_DT_ON	0	R/W	Channel select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT. When set to 0, data is output from the channel even when the setting of SEL_DT does not match the received data type as long as it matches the virtual channel. When set to 1, data is output from the channel only when the setting of SEL_DT matches the received data type and the virtual channel.
5 to 0	SEL_DT	H'1E	R/W	Channel select data type H'00 to H'3F These bits specify the data type for channel to capture. The CSI2 LINK block outputs the received payload data as it is regardless of the data type when SEL_DT_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module.

Note 1. This register must be set during the initialization sequence.
Note 2. In the table above, “virtual channel” refers to a channel through which data flows from the camera and “channel” refers to an output channel of the CSI2.

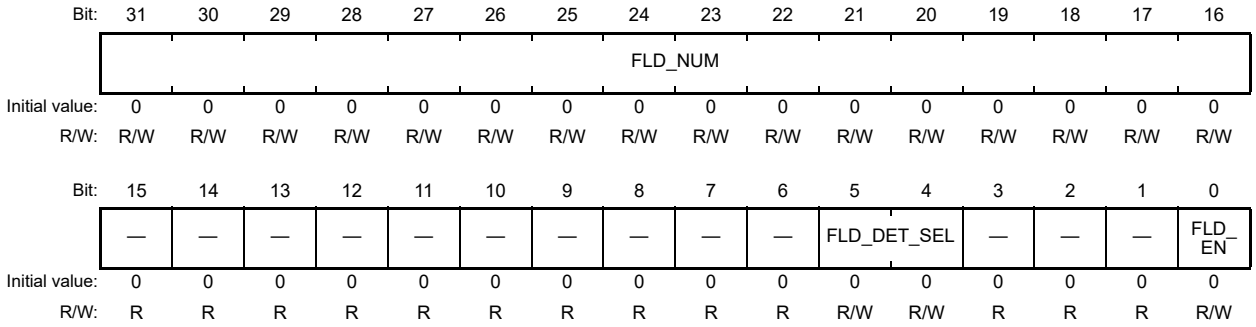
47.2.6 Frame Data Type Select Register (FRDT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	DT_FS						—	—	DT_FE					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	DT_FS	H'00	R/W	Frame start data type These bits specify the frame start data type. When the value of these bits matches the received data type, the data is determined as a frame start.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21 to 16	DT_FE	H'01	R/W	Frame end data type These bits specify the frame end data type. When the value of these bits matches the received data type, the data is determined as a frame end.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

47.2.7 Field Detection Control Register (FLD)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	FLD_NUM	H'0000	R/W	Even field number setting These bits specify the value for detecting the even field of the interlaced image. For detecting the even field, the WC value (16 bits) of the Frame Start packet is referred to. When the WC value matches the setting of these bits, the field is detected as the even field. During the frame period, the CSIR_FLD signal stays High.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	FLD_DET_SEL	B'00	R/W	Even field detection condition select 00: The field is detected as the first field when FLD_NUM matches WC. 01: The field is detected as the first field when FLD_NUM[0] matches WC[0]. 10: The field is detected as the first field when FLD_NUM[0] matches WC[8]. 11: Setting is prohibited.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FLD_EN	0	R/W	Channel even field detection control This bit enables or disables the detection of even fields in channel 1. Set this bit to 1 to enable detection. This bit must be set to 0 when input images are arranged for progressive (sequential) scanning.

Note: This register must be set during the initialization sequence.

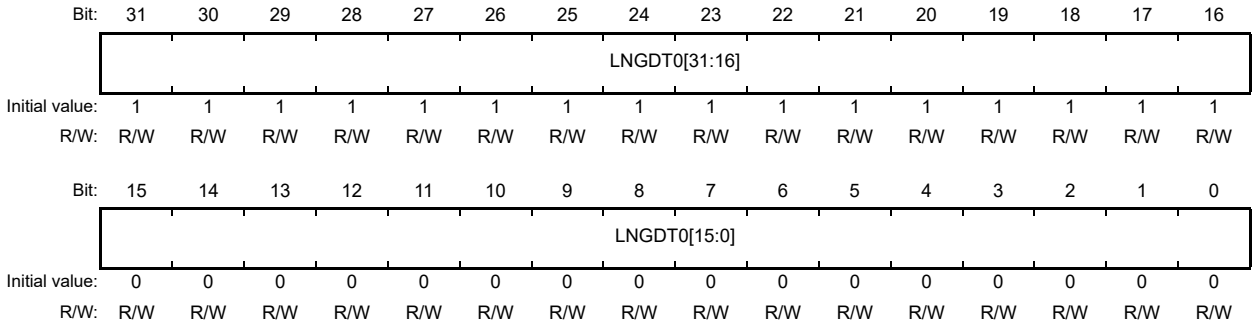
47.2.8 Automatic Standby Control Register (ASTBY)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	VD_MSK_CYCLE						—	—	VD_MSK_EN	AUTO_STANDBY_EN				
Initial value:	0	0	1	1	1	1	1	1	0	0	1	0	0	0	0	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

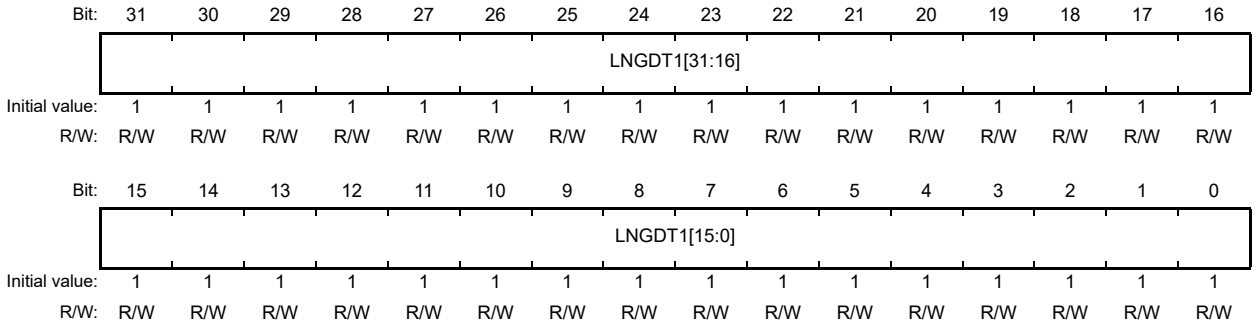
Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	VD_MSK_CYCLE	H'3F	R/W	VD masking cycle These bits specify the period for the masking of VD and FLD in response to frame-start errors. A frame-start error is the state in which FS is received and a further FS is received before FE is received. When a frame-start error occurs, the VD signal does not go low (Vsync is not generated); masking VD leads to the generation of the period over which VD is low. VD is masked for 4 × VD_MSK_CYCLE × input clock period. Maximum value: This bit must be set so that VD is masked for less than the period from an EOT short packet (frame start) to an SOT long packet. Minimum value: This bit must be at least 5, i.e. VD is masked for 20 × input clock period.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	VD_MSK_EN	1	R/W	VD masking enable 0: Disables masking VD. 1: Enables masking VD. This bit enables or disables VD and FLD masking function when a frame start error occurs. When this bit is set to enable the function, VD and FLD are masked for the period specified with the VD_MSK_CYCLE bits.
4 to 0	AUTO_STANDBY_EN	H'01	R/W	Automatic standby control 0: Neither VD nor FLD is initialized. 1: VD and FLD are initialized. [0]: ECC 2-bit error [1]: ECC 1-bit error on receiving FS [2]: ECC 1-bit error on receiving FE [3]: ECC 1-bit error on receiving data other than FS or FE [4]: CRC error Each bit enables or disables initialization of VD and FLD in response to the corresponding error. Set the corresponding bit to 1 to enable initialization of the VD and FLD signals.

47.2.9 Long Data Type Setting Register 0 (LNGDT0)



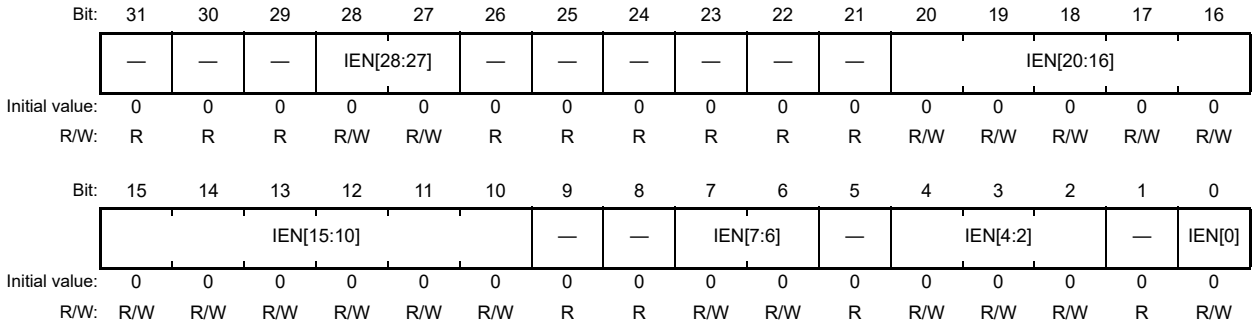
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LNGDT0	H'FFFF 0000	R/W	Long data type setting 0: Short packet 1: Long packet This register is combined with LNGDT1 register as in LNGDT = {LNGDT1, LNGDT0}. When LNGDT[received DT[5:0]] is 1, data is determined as a long packet and it is determined as a short packet when 0. According to the MIPI standard, DT = H'00 to H'0F is defined as a short packet and DT = H'10 to H'3F is defined as a long packet; to satisfy these conditions, the initial values of LNGDT are 0 in bits 0 to 15 and 1 in bits 16 to 63.

47.2.10 Long Data Type Setting Register 1 (LNGDT1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LNGDT1	H'FFFF FFFF	R/W	Long data type setting 1 0: Short packet 1: Long packet These bits set the long packet or short packet as the data type (assigns H'3F to H'20).

47.2.11 Interrupt Enable Register (INTEN)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	IEN[28]	0	R/W	Interrupt 28 (INT_LESS_THAN_WC) enable 0: Disables the interrupt. 1: Enables the interrupt.
27	IEN[27]	0	R/W	Interrupt 27 (INT_AFIFO_OF) enable 0: Disables the interrupt. 1: Enables the interrupt.
26 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	IEN[20]	0	R/W	Interrupt 20 (INT_VD_START) enable 0: Disables the interrupt. 1: Enables the interrupt.
19	IEN[19]	0	R/W	Interrupt 19 (INT_VD_END) enable 0: Disables the interrupt. 1: Enables the interrupt.
18	IEN[18]	0	R/W	Interrupt 18 (INT_SHP_STB) enable 0: Disables the interrupt. 1: Enables the interrupt.
17	IEN[17]	0	R/W	Interrupt 17 (INT_FSFE) enable 0: Disables the interrupt. 1: Enables the interrupt.
16	IEN[16]	0	R/W	Interrupt 16 (INT_LNP_STB) enable 0: Disables the interrupt. 1: Enables the interrupt.
15	IEN[15]	0	R/W	Interrupt 15 (INT_CRC_ERR) enable 0: Disables the interrupt. 1: Enables the interrupt.
14	IEN[14]	0	R/W	Interrupt 14 (INT_HD_WC_ZERO) enable 0: Disables the interrupt. 1: Enables the interrupt.
13	IEN[13]	0	R/W	Interrupt 13 (INT_FRM_SEQ_ERR1) enable 0: Disables the interrupt. 1: Enables the interrupt.
12	IEN[12]	0	R/W	Interrupt 12 (INT_FRM_SEQ_ERR0) enable 0: Disables the interrupt. 1: Enables the interrupt.
11	IEN[11]	0	R/W	Interrupt 11 (INT_ECC_ERR) enable 0: Disables the interrupt. 1: Enables the interrupt.
10	IEN[10]	0	R/W	Interrupt 10 (INT_ECC_CRCT_ERR) enable 0: Disables the interrupt. 1: Enables the interrupt.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	IEN[7]	0	R/W	Interrupt 7 (INT_ULPS_START) enable 0: Disables the interrupt. 1: Enables the interrupt.
6	IEN[6]	0	R/W	Interrupt 6 (INT_ULPS_END) enable 0: Disables the interrupt. 1: Enables the interrupt.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	IEN[4]	0	R/W	Interrupt 4 (INT_ERRSOTHS) enable 0: Disables the interrupt. 1: Enables the interrupt.
3	IEN[3]	0	R/W	Interrupt 3 (INT_ERRSOTSYNCHS) enable 0: Disables the interrupt. 1: Enables the interrupt.
2	IEN[2]	0	R/W	Interrupt 2 (INT_ERRESC) enable 0: Disables the interrupt. 1: Enables the interrupt.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	IEN[0]	0	R/W	Interrupt 0 (INT_ERRCONTROL) enable 0: Disables the interrupt. 1: Enables the interrupt.

Note 1. The setting of the effective bit of this register becomes applicable the instant the register is set.
Note 2. Do not change the settings in this register while the CSI2 is operating.

47.2.12 Interrupt Source Mask Register (INTCLOSE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	ICL[28:27]		—	—	—	—	—	—	ICL[20:16]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

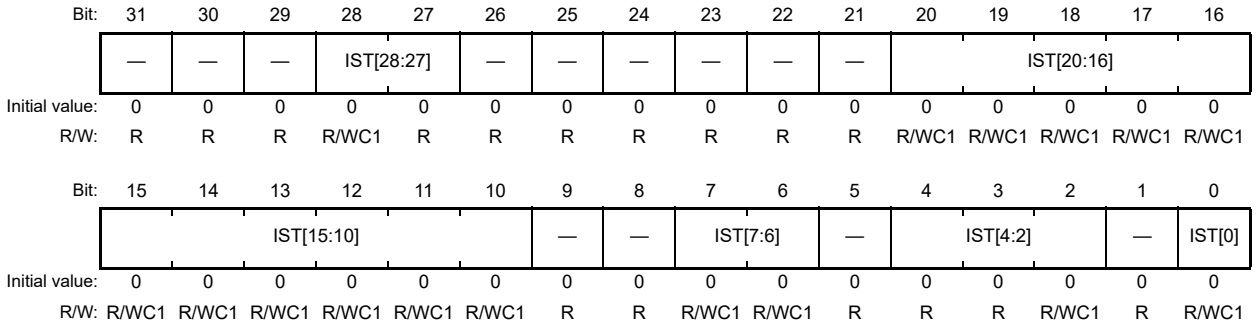
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICL[15:10]						—	—	ICL[7:6]		—	ICL[4:2]			—	ICL[0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	ICL[28]	0	R/W	Interrupt 28 (INT_LESS_THAN_WC) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
27	ICL[27]	0	R/W	Interrupt 27 (INT_AFIFO_OF) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
26 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	ICL[20]	0	R/W	Interrupt 20 (INT_VD_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
19	ICL[19]	0	R/W	Interrupt 19 (INT_VD_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
18	ICL[18]	1	R/W	Interrupt 18 (INT_SHP_STB) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
17	ICL[17]	0	R/W	Interrupt 17 (INT_FSFE) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
16	ICL[16]	0	R/W	Interrupt 16 (INT_LNP_STB) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
15	ICL[15]	0	R/W	Interrupt 15 (INT_CRC_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
14	ICL[14]	0	R/W	Interrupt 14 (INT_HD_WC_ZERO) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
13	ICL[13]	0	R/W	Interrupt 13 (INT_FRM_SEQ_ERR1) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
12	ICL[12]	0	R/W	Interrupt 12 (INT_FRM_SEQ_ERR0) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
11	ICL[11]	0	R/W	Interrupt 11 (INT_ECC_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
10	ICL[10]	0	R/W	Interrupt 10 (INT_ECC_CRCT_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ICL[7]	0	R/W	Interrupt 7 (INT_ULPS_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
6	ICL[6]	0	R/W	Interrupt 6 (INT_ULPS_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	ICL[4]	0	R/W	Interrupt 4 (INT_ERRSOTHS) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
3	ICL[3]	0	R/W	Interrupt 3 (INT_ERRSOTSYNCHS) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
2	ICL[2]	0	R/W	Interrupt 2 (INT_ERRESC) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	ICL[0]	0	R/W	Interrupt 0 (INT_ERRCONTROL) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.

Note: The setting of the effective bit of this register becomes applicable the instant the register is set.
Note: The settings of this register are optional. When INTCLOSE is set, the following sequence is recommended before “Start of PHY” operation.
1. set INTCLOSE
2. clear INTSTATE and INTERRSTATE
3. set INTEN

47.2.13 Interrupt Status Monitor Register (INTSTATE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	IST[28]	0	R/WC1	Interrupt 28 (INT_LESS_THAN_WC) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 28 is an error interrupt that is generated when the length of payload data of a long packet is less than the WC value.
27	IST[27]	0	R	Interrupt 27 (INT_AFIFO_OF) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 27 is generated in response to an overflow of the asynchronous FIFO, which holds the HS data sent from the PHY. IST[27] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[8]) generates the interrupt. Therefore, the interrupt is cleared using the interrupt error status monitoring register. Check the relevant registers such as the PHY data lane monitoring register since synchronization between lanes may not be taken or data may not be received in a specific lane.
26 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	IST[20]	0	R/WC1	Interrupt 20 (INT_VD_START) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 20 is generated in response to the start of VD output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD signal.
19	IST[19]	0	R/WC1	Interrupt 19 (INT_VD_END) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 19 is generated in response to the end of VD output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD signal.

Bit	Bit Name	Initial Value	R/W	Description
18	IST[18]	0	R/WC1	Interrupt 18 (INT_SHP_STB) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 18 is a short packet reception interrupt. It is issued upon reception of short packets such as frame start and frame end packets.
17	IST[17]	0	R/WC1	Interrupt 17 (INT_FSFE) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 17 is a frame packet reception interrupt. It is issued upon reception of a frame start or frame end packet among short packets.
16	IST[16]	0	R/WC1	Interrupt 16 (INT_LNP_STB) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 16 is a long packet reception interrupt. It is issued upon reception of long packets such as YUV data.
15	IST[15]	0	R/WC1	Interrupt 15 (INT_CRC_ERR) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 15 is a CRC error interrupt. It is issued if there is a data error in a long packet. To perform the CRC check, set the CRC_EN bit in the CHKSUM register to 1.
14	IST[14]	0	R/WC1	Interrupt 14 (INT_HD_WC_ZERO) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 14 is a WC (word count) zero interrupt. It is issued when the WC value in the packet header of a long packet is zero.
13	IST[13]	0	R/WC1	Interrupt 13 (INT_FRM_SEQ_ERR1) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 13 is a frame sequence error 1 interrupt. It is issued when an illegal Frame End packet is received. Specifically, it is issued in the following cases (assuming that the same channel is used): - A Frame End packet is received before a Frame Start packet is received. - Frame End packets are continuously received.
12	IST[12]	0	R/WC1	Interrupt 12 (INT_FRM_SEQ_ERR0) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 12 is a frame sequence error 0 interrupt. It is issued when an illegal Frame Start packet is received. Specifically, it is issued in the following case (assuming that the same channel is used): - Frame Start packets are continuously received.

Bit	Bit Name	Initial Value	R/W	Description
11	IST[11]	0	R/WC1	Interrupt 11 (INT_ECC_ERR) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 11 is an ECC error interrupt. It is issued when two or more bits of errors are found in a packet header. To perform the ECC processing, set the ECC_EN bit in the CHKSUM register to 1.
10	IST[10]	0	R/WC1	Interrupt 10 (INT_ECC_CRCT_ERR) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 10 is an ECC 1-bit correction interrupt. It is issued when 1-bit correction is performed for a packet header during ECC processing. To perform the ECC processing, set the ECC_EN bit in the CHKSUM register to 1.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	IST[7]	0	R/WC1	Interrupt 7 (INT_ULPS_START) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 7 is an ultra-low power data transfer start interrupt. This bit is set to high when any of the lanes shifts to the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM). It is need to write to 1’b1 after initial sequence of PHY.
6	IST[6]	0	R/WC1	Interrupt 6 (INT_ULPS_END) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 6 is an ultra-low power data transfer end interrupt. This bit is set to high when no lanes are in the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM). It is need to write to 1’b1 after initial sequence of PHY.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	IST[4]	0	R	Interrupt 4 (INT_ERRSOTHS) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 4 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the interrupt error status monitoring register (INTERRSTATE). IST[4] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[5:4]) generates the interrupt. Since the ERRSOTHS_[3-0] input from the PHY are pulse signals, the state are not retained. Therefore, the interrupt error status register is provided as the interrupt status register for each lane. Therefore, the interrupt is cleared using the interrupt error status monitoring register.

Bit	Bit Name	Initial Value	R/W	Description
3	IST[3]	0	R	Interrupt 3 (INT_ERRSOTSYNCHS) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 3 is a non-synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the interrupt error status monitoring register (INTERRSTATE). IST[3] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[5:4]) generates the interrupt. Since the ERRSOTSYNCHS [3-0] input from the PHY are pulse signals, the state are not retained. Therefore, the interrupt error status register is prepared as the interrupt status register for each lane. Therefore, the interrupt is cleared using the interrupt error status monitoring register.
2	IST[2]	0	R/WC1	Interrupt 2 (INT_ERRESC) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 2 is an escape mode entry error interrupt. It is issued when an unrecognizable escape entry command is received. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the PHY ESC error monitoring register (PHEERM). Even after the interrupt is cleared, the PHEERM register retains the high- level state until a stop state is received.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	IST[0]	0	R/WC1	Interrupt 0 (INT_ERRCONTROL) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 0 is a PHY control error interrupt. It is issued when a transition is made to an incorrect line state. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the PHY ESC error monitoring register (PHEERM). Even after the interrupt is cleared, the PHEERM register retains the high-level state until a stop state is received.

47.2.14 Interrupt Error Status Monitor Register (INTERRSTATE)

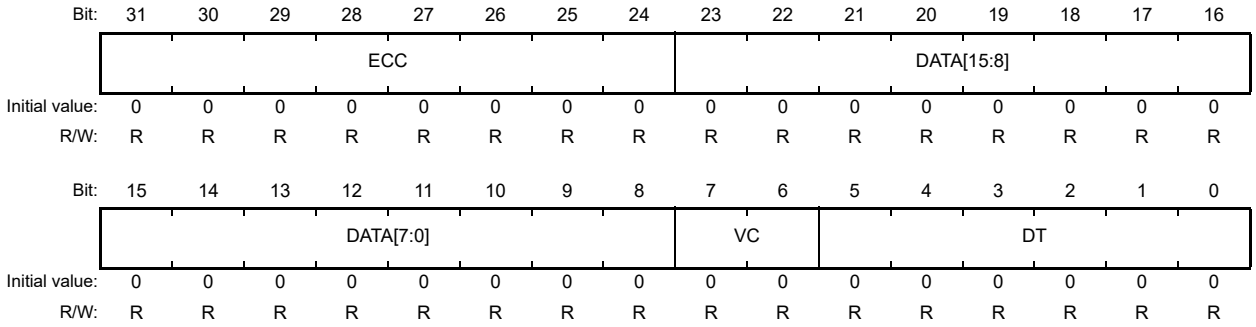
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	IEST [13]	IEST [12]	—	—	—	IEST[8]	—	—	IEST[5:4]		—	—	IEST[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R/WC1	R/WC1	R	R	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	IEST[13]	0	R/WC1	Error interrupt 13 (INT_FIFO_OF_1) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Error interrupt 13 is generated in response to an overflow of the synchronous FIFO, which holds HS data sent from the PHY block. If the setting of ICL[27] in the interrupt source mask register is 1, INT_FIFO_OF_1 is cleared.
12	IEST[12]	0	R/WC1	Error interrupt 12 (INT_FIFO_OF_0) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Error interrupt 12 is generated in response to an overflow of the synchronous FIFO, which holds HS data sent from the PHY block. If the setting of ICL[27] in the interrupt source mask register is 1, INT_FIFO_OF_0 is cleared.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IEST[8]	0	R/WC1	Error interrupt 8 (INT_AFIFO_OF_0) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Error interrupt 8 is generated in response to an overflow of the asynchronous FIFO, which holds HS data sent from the PHY block. If the setting of ICL[27] in the interrupt source mask register is 1, INT_AFIFO_OF_0 is cleared to 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	IEST[5]	0	R/WC1	Error interrupt 5 (INT_ERRSOTHS_1) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Note: When the connected PHY is single-lane, the interrupt is not generated. Error interrupt 5 is generated in response to a synchronized start-of-transmission (SoT) error during HS reception. This bit is set to 1 when an error is detected in lane 1. If the setting of ICL[4] in the interrupt source mask register is 1, INT_ERRSOTHS_1 is cleared to 0.
4	IEST[4]	0	R/WC1	Error interrupt 4 (INT_ERRSOTHS_0) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Error interrupt 4 is generated in response to a synchronized synchronized start-of-transmission (SoT) error during HS reception. This bit is set to 1 when an error is detected in lane 0. If the setting of ICL[4] in the interrupt source mask register is 1, INT_ERRSOTHS_0 is cleared to 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	IEST[1]	0	R/WC1	Error interrupt 1 (INT_ERRSOTSYNCHS_1) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Note: When the connected PHY is single-lane, the interrupt is not generated. Error interrupt 1 is generated in response to a non-synchronized start-of-transmission (SoT) during HS reception. This bit is set to 1 when an error is detected in lane 1. If the setting of ICL[3] in the interrupt source mask register is 1, INT_ERRSOTSYNCHS_1 is cleared to 0.
0	IEST[0]	0	R/WC1	Error interrupt 0 (INT_ERRSOTSYNCHS_0) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Error interrupt 0 is generated in response to a non-synchronized start-of-transmission (SoT) during HS reception. This bit is set to 1 when an error is detected in lane 0. If the setting of ICL[3] in the interrupt source mask register is 1, INT_ERRSOTSYNCHS_0 is cleared to 0.

47.2.15 Short Packet Data Register (SHPDAT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	H'00	R	ECC data received
23 to 8	DATA	H'0000	R	Short packet data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type received

SHPDAT is used to read the received short packet data. The value of this register is stored in the FIFO and the number of packets stored can be checked by reading the short packet count register (SHPCNT). Short packets with the data types H'00 (frame start), H'01 (frame end), and H'08 (Generic Short Packet Code 1, DSI End of Transmission) are not stored.

47.2.16 Short Packet Count Register (SHPCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	NUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	OVF	0	R	FIFO overflow bit FIFO has overflowed. The received data may have been lost.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	NUM	H'0	R	Stored short packet count The number of short packets stored in the FIFO can be read. Up to nine packets can be stored.

47.2.17 LINK Operation Control Register (LINKCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MONITOR_EN	—	—	—	—	—	REG_MONI_PACT_EN	—	—	—	—	—	—	—	—	—
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	MONITOR_EN	1	R/W	Monitoring function control 0: Disable 1: Enable This bit updates the monitor state to be read by the registers.
30 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	REG_MONI_PACT_EN	0	R/W	Monitoring packet counter enable 0: Disable 1: Enable This bit controls the packet counter for monitoring.
24 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

47.2.18 Lane Swap Register (LSWAP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	L1SEL		L0SEL	
Initial value:	0	0	0	0	0	0	0	0	1	1	1	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3, 2	L1SEL	H'1	R/W	LINK lane 1 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Setting prohibited H'3: Setting prohibited Note: When the connected PHY is single-lane, this setting has no effect. These bits select a PHY lane to be assigned to LINK lane 1. These bits should be set before the start of PHY operation and should not be modified during operation.
1, 0	L0SEL	H'0	R/W	LINK lane 0 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Setting prohibited H'3: Setting prohibited These bits select a PHY lane to be assigned to LINK lane 0. These bits should be set before the start of PHY operation and should not be modified during operation.

Note: The setting of the effective bit of this register becomes applicable the instant the register is set. Set the ENABLE_0 bit in PHYCNT to 1 to enable modifying the value of this register.

47.2.19 PHY ESC Error Monitor Register (PHEERM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CL_ERR CONTROL	—	—	ERRESC_1	ERRESC_0	—	—	—	—	—	—	ERRCONTROL_1	ERRCONTROL_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	CL_ERR CONTROL	0	R	Clock lane status control error bit If an incorrect line state is entered during entry to the HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	ERRESC_1	0	R	Lane 1 escape mode error bit Note: When 1-lane PHY is connected, the error is not generated. If an unrecognizable escape entry command is received, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state.
8	ERRESC_0	0	R	Lane 0 escape mode error bit If an unrecognizable escape entry command is received, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ERRCONTROL_1	0	R	Lane 1 status control error bit Note: When 1-lane PHY is connected, the error is not generated. If an incorrect line state is entered during entry to HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state.
0	ERRCONTROL_0	0	R	Lane 0 status control error bit If an incorrect line state is entered during entry to HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state.

47.2.20 PHY Clock Lane Monitor Register (PHCLM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ULPSACTIVENOTCLK	RXULPSCLKNOT	RXCLKACTIVEHS	STOPSTATECLK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	ULPSACTIVENOTCLK	1	R	This active-low signal is asserted to indicate that the clock lane is in the ultra low power (ULP) state. This bit is set to 0 to when the clock lane is placed in the ULP state, and is set to 1 to when the Mark-1 state (LP-10) is observed.
2	RXULPSCLKNOT	1	R	This active-low signal is asserted to indicate that the clock lane is in the ULP state. This bit is set to 0 when the clock lane is placed in the ULP state, and is set to 1 when the stop state (LP-11) is observed.
1	RXCLKACTIVEHS	0	R	This bit being 1 indicates that the clock lane is receiving the HS DRR clock.
0	STOPSTATECLK	0	R	This bit being 1 indicates that the clock lane is in the stop state.

47.2.21 PHY Data Lane Monitor Register (PHDLM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ULPSACTIVENOT_1	ULPSACTIVENOT_0	—	—	RXULPSESC_1	RXULPSESC_0	—	—	—	—	—	—	STOPSTATEDATA_1	STOPSTATEDATA_0
Initial value:	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	ULPSACTIVENOT_1	1	R	This active-low signal is asserted to indicate that lane 1 is in the ultra low power (ULP) state. Note: When the connected PHY is single-lane, this bit is fixed to 1. This bit is set to 0 when lane 1 is placed in the ULP state, and is set to 1 when the Mark-1 state (LP-10) is observed.
12	ULPSACTIVENOT_0	1	R	This active-low signal is asserted to indicate that lane 0 is in the ULP state. This bit is set to 0 when lane 0 is placed in the ULP state, and is set to 1 when the Mark-1 state (LP-10) is observed.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	RXULPSESC_1	0	R	This bit indicates that lane 1 is in the ULP state. Note: When the connected PHY is single-lane, this bit is fixed to 0. This bit is set to 1 when lane 1 is placed in the ULP state, and is set to 0 to when the stop state (LP-11) is observed.
8	RXULPSESC_0	0	R	This bit indicates that lane 0 is in the ULP state. This bit is set to 1 to indicate that lane 0 is placed in the ULP state, and is set to 0 to indicate that the stop state (LP-11) is observed.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	STOPSTATEDATA_1	0	R	This bit being 1 indicates that lane 1 is in the stop state. Note: When the connected PHY is single-lane, this bit is fixed to 0.
0	STOPSTATEDATA_0	0	R	This bit being 1 indicates that lane 0 is in the stop state.

47.2.22 Packet Header 0 Monitor Register 0 (PH0M0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WC[15:8]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WC[7:0]								VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PH0M0 is used to monitor the received packet header.

47.2.23 Packet Header 0 Monitor Register 1 (PH0M1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PH_CNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PH_CNT	H'0000	R	PH0M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH0M0 register.

47.2.24 Packet Header 1 Monitor Register 0 (PH1M0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WC[15:8]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WC[7:0]								VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PH1M0 is used to monitor the received packet header (previous data of PH0M0).

47.2.25 Packet Header 1 Monitor Register 1 (PH1M1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PH_CNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PH_CNT	H'0000	R	PH1M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH1M0 register.

47.2.26 Packet Header 2 Monitor Register 0 (PH2M0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WC[15:8]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WC[7:0]								VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PH2M0 is used to monitor the received packet header (previous data of PH1M0).

47.2.27 Packet Header 2 Monitor Register 1 (PH2M1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PH_CNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PH_CNT	H'0000	R	PH2M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH2M0 register.

47.2.28 Packet Header 3 Monitor Register 0 (PH3M0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WC[15:8]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WC[7:0]								VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PH3M0 is used to monitor the received packet header (previous data of PH2M0).

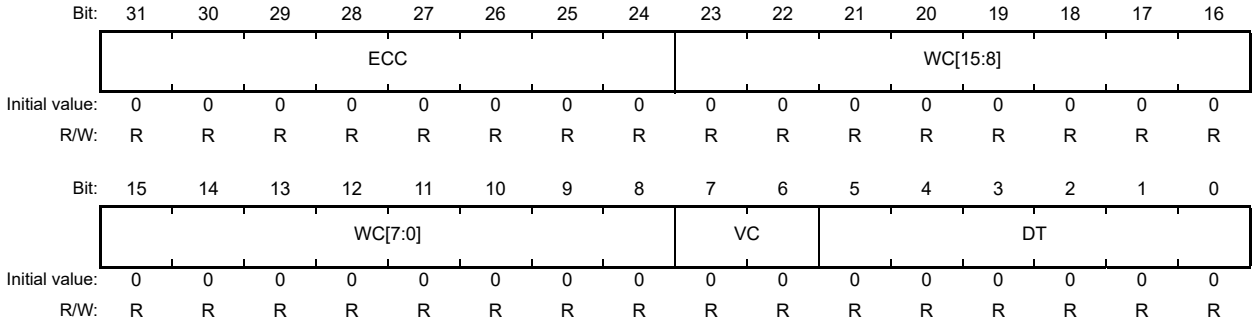
47.2.29 Packet Header 3 Monitor Register 1 (PH3M1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PH_CNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PH_CNT	H'0000	R	PH3M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH3M0 register.

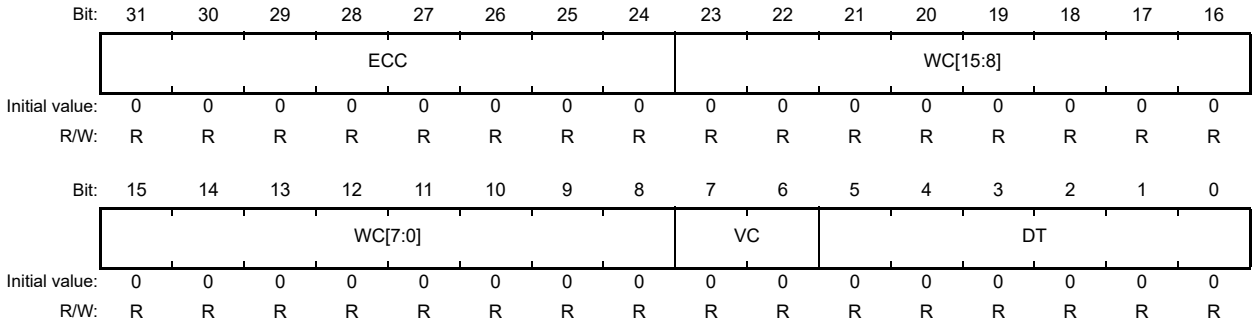
47.2.30 Packet Header R Monitor Register 0 (PHRM0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	H'00	R	ECC data received
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PHRM0 is used to monitor the currently received packet header.

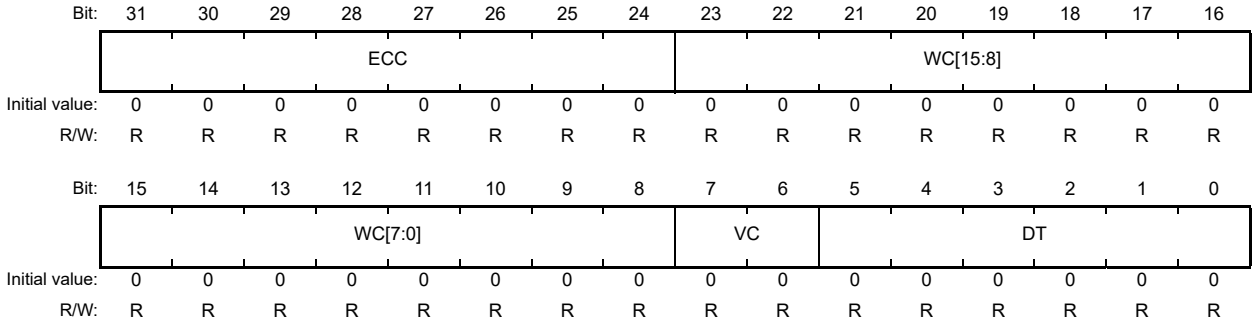
47.2.31 Packet Header R Monitor Register 1 (PHRM1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	H'00	R	ECC data received
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PHRM1 is used to monitor the received packet header (previous data of PHRM0).

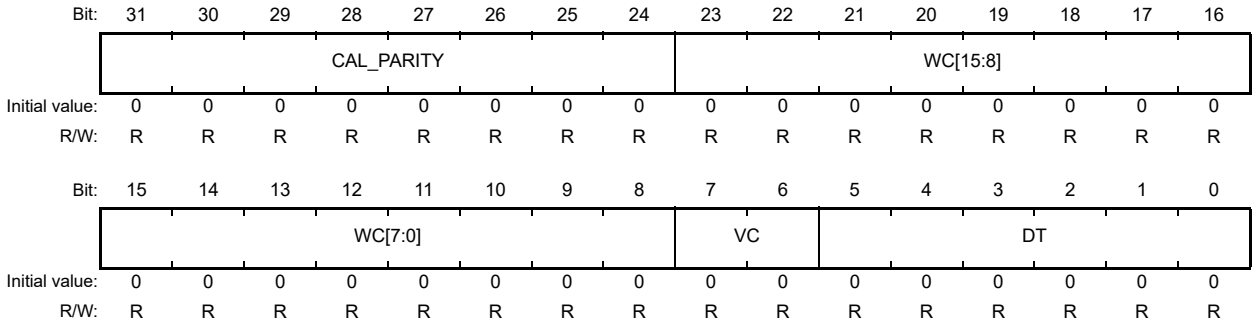
47.2.32 Packet Header R Monitor Register 2 (PHRM2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	H'00	R	ECC data received
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PHRM2 is used to monitor the received packet header (previous data of PHRM1).

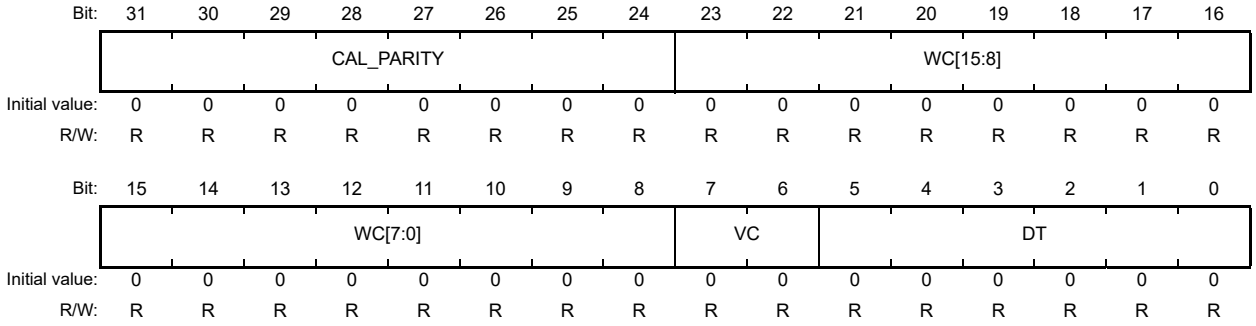
47.2.33 Packet Header C Monitor Register 0 (PHCM0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CAL_PARITY	H'00	R	Parity calculated from the header
23 to 8	WC	H'0000	R	Received word count data after ECC correction
7, 6	VC	B'00	R	Received virtual channel data after ECC correction
5 to 0	DT	H'00	R	Received data type data after ECC correction

PHCM0 is used to monitor the currently received ECC-corrected packet header and calculated parity.

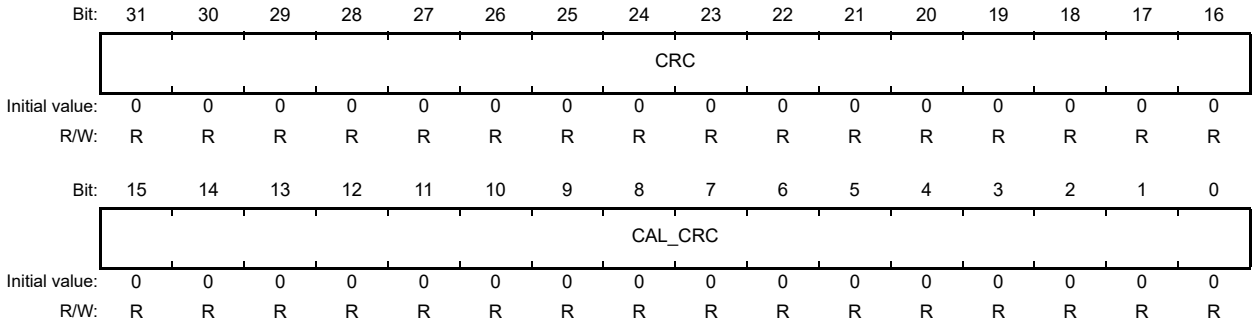
47.2.34 Packet Header C Monitor Register 1 (PHCM1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CAL_PARITY	H'00	R	Parity calculated from the header
23 to 8	WC	H'0000	R	Received word count data after ECC correction
7, 6	VC	B'00	R	Received virtual channel data after ECC correction
5 to 0	DT	H'00	R	Received data type data after ECC correction

PHCM1 is used to monitor the currently received ECC-corrected packet header and calculated parity (previous data of PHCM0).

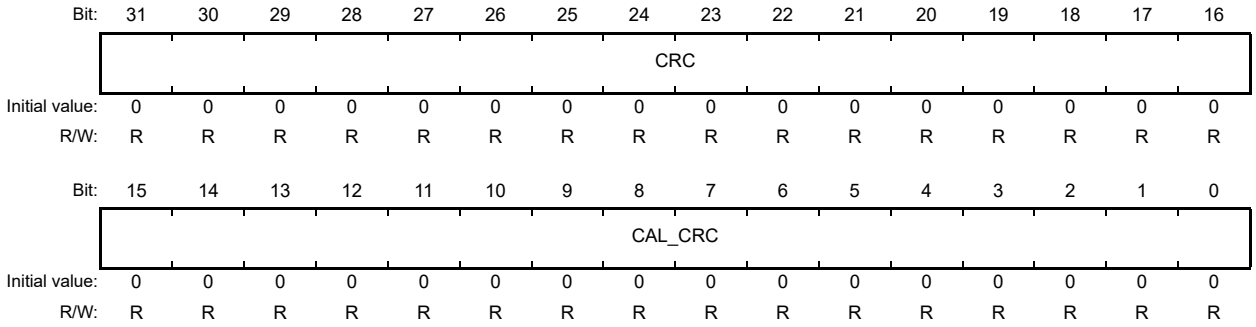
47.2.35 CRC Monitor Register 0 (CRCM0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CRC	H'0000	R	Received CRC
15 to 0	CAL_CRC	H'0000	R	Received data type data after ECC correction

CRCM0 is used to monitor the CRC currently received and CRC calculated from the received data.

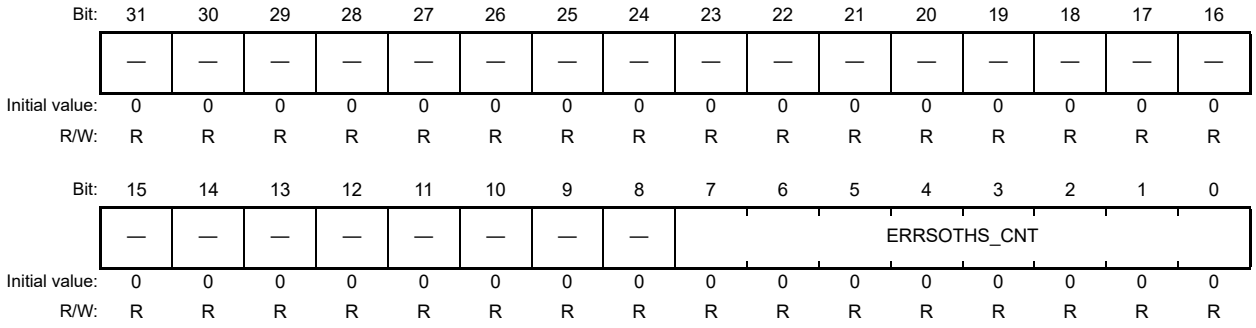
47.2.36 CRC Monitor Register 1 (CRCM1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CRC	H'0000	R	Received CRC
15 to 0	CAL_CRC	H'0000	R	CRC result calculated from the received data

CRCM1 is used to monitor the CRC currently received and CRC calculated from the received data (previous data of CRCM0).

47.2.37 SOT Error Count Register (SERRCNT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ERRSOTHS_CNT	H'00	R	Synchronized SOT error count These bits monitor the number of synchronized SOT errors. The count is the sum of the errors on each lane.

47.2.38 SOTSYNC Error Count Register (SSERRCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ERRSOTSYNCHS			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ERRSOTSYNCHS	H'0	R	Non-synchronized SOT error count These bits monitor the number of non-synchronized SOT errors. The count is the sum of the errors on each lane. After this error is input, no synchronization signal is generated. If the asynchronous FIFO for storing data from the PHY overflows here, the internal registers shift to the abnormal state. In this case, the state can only be restored by resetting the CSI2 control circuit using the software reset register (within this module) or inputting a software reset from an external module after resetting the PHY and stopping the normal lane data from the PHY.

47.2.39 ECC_CRCT Count Register (ECCCM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ECC_CRCT_CNT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ECC_CRCT_CNT	H'00	R	ECC 1-bit correction count These bits monitor the number of ECC 1-bit corrections.

47.2.40 ECC_ERR Count Register (ECECM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ECC_ERR_CNT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ECC_ERR_CNT	H'00	R	ECC error (two bits or more) count These bits monitor the number of ECC errors (of two bits or more).

47.2.41 CRC_ERR Count Register (CRCECM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CRC_ERR_CNT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	CRC_ERR_CNT	H'00	R	CRC error count These bits monitor the number of CRC errors.

47.2.42 Line Register (LCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LINE_CNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	LINE_CNT	H'0000	R	Channel reception line These bits monitor the line currently received on channel.

47.2.43 Line Monitor Register (LCNTM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MONI_LINECNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MONI_ LINECNT	H'0000	R	Channel received line count These bits monitor the number of lines of the most recently received frame on channel.

47.2.44 Frame Count Monitor Register (FCNTM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MONI_FCOUNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MONI_ FCOUNT	H'0000	R	Channel received frame count These bits monitor the number of frames which have been received so far on channel.

47.2.45 PHY Data IN Monitor Register (PHYDIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXDATAHS_1								RXDATAHS_0							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	RXDATAHS_1	H'00	R	Byte data received on data lane1 When 1-lane PHY is connected, these bits are fixed to 0.
7 to 0	RXDATAHS_0	H'00	R	Byte data received on data lane 0

PHYDIM is used to monitor byte data input from the PHY block.

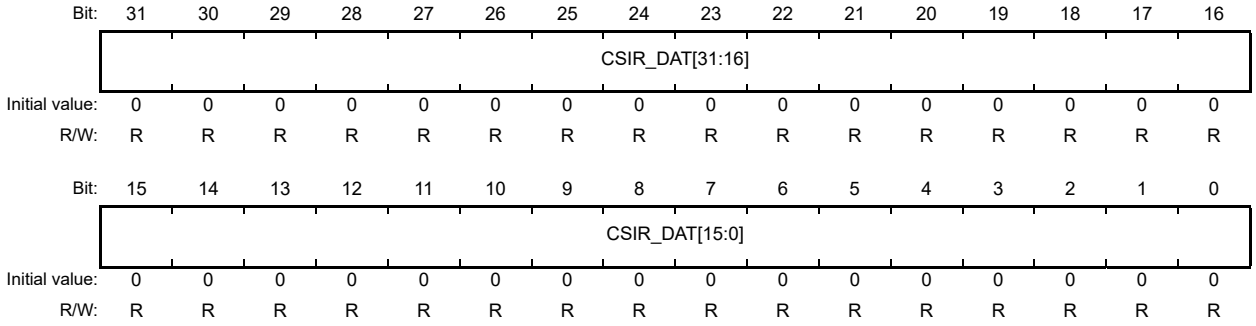
47.2.46 PHY Input Monitor Register (PHYIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RXCLK_CNT	—	—	—	—	—	—	—	—	—	RXVALIDHS_1	RXVALIDHS_0	—	—	RXACTIVEHS_1	RXACTIVEHS_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RXSYNCHS_1_CNT				RXSYNCHS_0_CNT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

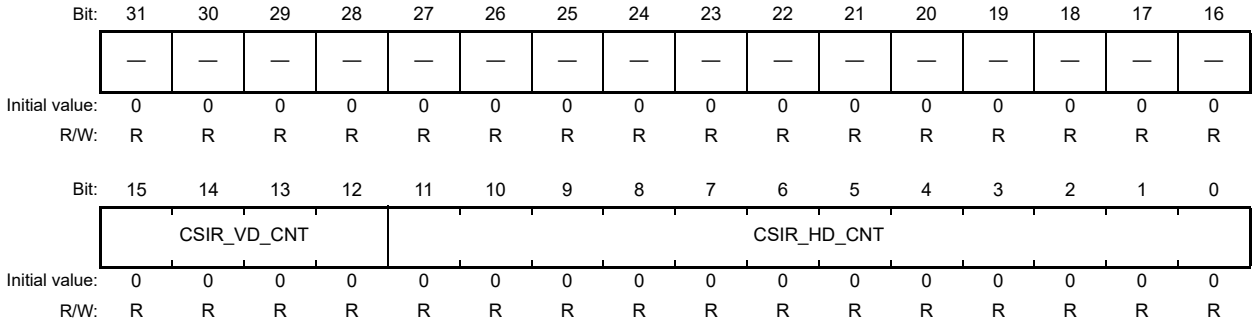
Bit	Bit Name	Initial Value	R/W	Description
31	RXCLK_CNT	0	R	RXCLK counter 0 This bit monitors signals toggled at the rising edge of RXCLK.
30 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	RXVALIDHS_1	0	R	Data lane 1 HS valid signal Note: When 1-lane PHY is connected, this bit is fixed to 0. This bit monitors the valid signal on lane 1 input from the PHY.
20	RXVALIDHS_0	0	R	Data lane 0 HS valid signal This bit monitors the valid signal on lane 0 input from the PHY.
19,18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	RXACTIVEHS_1	0	R	Data lane 1 HS active signal Note: When 1-lane PHY is connected, this bit is fixed to 0. This bit monitors the active signal on lane 1 input from the PHY.
16	RXACTIVEHS_0	0	R	Data lane 0 HS active signal This bit monitors the active signal on lane 0 input from the PHY.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	RXSYNCHS_1_CNT	H'0	R	Data lane 1 HS synchronization signal count Note: When 1-lane PHY is connected, these bits are fixed to 0. These bits monitor the count of RSYNCHS_1 input from the PHY.
3 to 0	RXSYNCHS_0_CNT	H'0	R	Data lane 0 HS synchronization signal count These bits monitor the count of RSYNCHS_0 input from the PHY.

47.2.47 VIN Data Monitor Register (VINDM)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CSIR_DAT [31:0]	H'0000_0000	R	Data output from CSI2 These bits monitor the CSIR_DAT signal output from the CSI2.

47.2.48 VIN Signal Monitor Register 1 (VINSM1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	CSIR_VD_ CNT	H'0	R	Count of VD output from CSI2 These bits count and monitor the vertical synchronization signals for channel output from CSI2.
11 to 0	CSIR_HD_ CNT	H'000	R	Count of HD output from CSI2 These bits count and monitor the HD signals for channel output from CSI2.

47.2.49 VIN Signal Monitor Register 3 (VINSM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIR_ERRE	CSIR_ERRC	CSIR_TAG		CSIR_FLD				CSIR_PEB				—	—	—	CSIR_PE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	CSIR_ERRE	0	R	ECC error output from CSI2 This bit monitors the ECC error signal output from CSI2.
14	CSIR_ERRC	0	R	CRC error output from CSI2 This bit monitors the CRC error signal output from CSI2.
13, 12	CSIR_TAG	B'00	R	TAG output from CSI2 These bits monitor the channel information output from CSI2.
11 to 8	CSIR_FLD	H'0	R	FLD output from CSI2 These bits monitor the field information output from CSI2.
7 to 4	CSIR_PEB	H'0	R	PEB output from CSI2 These bits monitor the byte enable signal output from CSI2.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CSIR_PE	0	R	PE output from CSI2 This bit monitors the packet enable signal output from CSI2.

47.2.50 PHY Output Monitor Register (PHYOM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENABLE CLK	—	—	ENABLE_1	ENABLE_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENABLECLK	0	R	Lane enable signal to the clock lane
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENABLE_1	0	R	Lane enable signal to data lane 1
0	ENABLE_0	0	R	Lane enable signal to data lane 0

PHYOM is used to monitor the lane enable signal output from the CSI2 to the PHY block.

47.2.51 Packet Header Monitor Registers 1 to 8 (PHM1 to PHM8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECC								WC[15:8]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WC[7:0]								VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	H'00	R	ECC data received
23 to 8	WC	H'0000	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PHM1 to PHM8 are used to monitor received packet headers.
The first data are stored in PHM1, and then are shifted to PHM2 when the received packet header changes. After data have been stored in PHM8, data are stored in PHM1 again.

47.2.52 PHY Timing Register 1 (PHYTIM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	THS_ SETTLE	H'00	R/W	MIPI D-PHY T_{HS_SETTLE} parameter setting These bits specify the period over which a transition to the HS state is to be ignored after the $T_{CLK\_PREPARE}$ period has begun in the data lane.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	THS_ PREPARE	H'00	R/W	MIPI D-PHY $T_{HS\_PREPARE}$ parameter setting These bits specify the duration of the LP-00 state (immediately before entry to the HS-0 state) in the data lane.

47.3 Operation

47.3.1 Transfer Rate

This module supports transfer rates from 80 Mbps to 1.0 Gbps.
Figure 47.3 shows a transfer at 1.0 Gbps.

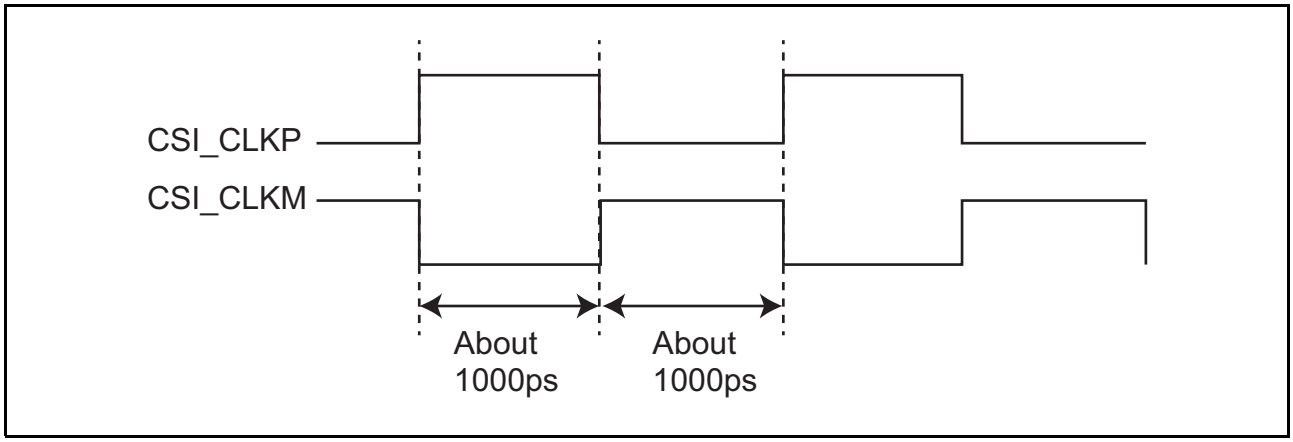

Figure 47.3 CSI-2 Transfer Rate

47.3.2 ECC 1-Bit Error Correction and 2-Bit or More Error Detection for Packet Headers

An interrupt can be generated upon ECC 1-bit error correction and 2-bit or more error detection.

Interrupt Source	Register Bit Name	Bit
ECC error in 2 or more bits	ECC_ERR	[11]
ECC 1-bit error correction	ECC_CRCT_ERR	[10]

The ECC_EN bit in the checksum control register (CHKSUM) is used to enable or disable this function.

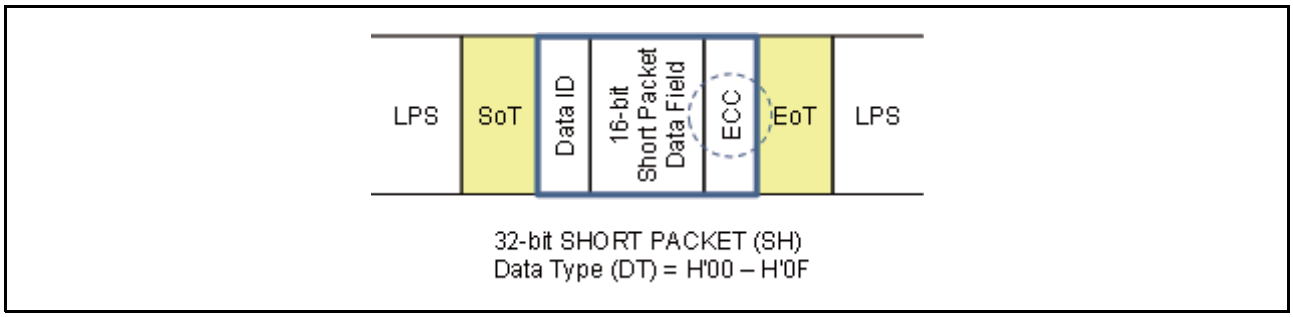

Figure 47.4 MIPI CSI-2 Short Packet

47.3.3 CRC Error Detection for the Payload Data

This module generates an interrupt in response to detection of a CRC error.

Interrupt Source	Register Bit Name	Bit
CRC error	CRC_ERR	[15]

The CRC_EN bit in the checksum control register (CHKSUM) is used to enable or disable this function.

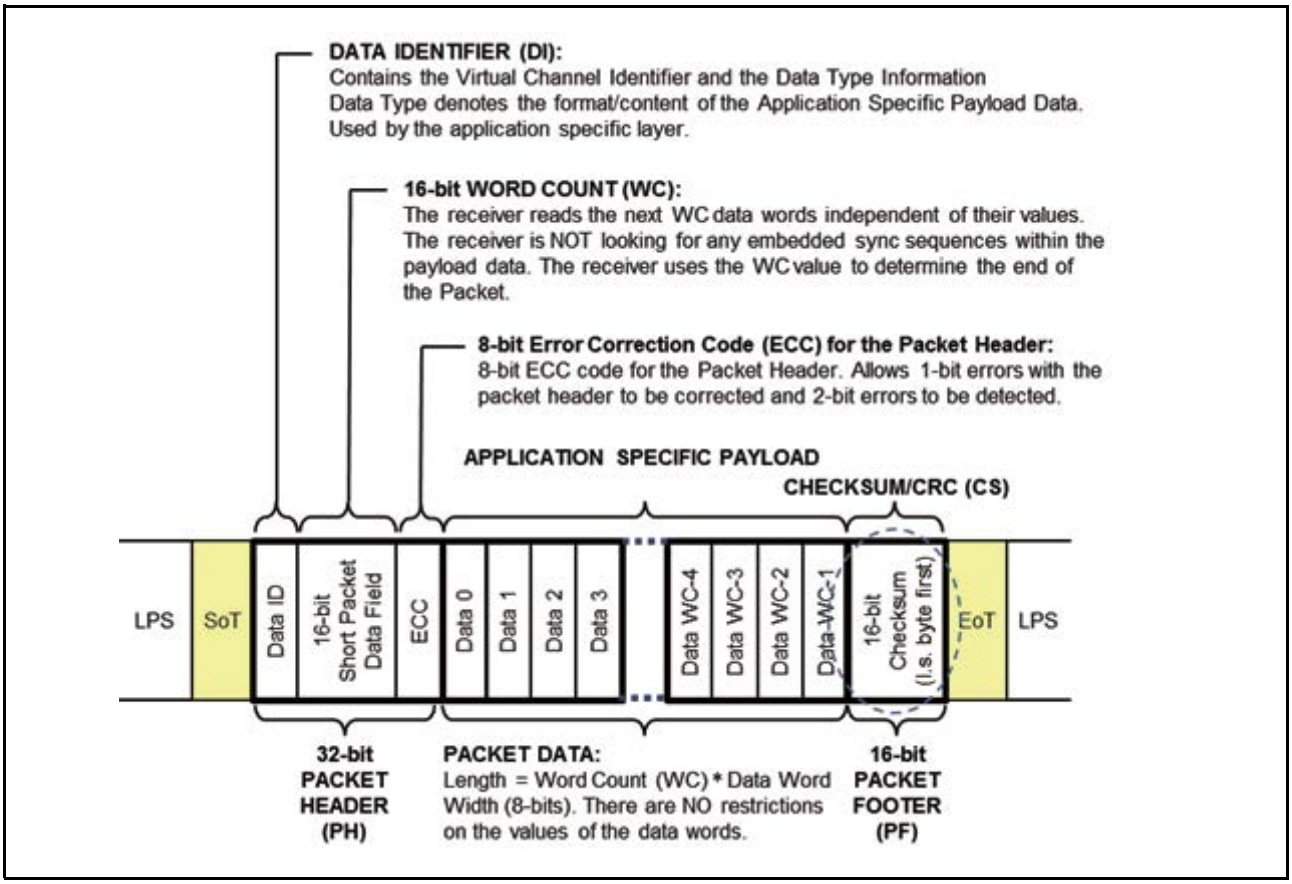

Figure 47.5 MIPI CSI-2 Long Packet

47.3.4 Generation of Vertical Sync (VD), Horizontal Sync (HD), and Field (FLD) Signals

(1) VD

When a frame start short packet is received, VD is driven high. When a frame end short packet is received, VD is driven low. (This applies to the channel specified with the VC value in the packet header.)

(2) HD

When the sync signal of a long packet (SOT) is received, HD is driven high. When the number of the received long packets reaches the WC value in the packet header, HD is driven low. The frame start short packet of the reception channel should be received in advance.

(3) FLD

When a frame start short packet is received, if the field value of the short packet data satisfies the condition specified with the field detection control register (FLD), FLD is driven high. When a frame end short packet is received, FLD is driven low. (This applies to the channel specified with the VC value in the packet header.)

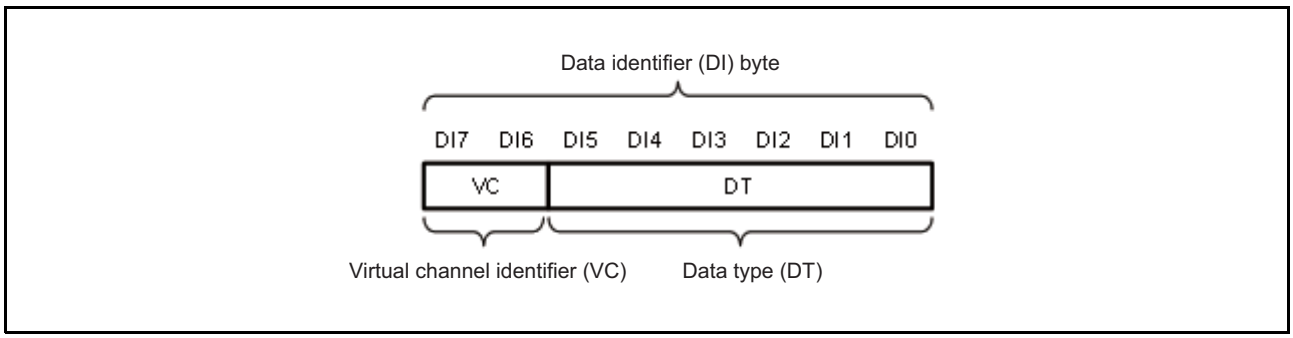

Figure 47.6 MIPI CSI-2 DI

Table 47.3 MIPI CSI-2 Short Packet Data Type Codes

Data Type	Description
H'00	Frame Start Code
H'01	Frame End Code
H'02	Line Start Code (Optional)
H'03	Line End Code (Optional)
H'04 to H'07	Reserved

47.3.5 Single-Channel Output

As shown in Figure 47.7 and Figure 47.8, when an interleaved transfer of virtual channels is received, the output virtual channel can be selected. The output virtual channel can be selected among the four virtual channels between 0 and 3. The receiving virtual channel can be changed with the register setting (SEL_VC bit of the channel data type selection register (VCDT)).

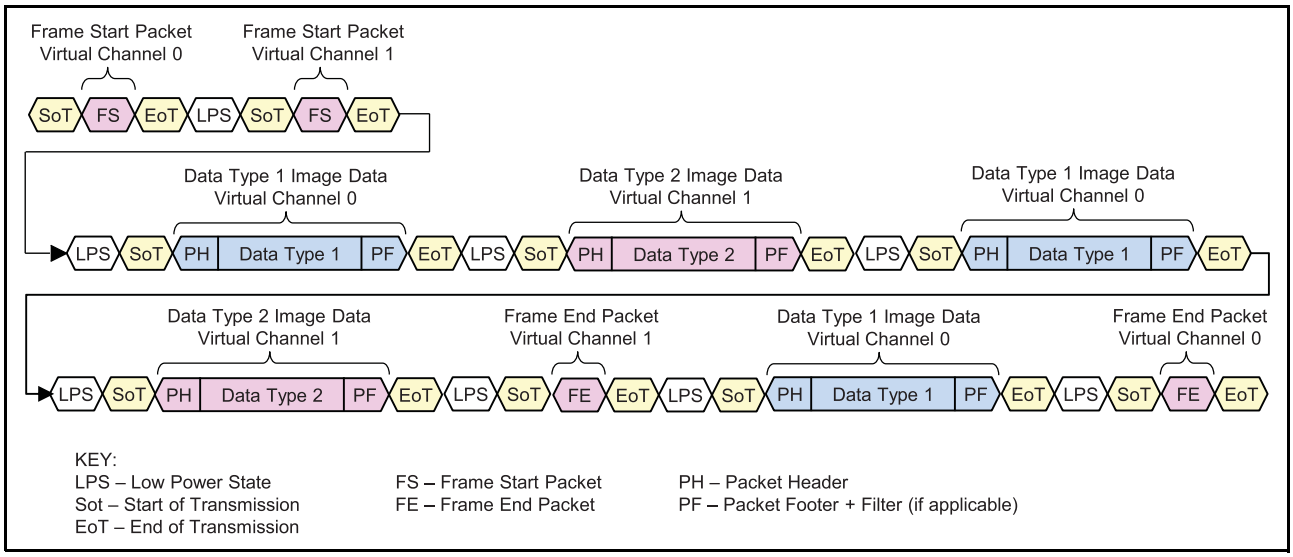

Figure 47.7 (1) MIPI CSI-2 Interleaved Transmission 1

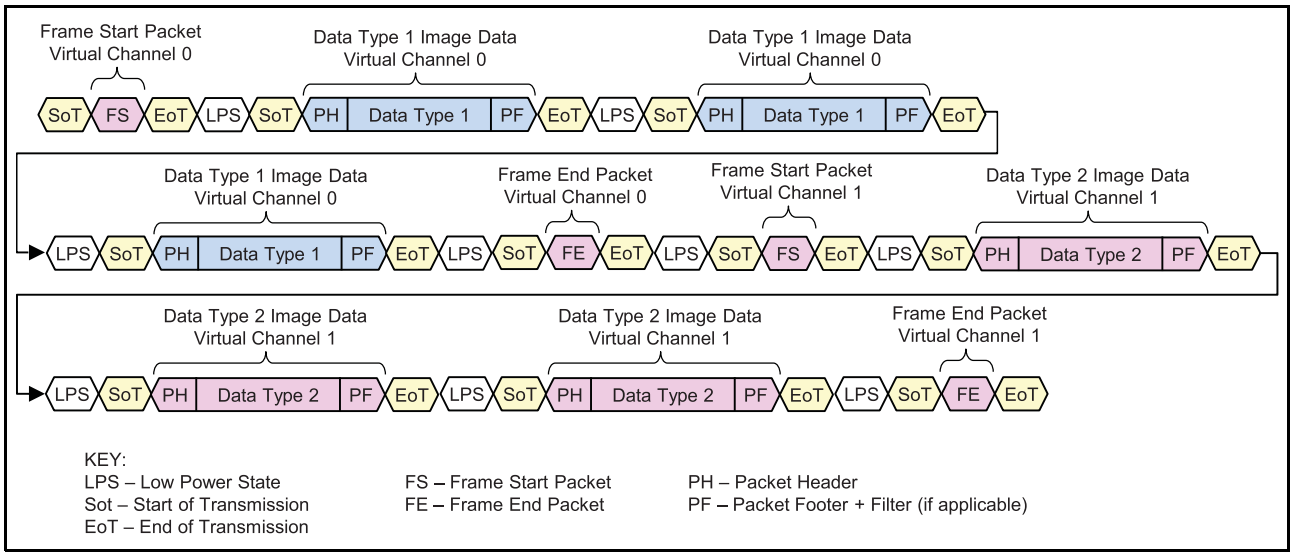

Figure 47.8 (2) MIPI CSI-2 Interleaved Transmission 2

47.3.6 Interrupts

Table 47.4 Interrupt Registers

Function	Register Name
Monitors interrupt state.	INTSTATE
Monitors interrupt error state.	INTERRSTATE
Enables interrupts.	INTEN
Masks interrupt sources.	INTCLOSE

As shown in Figure 47.9, the AFIFO (asynchronous FIFO) overflow and ERRSOT* (HS synchronization error) have corresponding interrupt error status monitoring register flag bits for each channel. To clear a status flag, write 1 to the corresponding bit of the INTERRSTATE register.

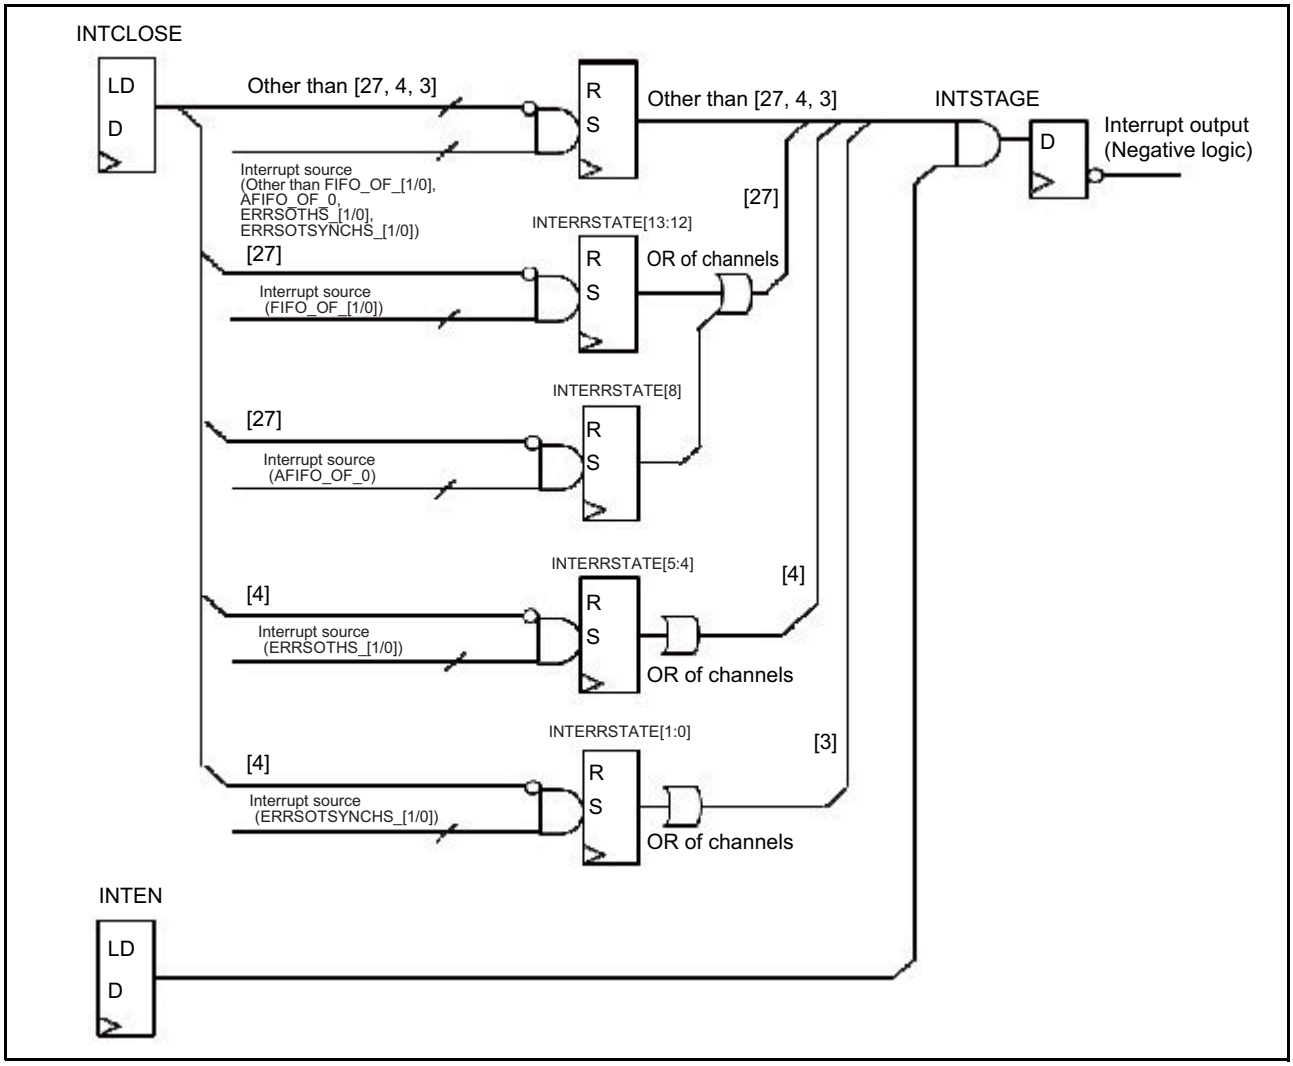

Figure 47.9 Interrupt Structure

Table 47.5 Interrupt Bit Assignments

Interrupt Source	Register Bit Name	Bit
Long packet payload data count less than WC value	LESS_THAN_WC	[28]
Overflow of asynchronous FIFO for storing HS data	AFIFO_OF	[27]
-	-	[26]
-	-	[25]
-	-	[24]

-	-	[14]
-	-	[13]
-	-	[12]
-	-	[11]
-	-	[10]
-	-	[9]
Overflow of asynchronous FIFO for storing HS data on lane 0	AFIFO_OF_0	[8]
-	-	[7]
-	-	[6]
Synchronized SOT (start of transfer) error during HS reception on lane 1	ERRSOTHS_1	[5]
Synchronized SOT (start of transfer) error during HS reception on lane 0	ERRSOTHS_0	[4]
-	-	[3]
-	-	[2]
Non-synchronized SOT (start of transfer) error during HS reception on lane 1	ERRSOTSYNCHS_1	[1]
Non-synchronized SOT (start of transfer) error during HS reception on lane 0	ERRSOTSYNCHS_0	[0]

Table 47.7 MIPI CSI-2 PHY/ Annex A.1 Signal Description

Error Signals	Description
ERRSOTHS	Start-of-Transmission (SoT) Error. If the High-Speed Sot leader sequence is corrupted, but in such a way that proper synchronization can still be achieved, this active high signal is asserted for one cycle of RXBYTECLKHS. This is considered to be a "soft error" in the leader sequence and confidence in the payload data is reduced.
ERRSOTSYNCHS	Start-of-Transmission Synchronization Error. If the High-Speed Sot leader sequence is corrupted in a way that proper synchronization cannot be expected, this active high signal is asserted for one cycle of RXBYTECLKHS.
ERRESC	Escape Entry Error. If an unrecognized escape entry command is received, this active high signal is asserted and remains asserted until the next change in line state.
ERRCONTROL	Control Error. This active high signal is asserted when an incorrect line state sequence is detected. For example, if a turn-around request or escape mode request is immediately followed by a Stop state instead of the required Bridge state, this signal is asserted and remains asserted until the next change in line state.

47.3.7 Lane Swapping

The lane assignment for data received from the PHY block by the LINK block can be modified by setting the relevant register (see section 47.2.18, Lane Swap Register (LSWAP)). This capability provides for flexible pin assignment to compensate for the lack of a connector specification for the MIPI CSI-2.

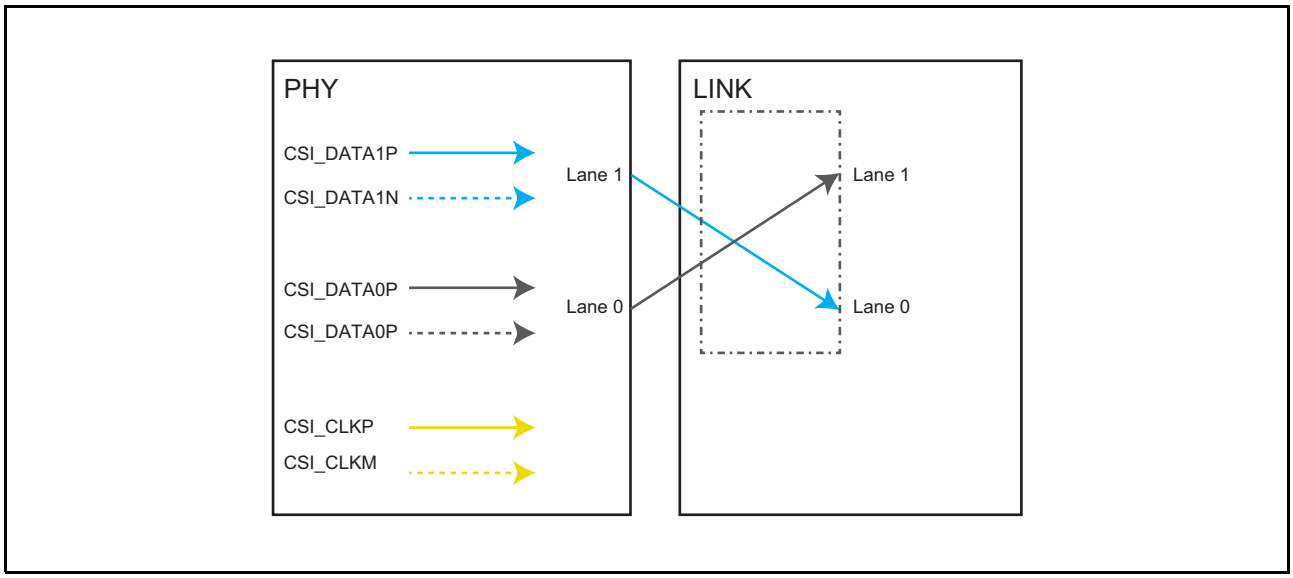

Figure 47.10 Example of Lane Swapping

47.3.8 PHY Timing Setting

The operation timing parameters defined in the MIPI D-PHY standard can be specified by setting PHY timing register 1 (PHYTIM1) in section 47.2.52, PHY timing register 2 (PHYTIM2) in section 47.2.53, and PHY timing register 3 (PHYTIM3) in section 47.2.54.

(1) T_INIT_SLAVE

These bits specify the PHY initialization period.
The PHY initialization period is the period calculated by the formula below after the SHUTDOWNZ and RSTZ bits of the PHY operation control register (PHYCNT) have been set to 1.

(T_INIT_SLAVE setting + 1 (PHY internal delay)) × (1/internal bus clock (Bφ))

When supporting the minimum value (100 µs) of T_{INIT} that is defined in the MIPI D-PHY standard, set the T_INIT_SLAVE bits to satisfy the following formula.

T_INIT_SLAVE setting + 1 (PHY internal delay) > 100 µs/(1/internal bus clock (Bφ))

(2) TCLK_MISS

These bits specify the period until a reception timeout of the HS clock is detected.
A reception timeout is detected when the period calculated by the formula below has elapsed after the receive clock has been stopped while receiving an HS clock.

TCLK_MISS setting × (1/internal bus clock (Bφ))

Note that the setting should have a margin because the difference in the clock accuracy with the device on the other end may cause a timeout to be erroneously detected.
When detecting a reception timeout of the HS clock in 80-Mbps transfer, set the TCLK_MISS bits to satisfy the following formula.

TCLK_MISS setting > (1/80 Mbps)/(1/internal bus clock (Bφ)) + 1 (margin)

(3) TCLK_PREPARE

These bits specify the period until HS IO of the clock lane is enabled.
HS IO is enabled when the period calculated by the formula below has elapsed after LP00 was input.

(TCLK_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ))) (PHY internal delay)

Set the TCLK_PREPARE bits so that HS IO is enabled within the HS0 period.
When supporting the maximum value (95 ns) of $T_{CLK\text{-}PREPARE}$ that is defined in the MIPI D-PHY standard, set the TCLK_PREPARE bits to satisfy the following formula.

(TCLK_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ))) (PHY internal delay) > 95 ns

(4) TCLK_SETTLE

These bits specify the period until HS clock reception of the clock lane is enabled.
HS clock reception is enabled when the period calculated by the formula below has elapsed after LP00 was input.

TCLK_SETTLE setting × (1/internal bus clock (Bφ))

Set the TCLK_SETTLE bits so that HS clock reception is enabled when at least 50 ns has elapsed after HS IO of the clock lane was enabled.
When supporting the maximum value (300 ns) of $T_{CLK\text{-}SETTLE}$ that is defined in the MIPI D-PHY standard, set the TCLK_SETTLE bits to satisfy the following formula.

300 ns > TCLK_SETTLE setting × (1/internal bus clock (Bφ)) > (TCLK_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ))) (PHY internal delay) + 50 ns

Figure 47.11 shows the relationship between TCLK_PREPARE and TCLK_SETTLE.

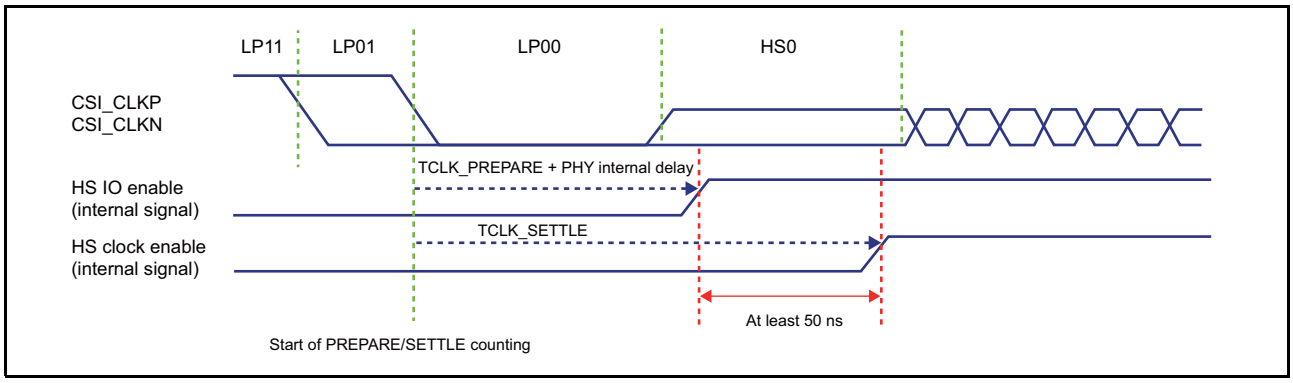

Figure 47.11 Timing of TCLK_PREPARE and TCLK_SETTLE

(5) THS_PREPARE

These bits specify the period until HS IO of the data lane is enabled.
HS IO is enabled when the period calculated by the formula below has elapsed after LP00 was input.

(THS_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ)) + 6 UI_{INST}) (PHY internal delay)

Set the THS_PREPARE bits so that HS IO is enabled within the HS0 period.
When supporting the maximum value (85 ns + 6 UI_{INST}) of $T_{HS\text{-}PREPARE}$ that is defined in the MIPI D-PHY standard, set the THS_PREPARE bits to satisfy the following formula.

(THS_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ)) + 6 UI_{INST}) (PHY internal delay) > 85 ns + 6 UI_{INST}

(6) THS_SETTLE

These bits specify the period until HS data reception of the data lane is enabled.
HS data reception is enabled when the period calculated by the formula below has elapsed after LP00 was input.

THS_SETTLE setting × (1/internal bus clock (Bφ))

Set the THS_SETTLE bits so that HS data reception is enabled when at least 50 ns has elapsed after HS IO of the data lane was enabled.
When supporting the maximum value (145 ns + 10 UI_{INST}) of $T_{HS-SETTLE}$ that is defined in the MIPI D-PHY standard, set the THS_SETTLE bits to satisfy the following formula.

145 ns + 10 UI_{INST} > THS_SETTLE setting × (1/internal bus clock (Bφ)) > (THS_PREPARE setting × (1/internal bus clock (Bφ))) + (3 × (1/internal bus clock (Bφ)) + 6 UI_{INST}) (PHY internal delay) + 50 ns

Figure 47.12 shows the relationship between THS_PREPARE and THS_SETTLE.

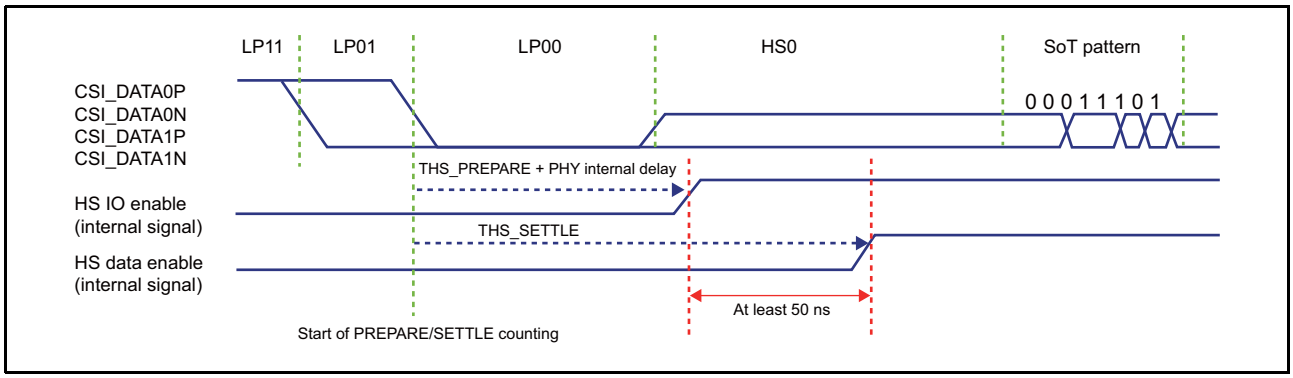

Figure 47.12 Timing of THS_PREPARE and THS_SETTLE

(7) Setting examples

Table 47.8 shows the setting examples that were given in the description of each parameter.

Table 47.8 Setting Examples of PHY Timing Registers (when Bφ = 132 MHz, 1 UI_{INST} = 1 ns)

Bit Name	Example of Calculation Formula	Setting Example
T_INIT_SLAVE	T_INIT_SLAVE + 1 > 100 µs/(1/Bφ)	16'h33F3
TCLK_MISS	TCLK_MISS > (1/80 Mbps)/(1/Bφ) + 1	5'h03
TCLK_PREPARE	(TCLK_PREPARE × (1/Bφ)) + (3 × (1/Bφ)) > 95 ns	5'h0A
TCLK_SETTLE	300 ns > TCLK_SETTLE × (1/Bφ) > (TCLK_PREPARE × (1/Bφ)) + (3 × (1/Bφ)) + 50 ns	6'h14
THS_PREPARE	(THS_PREPARE setting × (1/Bφ)) + (3 × (1/Bφ) + 6 UI_{INST}) > 85 ns + 6 UI_{INST}	6'h09
THS_SETTLE	145 ns + 10 UI_{INST} > THS_SETTLE × (1/Bφ) > (THS_PREPARE × (1/Bφ)) + (3 × (1/Bφ) + 6 UI_{INST}) (PHY internal delay) + 50 ns	6'h14

47.3.9 Initial Setting of the PHY Block

The initial sequence of the VIN module can be executed either before or after that of the CSI2 module.

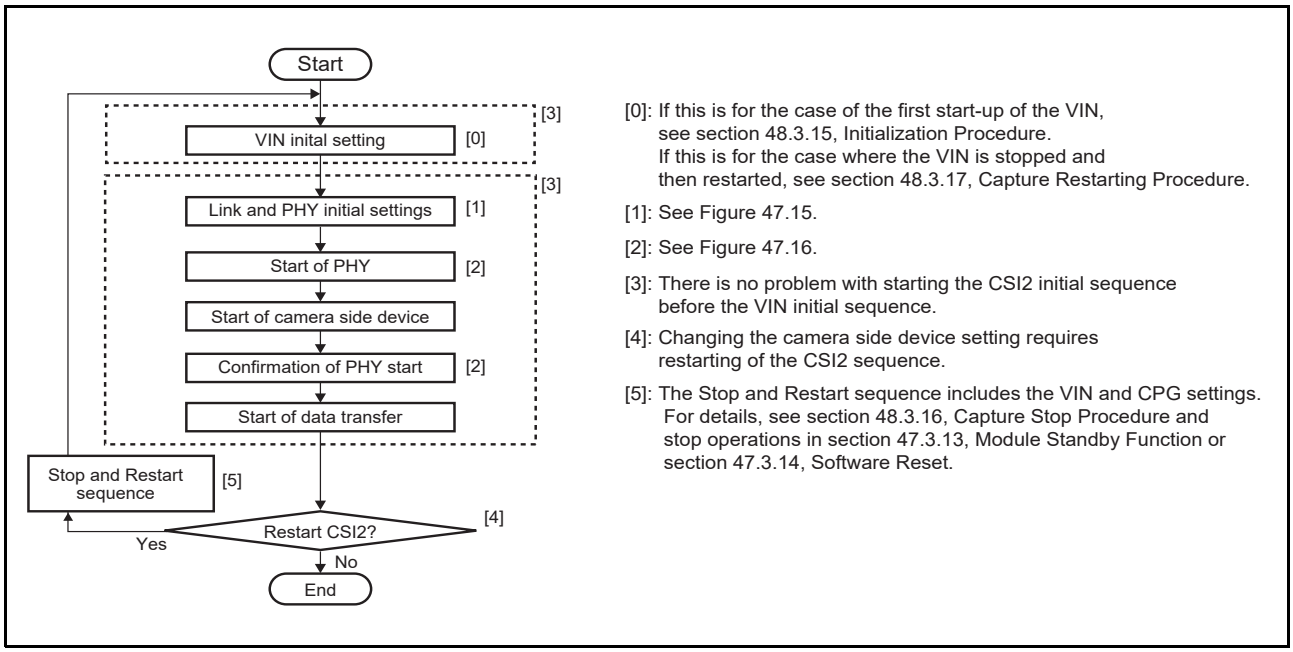

Figure 47.13 Example 1 of Initial Setting Procedure for the Video Modules

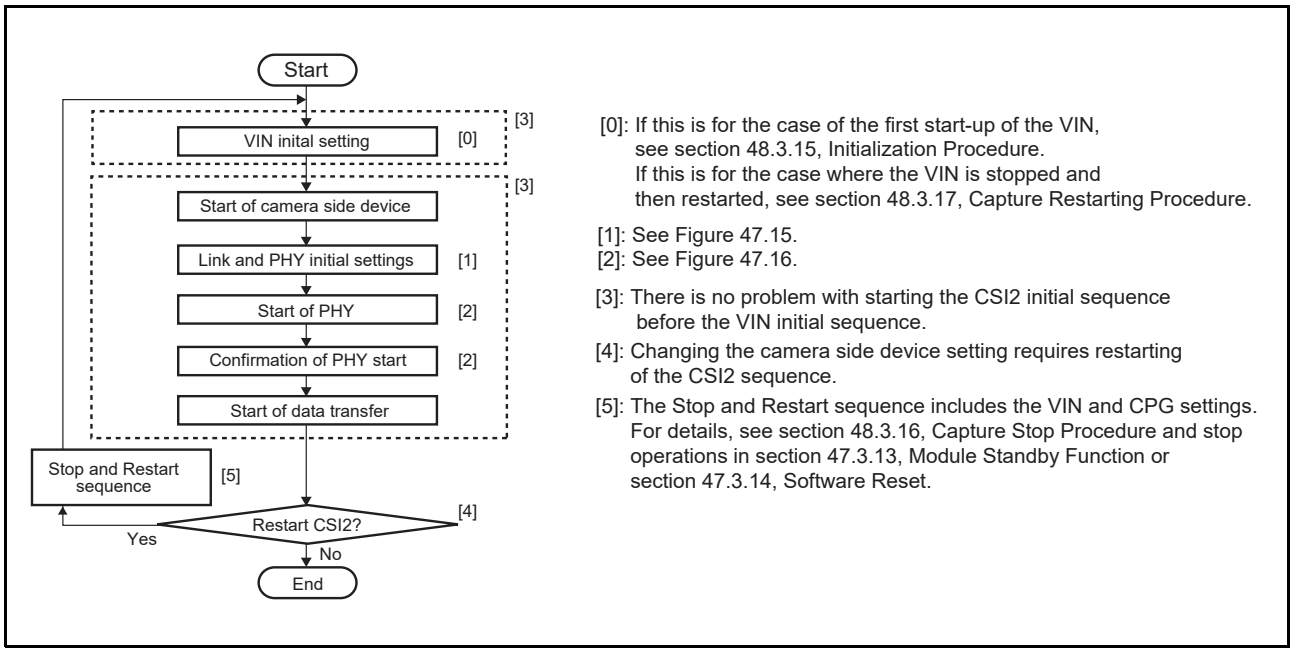

Figure 47.14 Example 2 of Initial Setting Procedure for the Video Modules

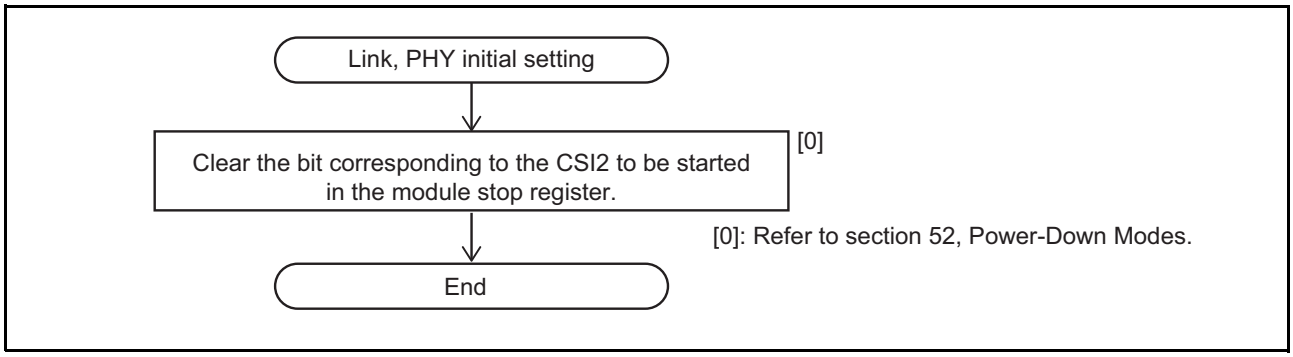

Figure 47.15 Example of PHY Initialization

47.3.9.1 Terminology

This section explains the terminology for CSI2.

- Start of PHY
  Initialization of CSI-2 receiver module. After initialization, CSI-2 receiver module expects that CSI-2 transmitter device stays StopState (LP-11).
- Start of camera side device
  Initialization of CSI-2 transmitter device. After initialization, CSI-2 transmitter device keeps StopState (LP-11).
- Confirmation of PHY start
  CSI-2 receiver module confirms that CSI-2 transmitter device stays StopState (LP-11) after initialization.
- Start data transfer
  CSI-2 transmitter device starts to send High-Speed data to CSI-2 receiver module.

47.3.10 PHY Control and Monitoring through Register Setting

The PHY IP can be controlled by setting the relevant LINK registers. For register functions, see sections 47.2.3 PHY Operation Control Register (PHYCNT), 47.2.52 PHY Timing Register 1 (PHYTIM1), 47.2.53 PHY Timing Register 2 (PHYTIM2), and 47.2.54 PHY Timing Register 3 (PHYTIM3).
The PHY IP status can be monitored through the relevant LINK registers. For register functions, see sections 47.2.19 PHY ESC Error Monitor Register (PHEERM), 47.2.20 PHY Clock Lane Monitor Register (PHCLM), and 47.2.21 PHY Data Lane Monitor Register (PHDLM).

(1) Case 1: Procedure for starting data transfer

1. Start the CSI-2 module of the camera without starting data transfer.
2. Start the CSI2 PHY module.
3. Start data transfer from the camera.

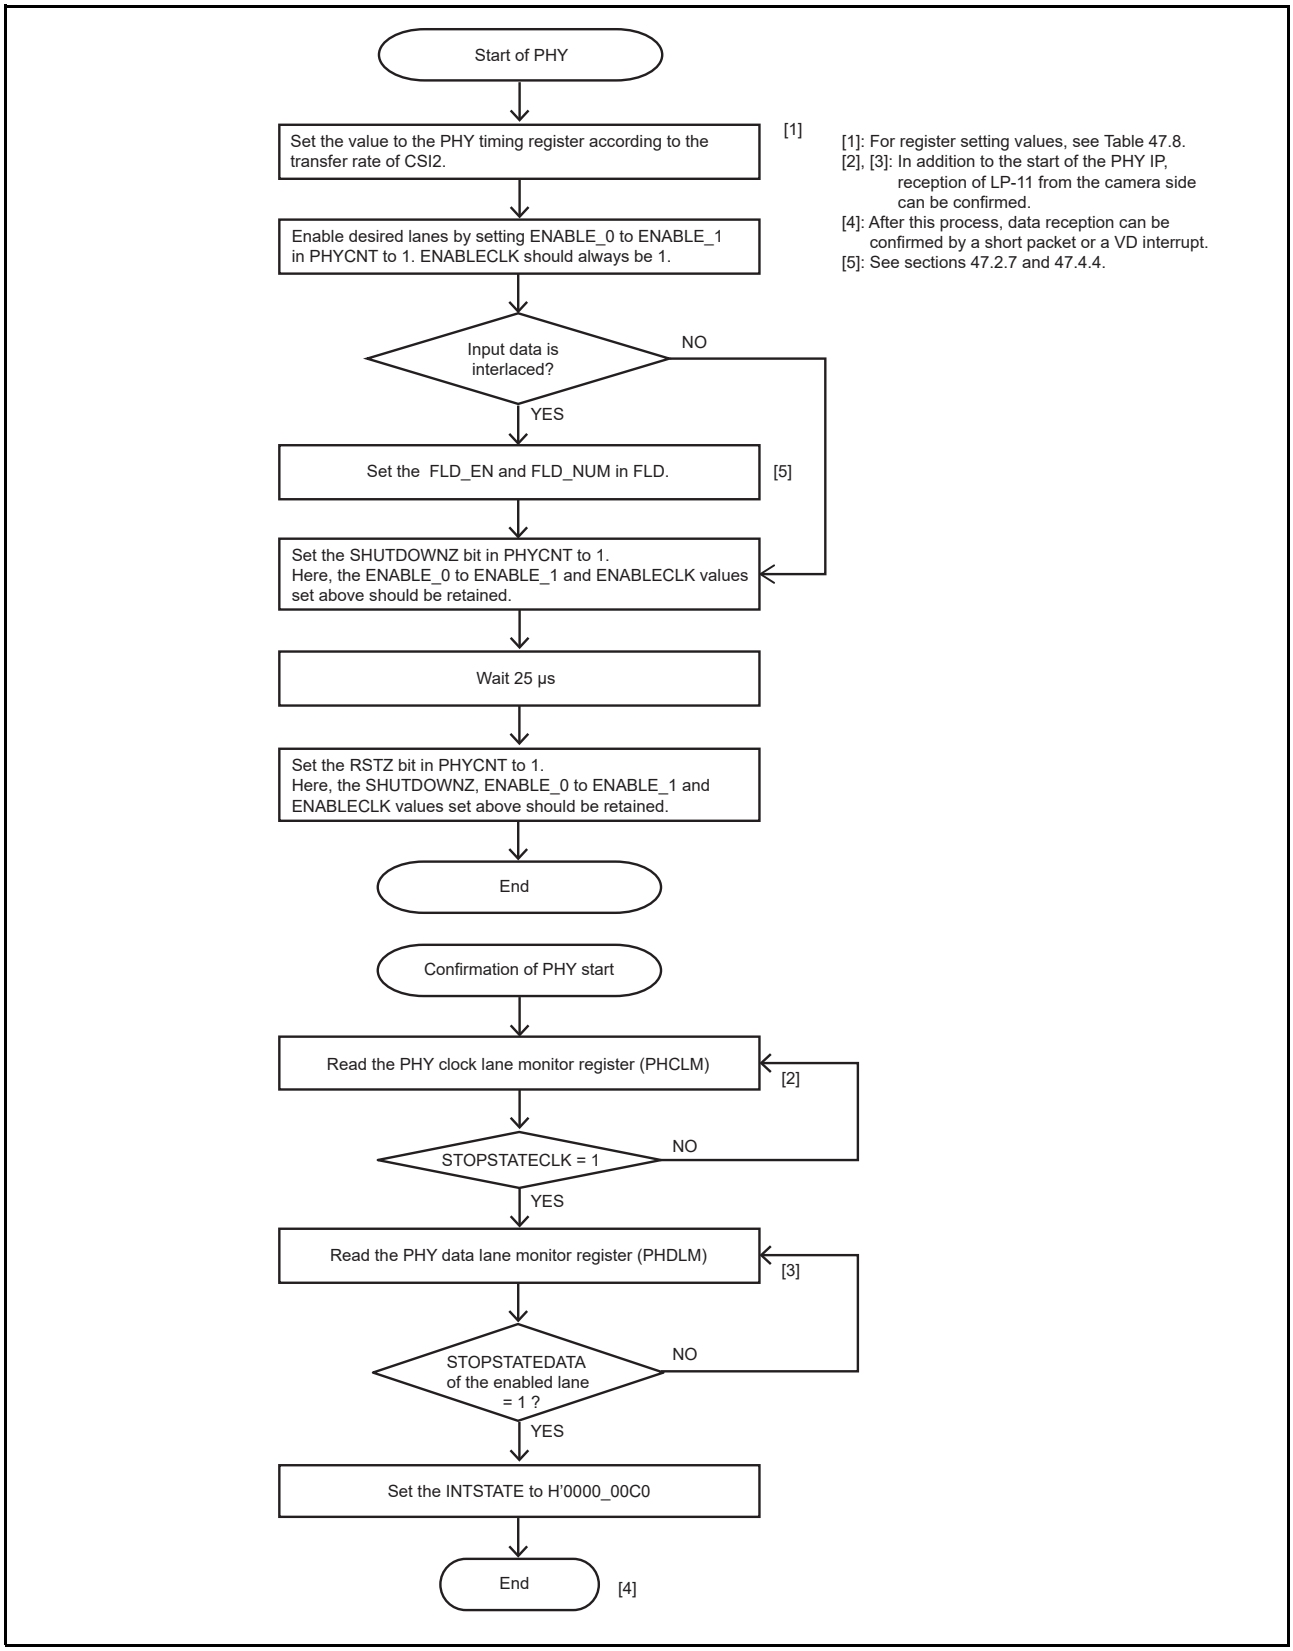

Figure 47.16 Example of PHY Starting Procedure

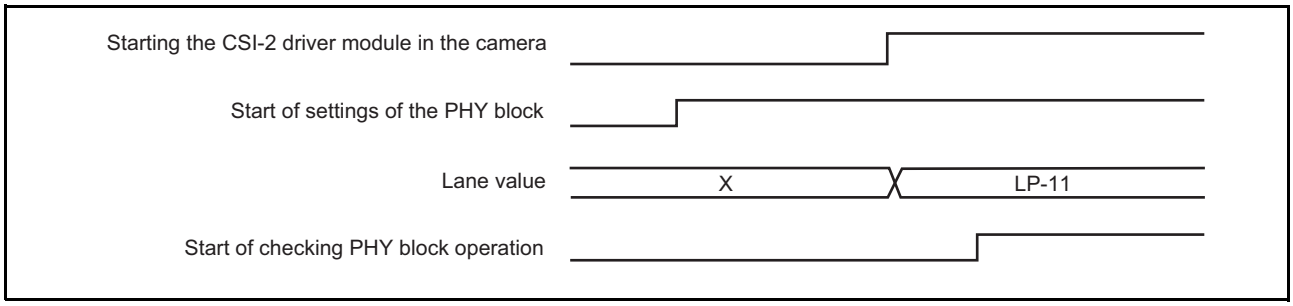

Figure 47.17 Procedure for Starting PHY Block 1

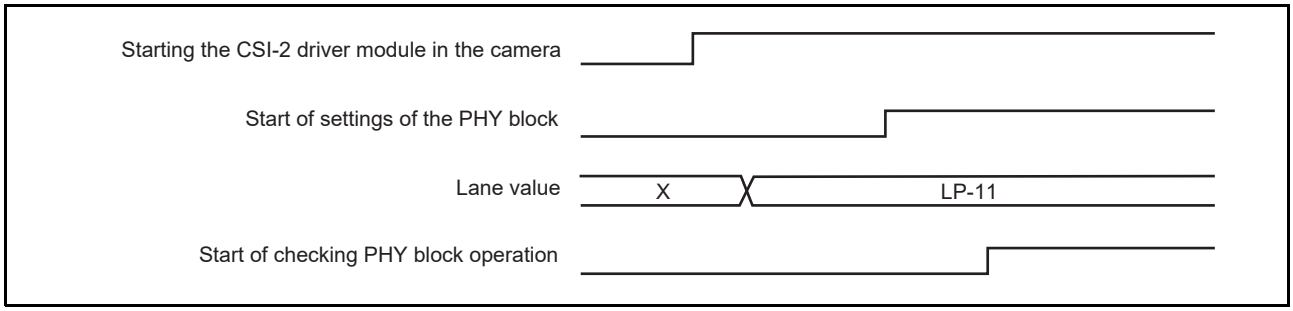

Figure 47.18 Procedure for Starting PHY Block 2

Table 47.9 Causes for Abnormal Reception

Symptom	Condition	State	Possible Causes	
PHY will not start.	Data not being transferred from the camera.	STOPSTATE = low	Internal	The CSI2 channel is different from the output channel on the camera side.
				CLK has been stopped.
				Module standby mode
				Software reset state (refer to section 47.3.14, Software Reset).
				RSTZ = 0
				SHUTDOWNZ = 0
				ENABLE = 0, ENABLECLK = 0 on reception lane
			External	No lane connected
				CSI2 on the camera side has not been started.
				The CSI2 module on the camera side has not output LP -11.
	Data being transferred from the camera.	STOPSTATE is always low.	External	The camera started up before this module and continued the output of data without stopping the signal in the clock lane (LP-11 was never received).
Reception failure	Data being transferred from the camera.	ERRSOTHS or ERRSOTSYNCHS is generated.	Internal	Different phases between the clock and data. Measures: Adjust the phase physically. Reduce the transfer rate.
		No interrupts are generated though ERRSOTHS or ERRSOTSYNCHS is not generated.		Abnormal voltage level Measures: Adjust the voltage level physically. Reduce the transfer rate.
		ECC error, CRC error, or asynchronous FIFO overflow occurs.		No ENABLE bits of the lanes during transmission are 1.
				Incorrect lane connection Measures: Change the connections. Perform lane swapping
		Clock lane is placed in ULP state.		Incorrect P/N connection of clock lane Measures: Change the connections.
		No output or abnormal output though no error occurs.	External	Incorrect transmission protocol Measures: Transfer data in the order: Frame Start → Payload data → Frame End.
			Internal	Incorrect LINK register setting (VCDT_EN = 0)

47.3.11 Interrupts Generated in Response to Changes in the ULP State and to Reception Errors

Table 47.10 MIPI CSI-2 Escape Entry Code

Escape Mode Action	Command Type	Entry Command Pattern (from the last to the first bit to have been transmitted)
Ultra-Low Power State	mode	B'0001 1110
Undefined-1	mode	B'1001 1111
Undefined-2	mode	B'1101 1110

This module can generate an interrupt signal on entry to and exit from the ultra-low-power (ULP) state.

Interrupt Source	Register Bit Name	Bit
Start of ultra-low power state	ULPS_START	[7]
End of ultra-low power state	ULPS_END	[6]

The state of the lanes can be monitored through the PHY clock lane monitoring register (PHCLM) and PHY data lane monitoring register (PHDLM).

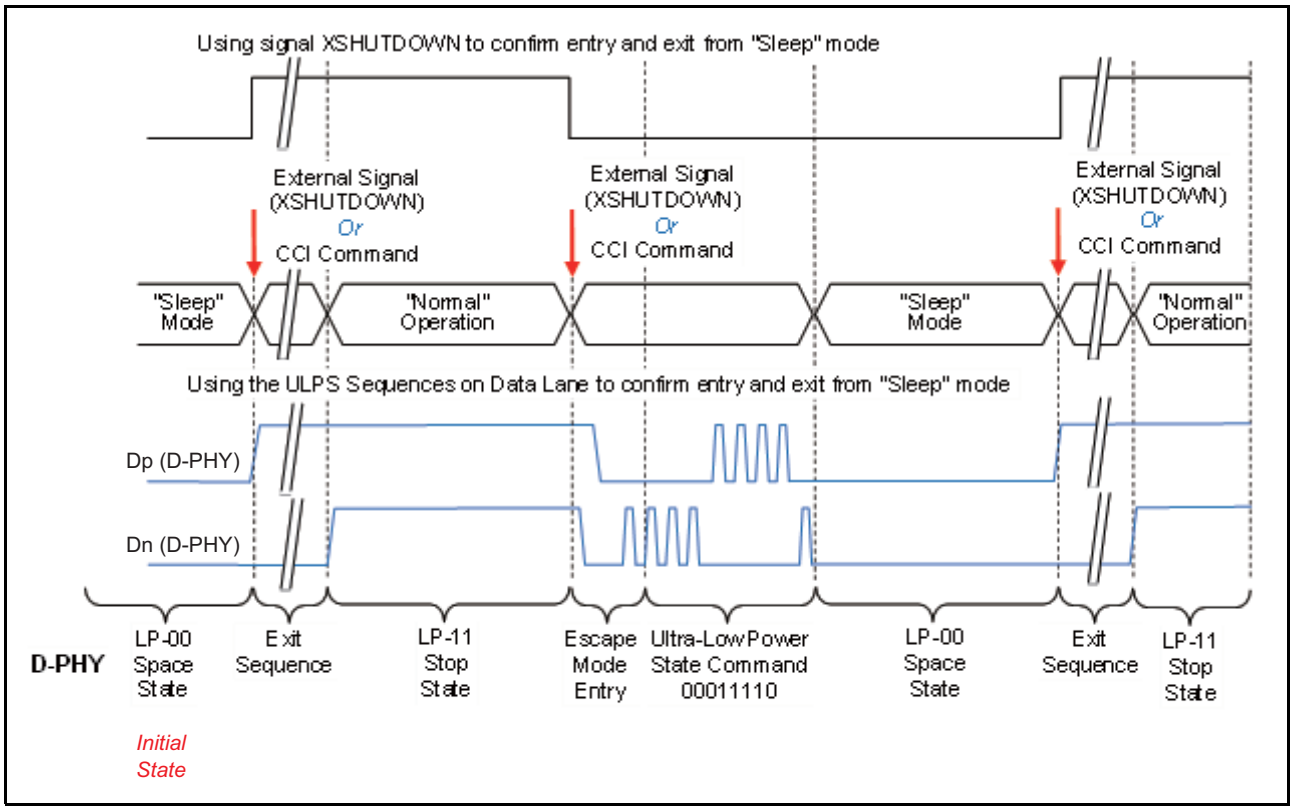

Figure 47.19 MIPI CSI-2 ULPS

This module can also generate an interrupt signal in response to reception errors

Interrupt Source	Register Bit Name	Bit
Synchronized SOT (start of transfer) error during HS reception	ERRSOTHS	[4]
Non-synchronized SOT (start of transfer) error during HS reception	ERRSOTSYNCHS	[3]
Escape mode entry error	ERRESC	[2]
PHY control error	ERRCONTROL	[0]

The error lanes related to ERRSOTHS and ERRSOTSYNCHS can be monitored through the interrupt error status monitoring register (INTERRSTATE) and the other error lanes can be monitored through the PHY ESC error monitoring register (PHEERM).

47.3.12 Monitoring Function

For monitoring of the packet header, see sections 47.2.22 to 47.2.34 and 47.2.51; for monitoring of CRC reception data, see sections 47.2.35 and 47.2.36; and for monitoring of the module internal signals used for debugging, see sections 47.2.37 to 47.2.50

47.3.13 Module Standby Function

Follow the steps below to place the CSI2 module in the module standby state. For the module standby function, refer to section 52, Power-Down Modes.

1. Set the SHUTDOWNZ bit to 0 in the PHY operation control register (PHYCNT).
2. Wait for 0.1 µs.
3. Set the SRST bit to 1 in the software reset register (SRST) of the CSI2 LINK.
4. Wait for 100 µs.
5. Set the MSTP bit assigned to this module to 1 (for details, refer to section 52, Power-Down Modes).

47.3.14 Software Reset

A software reset can be applied by controlling the SRST bit assigned to this module. The bit is stated in section 52, Power-Down Modes.
Resetting of the VIN module or stoppage of capture is required before the CSI2 module is reset.

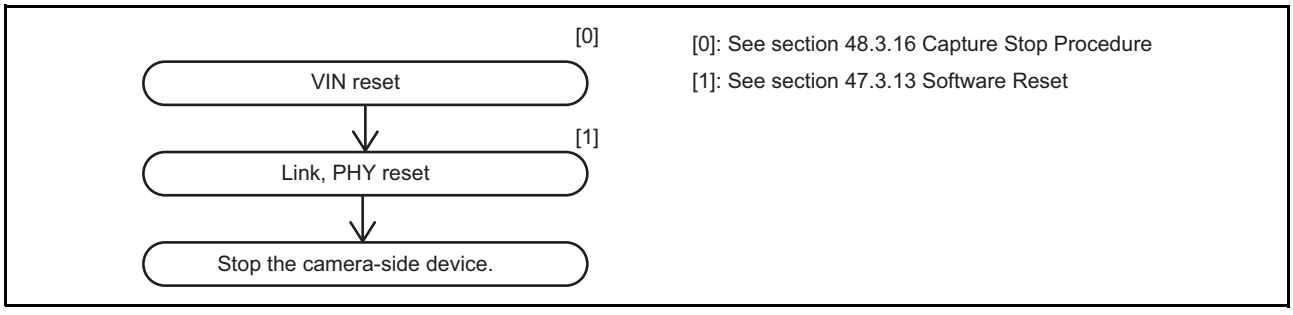

Figure 47.20 Example of Software Reset Procedure

47.4 Usage Notes

47.4.1 MIPI CSI-2 Transfer Rate

As described in section 47.3.1, Transfer Rate must not exceed 1.0 Gbps. Data being received at a rate exceeding 1.0 Gbps will result in the loss of the data for reception.

47.4.2 PHY Operation Control Register (PHYCNT)

When setting any of the ENABLE_1 to ENABLE_0 bits to 1, be sure to set the ENABLECLK bit to 1. The ENABLE_1, ENABLE_0, and ENABLECLK bits all have the initial value 0.

47.4.3 Synchronization Errors during HS (High-Speed) Reception

If HS reception fails to proceed normally, the PHY block outputs a synchronization error signal to the LINK block. When a synchronization error occurs, the PHY block may not output HS received data to the LINK block. If this occurs only in a specific lane, the lane synchronization function prevents reading of the FIFO buffer in the LINK block, thus causing an overflow. Synchronization errors and overflows can be monitored through the interrupt error status monitoring register (INTERRSTATE) by setting the interrupt source mask register (INTCLOSE) to 0.
After an overflow has occurred, the FIFO should be initialized by a software reset. For the software reset, refer to section 47.3.14, Software Reset.

47.4.4 FLD Signal

Since a field (FLD) signal is not generated in the initial state, appropriately set the field detection control register (FLD register) to select generation of an FLD signal.
This is shown in Figure 47.18, Example Interlaced Video.
In this case (the frame number of the even field is H’0002), set FLD_NUM to the same value as the frame number of the even field (H’0002) in the field detection control register (FLD) and set FLD_EN to 1 in the field detection control register (FLD register).

Note: The frame number is included in FS and FE. The frame number is incremented by 1 with every FS packet in the same virtual channel and is periodically reset to one, e.g. 1, 2, 1, 2, 1, 2.
If frame number of even field is H’0001, set FLD_NUM to H’0001.

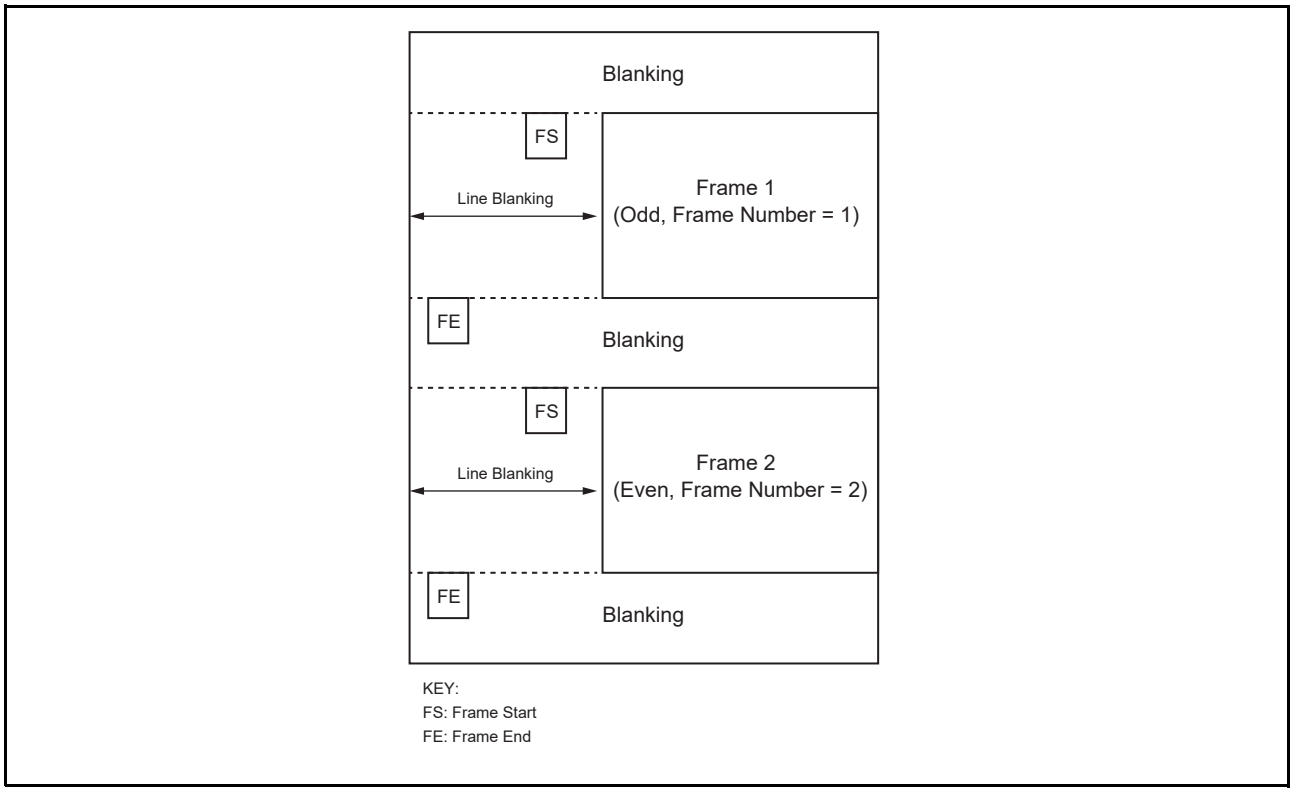

Figure 47.21 Example of Interlaced Video

47.4.5 INT_LESS_THAN_WC

When debugging INT_LESS_THAN_WC, only use a single virtual channel.

47.4.6 Transfer Rate for Interleaved Signal Transmission

When more than one virtual channel is in use, the transfer rate of the input to PHY block should be same in each of the virtual channels. When retention of the frame rate of an individual virtual channel is required, the transfer rate for input should be equivalent to the sum of the frame rates for each of the virtual channels.

47.4.7 V-Blanking Period

In order to receive data correctly, the minimum v-blanking period required is at least three lines.

Note: The V-blanking period is that from the frame end packet to the frame start packet.
The minimum and maximum values of VD_MSK_CYCLE do not define the supported minimum and maximum v-blanking periods.

47.4.8 Notes on Data

The input of data not compliant with the MIPI CSI-2 standard might cause the CSI2 module to hang or to behave in an unexpected manner.

47.4.9 Setting the Clock-Pulse Generator

Set the clock-pulse generator so that Gφ is 264 MHz when this module is to be used. For details on setting the clock-pulse generator, refer to section 6, Clock Pulse Generator.

48. Video Input Module

48.1 Overview

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores in external memory YCbCr-422 data and RGB data through the MIPI CSI-2 interface.
The module has one video channel that can control the capture of data into a capture area of up to 2048 × 2048 pixels. It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.
For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB and a format conversion function from RGB to ARGB.
As the VIN internally generates a field signal, it can capture progressive data.
Input of data through the MIPI Alliance CSI-2 interfaces is possible.

Note 1. For detailed specifications of the MIPI CSI-2 interface, see section 47, MIPI CSI2 Interface.
Note 2. The upper limits on size clipping depend on the use case.

48.1.1 Features

(1) Input interface

The following input interfaces can be selected.

Table 48.1 Input Interface for VIN

Interface (CSI2)	Data Width	Data Type
Interface (MIPI CSI-2)	—	YCbCr-422 8-bit data *1*2
Interface (MIPI CSI-2)	—	YCbCr-422 10-bit data *1*2
Interface (MIPI CSI-2)	—	RGB-888 data *1
Interface (MIPI CSI-2)	—	8-bit user defined data (RAW8) *1*2

Note 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.
Note 2. Disable the XY scaling setting (only the 100% scaling is enabled).

(2) Internal Sync Signal Generation

The field signal can be internally generated.

(3) Capture Mode

The following three modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.
Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode

(4) Vertical and Horizontal Scaling

Factors for scaling up or down can be set to values in the range from one sixteenth to three in the vertical direction and from one sixteenth to two in the horizontal direction.

Note 1. When scaling-up is used, horizontal size that can be input is up to 2048 pixel.
Note 2. When scaling-down is used, horizontal size that can be output is up to 2048 pixel.

(5) Size Clipping

The VIN module has two clipping circuits, which independently handle images with up to 2048 × 2048 pixels. Any capture size within this limit can be specified before or after scaling.

Note 1. The upper limits on size clipping depend on the use case.

(6) Color Space Conversion

Color space conversion can be performed from YC to RGB or from RGB to YC. Desired conversion coefficients can be specified through registers to adjust colors.

(7) Lookup Table (LUT) Precision Conversion

The lookup table (LUT) precision can be converted from 10 bits to 8 bits for each pixel according to the color space conversion result.

Note: When the precision conversion function is not used, the upper 8 bits of data are output.

(8) Image Data Format Conversion

To the precision converted YCbCr422 or RGB888 image data, the following data format conversions are applicable.

- YCbCr image data
  - Y/Cb/Cr 8-bit multiplex conversion
  - YCbCr422 → YC separation (separated into Y and CbCr components.)
  - YCbCr422 → Y component extraction

- RGB image data
  - RGB-888 → 32-bit/pixel conversion
  - RGB-888 → RGB-565 (16-bit/pixel) conversion
  - RGB-888 → ARGB-1555 (16-bit/pixel) conversion
  - RGB-888 → ARGB-8888 (32-bit/pixel) conversion

Note: The lookup table is common to the YCbCr and RGB formats.

(9) Memory Output Data Format

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
  - Y/Cb/Cr422, 8-bit multiplexed
  - Y/Cb/Cr422, 10-bit multiplexed
  - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 10-bit multiplexed
  - YC separation, Y data, 8-bit
  - YC separation, Y data, 10-bit

- RGB image data
  - RGB-565 (16 bits/pixel)
  - ARGB-1555 (16 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)

48.1.2 Block Diagram

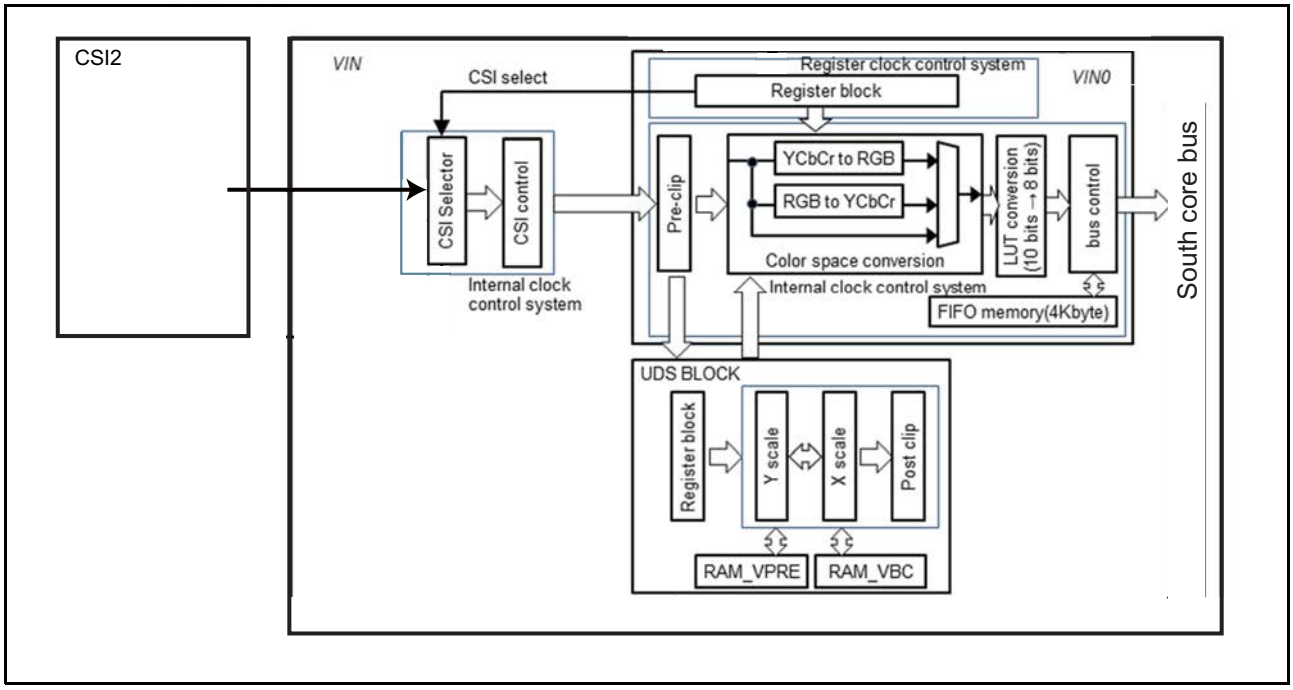

Figure 48.1 Functional Block Diagram of VIN

48.1.3 Register Configuration

Table 48.2 shows the VIN register configuration.

Note: Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. The registers can only be accessed in 32 bits.
*: A register that supports the internal update mode is updated immediately after the register is written to.
Δ: The internal update mode is supported for the VnMC.CLP[1:0] and VnMC.LUTE bits only.

Table 48.2 VIN Registers

Name	Symbol	R/W	Address	Initial Value	Access Size	Internal Update Mode Support*
Video 0 main control register	V0MC	R/W	H'E803 F000	H'0000 0000	32	Δ

R/W:	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	CLP[1:0]	00	R/W	Pixel Data Clipping When the input image data is in the YCbCr format, these bits specify the data clip value for clipping the YCbCr-RGB color conversion input data to the nominal range prescribed in the ITU-R BT.601 standard.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	SCLE	0	R/W	This bit is used to enable or disable scaling by the UDS. 0: Disables scaling by the UDS. 1: Enables scaling by the UDS.
25 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

CLP	Luminance	Color Difference	
00	No clipping	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	Initial condition
01	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	
10	No clipping	16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.	
11	No clipping	No clipping	

Note: These bits support the internal update mode.

Bit	Bit Name	Initial Value	R/W	Description
20	LUTE	0	R/W	Lookup Table Enable This bit enables conversion from 10 bits to 8 bits through the lookup table (LUT). 0: LUT is not used. 1: LUT is used. Note 1. To perform LUT conversion, the conversion table should be set with VnLUTP and VnLUTD. Note 2. This bit supports the internal update mode.
19	YCAL	0	R/W	YCbCr-422 Input Data Alignment This bit controls data alignment for YCbCr-422 input. 0: When the multiplexed CbCr interface is set, capturing is performed with Y in the upper bits and CbCr in the lower bits. 1: When the multiplexed CbCr interface is set, capturing is performed with CbCr in the upper bits and Y in the lower bits.
18 to 16	INF[2:0]	000	R/W	Input Interface Format These bits specify the format of images input to the VIN. 000: Setting prohibited 001: 8-bit YCbCr-422*1 010: Setting prohibited 011: 10-bit YCbCr-422*1 100: 8-bit user defined data (RAW8) *1 101: Setting prohibited 110: 24-bit RGB-888*1 111: Setting prohibited
15, 14	DC[1:0]	00	R/W	Dithering Mode Control These bits select the dithering mode for conversion from RGB888 to RGB565/ ARGB1555. 00: Dithering with cumulative addition 01: Ordered dithering 10: Setting prohibited 11: Setting prohibited
13 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	EN	0	R/W	Endian Type This bit specifies the endian type for data to be output to external memory. 0: Image data is packed and allocated in little endian. 1: Image data is packed and allocated in big endian. Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4, 3	IM[1:0]	00	R/W	Interlace Mode These bits specify the capture mode. Do not modify this setting during capture operation. 00: Odd-field (field 1) capture mode Handles only odd fields as frames and stores them in external memory. 01: Odd-/even-field capture mode Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode. 10: Even-field (field 2) capture mode Handles only even fields as frames and stores them in external memory. 11: Setting prohibited
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	BPS	0	R/W	Color Space Conversion Bypass Mode 0: The input YCbCr data is converted into the RGB color space and RGB data is converted into the YCbCr color space*2. 1: Color space conversion is not performed. Note: YCbCr → RGB or RGB → YCbCr conversion is performed with the coefficients specified by the YC-RGB conversion coefficient register or RGB-YC coefficient register.

Bit	Bit Name	Initial Value	R/W	Description
0	ME	0	R/W	Module Enable This is the enable bit for the VIN. Set this bit before setting the video n Frame Capture register (VnFC). 0: The module operation is stopped. 1: The module operation is enabled. *3

Note 1. Table 48.3 shows the combinations of interfaces that can be set by the input interface format (the INF bits in VnMC). Do not make any setting that is not listed in the table.
Note 2. Table 48.4 shows the image data that can be converted according to the color space conversion bypass mode settings (set by the BPS bit in VnMC).
Note 3. To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

Table 48.3 Capture Interface Settings

Interface	VnMC/INF
YCbCr-422 8-bit data (MIPI CSI-2)	001
YCbCr-422 10-bit data (MIPI CSI-2)	011
RGB-888 data (MIPI CSI-2)	110
8-bit user defined data (RAW8) (MIPI CSI-2)	100

Table 48.4 Captured Data Formats

Input Data Format	VnMC/INF	VnMC/BPS	VnMC/IM	Captured Data Format
YCbCr-422 (MIPI CSI-2)	001/011	0	—	RGB format
		1	—	YCbCr format
RGB-888 data (MIPI CSI-2)	110	0	—	YCbCr format
		1	—	RGB format
8-bit user defined data (RAW8)	100	1	01	User defined format

48.2.2 Video n Module Status Register (VnMS)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FBS[1:0]		FS	AV	CA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	FBS[1:0]	11	R	Frame Buffer Status These bits show the frame buffer status. 00: The latest valid frame buffer has the base address defined by the memory base 1 register. 01: The latest valid frame buffer has the base address defined by the memory base 2 register. 10: The latest valid frame buffer has the base address defined by the memory base 3 register. 11: There is no valid frame buffer. Note: When video capture is operating, these bits should be read after the FIS bit in VnINTS is set to 1.
2	FS	0	R	Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2). Note: When video capture is operating, this bit should be read after the FIS bit in VnINTS is set to 1.
1	AV	0	R	Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured.
0	CA	0	R	Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data.

48.2.3 Video n Frame Capture Register (VnFC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CC	SC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CC	0	R/W	Continuous Frame Capture Mode This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the video n memory base 1 register (VnMB1). After that, the capture operation is repeated in the order of MB2, MB3, MB1, and MB2. Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured. 0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set. After the capture operation is resumed by writing 1 into this bit, the memory address where the first capture frame is written depends on the value indicated by the frame buffer status (FBS[1:0]) bits in the video n module status register (VnMS). Note: When the capture is started with the SC bit set to 1 before setting this bit to 1, the first capture frame is written into the memory address specified by the video n memory base 2 register (VnMB2).
0	SC	0	R/W	Single Frame Capture Mode This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the video n memory base 1 register (VnMB1). Immediately after this bit is set to 1, the frame buffer status bits (FBS) in VnMS are initialized and the SC bit is also cleared to 0. 0: The single frame capture mode is not set. 1: The single frame capture mode is set. Note: Do not set this bit to 1 when the interlace mode bits (IM) in the video n main control register (VnMC) are set to 01 (odd-/even-field capture mode).

Note: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

48.2.4 Video n Start Line Pre-Clip Register (VnSLPrC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLPrC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SLPrC[10:0]	H'000	R/W	Start Line Pre-Clip These bits specify the (pre-clipping start line - 1) value in line units. This value is used before scaling. Specify a value in the range from 0 to 2046 so that the number of lines after pre-clipping will be 2 or more. (The value of 0 indicates the first valid line.) Note 1. When using vertical or horizontal scaling, specify a value in the range from 0 to 2044 so that the number of lines after pre-clipping will be 4 or more. Note 2. In case of using Scaler, set the value of SLPrC within input l ines.

48.2.5 Video n End Line Pre-Clip Register (VnELPrC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ELPrC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ELPrC[10:0]	H'000	R/W	End Line Pre-Clip These bits specify the (pre-clipping end line - 1) value in line units. This value is used before scaling. Specify a value in the range from 1 to 2047 so that the number of lines after pre-clipping will be 2 or more. Note 1. When using vertical or horizontal scaling, specify a value in the range from 3 to 2047 so that the number of lines after pre-clipping will be 4 or more. Note 2. In case of using Scaler, set the value of ELPrC within input lines. Note 3. If the interlace images are input, the value here should be such that ELPrC - SLPrC is half of the value of the number of the original line.

48.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPPrC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SPPrC[10:0]	H'000	R/W	Start Pixel Pre-Clip These bits specify the (pre-clipping start pixel - 1) value in pixel units. This value is used before scaling. Specify a value in the range from 0 to 2040 so that the number of pixels after pre-clipping will be an even number than 6. Note 1. When SPPrC is set to 0x0, the first valid pixel is specified. Note 2. Specify an even number. Note 3. In case of using Scaler, set the value of SPPrC within input pixels.

48.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	EPPrC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	EPPrC[10:0]	H'000	R/W	End Pixel Pre-Clip These bits specify the (pre-clipping end pixel - 1) value in pixel units. This value is used before scaling. Specify a value in the range from 7 to 2047 so that the number of pixels after pre-clipping will be an even number than 6. Note 1. Set these bits so that the (EPPrC - SPPrC) value is an odd number. Note 2. In case of using Scaler, set the value of EPPrC within input pixels.

48.2.8 Video n CSI2 Interface Mode Register (VnCSI_IFMD)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DES0	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DES0	0	R/W	Data Extension Select This bit is used to select how data are expanded to 12 bits within the VIN module. 0: Empty bits in the input data are repeatedly expanded from the highest-order bit. 1: Empty bits will be padded with zeros. This bit must be set to 1 when the YCbCr-422 interface is in use.
24 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.2.9 Video n Image Stride Register (VnIS)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IS[8:0]									—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

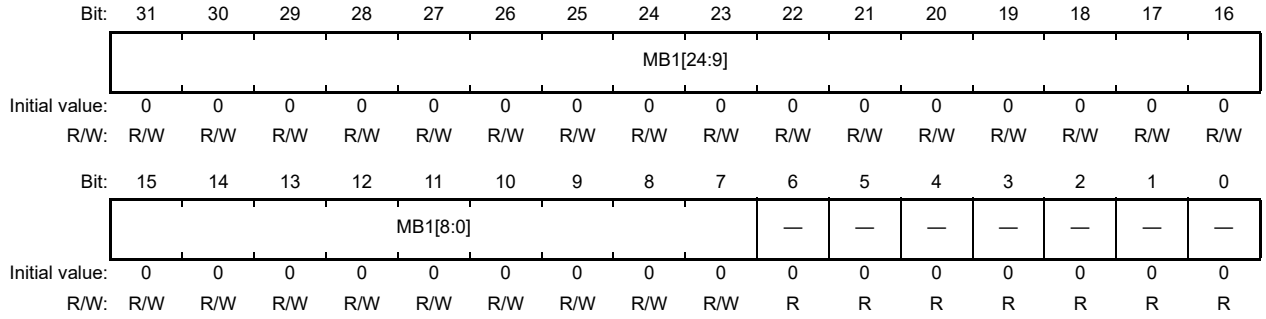
Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 4	IS[8:0]	H'000	R/W	Image Stride These bits specify the image stride. Set the value obtained by dividing the number of pixels by 16 as shown in the table below. When the UDS is in use: Specify a value no less than the post-clipping width (CL_HSIZE) . When the UDS is not in use: Specify a value no less than the pre-clipping width (EPPrC - SPPrC). Note: Set the parameters in accord with the output format as listed in the table below.
3 to 0	—	All 0	R	Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0.

Output Format	Unit for Setting (Number of Pixels)	Unit for Setting (IS[8:0])
YCbCr-422 8-bit data	64	4
YCbCr-422 10-bit data	32	2
YC separation YCbCr-422, 8-bit Y and 8-bit C data	128	8
YC separation YCbCr-422, 10-bit Y and 10-bit C data	64	4
YC separation YCbCr-422, 10-bit Y and 8-bit C data	128	8
RGB565	64	4
ARGB1555	64	4
RGB888	32	2
ARGB8888	32	2
RAW8 *1	64	4

Note 1. When the output format in use is RAW8, images are output as 1 byte per pixel. In this case, the image stride is obtained by multiplying the number of pixels specified in these bits by 2 bytes.

48.2.10 Video n Memory Base 1 Register (VnMB1)

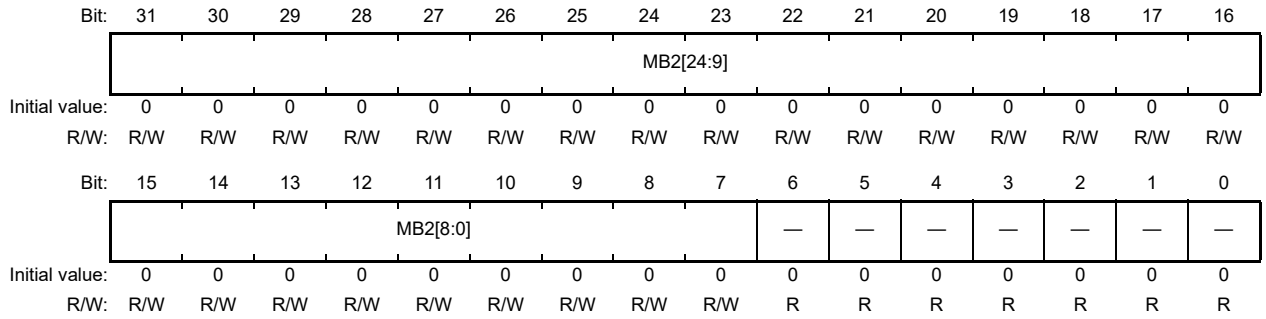
Note: Availability of channels: n = 0



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB1[24:0]	H'000 0000	R/W	Memory Base Address 1 These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. In single frame capture mode, this value is used as the capture address. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

48.2.11 Video n Memory Base 2 Register (VnMB2)

Note: Availability of channels: n = 0



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB2[24:0]	H'000 0000	R/W	Memory Base Address 2 These bits specify the transfer start address in frame buffer 2. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB2 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 2 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

48.2.12 Video n Memory Base 3 Register (VnMB3)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB3[24:9]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB3[8:0]									—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB3[24:0]	H'000 0000	R/W	Memory Base Address 3 These bits specify the transfer start address in frame buffer 3. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB3 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 3 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

48.2.13 Video n Line Count Register (VnLC)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	LC[11:0]	H'000	R	Line Count These bits show the line position in the current capture field.

48.2.14 Video n Interrupt Enable Register (VnIE)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIE2	—	—	—	—	—	—	—	—	—	—	—	—	—	VFE	VRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIE	—	SIE	EFE	FOE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIE2	0	R/W	Field Interrupt Enable 2 This bit enables or disables INTC output for field interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Field interrupts are disabled. 1: Field interrupts are enabled.
30 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	VFE	0	R/W	VSYNC Falling Edge Detect Interrupt Enable This bit enables or disables VSYNC falling edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC falling edge detect interrupts are disabled. 1: VSYNC falling edge detect interrupts are enabled.
16	VRE	0	R/W	VSYNC Rising Edge Detect Interrupt Enable This bit enables or disables VSYNC rising edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC rising edge detect interrupts are disabled. 1: VSYNC rising edge detect interrupts are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIE	0	R/W	Field Interrupt Enable This bit enables or disables field-switching interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Field-switching interrupts are disabled. 1: Field-switching interrupts are enabled.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	SIE	0	R/W	Scanline Interrupt Enable This bit enables or disables scanline interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Scanline interrupts are disabled. 1: Scanline interrupts are enabled.
1	EFE	0	R/W	End of Frame Interrupt Enable This bit enables or disables end of frame interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: End of frame interrupts are disabled. 1: End of frame interrupts are enabled.
0	FOE	0	R/W	FIFO Overflow Interrupt Enable This bit enables or disables FIFO overflow interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: FIFO overflow interrupts are disabled. 1: FIFO overflow interrupts are enabled.

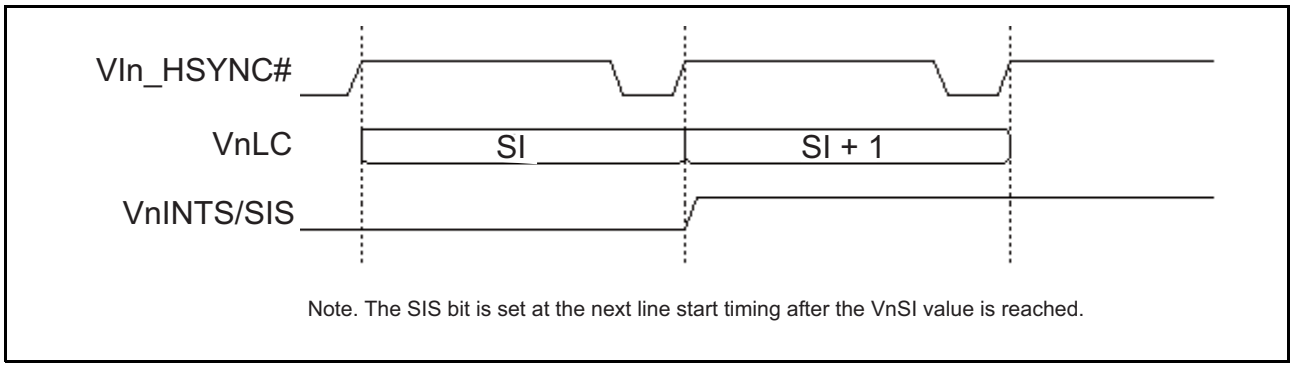
48.2.15 Video n Interrupt Status Register (VnINTS)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIS2	—	—	—	—	—	—	—	—	—	—	—	—	—	VFS	VRS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIS	—	SIS	EFS	FOS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIS2	0	R/W	Field Interrupt Status 2 This bit shows that the field has changed. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
30 to 18	—	All 0	R	Reserved These bits are always read as 0 or 1. The write value should always be 0.
17	VFS	0	R/W	VSYNC Falling Edge Detect Interrupt Status This bit shows that a VSYNC falling edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
16	VRS	0	R/W	VSYNC Rising Edge Detect Interrupt Status This bit shows that a VSYNC rising edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIS	0	R/W	Field Interrupt Status This bit shows that a field has been captured in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	SIS	0	R/W	Scanline Interrupt Status This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 at the next line start timing after the value in the VnLC register matches the VnSI register setting. This timing is shown in Figure 48.2, Scanline Interrupt Status Generation Timing.
1	EFS	0	R/W	End of Frame Interrupt Status This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1.
0	FOS	0	R/W	FIFO Overflow Interrupt Status This bit shows that the FIFO has overflowed in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer.



Note. The SIS bit is set at the next line start timing after the VnSI value is reached.

Figure 48.2 Scanline Interrupt Status Generation Timing

48.2.16 Video n Scanline Interrupt Register (VnSI)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	SI[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SI[10:0]	H'000	R	Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted. Note: When these bits are set to H'000, the value of the scanline interrupt status bit (SIS) in the video n interrupt status register (VnINTS) is always 0.

48.2.17 Video n Data Mode Register (VnDMR)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	A8BIT[7:0]								—	—	—	—	—	—	—	EVA

	—	YMODE[2:0]			YC_THR	—	—	EXRGB	—	—	—	BPSM	—	ABIT	DTMD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	H'00	R/W	Alpha 8 These bits set the alpha value for the ARGB8888 format output.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EVA	0	R/W	Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	YMODE[2:0]	000	R/W	YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). 000: Both Y and CbCr data are transferred to memory. 001: Only Y data is transferred to memory as 8-bit data. 010: 10-bit CrCb data is converted to 8-bit CrCb data and both Y data and CbCr data are transferred to memory. 011: 10-bit CrCb data is converted to 8-bit CrCb data and only Y data is transferred to memory. 100: Setting prohibited 101: Setting prohibited 110: Setting prohibited 111: Setting prohibited
11	YC_THR	0	R/W	YC Data Through Mode Y and CbCr data are transferred to memory as 10-bit data in accordance with the input format when this bit is set to 1. 0: Y and CbCr data are transferred to memory in accordance with the setting in the YMODE[2:0] bits. 1: Y and CbCr data are transferred to memory as 10-bit data in accordance with the input format.
10 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	EXRGB	0	R/W	Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	BPSM	0	R/W	Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABIT	0	R/W	Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1.
1, 0	DTMD[1:0]	00	R/W	Data Conversion Mode These bits set the format for storing RGB888 or YCbCr422 data after LUT conversion, in the external memory. *1 00: Data is not converted. 01: RGB is converted to ARGB before output. 10: YC is separated before output. *2 11: Setting prohibited

Note 1. The data conversion modes that can be set are shown in table 49.5. Do not set any other mode that is not listed in the table. RGB and YCbCr data after LUT conversion should be set as shown in Table 48.5.
Note 2. Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.

Table 48.5 Data Conversion Settings

• RGB Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
RGB-565 (16 bits/pixel) format	000	0	0	00	
RGB-888 (32 bits/pixel) format	000	1	0	00	
ARGB-1555 (16 bits/pixel) format	000	0	0	01	The alpha bit is set with the ABIT bit in VnDMR.
ARGB-8888 (32 bits/pixel) format	000	1	0	01	The alpha bit is set with the A8BIT bit in VnDMR.

• YCbCr Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
YCbCr-422 (8 bits) transfer	000	0	0	00	Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian. Make these settings if the setting of the INF[2:0] bits in VnMC is B'100.
YCbCr-422 (10 bits) transfer	000	0	1	00	
Y (8 bits)/CbCr (8 bits) separation transfer	000	0	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (10 bits)/CbCr (10 bits) separation transfer	000	0	1	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (8 bits) transfer	001	0	0	10	
Y (10 bits)/CbCr (8 bits) separation transfer	010	0	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (10 bits) transfer	011	0	0	10	

Note: If any combination of values not listed above is specified, correct operation is not guaranteed.

• 8-bit user defined data Mode

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
RAW8	000	0	0	00	MIPI CSI-2 IF Only

48.2.18 Video n Data Mode Register 2 (VnDMR2)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FTEV	FTEH
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VLV[3:0]				—	HLV[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	FTEV	0	R/W	VSYNC Field Toggle Mode Enable The VSYNC field toggle mode changes the capture field signal level according to the count of input VSYNC signal assertion. As the VIN controls capture operation only when the input field signal level changes, select the VSYNC field toggle mode when capturing MIPI CSI-2 input data. 0: The field toggle function according to the VSYNC count is disabled. 1: The field toggle function according to the VSYNC count is enabled. The period before a toggle should be specified in the VLV bits. Note: Do not set both FTEH and FTEV at the same time.
16	FTEH	0	R/W	HSYNC Field Toggle Counter Enable 0: The field toggle function according to the capture active line is disabled. 1: The field toggle function according to the capture active line is enabled. The period before a toggle should be specified in the HLV bits. Note: Do not set both FTEH and FTEV at the same time.
15 to 12	VLV[3:0]	H'0	R/W	VSYNC Field Toggle Mode Transition Period These bits specify the count of vertical sync signal input before the VSYNC field toggle mode is entered. After a transition to the VSYNC field toggle mode, the capture field signal is toggled every time VSYNC is input. When a change in the input field signal is detected, the toggle mode is canceled. H'0: The field signal is toggled at every VSYNC input. H'1: Toggle mode is entered after VSYNC is input once. H'2: Toggle mode is entered after VSYNC is input two times. H'3: Toggle mode is entered after VSYNC is input three times. : H'E: Toggle mode is entered after VSYNC is input 14 times H'F: Toggle mode is entered after VSYNC is input 15 times. Note: If the field signal changes while the transition period is counted, the counter is initialized.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 0	HLV[10:0]	H'000	R/W	HSYNC Field Toggle Count Value The HSYNC field toggle counter counts the capture active lines. If the external field signal does not change before the prespecified counter value is reached, the capture field signal is toggled. H'000: The field signal is toggled for every valid line. H'001: The field signal is toggled for every single valid line. H'002: The field signal is toggled for every two valid lines. : H'7FF: The field signal is toggled for every 2047 valid lines. Note: For the period before a toggle, specify a value greater than one VSYNC period.

48.2.19 Video n UV Address Offset Register (VnUVAOF)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVAOF[24:9]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVAOF[8:0]									—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	UVAOF[24:0]	H'000 0000	R/W	UV Data Address Offset These bits specify the transfer offset address for the YC separation YCbCr-422 UV. Specify bits 31 to 7 of the physical address in 128-byte units. Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs.
6 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

48.2.20 YC-RGB Conversion Coefficient Registers

YC → RGB color space conversion is performed with the following formula. Each of the coefficients can be set through the registers. Here, if 8-bit data format is selected, the coefficients set with the YMUL, CSUB, and YSUB bits in the VnCSCC1 register, the RCRMUL and GCRMUL bits in the VnCSCC2 register, and the GCBMUL and BCBMUL bits in the VnCSCC3 register are used to convert the color space. When 10-bit data format is selected, the YMUL2 bit in the VnCSCE1 register, the CSUB2 and YSUB2 bits in the VnCSCE2 register, the RCRMUL2 and GCRMUL2 bits in the VnCSCE3 register, and the GCBMUL2 and BCBMUL2 bits in the VnCSCE4 register are used in color space conversion.

$$R = \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE1/}\\ \textit{YMUL2[13:0]}\end{array}\right) \times (Y - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{YSUB2[11:0]}\end{array}\right)) + \left(\begin{array}{c}\textit{VnCSCC2/}\\ \textit{RCRMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE3/}\\ \textit{RCRMUL2[13:0]}\end{array}\right) \times (Cr - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{CSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{CSUB2[11:0]}\end{array}\right))$$

$$G = \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE1/}\\ \textit{YMUL2[13:0]}\end{array}\right) \times (Y - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{YSUB2[11:0]}\end{array}\right)) - \left(\begin{array}{c}\textit{VnCSCC2/}\\ \textit{GCRMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE3/}\\ \textit{GCRMUL2[13:0]}\end{array}\right) \times (Cr - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{CSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{CSUB2[11:0]}\end{array}\right)) - \left(\begin{array}{c}\textit{VnCSCC3/}\\ \textit{GCBMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE4/}\\ \textit{GCBMUL2[13:0]}\end{array}\right) \times (Cb - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{CSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{CSUB2[11:0]}\end{array}\right))$$

$$B = \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE1/}\\ \textit{YMUL2[13:0]}\end{array}\right) \times (Y - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{YSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{YSUB2[11:0]}\end{array}\right)) + \left(\begin{array}{c}\textit{VnCSCC3/}\\ \textit{BCBMUL[9:0]}\\ \textit{or}\\ \textit{VnCSCE4/}\\ \textit{BCBMUL2[13:0]}\end{array}\right) \times (Cb - \left(\begin{array}{c}\textit{VnCSCC1/}\\ \textit{CSUB[7:0]}\\ \textit{or}\\ \textit{VnCSCE2/}\\ \textit{CSUB2[11:0]}\end{array}\right))$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial values.

$$R = 1.164 \times (Y - 16) + 1.596 \times (Cr - 128)$$
$$G = 1.164 \times (Y - 16) - 0.813 \times (Cr - 128) - 0.392 \times (Cb - 128)$$
$$B = 1.164 \times (Y - 16) + 2.017 \times (Cb - 128)$$

48.2.20.1 Video n Color Space Conversion Coefficient 1 Register (VnCSCC1)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 48.6
27 to 16	HFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'800 to H'FFF can be specified when an image is upscaled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 48.6.
15 to 12	VMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 48.7.
11 to 0	VFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'556 to H'FFF can be specified when an image is upscaled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 48.7.

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in Table 48.6. (Setting a value outside the ranges of Table 48.6 in UDS operation is prohibited). Table 48.6 and Table 48.7 show the settings in the horizontal and vertical directions.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 48.6 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

HMANT	HFRAC	UDS Operation
H'0	H'800 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Table 48.7 Switching of Vertical Scale-Up/Down Operation According to VMANT and VFRAC Bit Settings

VMANT	VFRAC	UDS Operation
H'0	H'556 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Described here is the method for calculating the size of the upscaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the upscaled/downscaled image, as shown below.

$$hscale = \frac{4096}{4096 \times m_h + f_h}$$

m_h is the value of VnUDS_SCALE.HMANT, and f_h is the value of VnUDS_SCALE.HFRAC.
This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as $hsize_{org}$, the horizontal size of the image after scale-up/-down can be roughly obtained through $hsize_{org} \times$ hscale.
Similarly, define the variables necessary for calculating the vertical size of the upscaled/downscaled image.

$$vscale = \frac{4096}{4096 \times m_v + f_v}$$

When setting mv as the value of VnUDS_SCALE.VMANT, fv as the value of VnUDS_SCALE.VFRAC, and $vsize_{org}$ as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through $vsize_{org} \times$ vscale.
When the UDS performs scale-down with the settings of Table 48.6, using the variables defined so far, the horizontal size of the downscaled image $hsize_{down\_scaled}$ and the vertical size of the downscaled image $vsize_{down\_scaled}$ become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left(\left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times hscale \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left(\left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times vscale \right\rangle$$

Since the division of hscale and vscale has to be executed at the end of the above formulas, respectively, formulas considering the order of operation become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times 4096 \right) \Big/ (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times 4096 \right) \Big/ (4096 \times m_v + f_v) \right\rangle$$

The value of m_h' or m_v', which is shown in Table 48.8, changes according to the setting of VnUDS_SCALE.HMANT or VnUDS_SCALE.VMANT.

Table 48.8 m_h' or m_v' Setting

VnUDS_SCALE.HMANT Setting (VnUDS_SCALE.VMANT Setting)	m_h' (m_v')
1 to 3	1
4 to 7	2
8 to 15	4

When the UDS performs scale-up with the settings of Table 48.6 and VnUDS_CTRL.AMD is 0, the horizontal size of the upscaled image $hsize_{up\_scaled}$ and the vertical size of the upscaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle 1 + (hsize_{org} - 1) \times hscale \rangle$$

$$vsize_{up\_scaled} = \langle 1 + (vsize_{org} - 1) \times vscale \rangle$$

Similar to the scale-down case, formulas considering the division of hscale and vscale become as follows:

$$hsize_{up\_scaled} = \langle 1 + ((hsize_{org} - 1) \times 4096) / (4096 \times m_h + f_h) \rangle$$

$$vsize_{up\_scaled} = \langle 1 + ((vsize_{org} - 1) \times 4096) / (4096 \times m_v + f_v) \rangle$$

When VnUDS_CTRL.AMD is 1, the horizontal size of the upscaled image $hsize_{up\_scaled}$ and the vertical size of the upscaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle hsize_{org} \times hscale \rangle$$

$$vsize_{up\_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up\_scaled} = \left\langle (hsize_{org} \times 4096) / (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{up\_scaled} = \left\langle (vsize_{org} \times 4096) / (4096 \times m_v + f_v) \right\rangle$$

48.2.21.3 Video n Passband Registers (VnUDS_PASS_BWIDTH)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	BWIDTH_H [6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	BWIDTH_V [6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	BWIDTH_H [6:0]	H'00	R/W	Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later.
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	BWIDTH_V [6:0]	H'00	R/W	Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later.

The method for setting the passband in the horizontal direction of an image is described. When the VnUDS_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH_H bits according to the following formula. When the VnUDS_SCALE.HMANT bits are 0, set 64 in the BWIDTH_H bits.

$$BWIDTH\_H = \left\langle 64 \times \frac{4096 \times m_h'}{4096 \times m_h + f_h} \right\rangle \quad \text{(VnUDS\_SCALE.HMANT} \neq 0\text{)}$$

$$BWIDTH\_H = 64 \quad \text{(VnUDS\_SCALE.HMANT} = 0\text{)}$$

m_h is the value of VnUDS_SCALE.HMANT, and f_h is the value of VnUDS_SCALE.HFRAC. For the m_h' value, see Table 48.8. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH_H → BWIDTH_V

$m_h' \rightarrow m_v'$

$m_h \rightarrow m_v$

$f_h \rightarrow f_v$

VnUDS_SCALE.HMANT → VnUDS_SCALE.VMANT

VnUDS_SCALE.HFRAC → VnUDS_SCALE.VFRAC

48.2.21.4 Video n UDS Output Size Clipping Registers (VnUDS_CLIP_SIZE)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	CL_HSIZE [11:0]	H'000	R/W	Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2,048 in a scale-up/down operation (see Table 48.6). These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	CL_VSIZE [11:0]	H'000	R/W	Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2,048 in a scale-up/down operation (see Table 48.6). These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register.

Figure 48.3 shows the configuration of the UDS. The UDS consists of a scaling filter and clipping circuit, such as the configuration shown in Figure 48.3. The scaling filter and clipping circuit are independent of each other.

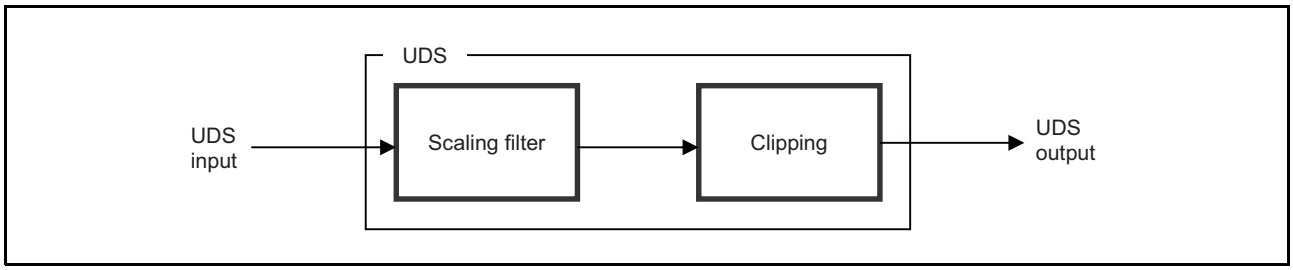

Figure 48.3 UDS Configuration

The size of the image actually output by the scaling filter (refer to section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE) for calculation) is determined from the size of the image input to the scaling filter and the VnUDS_SCALE setting; that is, two types of image are output by the UDS according to the relationship between the size of the image actually output from the scaling filter ($hsize_{scaled}$ and $vsize_{scaled}$) and this register setting as shown in Figure 48.4.

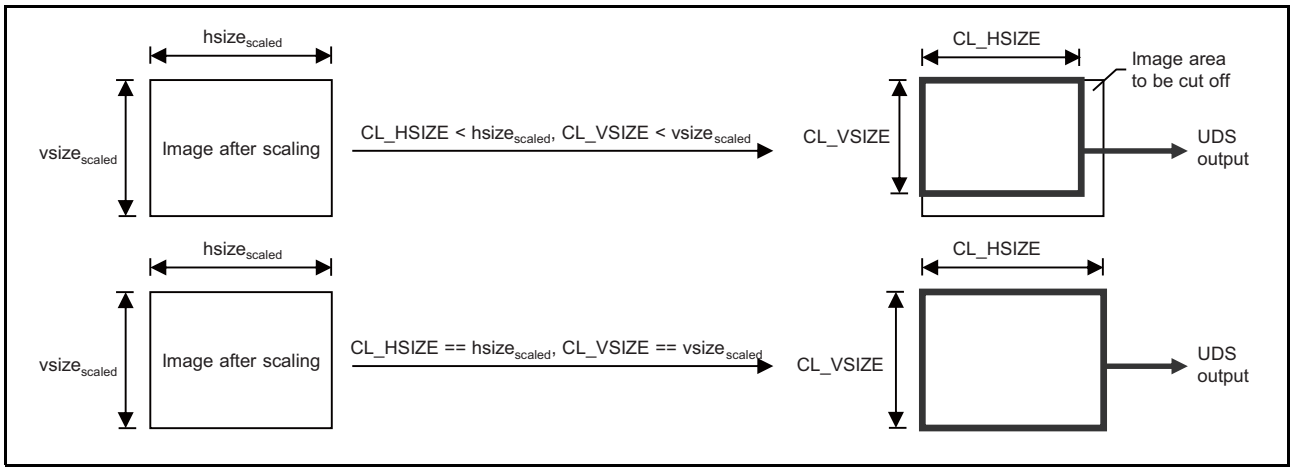

Figure 48.4 UDS Output Image for Each CL_HSIZE/VSIZE Setting

When the settings of the CL_HSIZE and CL_VSIZE bits are smaller than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the upscaled/downscaled image is clipped to become the UDS output image.

When the settings of the CL_HSIZE and CL_VSIZE bits are equal to the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDS output image without change.

Do not set the CL_HSIZE and CL_VSIZE bits to values that satisfy CL_HSIZE > $hsize_{scaled}$ or CL_VSIZE > $vsize_{scaled}$.

48.2.22 Video n Lookup Table Pointer (VnLUTP)

Note: Availability of channels: n = 0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LTYDT[7:0]	H'000	R/W	Lookup Table Y Data These bits set the LUT conversion data for Y and R data after color space conversion.
15 to 8	LTCBDT[7:0]	H'000	R/W	Lookup Table Cb Data These bits set the LUT conversion data for Cb and G data after color space conversion.
7 to 0	LTCRDT[7:0]	H'000	R/W	Lookup Table Cr Data These bits set the LUT conversion data for Cr and B data after color space conversion.

Note: The 8-bit data after LUT conversion is subjected to upper shift to carry out capture control as 12-bit data.
As for reading from the VnLUTD register, the data read the second time, including dummy read, after the VnLUTP register has been set is valid.

48.2.24 RGB-YC Conversion Coefficient Registers

Color space conversion from RGB to YC is done with the following formula. Each of the coefficients can be set with the registers.

$$Y = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$
$$Cb = CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP$$
$$Cr = CRCLRP \times R + CRCLGP \times G + CRCLBP \times B + CRCLAP$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$
$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$
$$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$$

16	CRCLCEN	0	R/W	Cr Calculation Data Clip Enable This bit enables data clipping process for Cr data calculation in RGB888 → YCbCr422 color space conversion. 0: Data clipping process is disabled. 1: Data clipping process is enabled.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	CRCLAP[11:0]	H'080	R/W	Cr Calculation Data Normalized Additional Value These bits set the Cr data addition constant for RGB888 → YCbCr422 color space conversion. (Initial value: 128)

48.3 Operation

48.3.1 Input Interface

The VIN captures video data in the MIPI CSI-2 interface and stores it in external memory. The following tables show the interface and data format supported.

Table 48.9 Supported Interfaces

Input interface	MIPI CSI-2	YCbCr-422	8 bits	Supported
			10 bits	Supported
		RGB-888	24 bits	Supported
		8-bit user defined data (RAW8)	8 bits	Supported
Output interface	RGB output	RGB-565	16 bits	Supported
		ARGB-1555	16 bits	Supported
		RGB-888	32 bits	Supported
		ARGB-8888	32 bits	Supported
	YCbCr output	YCbCr-422 multiplexed	8 bits	Supported
			10 bits	Supported
		YCbCr-422 separated Y/CbCr	Y: 8 bits CbCr: 8 bits	Supported
			Y: 10 bits CbCr: 8 bits	Supported
			Y: 10 bits CbCr: 10 bits	Supported
		YCbCr-422 separated only Y	8 bits	Supported
			10 bits	Supported

Note 1. When capturing MIPI CSI-2 input data, be sure to enable the internal field signal generation function.
Note 2. Dithering is performed for RGB-888 → RGB-565 conversion.
Note 3. RGB data is converted and transferred to memory from the video module after 8-bit precision conversion.
Note 4. For details of output interfaces, see section 48.3.9, Output Data Format.

48.3.2 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.
Specifying the capture field in IM bits of the video n main control register (VnMC) and then setting the SC bit in the video n frame capture register (VnFC) to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the video n start line pre-clip register (VnSLPrC), or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the video n memory base 1 register (VnMB1). For using single frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable bit (ME) in the video n main control register (VnMC).
2. Set 1 to the single frame capture mode bit (SC) in the video n frame capture register (VnFC).

Note: When using this setting, don't set 2'b01 to the interlace mode bits (IM) in the video n main control register (VnMC).

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the video n module status register (VnMS). For using continuous frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable bit (ME) in the video n main control register (VnMC).
2. Set 1 to the continuous frame capture mode bit (CC) in the video n frame capture register (VnFC)

Note: Don't set 1 to the single frame capture mode bit (SC) and the continuous frame capture mode bit (CC) at the same time.

When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal. For details, see section 48.2.18, Video n Data Mode Register 2 (VnDMR2).

48.3.3 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: Video n start line pre-clip (VnSLPrC), Video n end line pre-clip (VnELPrC), Video n start pixel pre-clip (VnSPPrC), and Video n end pixel pre-clip (VnEPPrC).
For post-clipping after horizontal or vertical scaling, see section 48.2.21.4, Video n UDS Output Size Clipping Registers (VnUDS_CLIP_SIZE).

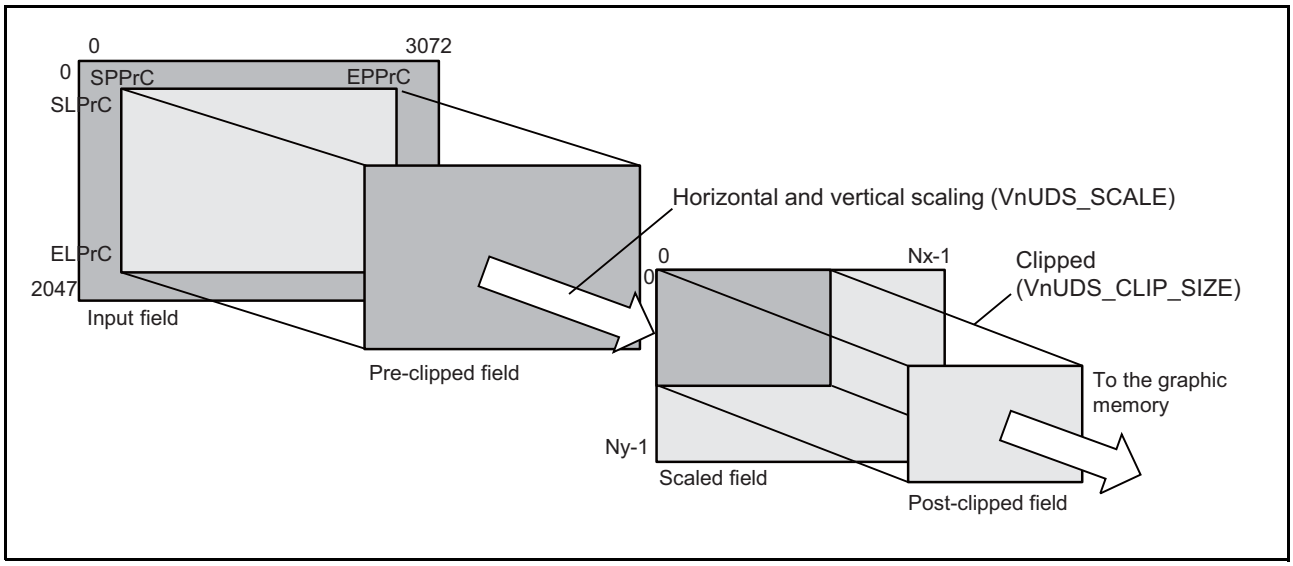

Figure 48.5 Example of Clipping

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the video n image stride register (VnIS). The setting can be larger than the post-clipped frame width, but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: Video n start line pre-clip (VnSLPrC), Video n end line pre-clip (VnELPrC), Video n start pixel pre-clip (VnSPPrC), and Video n end pixel pre-clip (VnEPPrC).

48.3.4 Vertical Scaling

For details on scaling in the vertical direction, see section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE).

48.3.5 Horizontal Scaling

For details on scaling in the horizontal direction, see section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE).

48.3.6 Color Conversion Function

(1) YC-RGB Color Conversion

When the data input format is YCbCr, set the BPS bit in the VnMC register to 0 to convert YCbCr data to RGB data. If an 8-bit data format is used for the capture interface, the color conversion is carried out according to the matrix coefficients set in the VnCSCC1, VnCSCC2, and VnCSCC3 registers. Otherwise, it is carried out according to the matrix coefficients set in the VnCSCE1, VnCSCE2, VnCSCE3, and VnCSCE4 registers. All of the input YCbCr data is extended to 12-bit data before carrying out color conversion.
Here, if the BPS bit in VnMC is set to 1, the data is stored in memory as it is in YCbCr format.

$$R = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times \left(Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]\right) + \left[\begin{array}{c}VnCSCC2/\\RCRMUL[9:0]\\or\\VnCSCE3/\\RCRMUL2[13:0]\end{array}\right] \times \left(Cr - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right]\right)$$

$$G = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times \left(Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]\right) - \left[\begin{array}{c}VnCSCC2/\\GCRMUL[9:0]\\or\\VnCSCE3/\\GCRMUL2[13:0]\end{array}\right] \times \left(Cr - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right]\right) - \left[\begin{array}{c}VnCSCC3/\\GCBMUL[9:0]\\or\\VnCSCE4/\\GCBMUL2[13:0]\end{array}\right] \times \left(Cb - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right]\right)$$

$$B = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times \left(Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]\right) + \left[\begin{array}{c}VnCSCC3/\\BCBMUL[9:0]\\or\\VnCSCE4/\\BCBMUL2[13:0]\end{array}\right] \times \left(Cb - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right]\right)$$

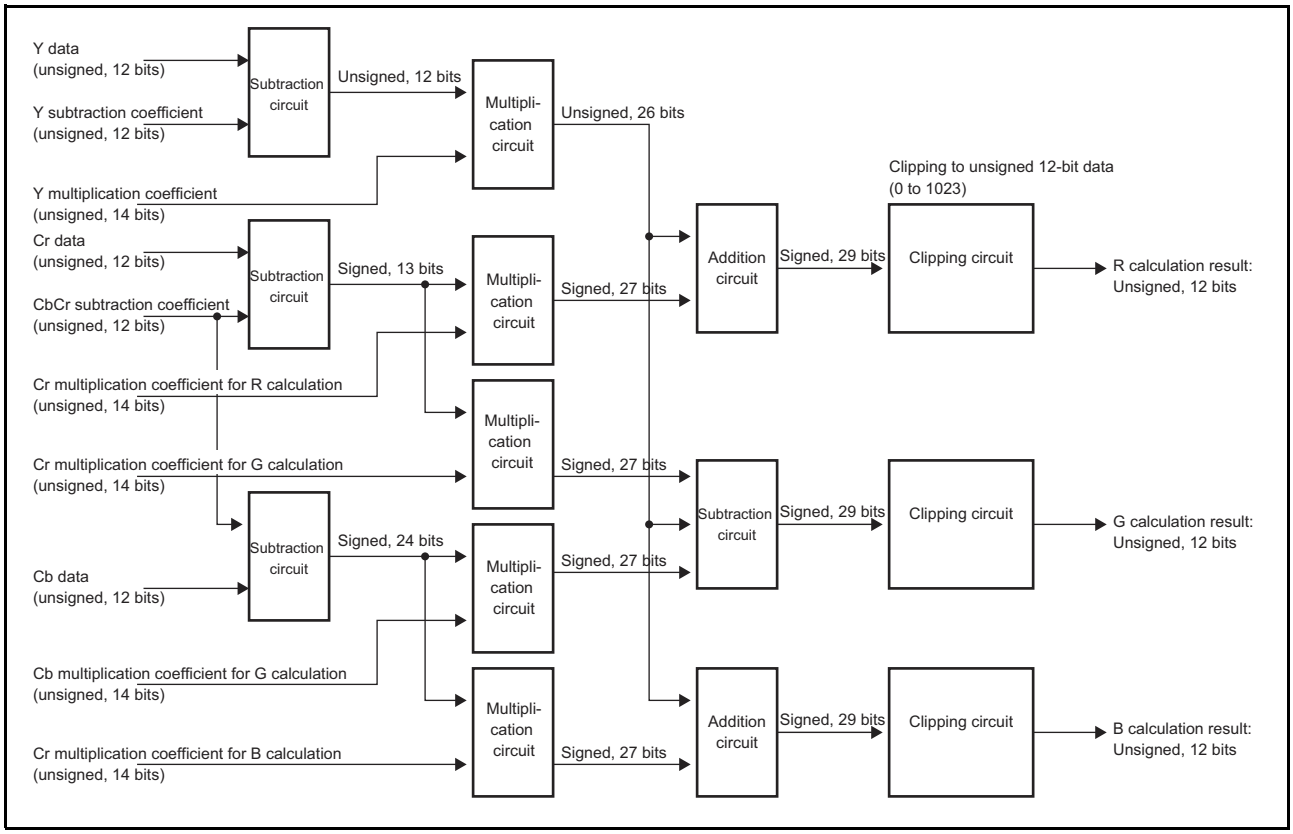

Figure 48.6 YCbCr → RGB Calculation Circuit Configuration

Examples of color space that can be set in YC-RGB conversion coefficient registers are shown below. See the register descriptions for details of the coefficients.

Table 48.10 Examples of YC-RGB Conversion Coefficient Register Settings

YC-RGB Conversion Coefficient	YMUL	YSUB	CSUB	RCRMUL	GCRMUL	GCBMUL	BCBMUL
ITU-R BT.601 (initial value) 16 ≤ Y ≤ 235, 16 ≤ Cb, Cr ≤ 240	1.164	16	128	1.596	0.813	0.392	2.017
Luminance expansion example 1 ≤ Y ≤ 254, 16 ≤ Cb, Cr ≤ 240	1.008	1	128	1.596	0.392	0.813	2.017

Specify an integer in each addition coefficient bit field. For each multiplication coefficient, specify a value obtained by multiplying the desired coefficient value by 256.

Example: When the desired multiplication coefficient is 1.164

1.164 × 256 = 297 (set value: B'0100101001)

Note 1. In order to process the data outside the range prescribed by the ITU-R BT.601 standard, set the CLP[1:0] bits in VnMC to 11. The data is clipped to the specified value before color space conversion.

Note 2. The YC-RGB color conversion data is unconditionally rounded to the 0 ≤ R, G, B ≤ 255 range.

(2) RGB-YC Color Conversion

When the data input format is RGB, set the BPS bit in VnMC to 0 for color conversion of RGB data into YCbCr data format. Color conversion from RGB to YCbCr is done according to the matrix coefficients set in RGB-YC conversion coefficient registers (VnYCCR1-VnYCCR3/VnCBCCR1-VnCBCCR3/VnCRCCR1-VnCRCCR3). All of the input RGB data is extended to 12-bit data before color conversion.
If 1 is set to the BPS bit in VnMC, the data will be stored in the memory as it is in RGB format.

$$Y = ((YCLRP \times R + YCLGP \times G + YCLBP \times B) \times 2^{YCLSFT}) + YCALP$$
$$Cb = ((CBCLRP \times R + CBCLGP \times G + CBCLBP \times B) \times 2^{CBCLSFT}) + CBCALP$$
$$Cr = ((CRCLRP \times R + CRCLGP \times G + CRCLBP \times B) \times 2^{CRCLSFT}) + CRCALP$$

The following data rounding functions of RGB-YCbCr color conversion function can be independently set to each pixel. The circuit configuration of Y data is given below.

Table 48.11 Data Rounding Functions of RGB-YC Color Conversion Function

Function	Symbol	Description
Sign extension enable	YEXPEN	Enables/disables signed bits of the matrix multiplication result.
Multiplication result shift down amount	YCLSFT[4:0]	Amount of shift down in the matrix multiplication result
Rounding off enable	YCLHEN	Enables/disables rounding off to the shift down amount.
Clipping enable	YCLCEN	Enables/disables data rounding process between 0 to 1023 of the output data.

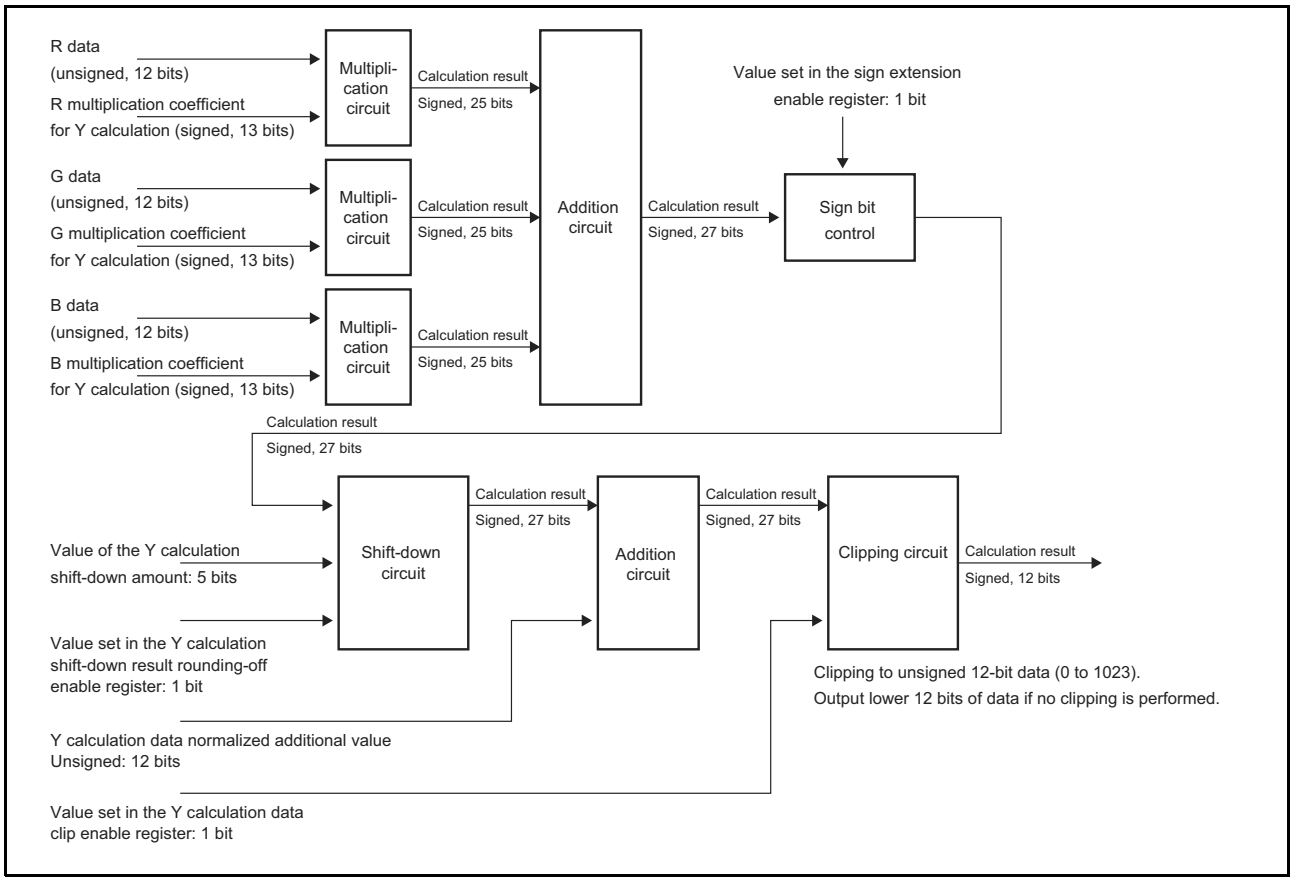

Figure 48.7 Y Data Circuit Configuration of RGB → YCbCr Color Conversion Function

48.3.7 Image Data Format Conversion Functions

(1) Lookup Table (LUT) Precision Conversion Function

Set the LUTE bit in VnMC to 1 to enable table conversion of each pixel data of Y, Cb, and Cr or R, G, and B data after color conversion.

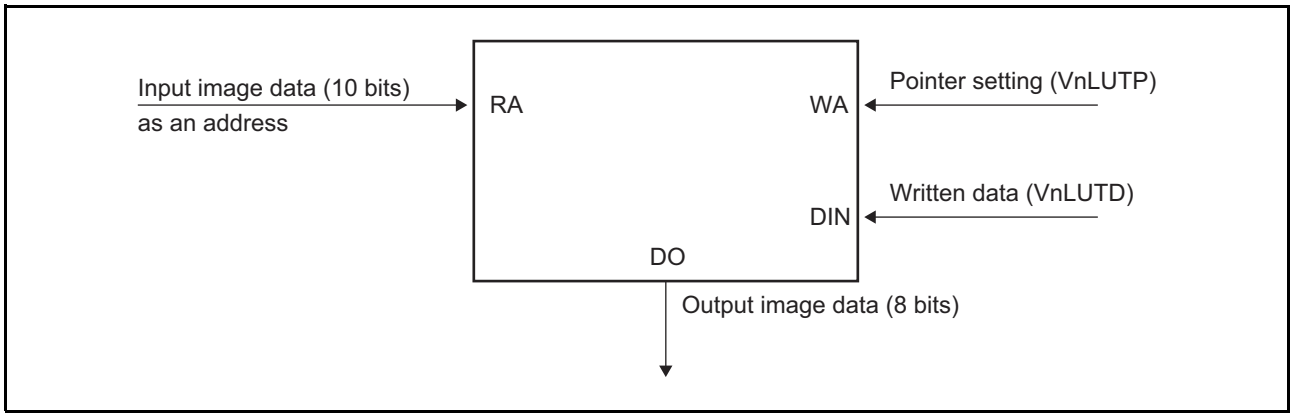

Figure 48.8 Lookup Table

Pointer Access:

The pointer is incremented every time a write access to the VnLUTD register is made.
The incremented pointer value is read when the VnLUTP register is read. Since the pointer is not incremented at read access to the VnLUTD register, the pointer should be set just before reading.
The procedure given below must be followed to access the lookup table.
The lookup table cannot be accessed from the CPU during the conversion process.
(For write/read access to the LUT from the CPU, the LUTE bit in VnMC should be 0.)

Write access:

1. Write the access destination address in VnLUTP.
2. Write the data in VnLUTD. Thereby the data will be reflected in the lookup table.
   Also the pointer will automatically increase by 1.
3. Writing to VnLUTD will consecutively update the lookup table.

Read Access:

1. Write the access destination address in VnLUTP.
2. Read VnLUTD. This is dummy read; thus the read data needs to be discarded.
3. Read VnLUTD. This reading allows the address data written in VnLUTP to be acquired.

[Notes on Using the Lookup Table]

1. Set the lookup table only after capture operation has stopped.
2. Rewrite all before using the lookup table.
3. Data set to the lookup table should be within the range compatible to the input bit width.

(2) YCbCr422 → YC Separation Function

When transferring YCbCr data to memory, Y data and CbCr data can be separated and transferred to different address spaces.

To perform YCbCr separation transfer, set the DTMD[1:0] bits in the VnDMR register to B'10. In this case, the Y data will be transferred to the address set in the memory base address register and CbCr data will be transferred to the address obtained by adding the value set in the VnUVAOF register to the memory base address register.

If the YMODE[0] bits in the VnDMR register are set, only Y data will be transferred to memory and CbCr data is not transferred to memory.

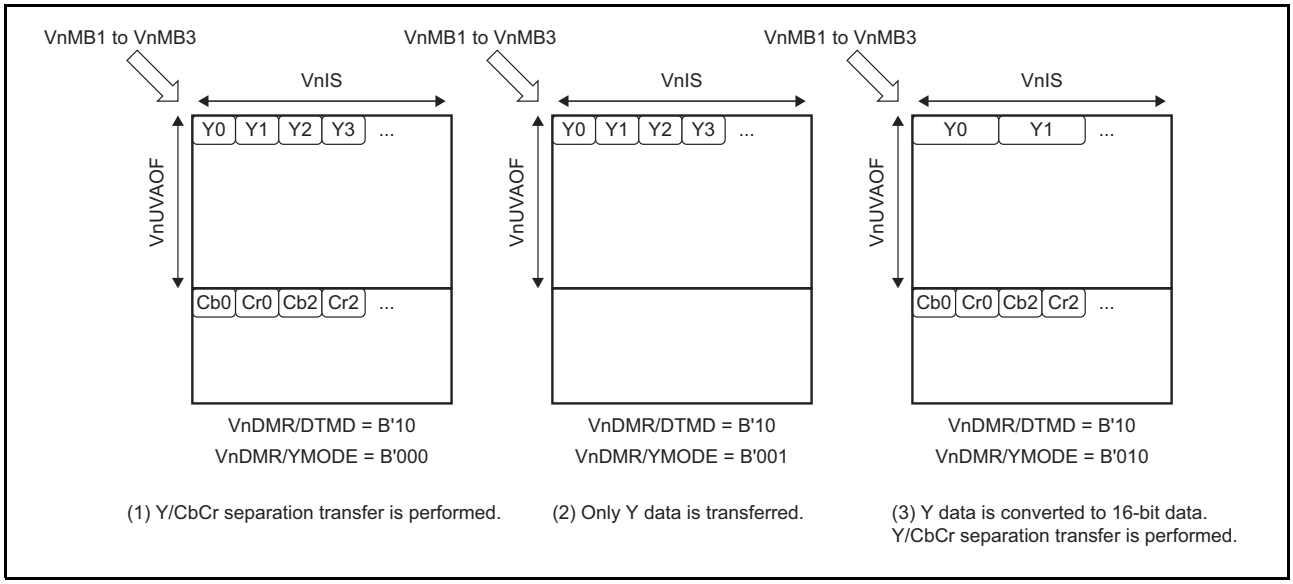

Figure 48.9 Y/Cb/Cr Separation in Big Endian

(3) Dithering Function

Dithering is performed when the internal RGB-888 format after color space conversion is converted to the RGB-565 or RGB-1555 format. The dithering mode can be selected with the DC[1:0] bits in VnMC.

(a) Dithering with Cumulative Addition

Set the DC[1:0] bits in VnMC to B'00 to perform dithering using the cumulative addition method in horizontal pixel units.

Rn [7:3] ≤ (Rx[7:0] + Rn-1[2:0]) >> 3
Gn [7:2] ≤ (Gx[7:0] + Gn-1[1:0]) >> 2
Bn [7:3] ≤ (Bx[7:0] + Bn-1[2:0]) >> 3

Where:
(Rn, Gn, Bn) = Output RGB-565 pixel
(Rx, Gx, Bx) = Input RGB-888 pixel
(Rn-1, Gn-1, Bn-1) = Pseudo random error (LSB of the cumulative error)

(b) Ordered Dithering

Set the DC[1:0] bits in VnMC to B'01 to perform dithering using the ordered dithering method.

Rn [7:3] ≤ (Rx[7:0] + D42xy) >> 3
Gn [7:2] ≤ (Gx[7:0] + D22xy) >> 2
Bn [7:3] ≤ (Bx[7:0] + D42xy) >> 3

Where:
(Rn, Gn, Bn) = Output RGB-565 pixel
(Rx, Gx, Bx) = Input RGB-888 pixel
(D22xy, D42xy) = Input x, y coordinate dithering matrix result

$$D22 = \begin{bmatrix} 0 & 3 \\ 2 & 1 \end{bmatrix}, \quad D42 = \begin{bmatrix} 0 & 3 & 4 & 7 \\ 2 & 1 & 6 & 5 \end{bmatrix}$$

48.3.8 Internal Field Signal Generation

As the VIN controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function through the FTEV and FTEH bits in the video n data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)
  When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).
- HSYNC field toggle counter (FTEH = 1 in VnDMR2)
  This counter counts the capture active lines. If the external field signal does not change until the count reaches the HLV setting in VnDMR2, the capture field signal is controlled.

Note 1. Do not set both the FTEV and FTEH bits in VnDMR2 at the same time.
Note 2. Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

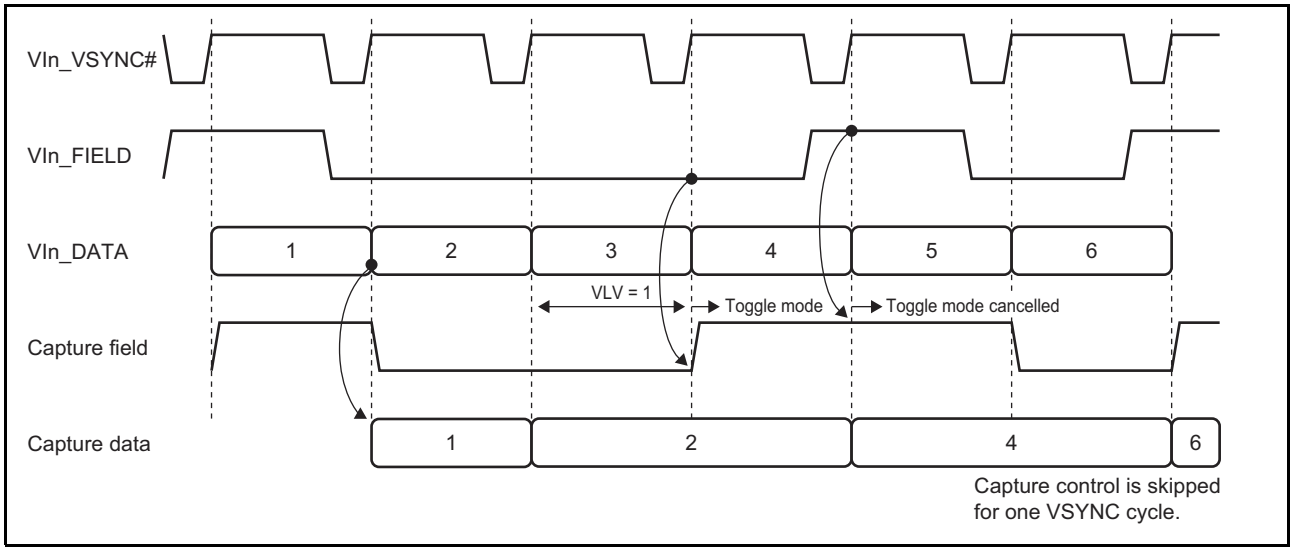

Figure 48.10 Overview and Notes of VSYNC Field Toggle Mode

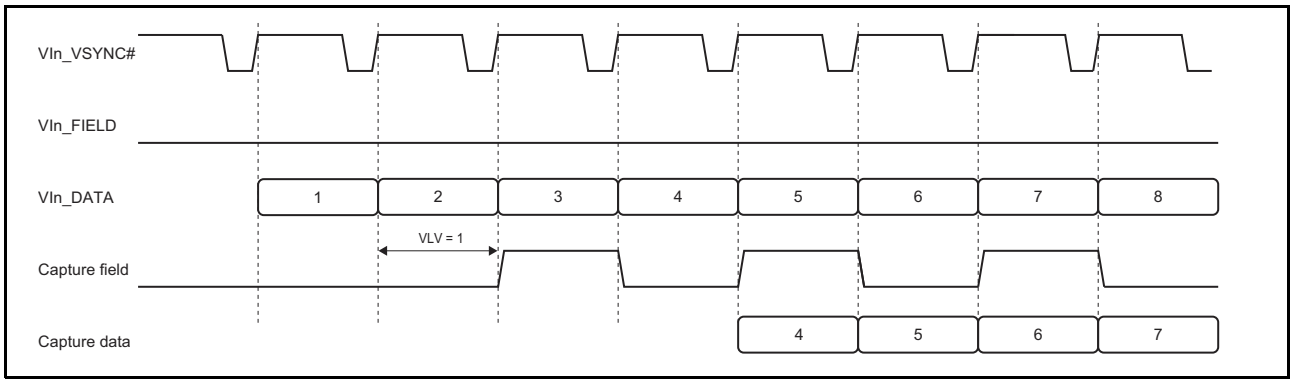

Figure 48.11 VSYNC Field Toggle Mode When the External Field Signal Does Not Change

48.3.9 Output Data Format

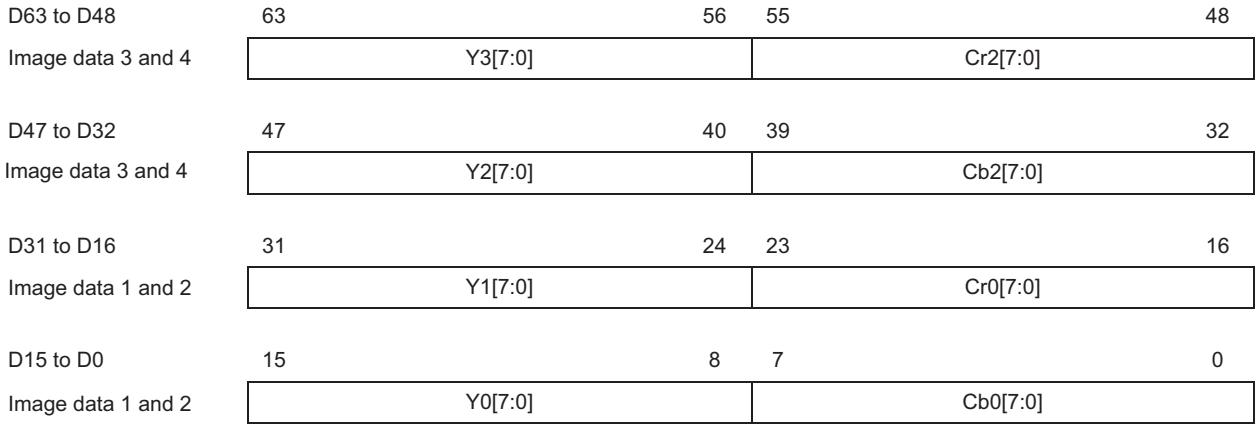
The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

(1) YC: YCbCr-422, 8 bits

The 8-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

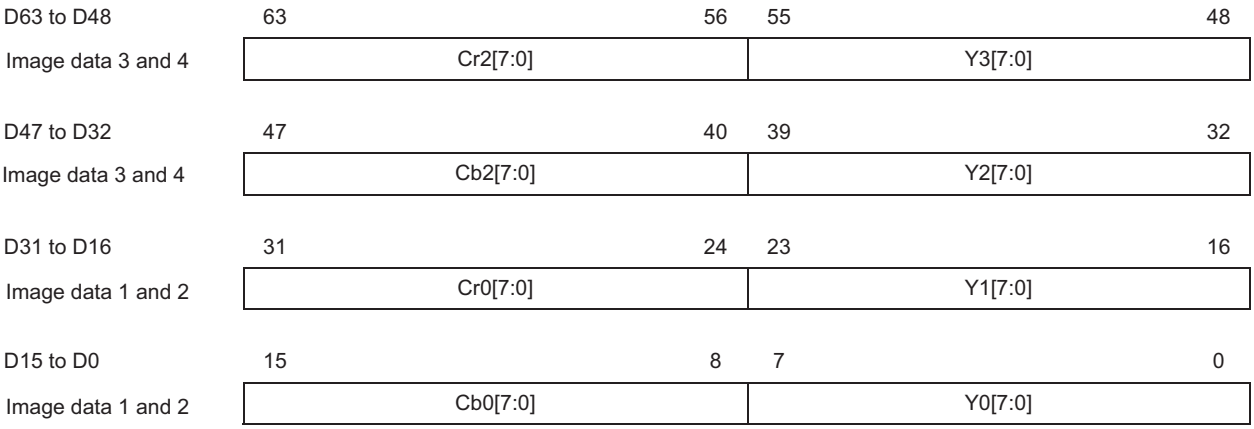
- BPSM = 0 in VnDMR: UYVY format

• 8-bit YCbCr-422 data (UYVY format)



- BPSM = 1 in VnDMR: YUYV format

• 8-bit YCbCr-422 data (YUYV format)



(2) YC: YCbCr-422, 10 bits

The 10-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below.

Note 1. In this format, the YC_THR bit in VnDMR should be set to 1.
Note 2. Word addresses of YCbCr data are output in accordance with the VnIS register setting.

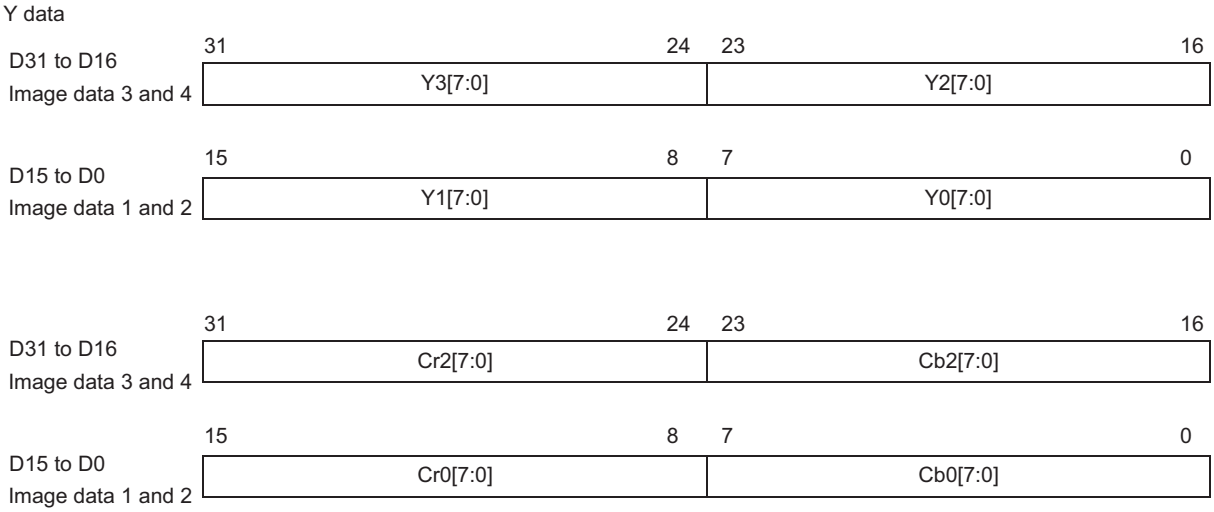
- 10-bit YCbCr-422 data: (UYVY format)

	127					122	121	112
D127 to D112 Image data 8	0	0	0	0	0	0	Y3[9:0]	
	111					106	105	96
D111 to D96 Image data 7	0	0	0	0	0	0	Cr2[9:0]	
	95					90	89	80
D95 to D80 Image data 6	0	0	0	0	0	0	Y2[9:0]	
	79					74	73	64
D79 to D64 Image data 5	0	0	0	0	0	0	Cb2[9:0]	
	63					58	57	48
D63 to D48 Image data 4	0	0	0	0	0	0	Y1[9:0]	
	47					42	41	32
D47 to D32 Image data 3	0	0	0	0	0	0	Cr0[9:0]	
	31					26	25	16
D31 to D16 Image data 2	0	0	0	0	0	0	Y0[9:0]	
	15					10	9	0
D15 to D0 Image data 1	0	0	0	0	0	0	Cb0[9:0]	

(3) YC: YC Separation YCbCr-422, Y (8 bits)/C (8 bits)

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the video n data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.



(4) YC: YC Separation YCbCr-422 Y (10 bits)/C (10 bits)

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the video n data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Note 1. In this format, the YC_THR bit in VnDMR should be set to 1.
Note 2. Word addresses of YCbCr data are output in accordance with the VnIS register setting.

Y data (10 bits)

	63					58	57	48
D63 to D48 Image data 4	0	0	0	0	0	0	Y3[9:0]	

	47					42	41	32
D47 to D32 Image data 3	0	0	0	0	0	0	Y2[9:0]	

	31					26	25	16
D31 to D16 Image data 2	0	0	0	0	0	0	Y1[9:0]	

	15					10	9	0
D15 to D0 Image data 1	0	0	0	0	0	0	Y0[9:0]	

Cb, Cr data (10 bits)

	63					58	57	48
D63 to D48 Image data 4	0	0	0	0	0	0	Cr2[9:0]	

	47					42	41	32
D47 to D32 Image data 3	0	0	0	0	0	0	Cb2[9:0]	

	31					26	25	16
D31 to D16 Image data 2	0	0	0	0	0	0	Cr0[9:0]	

	15					10	9	0
D15 to D0 Image data 1	0	0	0	0	0	0	Cb0[9:0]	

(5) YC: YC Separation YCbCr-422, Y (10 bits)/C (8 bits)

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.
If the setting of the YMODE[2:0] bits in the video n data mode register (VnDMR) is B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 leads to the conversion of 10-bit CrCb data to 8-bit CrCb data and changing the format to 4:2:2.
UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

Note 1. Word addresses of Y data are output in accordance with the VnIS register setting.
Note 2. Byte addresses of CbCr data are output in accordance with the VnIS register setting.

Y data

	63					58	57	48
D63 to D48 Image data 4	0	0	0	0	0	0	Y3[9:0]	
D47 to D32 Image data 3	47					42	41	32
	0	0	0	0	0	0	Y2[9:0]	
D31 to D16 Image data 2	31					26	25	16
	0	0	0	0	0	0	Y1[9:0]	
D15 to D0 Image data 1	15					10	9	0
	0	0	0	0	0	0	Y0[9:0]	

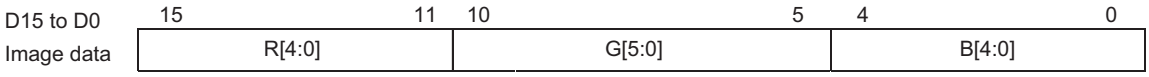
Cb, Cr data

	31	24	23	16
D31 to D16 Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	
D15 to D0 Image data 1 and 2	15	8	7	0
	Cr0[7:0]		Cb0[7:0]	

(6) 16 Bits/Pixel: RGB-565

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16-bit/pixel data (RGB data) format

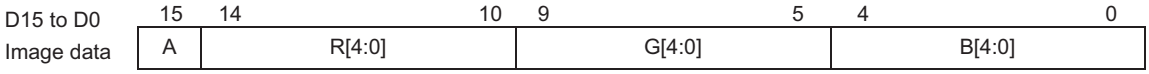


(7) 16 Bits/Pixel: ARGB-1555

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the video n data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

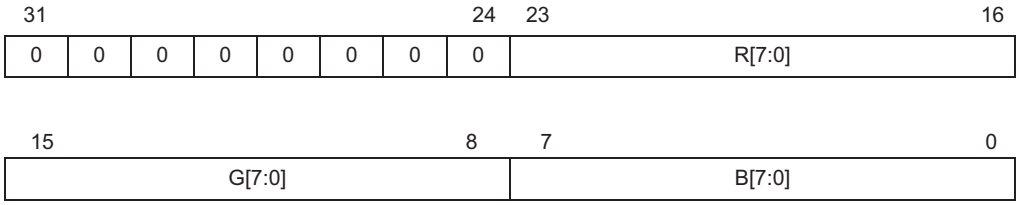
16-bit/pixel data (ARGB data) format



(8) 32 Bits/Pixel: RGB-888

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

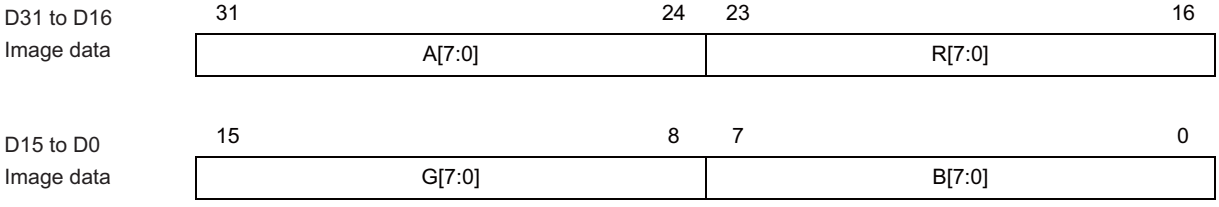
32-bit/pixel data (RGB data) format



(9) 32 Bits/Pixel: ARGB-8888

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32-bit/pixel data (ARGB data) format

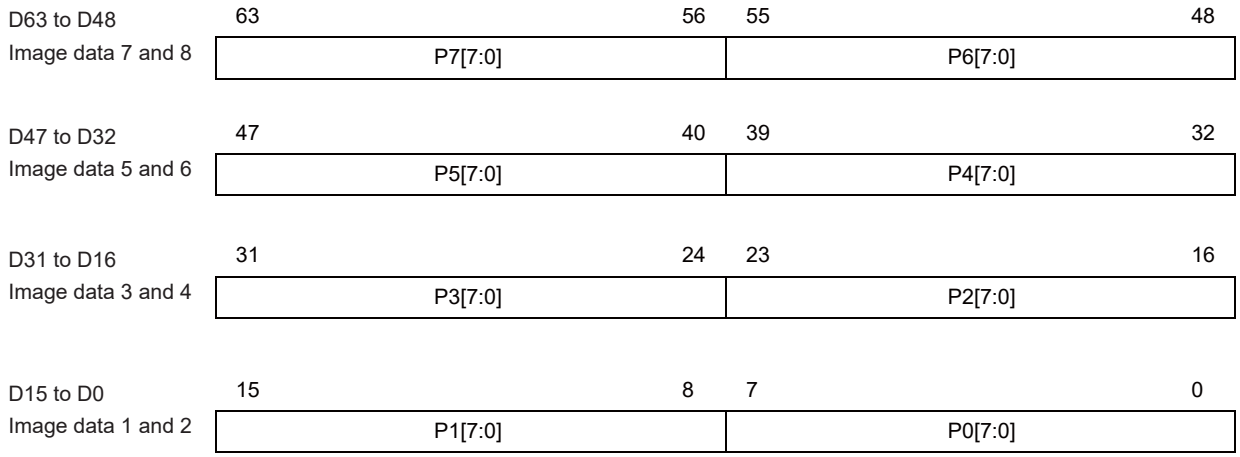


(10) Raw: 8 bits

The format of 8-bit raw image data is shown below.

Note 1. The data transfer is in 4-byte units.
Note 2. Byte addresses of raw data are output in accordance with the VnIS register setting.

8-bit raw data format



48.3.10 Endianess Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the video n main control register (VnMC) to 1 to convert data into big endian before storing in memory.
Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the video n data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR and BPS bit in VnMC.

Table 48.12 Endian Conversion Unit

Data Format	BPS in VnMC	DTMD[1:0] in VnDMR	EXRGB in VnDMR	BPSM in VnDMR	Endian Conversion Unit
RGB-565	0	00	0	0	Word units
RGB-888	0	00	1	0	Longword units
YCbCr-422	1	00	0	1	Byte units
ARGB-1555	0	01	0	0	Word units
ARGB-8888	0	01	1	0	Longword units
YC	1	10	0	0	Byte units

The following figures show endian conversions in byte, two-byte, and four-byte units.

Endian conversion in byte units:

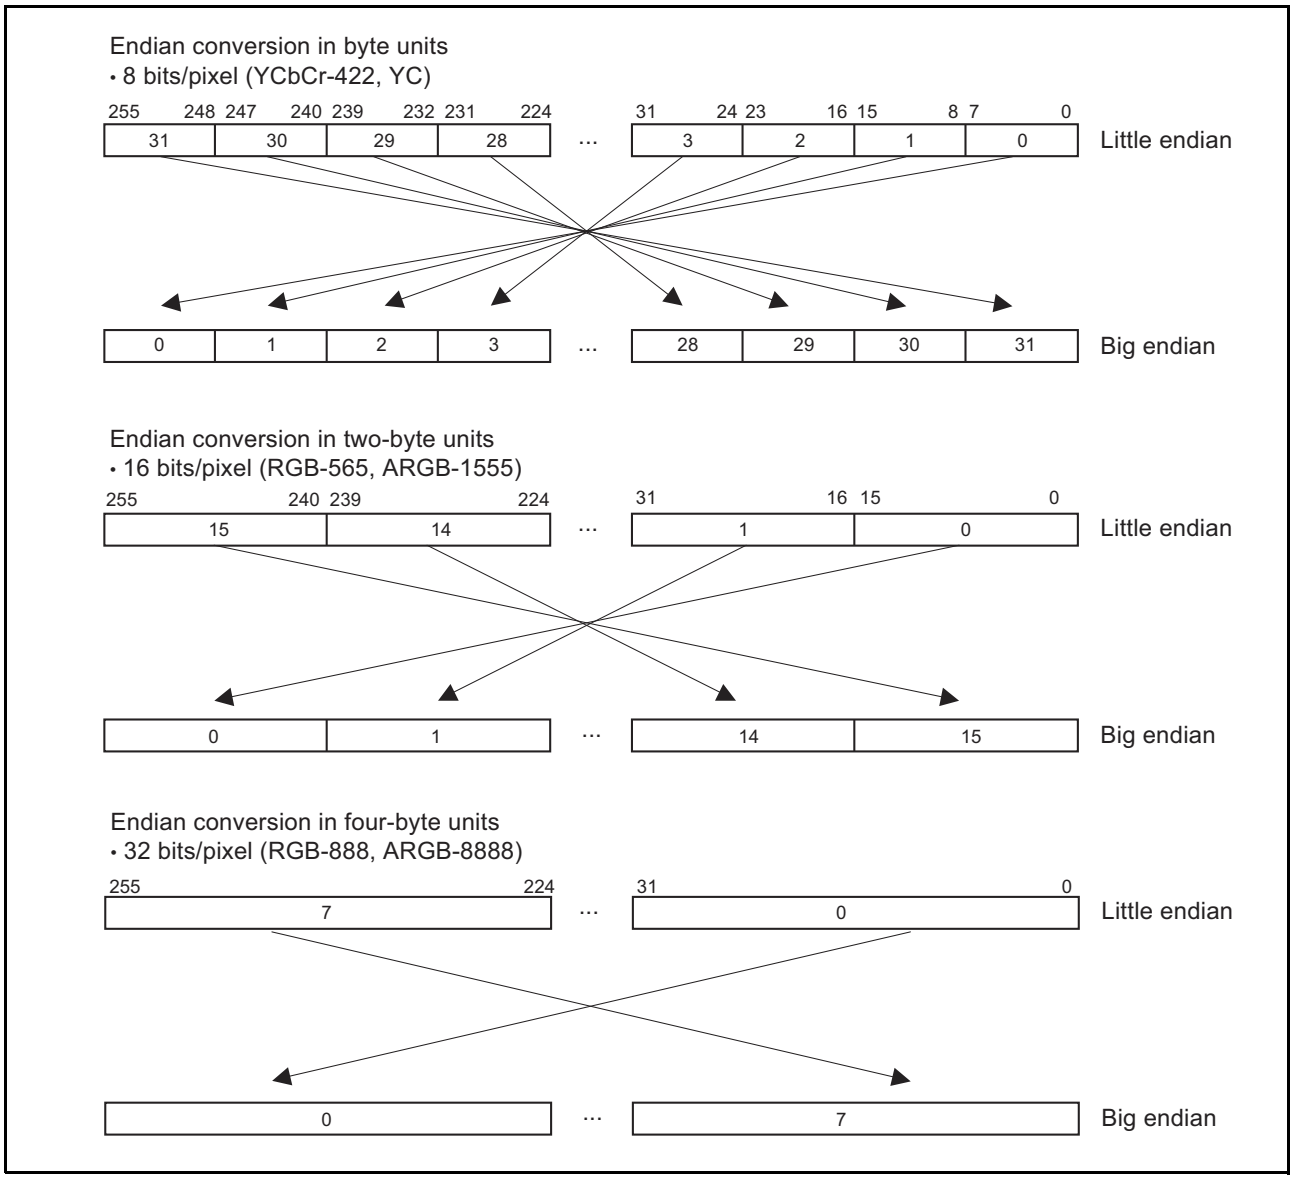


Figure 48.12 Data Alignment Conversion from Little Endian to Big Endian

48.3.11 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The VIN should not be accessed during module standby mode. For details of the module standby function, refer to section 52, Power-Down Modes.

48.3.12 Transition to Module Standby Mode

1. Clear the module enable bit (ME) in the video n main control register (VnMC) and the continuous frame capture mode bit (CC) and the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 0 to stop the VIN.
2. Confirm that the capture active bit (CA) in the video n module status register (VnMS) is cleared to 0.*1
3. Set MSTP to 1, assigned to this module in the setting of section 52, Power-Down Modes.

Note 1. The camera device should be kept operation until the CA bit in VnMS set to 0.

48.3.13 Cancellation of Module Standby Mode and Restarting of VIN

1. Set MSTP to 0, assigned to this module in the setting of section 52, Power-Down Modes.
2. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
3. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

48.3.14 Interrupts

The VIN is capable of generating 1 interrupt.
For details, refer to section 7, Interrupt Controller.

Table 48.13 Interrupt assignment

Interrupt Name	Cause of interrupt
VIN.	FIS2 or VFS or VRS or FIS or SIS or EFS or FOS bit in V0INTS

48.3.15 Initialization Procedure

The VIN initialization procedure can be executed either before or after the CSI2 initialization procedure.

[VIN initialization procedure]

1. Set the VIN registers.
2. Set the VSYNC field toggle mode enable bit (FTEV) in the video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period bits (VLV[3:0]) in the VnDMR2 shall be set to H'0.
3. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
4. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

[CSI2 initialization procedure]

1. Set the Link and PHY of the CSI-2 module registers*1.
2. Start the camera device.
3. Confirm that the PHY of the CSI-2 module starts.

Note 1. For details, see section 47, MIPI CSI2 Interface.

48.3.16 Capture Stop Procedure

1. Clear the module enable bit (ME) in the video n main control register (VnMC) and the continuous frame capture mode bit (CC) and the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 0 to stop the VIN.
2. Confirm that the video capture active status bit (CA) in the video n module status register (VnMS) is cleared to 0.*1
3. Set the MSTP bit to 1 in the module stop control register.
4. Set the SRST bit to 1 in the software reset register.
5. Reset the Link and PHY of the CSI-2 module.
6. Stop the camera device.

Note 1. The camera device should be kept operating until the CA bit in VnMS is set to 0.

48.3.17 Capture Restarting Procedure

The VIN initial procedure can be executed either before or after the CSI2 initial procedure.

[VIN restarting procedure]

1. Set the SRST bit to 0 in the software reset register.
2. Set the MSTP bit to 0 in the module stop control register.
3. Set the VIN registers.
4. Set the VSYNC field toggle mode enable bit (FTEV) in the video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period bits (VLV[3:0]) in the VnDMR2 shall be set to H'0.
5. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
6. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

[CSI2 restarting procedure]

1. Set the Link and PHY of the CSI-2 module registers.
2. Start the camera device.
3. Confirm that the PHY of the CSI-2 module starts.

48.4 Usage Notes

48.4.1 Specifications

The following shows the specifications.

Table 48.14 Specifications

Item	Description
Input from MIPI CSI-2 interface	In the input of progressive images through the MIPI CSI-2 interface, use the internal field signal generation function. For detail, see section 48.2.18, Video n Data Mode Register 2 (VnDMR2).
Limitation on register update	If a register is updated during capture, data captured immediately after the register update cannot be guaranteed. A register that supports the internal update mode as shown in Table 48.2 is updated immediately after the register is written to. To update other registers, stop capture operation and then update them.
Field capture mode image quality	Images of odd-numbered, odd/even-numbered and even-numbered fields, captured by VnMC/IM interlace mode bit settings, contain every other line from the input interlace images. Therefore, note that the horizontal resolution for video display is in units of fields.
Limitation on horizontal scaling	When scaling-up is used, the horizontal size that can be input is up to 2048 pixels. When scaling-down is used, the horizontal size that can be output is up to 2048 pixels.
Interrupt event timing	An interrupt event asserted by this module indicates the time when the interrupt event occurs in VIN, not the time when the transfer of captured data to memory is completed.
Pixel post-clip setting	Even when the output format is YCbCr-422, pixel post-clipping is applied in accordance with the VnUDS_CLIP_SIZE setting. Therefore, specify an even value for the clipping size in the CL_HSIZE bits when the output format is YCbCr-422.
Coefficient settings for color space conversion	Specify appropriate values in the color space conversion coefficient 1 to 3 registers (VnCSCC1 to VnCSCC3) to keep the RGB image data within the range 0 < R', G', B' < 255. After calculation for color space conversion, pixel values less than 0 normalized to 0, and pixel values greater than or equal to 255 normalized to 255.
Scaling up	When horizontal and vertical scaling up is specified, the amount of memory transfer becomes greater with an increase in traffic. Note the amount of traffic on the entire system when using the scaling-up function because the overall transfer efficiency of the system might degrade due to the increased use of the internal buses.
YC Restrictions on YC separation function	Set the offset register (VnUVAOF) that stores UV data such that the storage areas of Y and UV data are not the same.
RGB-888 → RGB-565 conversion function	In the dithering process by cumulative addition, if the same color is captured as in a blue back image, periodic noise may be generated by the cumulative addition process (carried by addition). In this case, set the DC[1:0] bits in VnMC to the ordered dithering.
The maximum size that can be captured	The maximum number of lines and pixels that can be captured at this time is shown below. The maximum number of lines that can be captured = 2048 (the maximum value of the clipping register) – The vertical blanking time The maximum number of pixels that can be captured = 2048 (the maximum value of the clipping register) – The horizontal blanking time
Clipping size setting	The common pre-clipping size for odd and even fields is specified in VnSLPrC, VnELPrC, VnSPPrC, and VnEPPrC. The common post-clipping size for odd and even fields is specified in VnUDS_CLIP_SIZE.
Limitation on interlace input	When an interlace image is input, be sure to supply the field signal to VIN. When an interlace image is input from the MIPI CSI-2 interface, it is necessary to create the field signal in the CSI2 module. For the details of the field signal creation in CSI2, see section 47, MIPI CSI2 Interface.

Table 48.14 Specifications

Item	Description
UDS scaler setup sequence	[Initial setting ~ Capture start] [1] Set the SCLE bit in VnMC to 1. Set the other bits in VnMC to 0. [2] Set the UDS registers. [3] Set the VIN registers. [4] Set the ME bit in VnMC to 1. [5] Set the CC bit in VnFC to 1. [6] Capture starts. [Procedure to stop capturing and disable the UDS registers] [1] Set the ME bit in VnMC to 0. Keep the current values of the other bits in VnMC unchanged. [2] Set the CC bit in VnFC to 0. [3] Wait until the CA bit in VnMS is set to 0. (Maximum two vsync cycles) [4] Set the SCLE bit in VnMC to 0. [Resume capturing while the UDS is in use] [5] Change the values of the UDS control registers. [6] Set the SCLE bit in VnMC to 1. [7] Set the ME bit in VnMC to 1. [8] Set the CC bit in VnFC to 1. [9] Capture restarts. (After a maximum of two vsync cycles)
Horizontal clipping specification	Horizontal clipping size shall be set as follows.

Capture data	Pre-clipping start unit	Clipping size unit
YCbCr-422 data	2 pixels	2 pixels
RGB data	2 pixels	2 pixels
RAW data	4 pixels	4 pixels

48.4.2 Limitations on Usage

Table 48.15 Limitations on Usage

Item	Description
Frame buffers	Allocate the frame buffers in the on-chip RAM. To prevent performance to be degraded due to a page conflict when accessing the on-chip RAM, the maximum number of masters that simultaneously access the page where the frame buffers are allocated should be four, which includes the VIN.

49. SD/MMC Host Interface

Note: Development of the SD host--related products needs the conclusion of the following agreement. SD Host/ Ancillary Product License Agreement (SD HALA)

49.1 Overview

49.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, DDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = Bφ frequency/2^n (n = 0 to 9)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 1
- Card detect function
- Write protect support
- MMC interface (1-/4-/8-bit MMC bus)
  Note: Channel 1 only supports a 1- or 4-bit MMC bus.
- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

Block Diagram

Figure 49.1 shows a block diagram of the SD/MMC host interfaces.

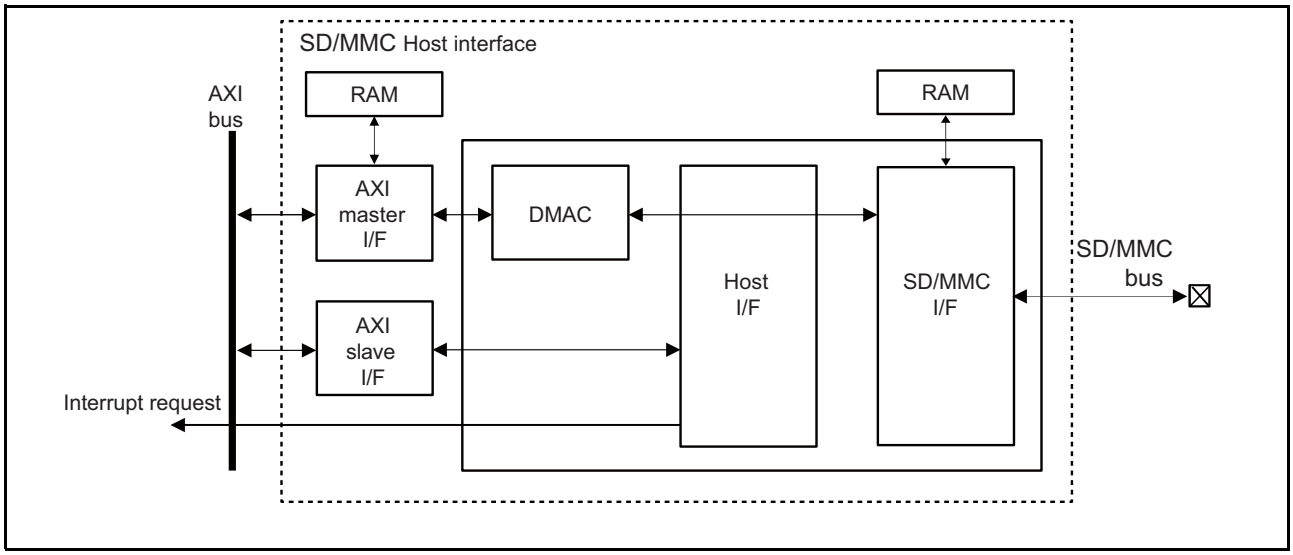

Figure 49.1 Block Diagram of SD/MMC Host Interface

49.1.2 External Pins

Table 49.1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V. Channels 0 and 1 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the dedicated pin POC control register (PPOC) and SD/MMC host interface dedicated pin driving ability control registers 0 to 2 (PSDMMC0 to PSDMMC2).
For details, see the following sections:
section 51.3.30, Dedicated Pin POC Control Register (PPOC),
section 51.3.31, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0),
section 51.3.32, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1),
section 51.3.33, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2).

Table 49.1 Pin Configuration

PIN Name	I/O	Function
SDx_CLK*1	O	SD/MMC clock output
SDx_CMD*1	I/O	SD/MMC command output, response input
SDx_DAT0*1	I/O	SD/MMC Data 0 [bit 0]
SDx_DAT1*1	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt
SDx_DAT2*1	I/O	SD/MMC Data 2 [bit 2], read wait
SDx_DAT3*1	I/O	SD/MMC Data 3 [bit 3], Card detection
SD0_DAT4*1	I/O	SD/MMC Data 4 [bit 4],
SD0_DAT5*1	I/O	SD/MMC Data 5 [bit 5]
SD0_DAT6*1	I/O	SD/MMC Data 5 [bit 6]
SD0_DAT7*1	I/O	SD/MMC Data 7 [bit 7]
SDx_CD*1	I	SD/MMC card detection*2
SDx_WP*1	I	SD/MMC write protection*2
SD0_RST#	O	SD/MMC reset

Note 1. x(= 0, 1) is the channel number of the SD/MMC host interface.
Note 2. Fix to 1 when not in use.

49.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0: H'E8228000
Channel 1: H'E822A000

Table 49.2 Register Configurations

Name	Abbreviation	Address	Access Width	Mirror
Command type register	SD_CMD	H'0000	16/32/64	
Command argument registers	SD_ARG	H'0010	16/32/64	
	SD_ARG1	H'0018	16/32/64	SD_ARG[31:16]

Note 2. Refer to section 49.7, SCC Register Descriptions.

49.2 Register Description

49.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.
For details on the SD_CMD setting, refer to section 49.4.14, Example of SD_CMD Register Setting.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 14	MD7 MD6	00	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD/MMC host interfaces -> SD card) 1: Read (SD/MMC host interfaces <- SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10 9 8	MD2 MD1 MD0	000	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see section 49.4.14, Example of SD_CMD Register Setting to select mode/response type.
7 6	C1 C0	00	R/W	00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited
5 4 3 2 1 0	CF45 CF44 CF43 CF42 CF41 CF40	000000	R/W	Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = B'0000 0110 CMD18: SD_CMD[7:0] = B'0001 0010 ACMD13: SD_CMD[7:0] = B'0100 1101

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

49.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.
Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.

SD_ARG

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CF39 to CF8	All 0	R/W	Set command format[39:8] (argument).

SD_ARG1 (Mirror of SD_ARG[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Fixed 0
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument).

49.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
18	—	0*1	R/W	Reserved The write value should always be 0.
17	HPIMODE	0*1	R/W	HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode.
16	HPICMD	0*1	R/W*3	HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. • After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. • After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. 1.CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2.SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	STP	0*1	R/W	Stop • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. • Set STP to 1 after the response end flag has been set. • Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.
Note 3. It is effective only if 1 is written.

49.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT31 to CNT0	All 0	R/W	Number of Transfer Blocks* When H'0000 0001 is set, the number of transfer blocks is 1. : When H'0000 FFFF is set, the number of transfer blocks is 65535. : When H'FFFF FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H'0000 0000 if multiple blocks are to be transferred.

Note: * Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

49.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8	All 0	R	Hold the response from the SD card

SD_RSP1 (Mirror of SD_RSP10[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R39 to R24	All 0	R	Hold the response from the SD card

SD_RSP32 (Mirror of SD_RSP10[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	R71 to R40	All 0	R	Hold the response from the SD card

SD_RSP3 (Mirror of SD_RSP32[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R71 to R56	All 0	R	Hold the response from the SD card

SD_RSP54

Bit	Bit Name	Initial Value	R/W	Description
63 to 56	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
55 to 0	R127 to R72	All 0	R	Hold the response from the SD card

SD_RSP5 (Mirror of SD_RSP54[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R103 to R88	All 0	R	Hold the response from the SD card

SD_RSP76 (Mirror of SD_RSP54[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	R127 to R104	All 0	R	Hold the response from the SD card

SD_RSP7 (Mirror of SD_RSP76[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	R127 to R120	All 0	R	Hold the response from the SD card

Table 49.3 lists the response types and corresponding SD_RSP registers.

Table 49.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note: The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

49.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.
For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.
Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.
INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	HPIRES	0*2	R/W*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	INFO10	Unknown	R	Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1.
9	INFO9	0	R/W*1	SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of 2 Bφ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of 2 Bφ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
5	INFO5	Unknown	R	Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0	R/W*1	ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
2	INFO2	0*2	R/W*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	INFO0	0*2	R/W*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write, In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

Note 1. It is effective only if 0 is written.
Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

49.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0]= B'0000 1100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
11	—	0	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BWE	0*2	R/W*1	SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0 is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3
8	BRE	0*2	R/W*1	SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0 is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.

Bit	Bit Name	Initial Value	R/W	Description
7	DAT0	Unknown	R	SDDAT0 Indicates the SDDAT0 state. 0: SDDAT0 is set to 0. 1: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0 is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.
3	ERR3	0*2	R/W*1	Data Timeout (except response timeout) [Setting conditions] 1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.

Bit	Bit Name	Initial Value	R/W	Description
2	ERR2	0*2	R/W*1	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.
Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in Figure 49.18 under section 49, IO_RW_EXTENDED (CMD53/Multiple Block Read) or in Figure 49.21 under section 49.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write).
Note 5. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	IMASK16	1	R/W	HPIRES interrupt masked
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IMASK0	1	R/W	INFO0 interrupt masked

49.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11	—	1	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

49.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	—	0	R/W	Reserved The write value should always be 0.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	—	0*1	R/W	Reserved The write value should always be 0.
9	SDCLKOFFEN	0	R/W	SD Clock (SDCLK) Output Automatic Control Enable 0: Automatic control for SD clock (SDCLK) output is disabled. 1: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0*1	R/W*2	SD Clock (SDCLK) Output Control Enable 0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1: SD clock (SDCLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SDCLK) B'1000 0000: Bφ/512 B'0100 0000: Bφ/256 B'0010 0000: Bφ/128 B'0001 0000: Bφ/64 B'0000 1000: Bφ/32 B'0000 0100: Bφ/16 B'0000 0010: Bφ/8 B'0000 0001: Bφ/4 B'0000 0000: Bφ/2 B'1111 1111: Bφ Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[7:0] to B'1111 1111.
6	DIV6	0	R/W*2	
5	DIV5	1	R/W*2	
4	DIV4	0	R/W*2	
3	DIV3	0	R/W*2	
2	DIV2	0	R/W*2	
1	DIV1	0	R/W*2	
0	DIV0	0	R/W*2	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Notes on when setting the SD clock (SDCLK) to Bφ(DIV[7:0] = B'1111 1111)

When changing the setting of bits DIV[7:0] to B'1111 1111, or from B'1111 1111 to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)
(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)
(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to B'1111 1111 after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

49.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note: * Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

49.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	WIDTH	0*1	R/W	Bus width*2 {WIDTH,WIDTH8} = 01: 8 bits width {WIDTH,WIDTH8} = 00: 4 bits width {WIDTH,WIDTH8} = 10,11: 1 bit width In the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set this bit to 1. In the case of writing of one-byte block, 8 bits width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
13	WIDTH8	0*1	R/W	Bus width*2 See the description of the WIDTH bit.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	EXTOP	0*1	R/W	Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{13} to SDCLK*2^{27}. 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{14} to SDCLK*2^{28}.
8	TOUTMASK	0*1	R/W	Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.
7	TOP27	1*1	R/W	Timeout Counter*2 0000: SDCLK*2^{13} 0001: SDCLK*2^{14} : 1101: SDCLK*2^{26} 1110: SDCLK*2^{27} 1111: Setting prohibited
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 0000: SDCLK*2^{10} 0001: SDCLK*2^{11} : 1101: SDCLK*2^{23} 1110: SDCLK*2^{24} 1111: Setting prohibited
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

49.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 15	—	Unknown	R	Reserved These bits are always read as unknown. The write value should always be 0.
14	E14	0*1	R	These bits hold the CRC status. (normal: 010)
13	E13	1*1		
12	E12	0*1		
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
63 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	E6	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0*1	R	Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0*1	R	Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0*1	R	Set to 1 when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

Note: When using the DMAC, the bus width should be fixed at 64 bits.

49.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	C52PUB	0	R/W	SDIO None Abort • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1. • Set C52PUB to 1 after the response end flag has been set.
8	IOABT	0	R/W	SDIO Abort • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. • Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.

Bit	Bit Name	Initial Value	R/W	Description
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IOMOD	0	R/W	SDIO Mode*1 0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card 1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card

Note: Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	All 0*2	R/W	Reserved The write value should always be 1. The value may change during operation.
0	IOIRQ	0*2	R/W*1	[Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

49.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R/W	Reserved The write value should always be 1.
1	—	1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

49.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	—	All 0	R/W	Reserved The write value should always be 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	—	0	R/W	Reserved The write value should always be 0.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer* 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled.
0	—	0	R/W	Reserved The write value should always be 0.

Note: * Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SDRST	1	R/W	Software Reset of SD Interface Unit 0: Reset 1: Reset released

49.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15, 14	UR7, UR6	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5, UR4	00	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0	H'C	R	Version of Renesas' IP
7 to 0	IP7 to IP0	H'10	R	Version of introductory IP

49.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	BUSWIDTH	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	ENDIAN	0	R/W	SD_BUF0 data swap
0	WMODE	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.
Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

49.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies DDR mode.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	—	0*1	R/W	Reserved The write value should always be 0.
8	NOCHKCR	0*1	R/W	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DDR	0*1	R/W	DDR Mode Select*2 0: Normal mode (default, high speed, or SDR) 1: DDR mode Set this bit to 0 when the SD clock division ratio is specified as 1:1 (bits DIV[7:0] in SD_CLK_CTRL are set to 11111111).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

Bit	Bit Name	Initial Value	R/W	Description
63 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	SD_RST	0	R/W	Controls the output value on the SD0_RST# pin. 0: The output value on the SD0_RST# pin is 0. 1: The output value on the SD0_RST# pin is 1.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

49.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.
High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17, 16	CH_NUM	00	R/W	DMAC channel selector 00 : SD down stream 01 : SD up stream Other settings are prohibited.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5, 4	BUS_WIDTH [1:0]	11	R/W	Bus width selector 11: 64-bit Other settings are prohibited.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

49.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation.
High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	—	0	R/W	Reserved The write value should always be 0.
7 to 1	—	All 0	R	Reserved
0	DM_START	0	R/W	DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

49.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 10	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
9	DTRANRST1	1	R/W	Soft resets of the module built-in DMAC channel 1 0: Reset 1: Reset released
8	DTRANRST0	1	R/W	Soft resets of the module built-in DMAC channel 0 0: Reset 1: Reset released
7 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
0	SEQRST	1	R/W	Soft resets of the sequencer 0: Reset 1: Reset released

Note: When using the software reset by this register, see section 52.3.6, Software Reset and follow the procedures for using the STBREQ and STBACK registers.

49.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
20	DTRANEND1	0*1	R/W	Module built-in DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	DTRANEND0	0*2	R/W	Module built-in DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQEND	0*3	R/W	Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.
Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.
Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

49.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 21	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
20	DTRANEND1_MASK	1	R/W	DTRANEND1 interrupt masked
19 to 17	—	All 1	R/W	Reserved The write value should always be 1.
16	DTRANEND0_MASK	1	R/W	DTRANEND0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQEND_MASK	1	R/W	SEQEND interrupt masked

49.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
19, 18	—	00	R	Reserved The write value should always be 0.
17	DTRANERR1	0*1	R/W	Module built-in DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1
16	DTRANERR0	0*2	R/W	Module built-in DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQERR	0*3	R/W	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.
Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.
Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

49.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 20	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
19, 18	—	11	R	Reserved The write value should always be 1.
17	DTRANERR1_MASK	1	R/W	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1	R/W	DTRANERR0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQERR_MASK	1	R/W	SEQERR interrupt masked

49.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.
Higher-order 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 3	DADDR	All 0	R/W	Destination address / Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32}.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

49.3 Operation

49.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see Figure 49.2, Figure 49.3 and Figure 49.5.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see Figure 49.7)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see Table 49.4)

When data is written to the SD card, the above procedure will be reversed.
When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See Figure 49.7)

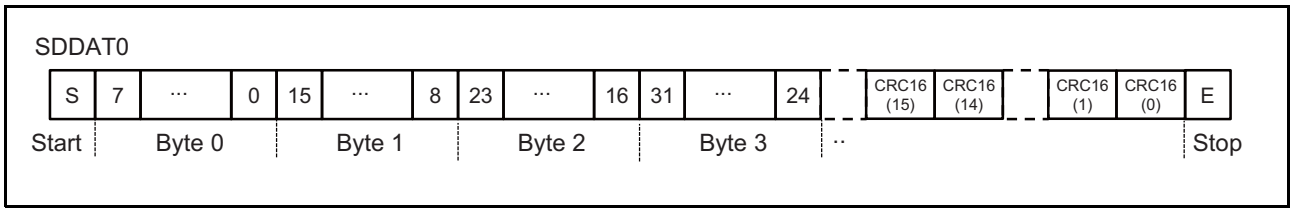

Figure 49.2 SDDAT in 1-Bit Width Mode

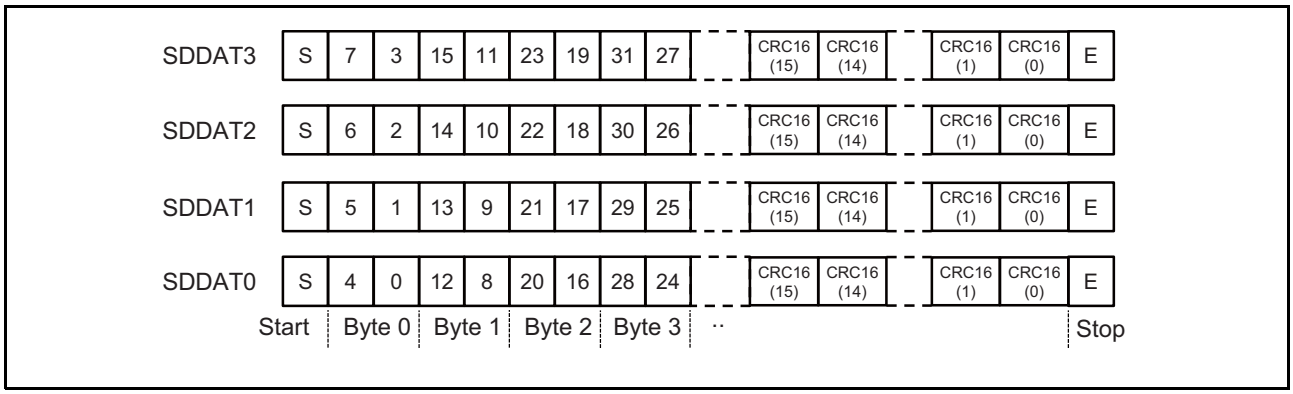

Figure 49.3 SDDAT in 4-Bit Width Mode

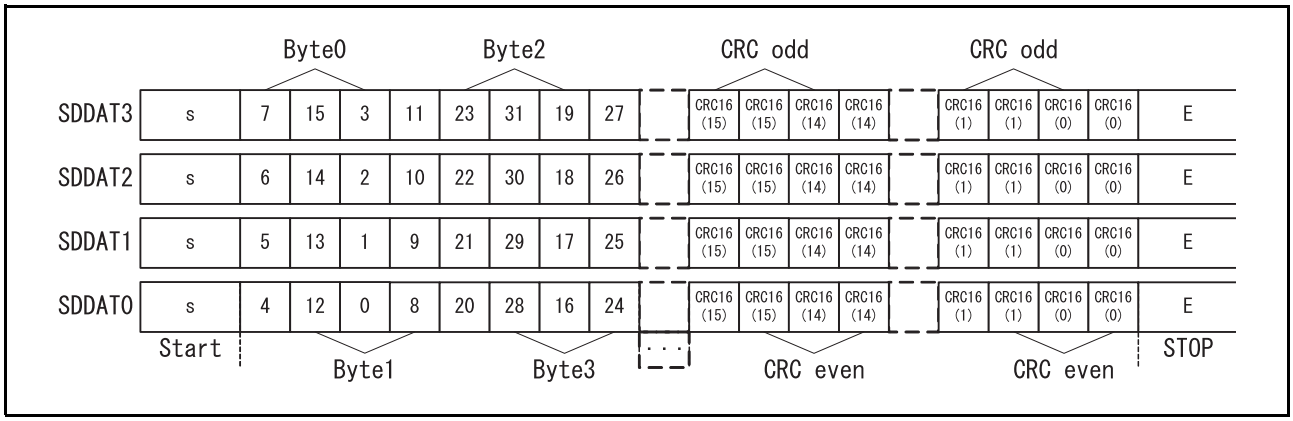

Figure 49.4 SDDAT in 4-Bit Width DDR Mode

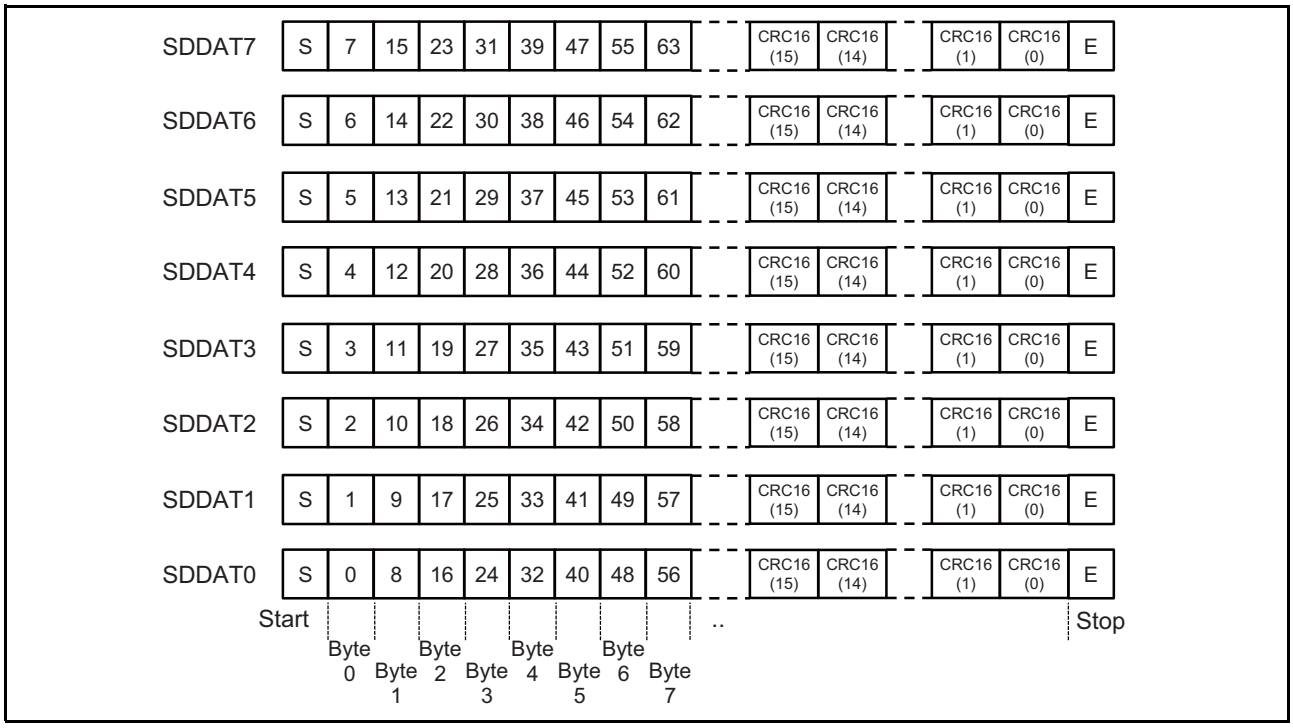

Figure 49.5 SDDAT in 8-Bit Width Mode

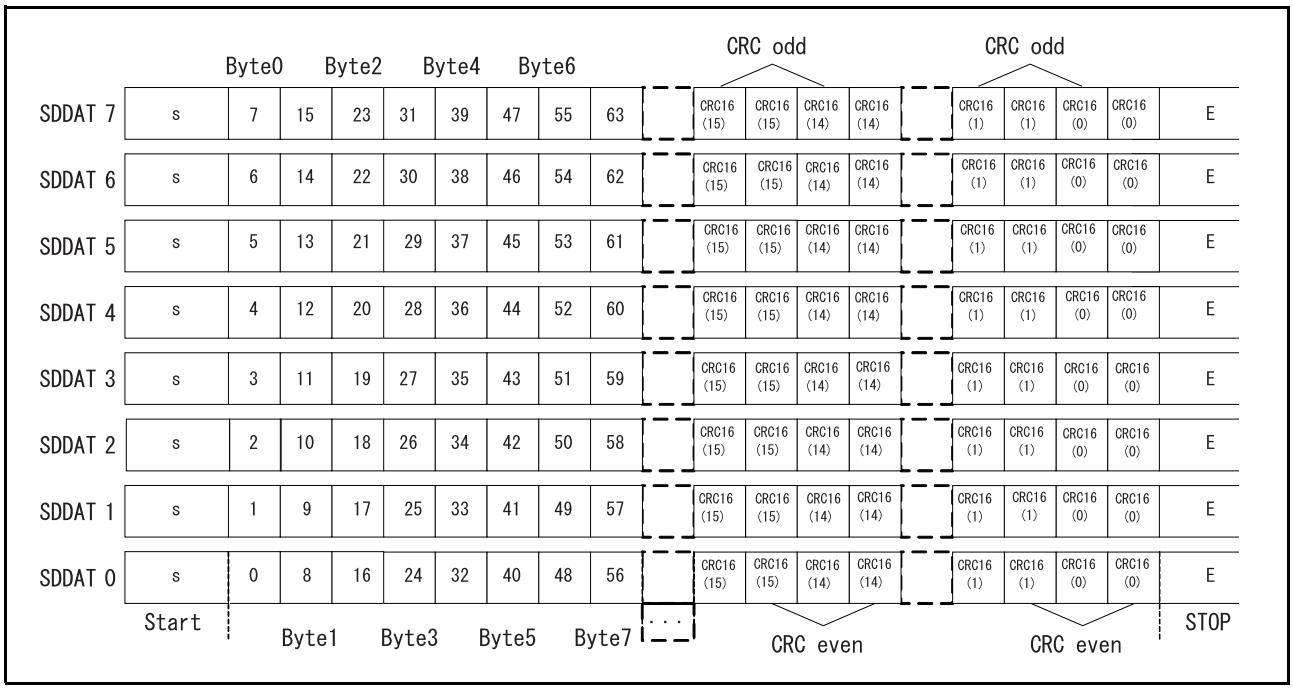

Figure 49.6 SDDAT in 8-Bit Width DDR Mode

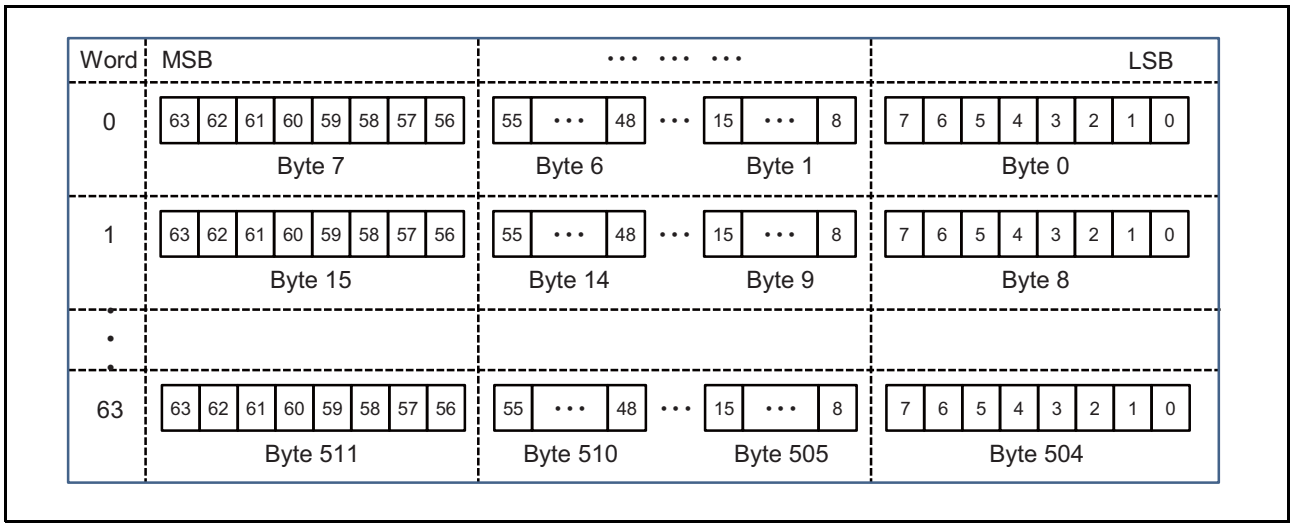

Figure 49.7 SD_BUF Store Data

Table 49.4 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	H'0123456789ABCDEF
0	0	1	H'EFCDAB8967452301
1	1	0	H'89ABCDEF (1st) H'01234567 (2nd)
1	1	1	H'EFCDAB89 (1st) H'67452301 (2nd)
1	0	0	H'CDEF (1st) H'89AB (2nd) H'4567 (3rd) H'0123 (4th)
1	0	1	H'EFCD (1st) H'AB89 (2nd) H'6745 (3rd) H'2301 (4th)

Note 1. The name of a bit in HOST_MODE.
Note 2. When the data stored in SD_BUF is H'0123456789ABCDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(i) Issuing CMD11
Perform command sequence processing of CMD11.

(ii) Stopping the SD clock (a)
Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop* the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.
Note: When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(iii) Checking the value of SDDAT
Check that the DAT0 bit in the SD_INFO2 register is 0.

(iv) Changing the supply voltage of the host device
Change the voltage which is supplied through the power supply pin of the given channel (PVcc_SD0 for channel 0 or PVcc_SD1 for channel 1) from 3.3 V to 1.8 V. In addition, set the POC bit for the given channel (POC2 for channel 0 or POC3 for channel 1) of the dedicated pin POC control register (PPOC) for the GPIO to 0. Also, make the GPIO settings for 1.8-V power supply in the bits of SD/MMC host interface dedicated pin driving ability control registers 0 to 2 (PSDMMC0 and PSDMMC1 for channel 0 or PSDMMC2 for channel 1).
For details, see the following sections:
section 51.3.30, Dedicated Pin POC Control Register (PPOC),
section 51.3.31, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0),
section 51.3.32, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1),
section 51.3.33, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2).

(v) Starting supply of the SD clock (b)
After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(vi) Checking the value of SDDAT
After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

49.3.2 Card Detect/Write Protect

(1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

Figure 49.8 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]
ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]
ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

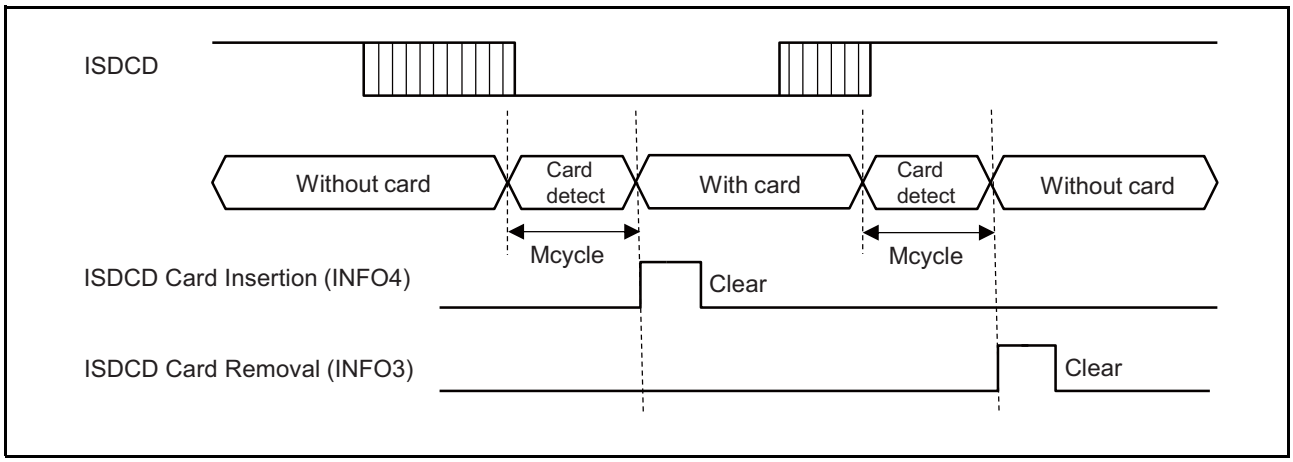

Figure 49.8 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

Figure 49.9 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

[Card insertion]
When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]
When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

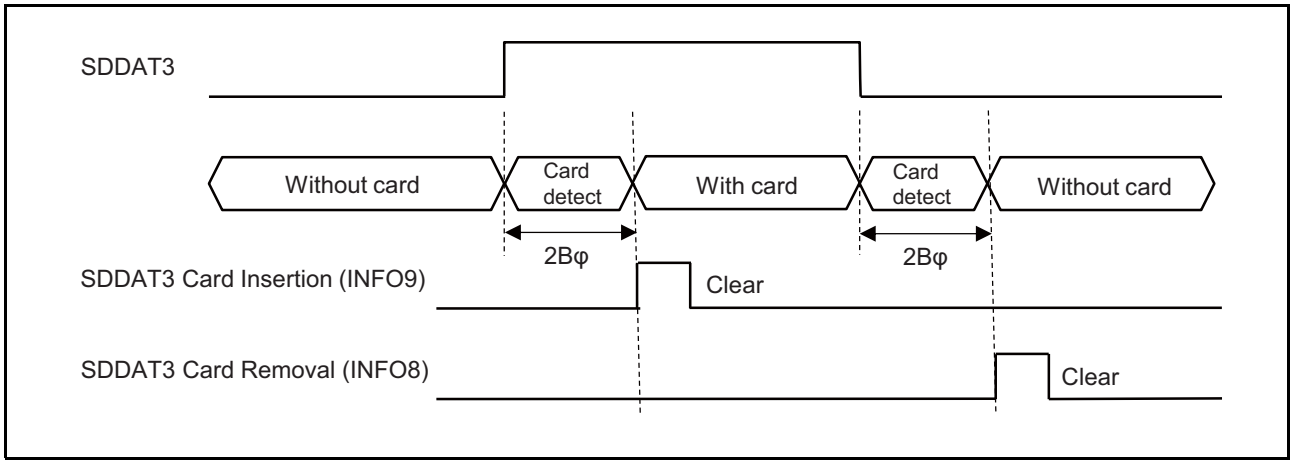

Figure 49.9 SD Card Detect with SDDAT3

(2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

The card's internal write protection and the card lock/unlock operation are realized by the command.

49.3.3 Interrupt Request

(1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in Table 49.5 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 49.5 Interrupt Request

Interrupt Request	Interrupt Flag Register		Interrupt Mask Register	
	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

49.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Table 49.6 and Table 49.7 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 49.6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		
	Register Name	Bit Name	Register Name	Bit Name	Description
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 49.7 Timeouts

Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after the CRC status
				E5	When the CRC status is not received t even after Ncycle* has elapsed after data writing
				E4	When read data is not received even after Ncycle* has elapsed after read command
					When read data for the next block are not received even after Ncycle* has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle* has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after R1b response

Note: *Ncycle is set by bit 7 to bit 4 in SD_OPTION.

49.4 Usage Example

49.4.1 Command without Data Transfer

(1) Flowchart

Figure 49.10 and Figure 49.11 show flowchart examples.

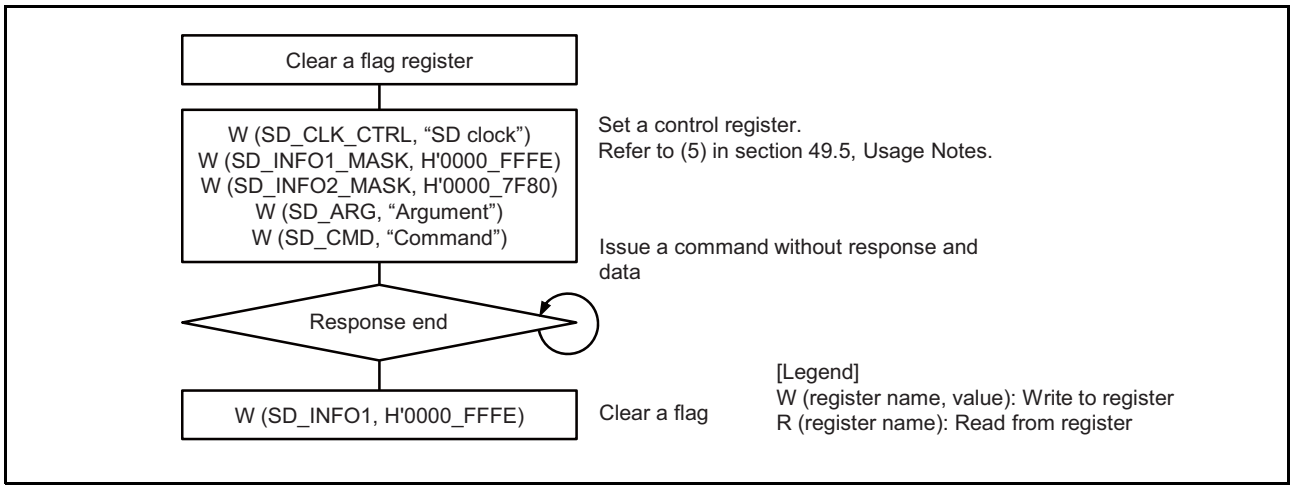

Figure 49.10 Flow Example of Command without Response and Data

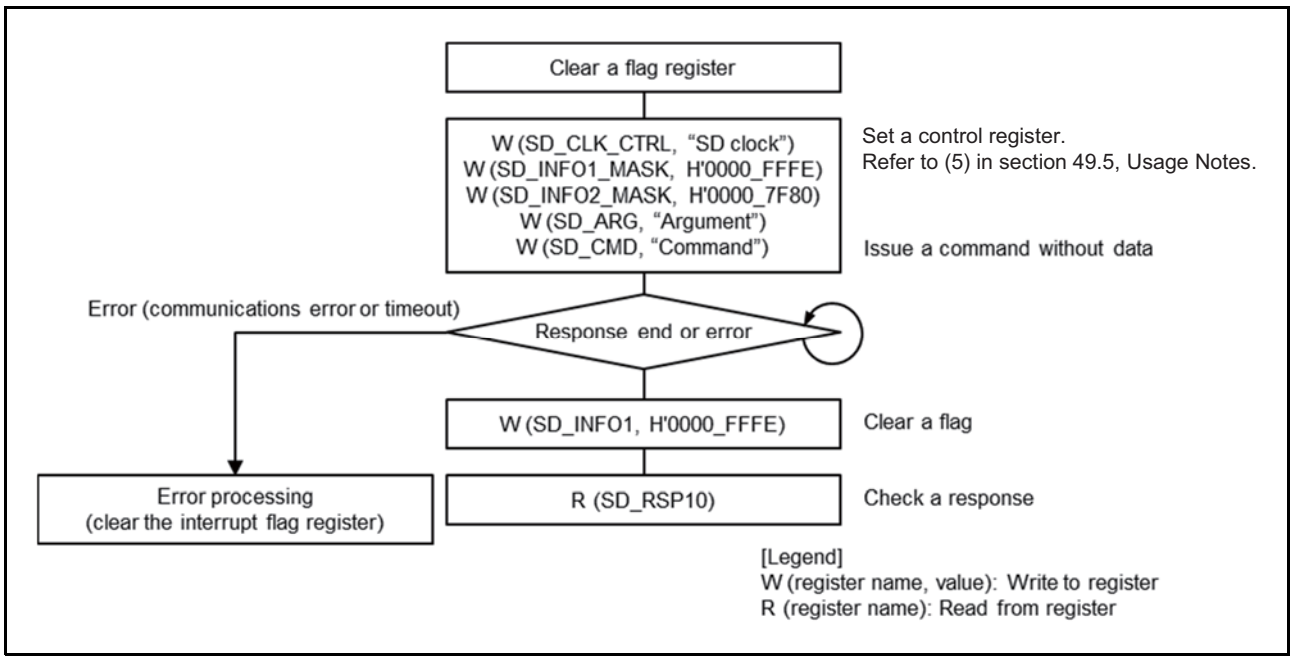

Figure 49.11 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register
R (register name):Read from register

The operation is described as below.

(a) Command without response and data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.2 Single Block Read

(1) Flowchart

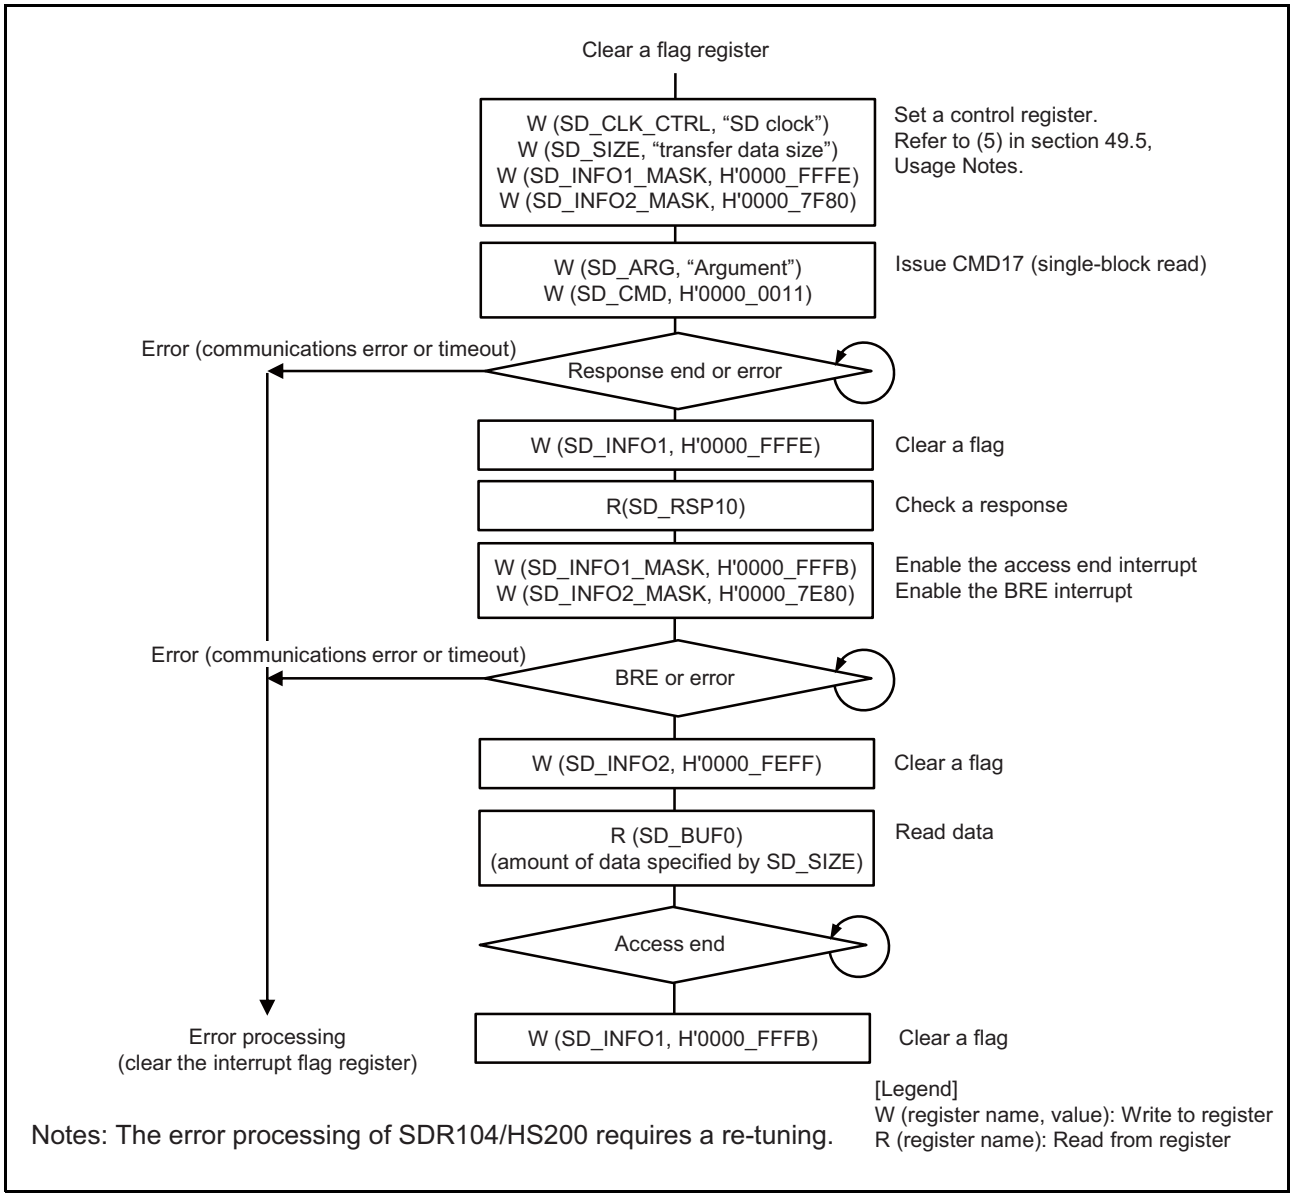

Figure 49.12 Single Block Read Flowchart Example

(2) Operation for Single Block Read

The operation of the single block read is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H'0000 0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.3 Single Block Write

(1) Flowchart

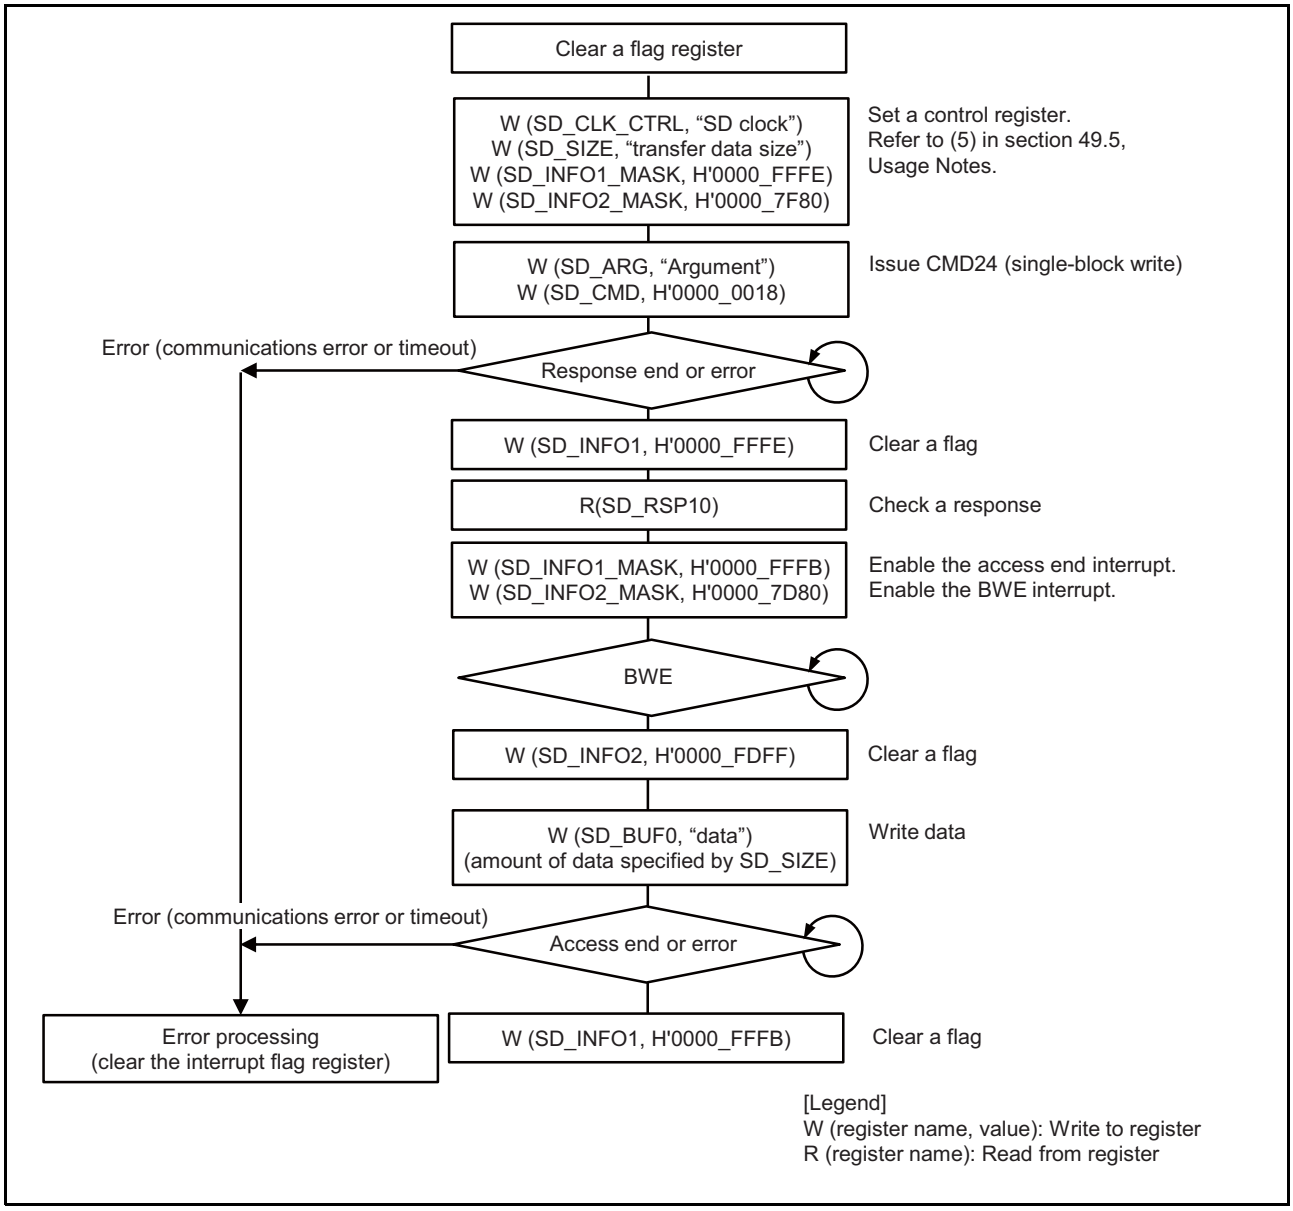

Figure 49.13 Single Block Write Flowchart Example

(2) Operation for Single Block Write

The operation of the single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.4 Multiple Block Read

(1) Flowchart

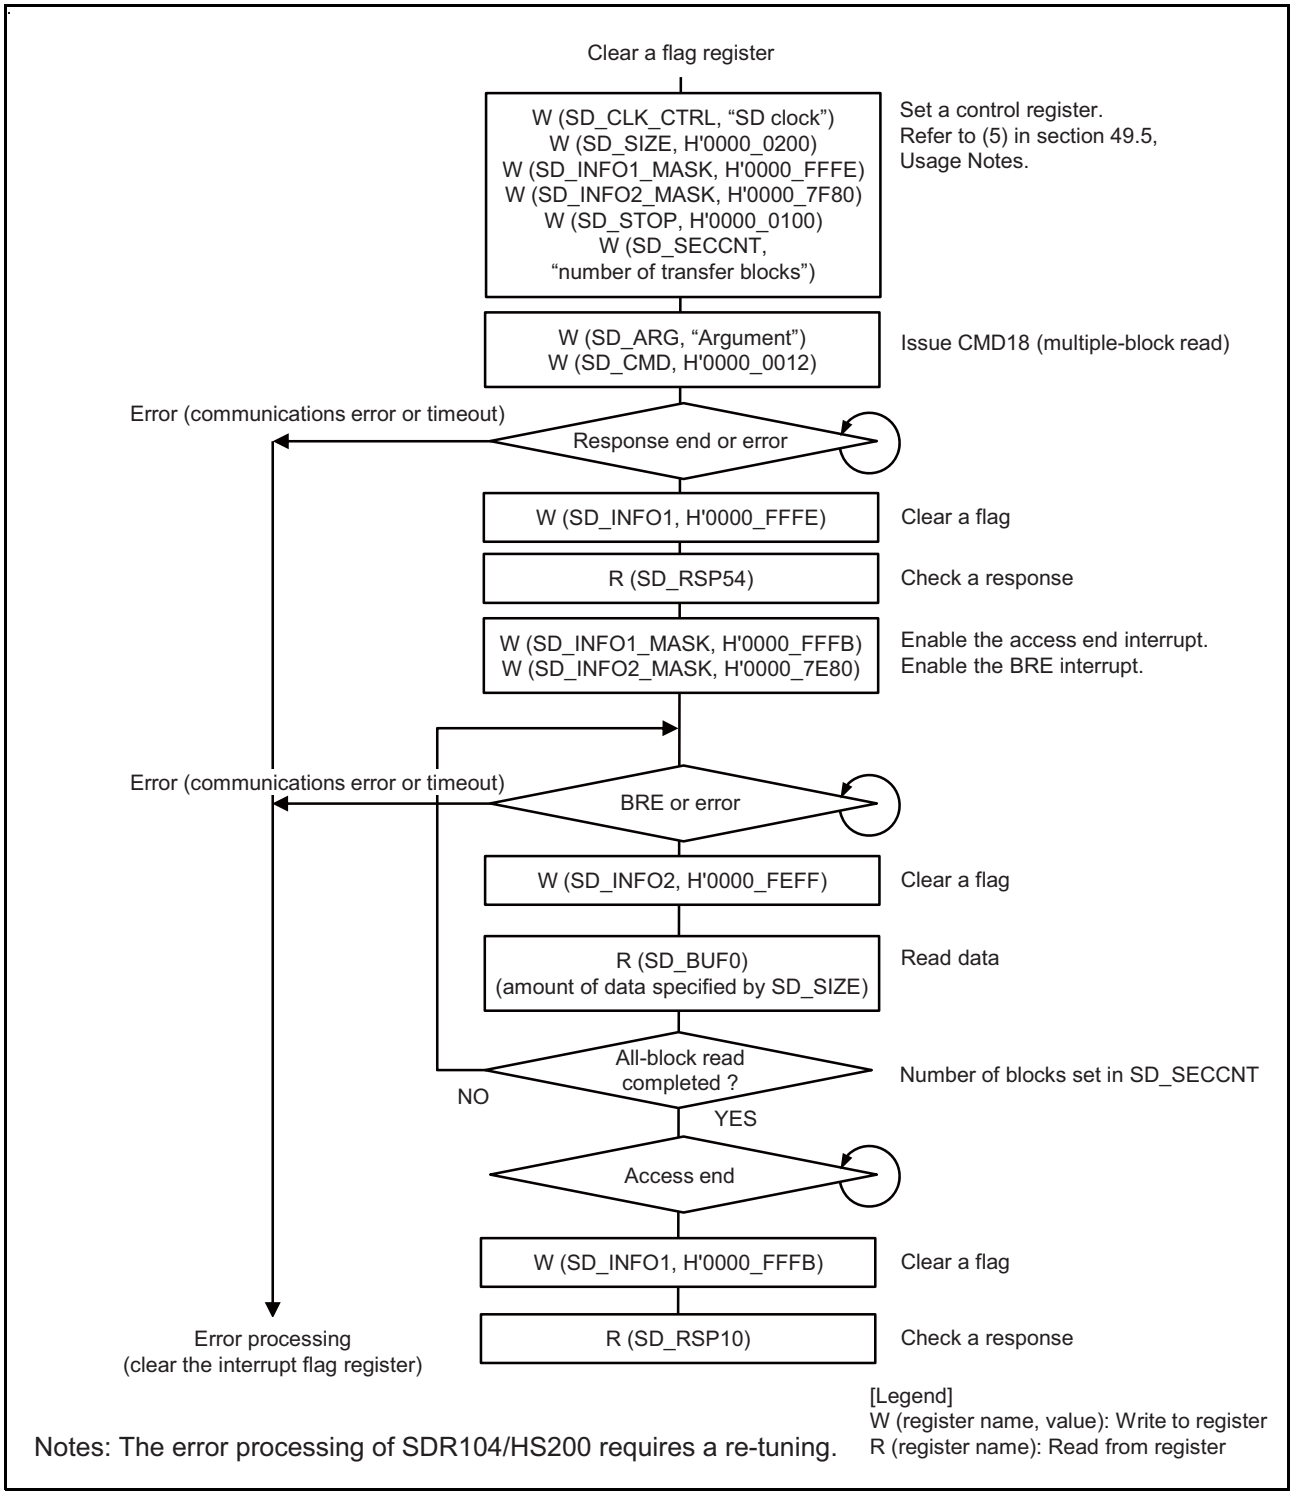

Figure 49.14 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 49.15 shows the flowchart when using an internal timer.

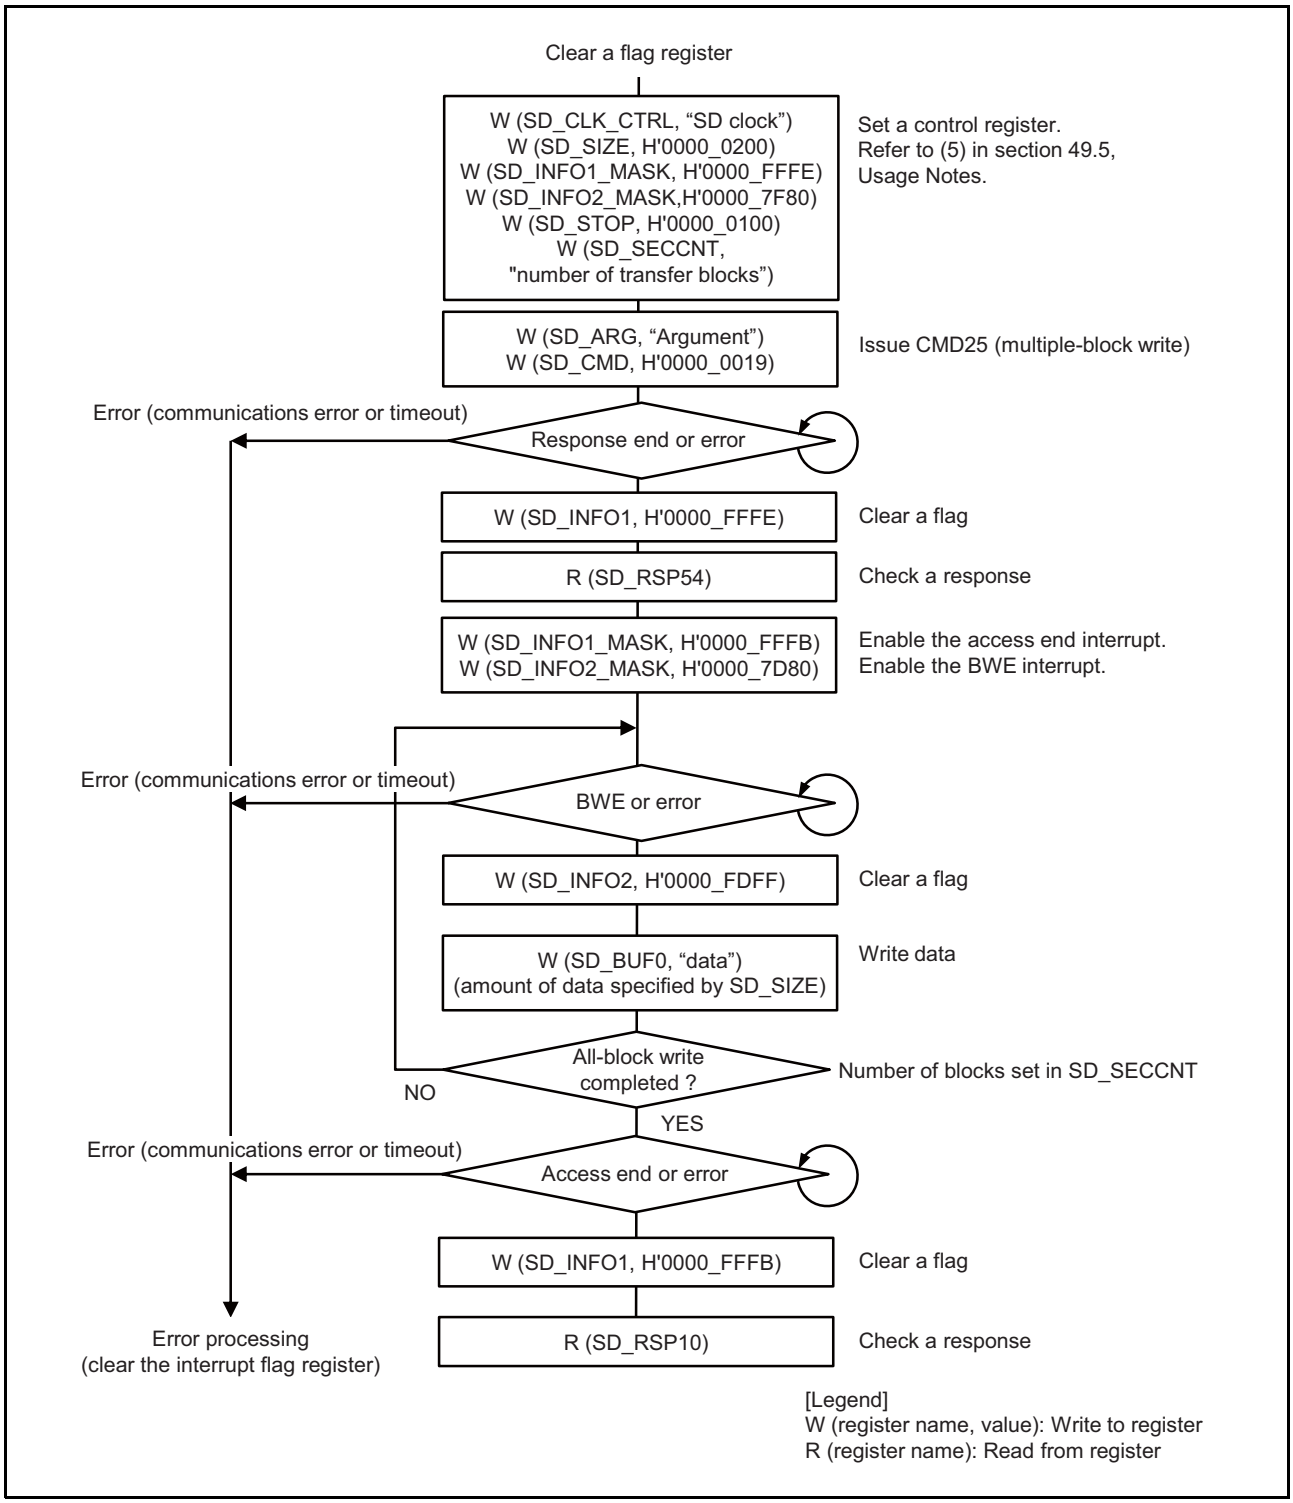

Figure 49.15 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 0000.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.

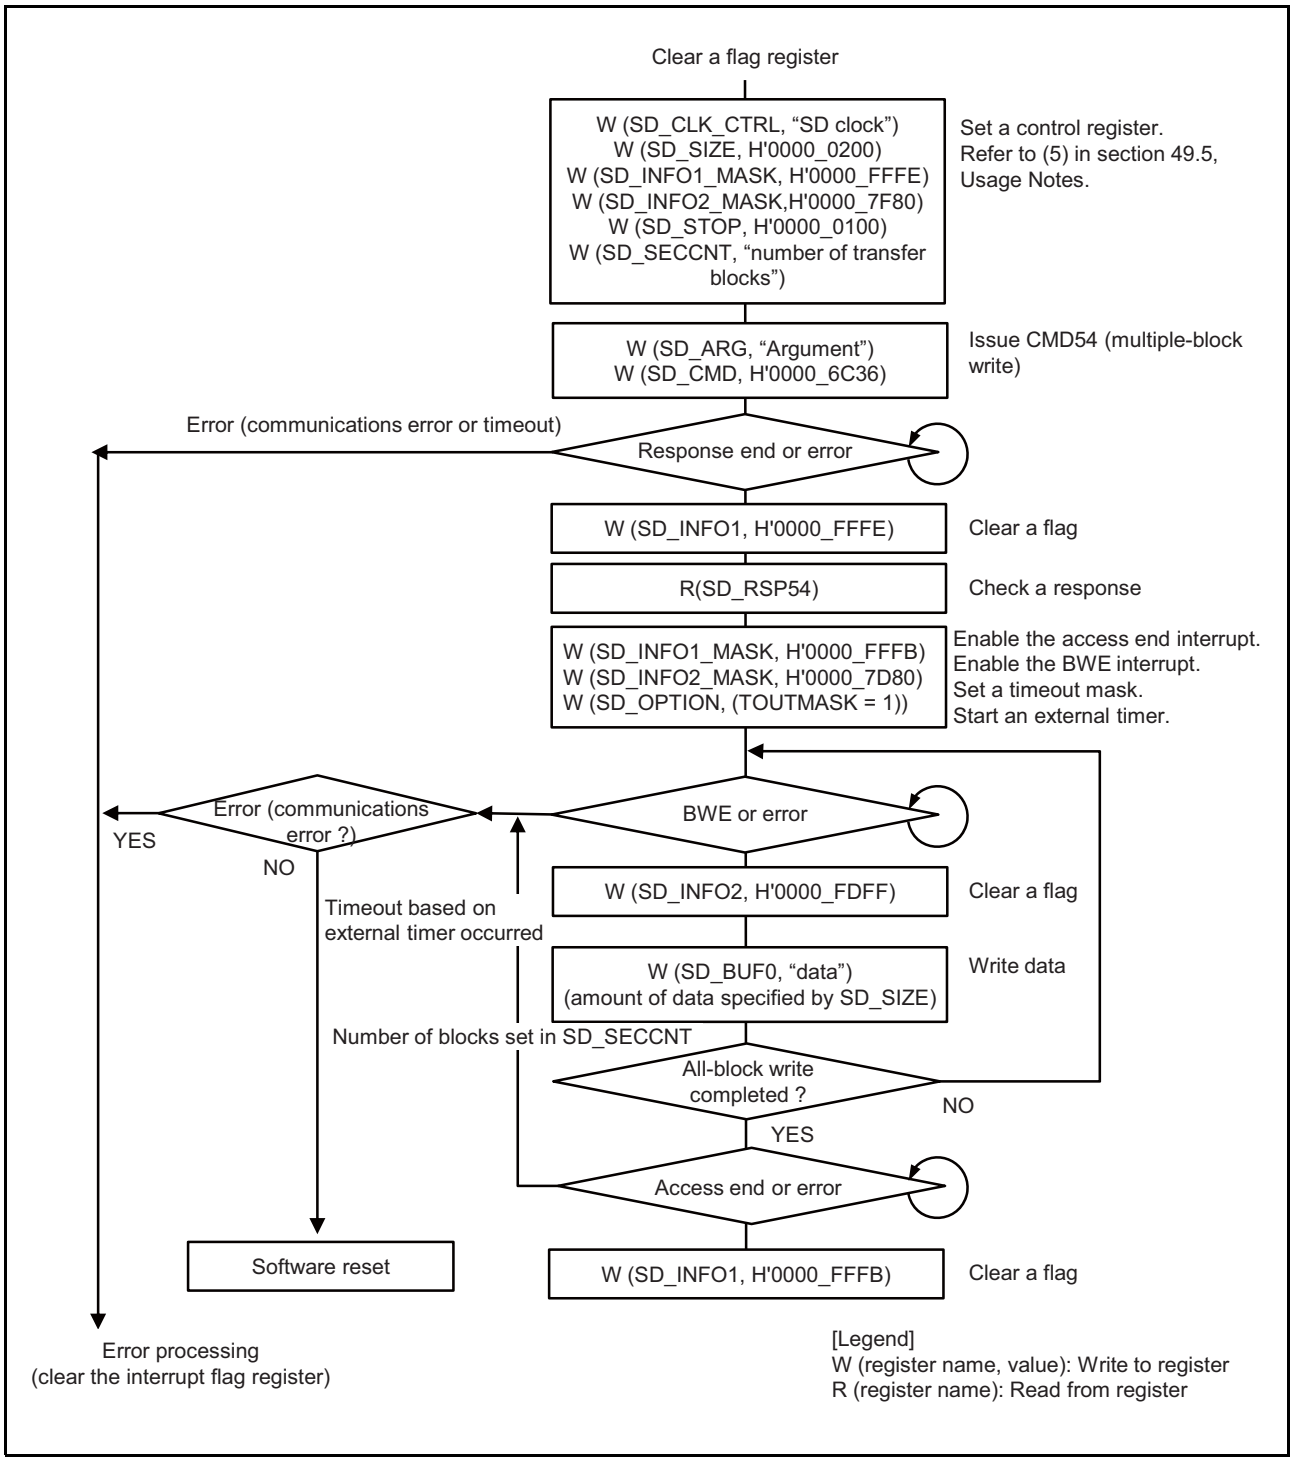

Figure 49.16 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write H'0000 6C36 to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

49.4.7 IO_RW_DIRECT Commend (CMD52)

(1) Flowchart

Figure 49.23 shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block write).

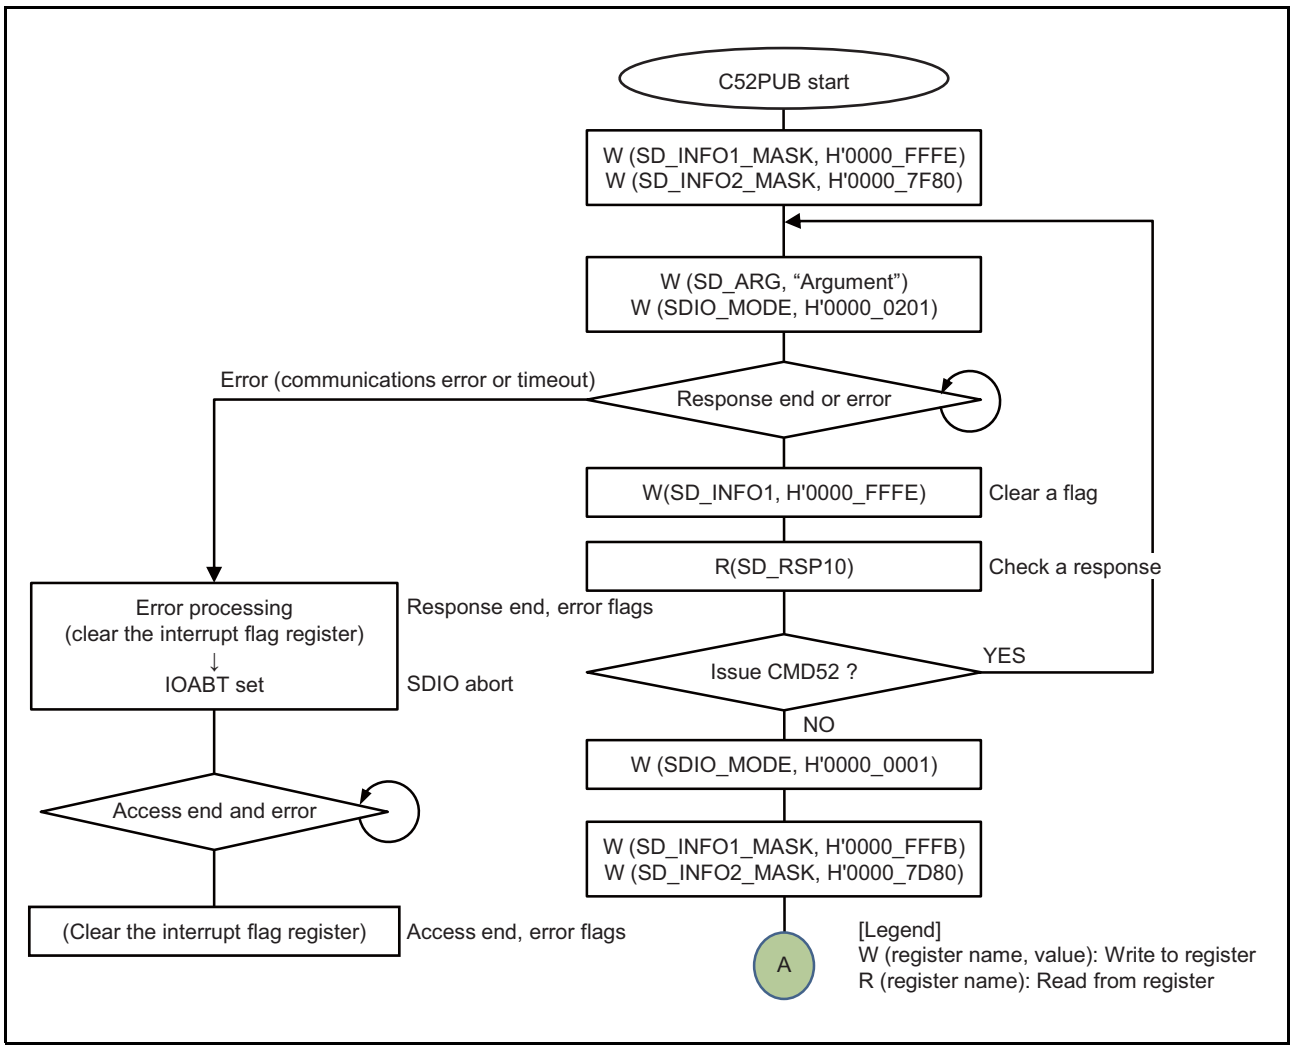

Figure 49.23 Flowchart Example when CMD52 (SDIO None Abort) is Issued at CMD53 (Multiple Block Write)

49.4.10 DMA Transfer

(1) SD_BUF DMA Transfer

Figure 49.24 shows a flowchart example for SD_BUF DMA read when CMD18 (multiple block read) is issued.

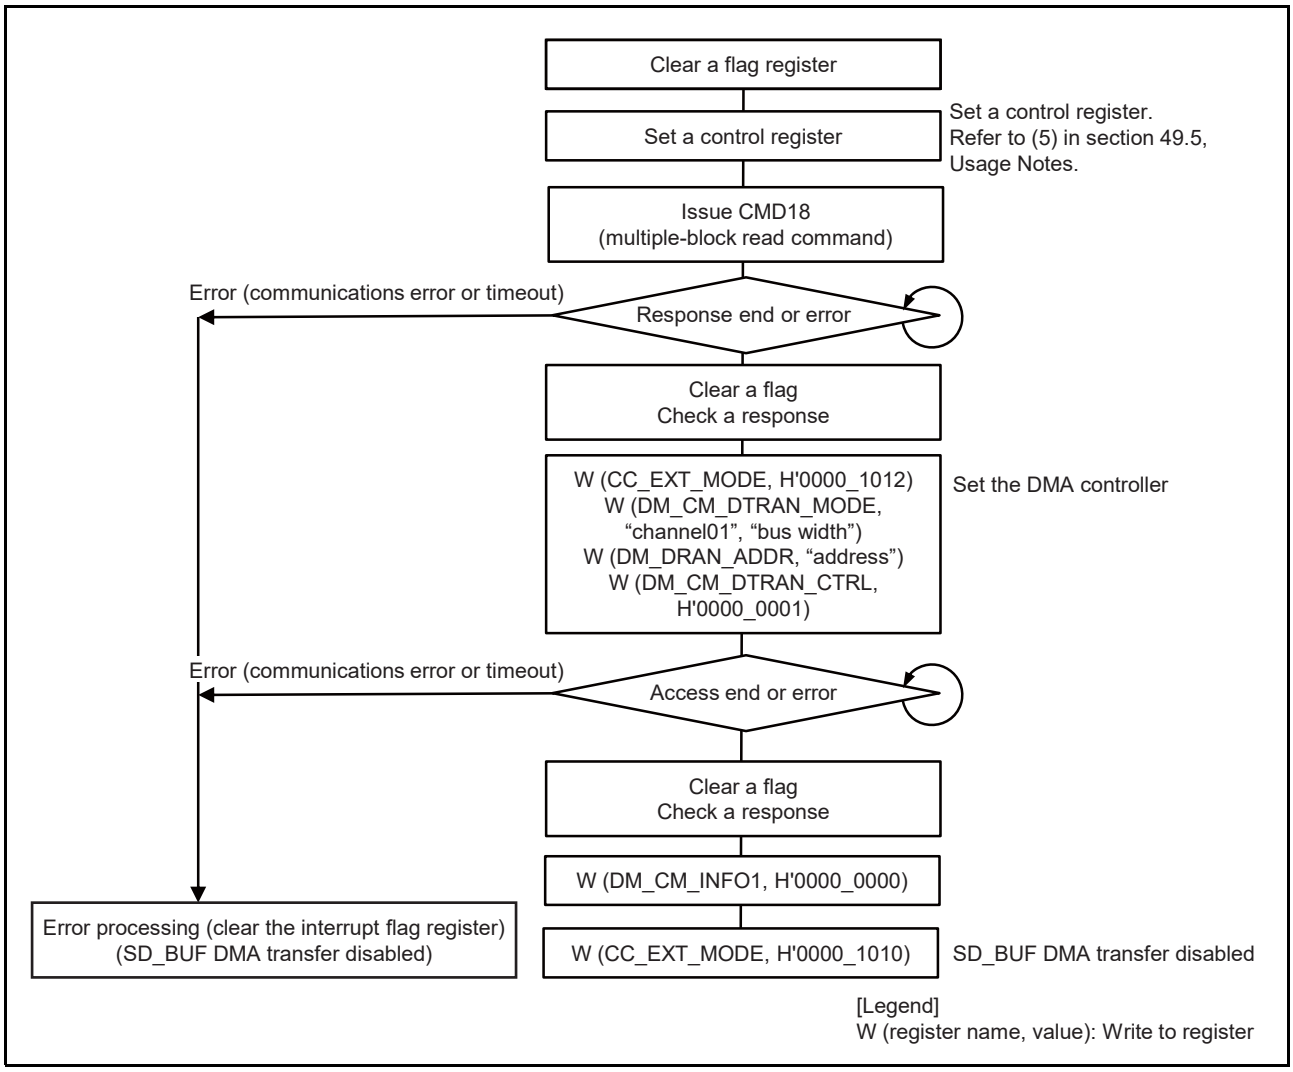

Figure 49.24 SD_BUF DMA Read Flowchart Example

Figure 49.25 shows a flowchart example for SD_BUF DMA write when CMD25 (multiple block write) is issued.

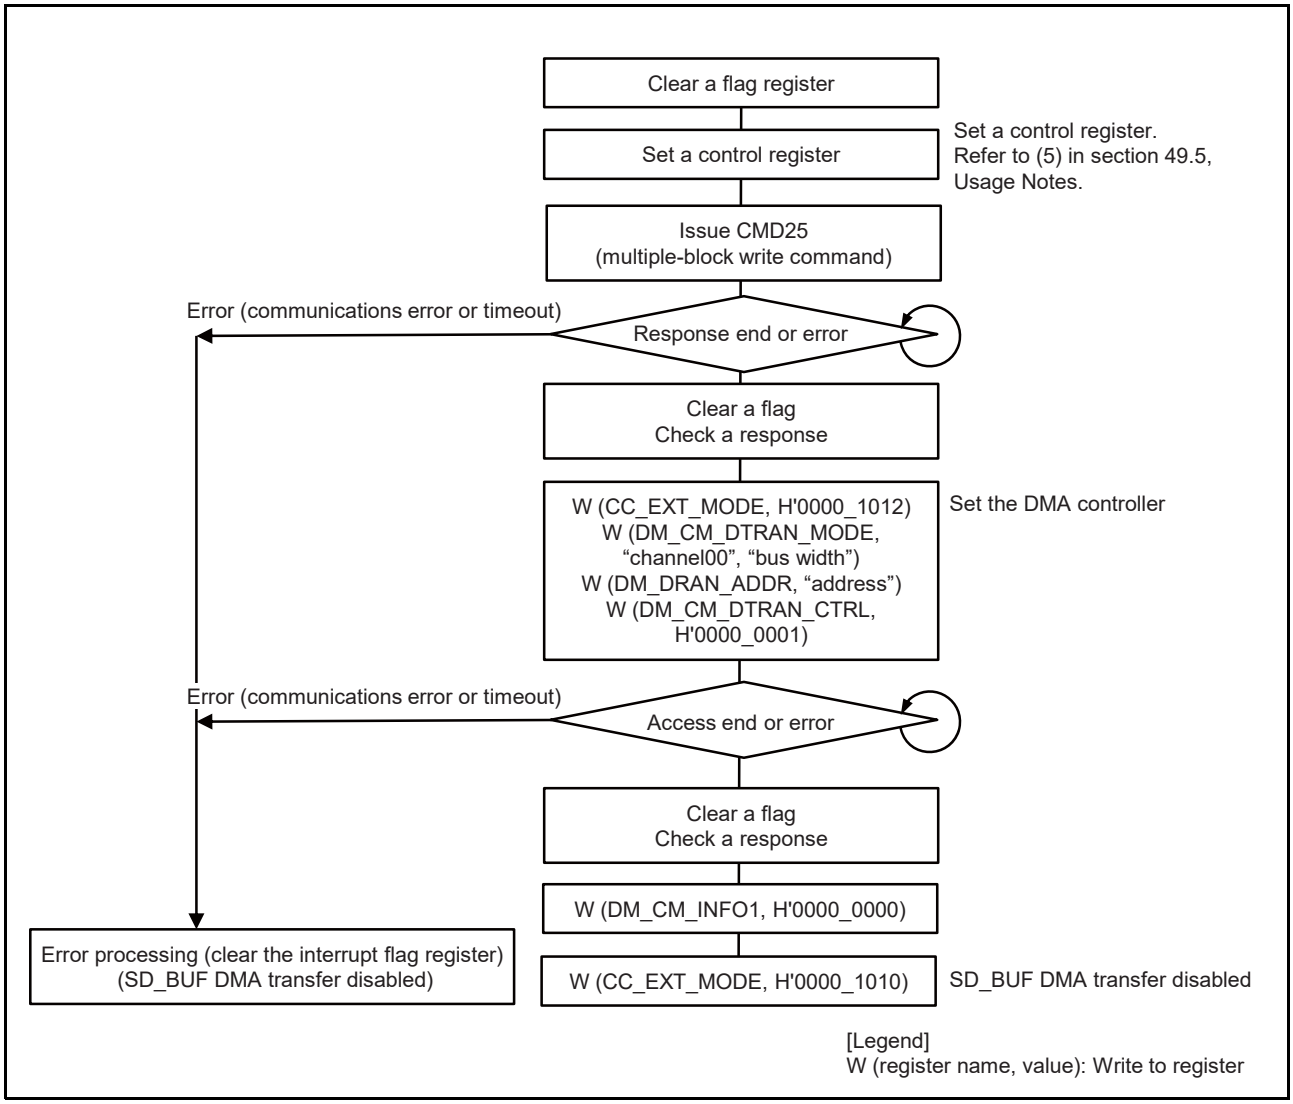

Figure 49.25 SD_BUF DMA Write Flowchart Example

49.4.11 High-Priority Interrupt (without Data Transfer)

(1) Flowchart

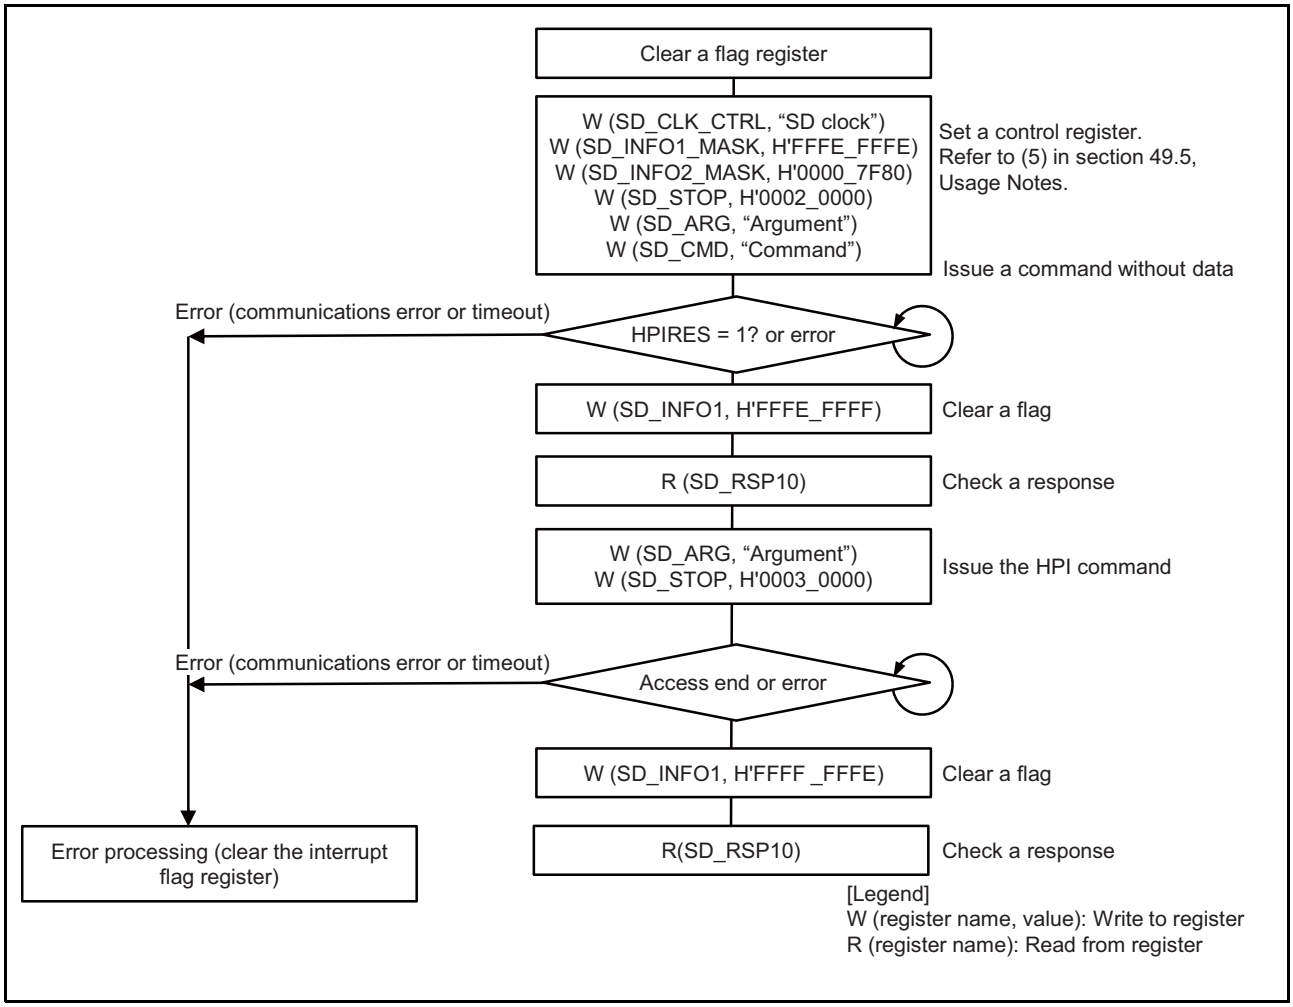

Figure 49.26 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.12 High-Priority Interrupt (at Single Block Write)

(1) Flowchart

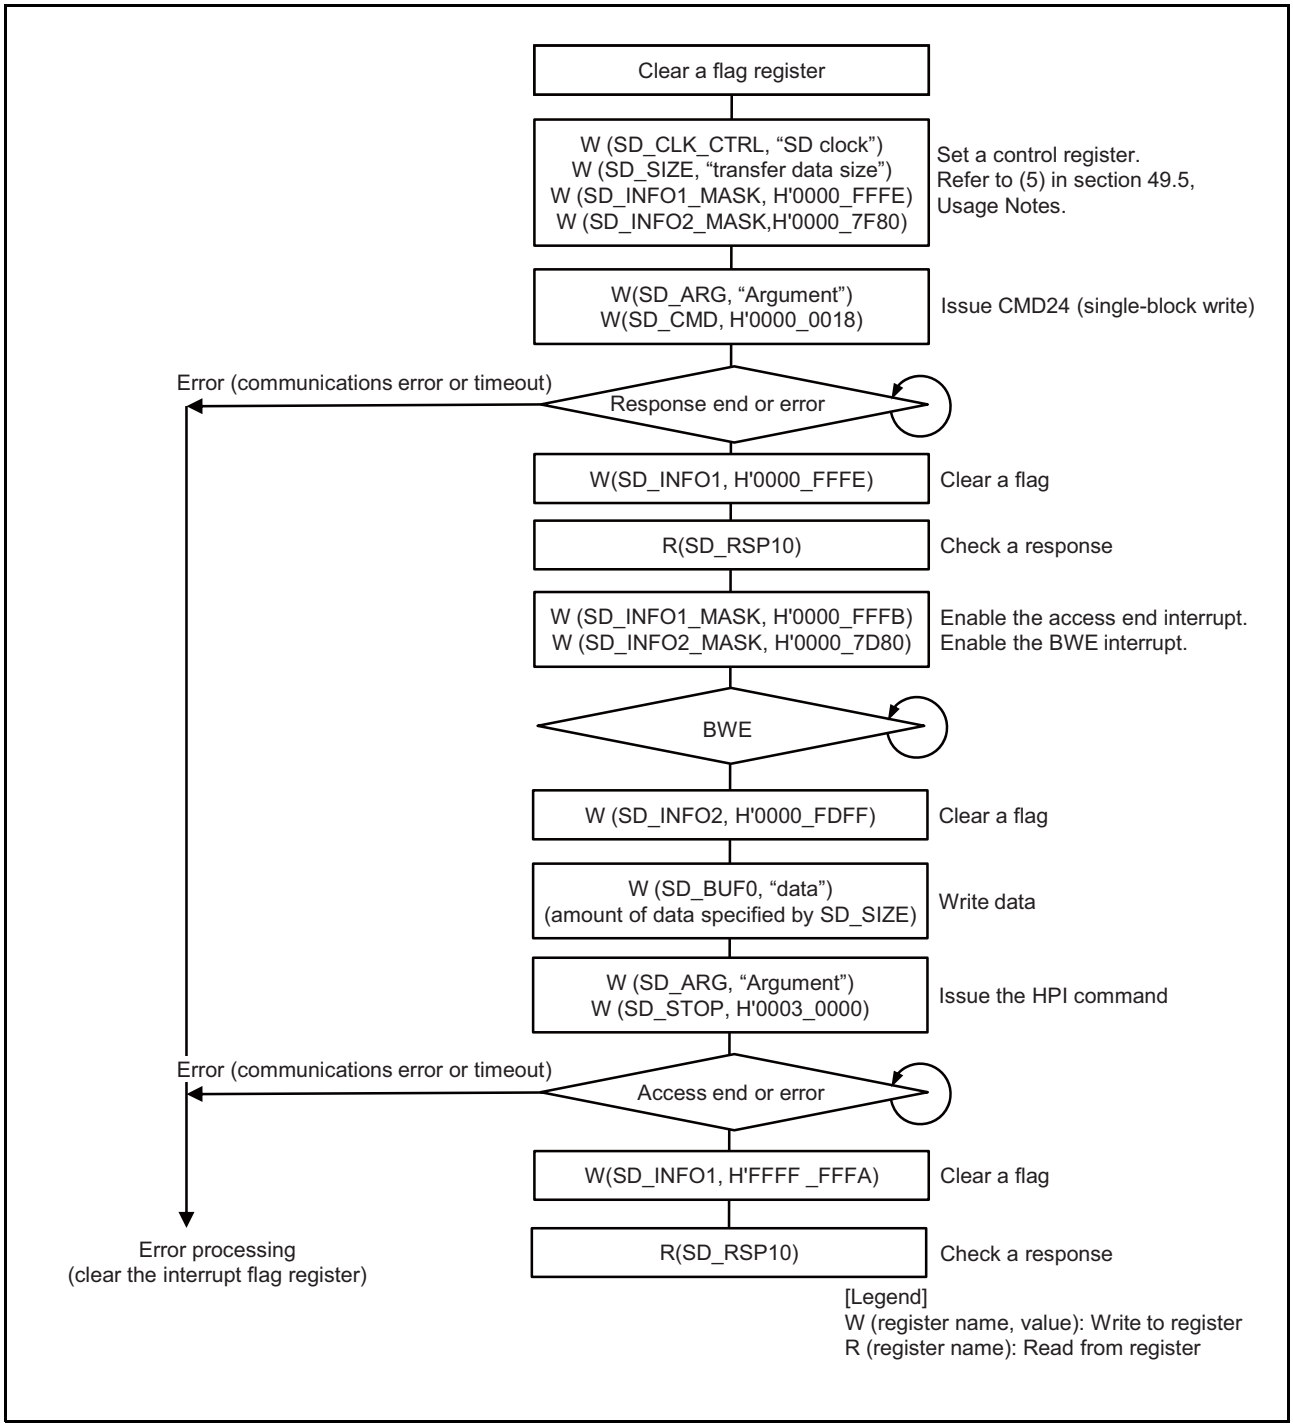

Figure 49.27 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.13 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart

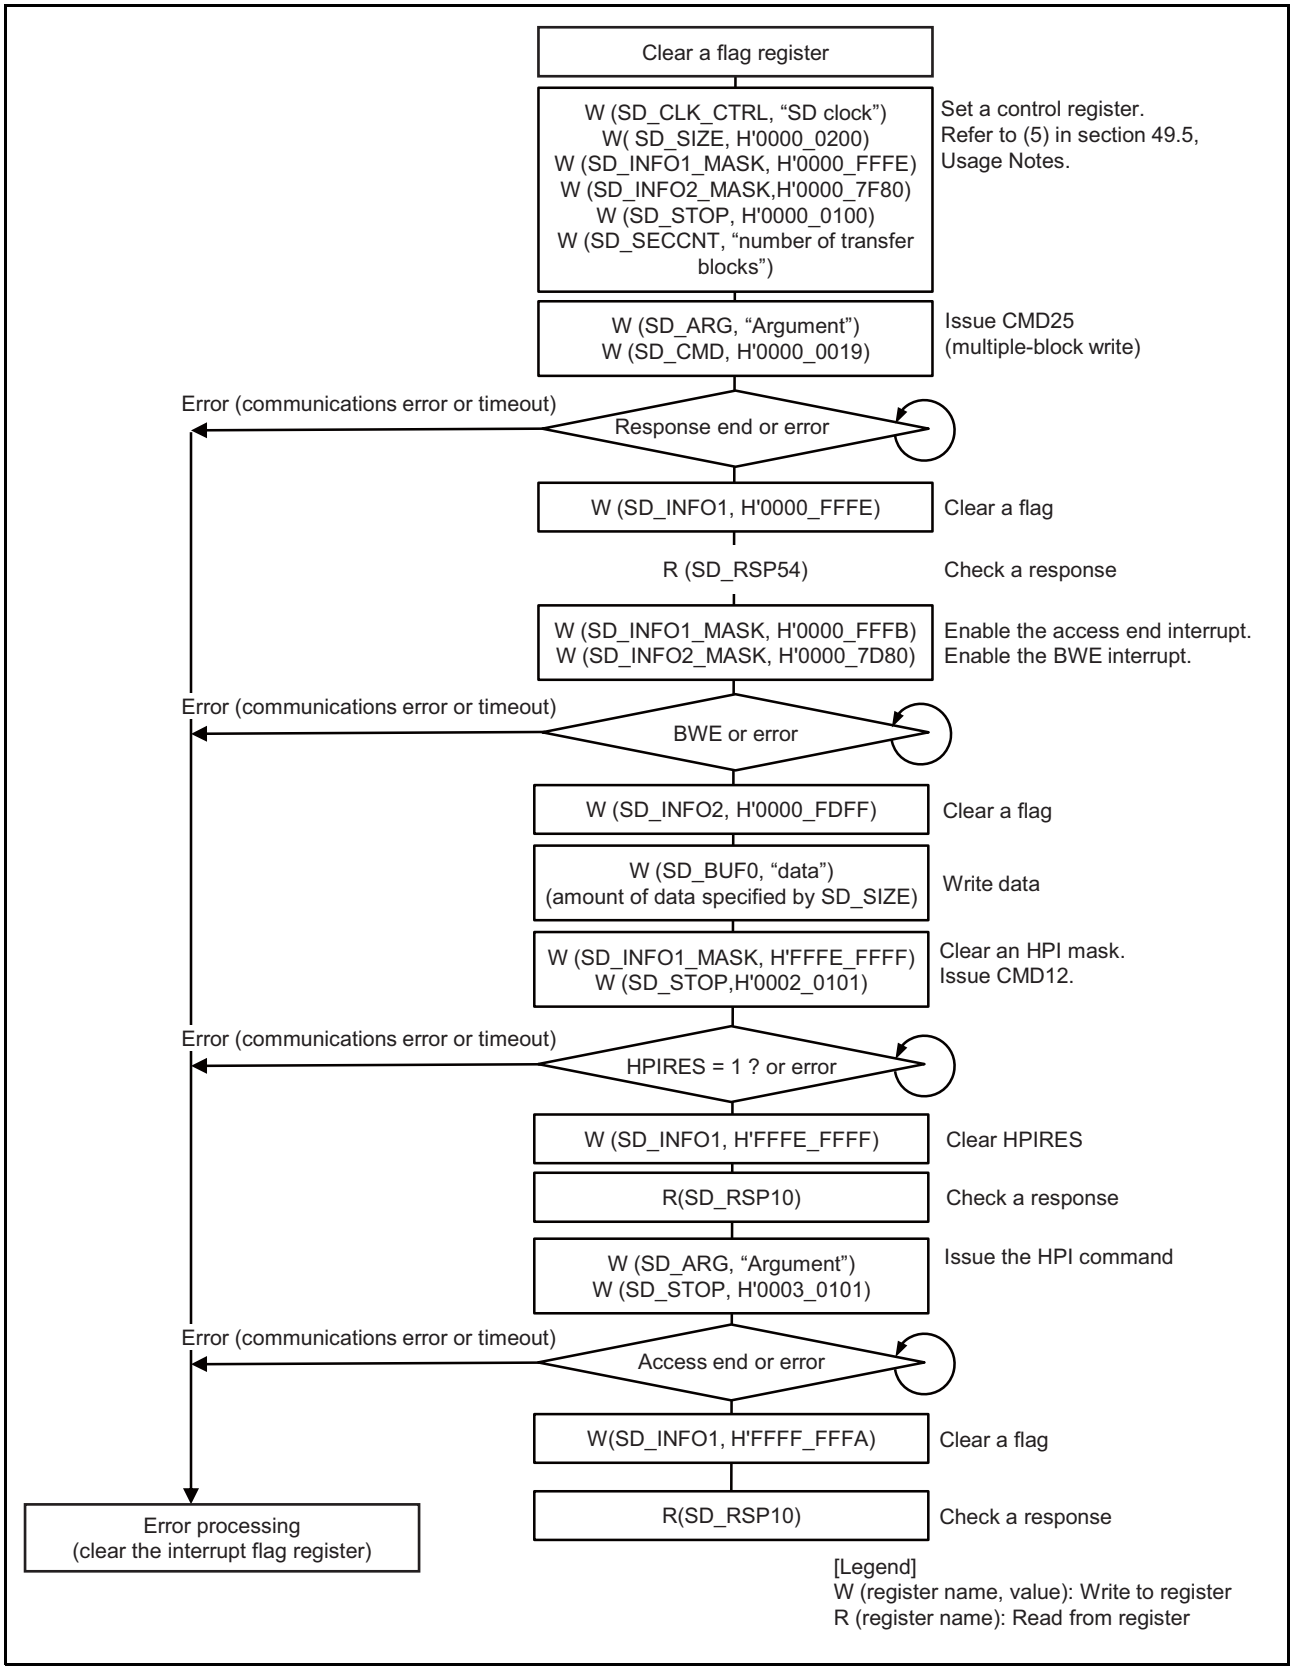

Figure 49.28 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)

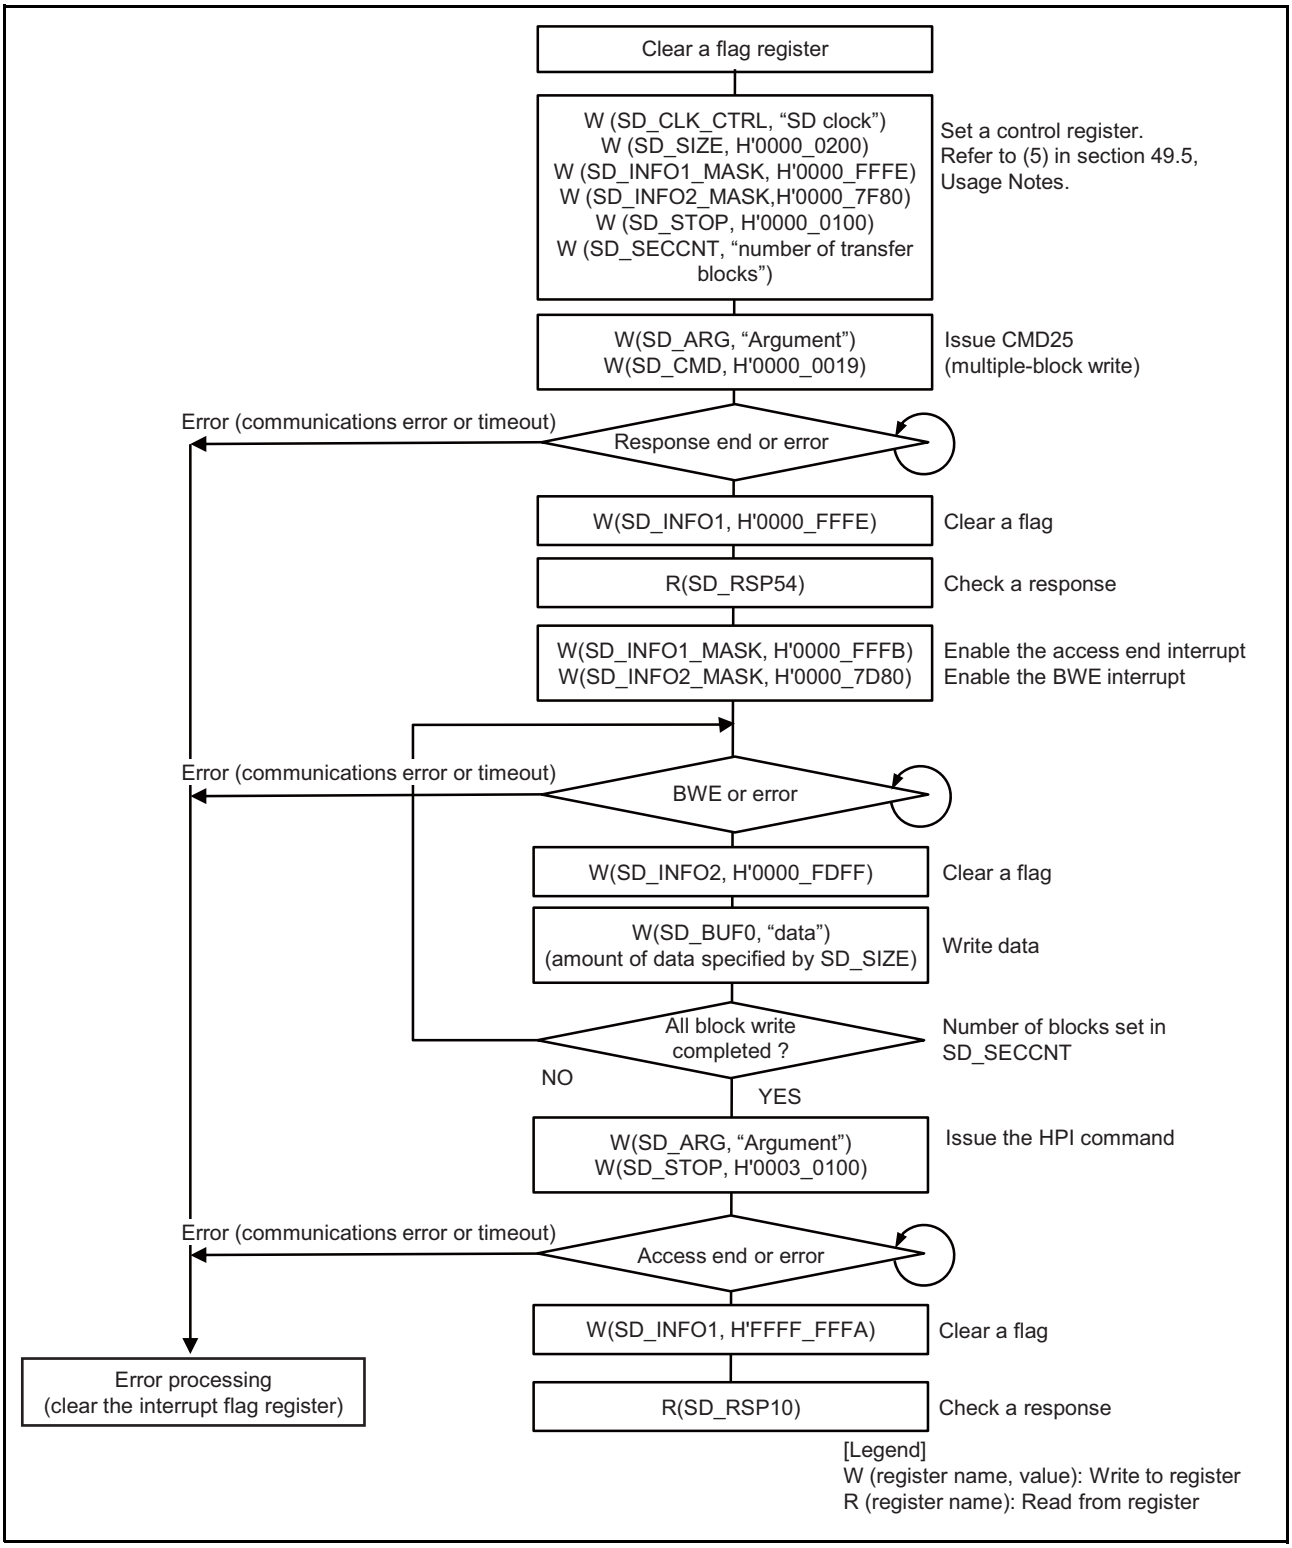

Figure 49.29 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write H'FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt.
   Write H'0002 0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.14 Example of SD_CMD Register Setting

Table 49.8 lists the example of SD_CMD (SD interface) register setting.

Table 49.8 Example of SD_CMD Register Setting (SD)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	H'0000 0000	
	CMD2	H'0000 0002	
	CMD3	H'0000 0003

	CMD55	H'0000 0037	
	CMD56	H'0000 0038	

49.5 Usage Notes

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.
If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.
However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 49.30 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 49.30, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

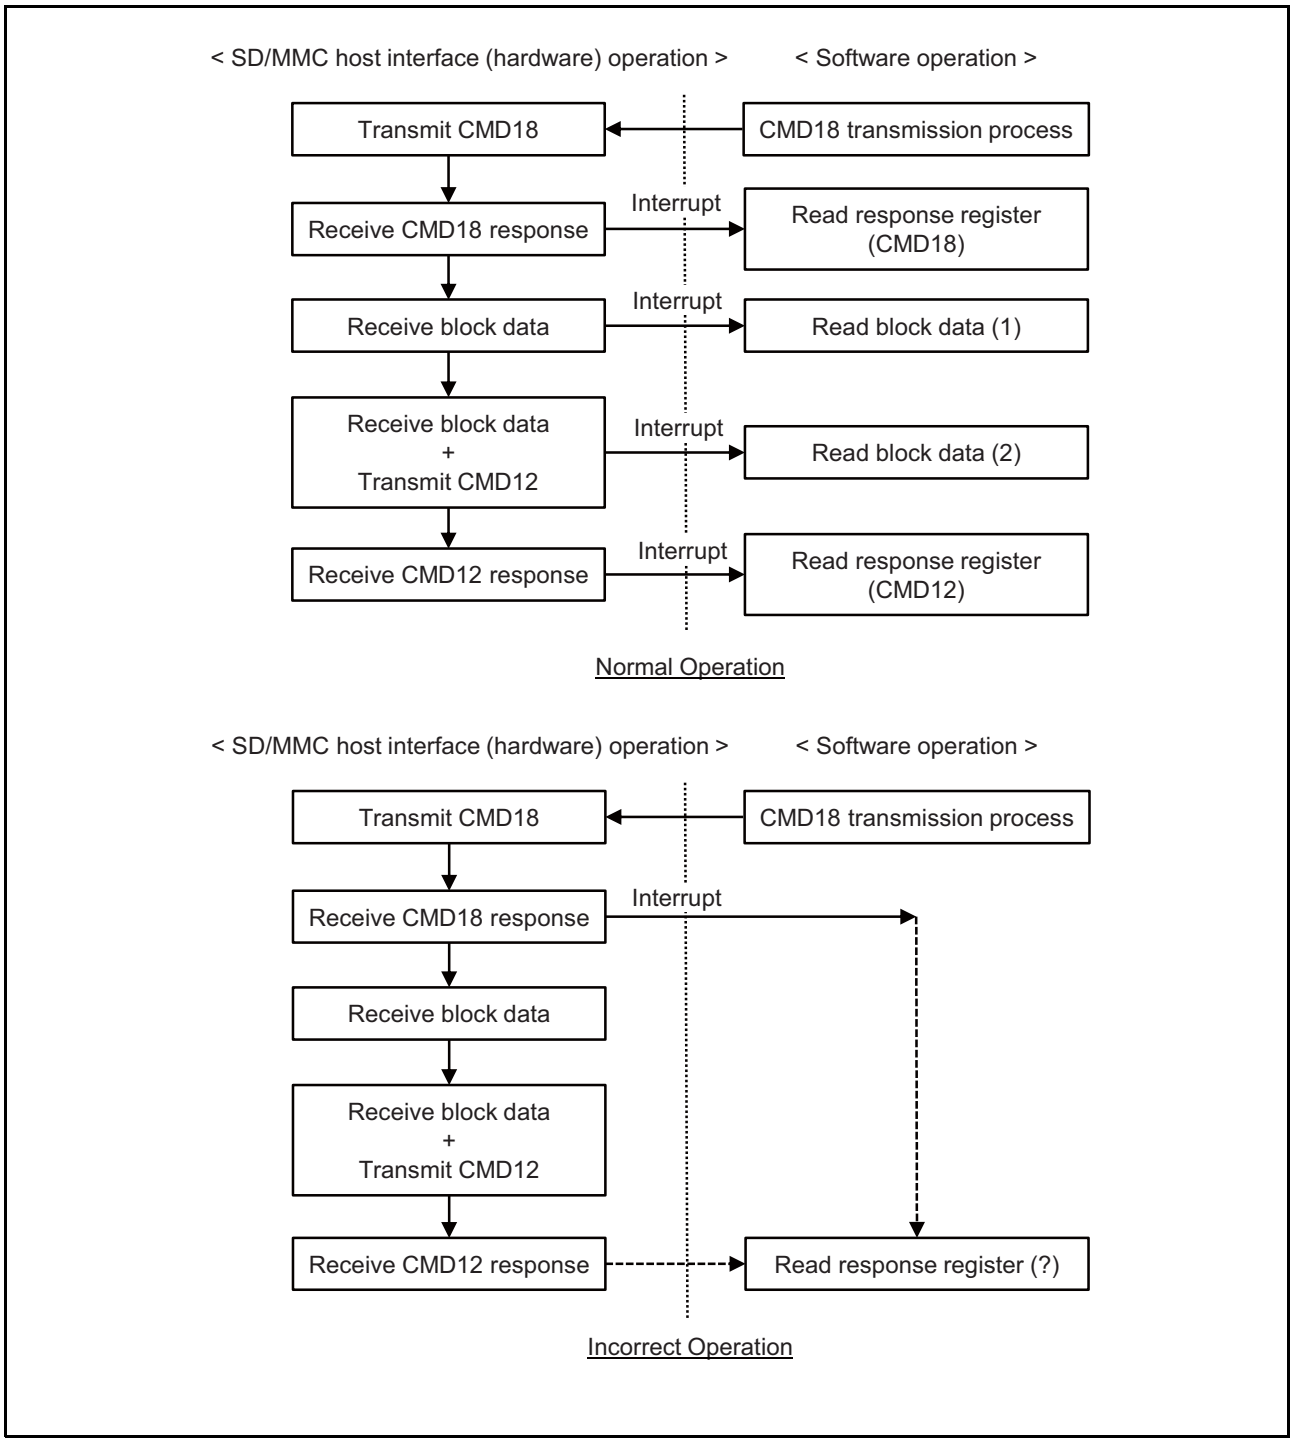

Figure 49.30 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

(7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.
To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)
When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.
When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

49.6 Sampling Clock Controller (SCC)

49.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/ SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

49.6.2 SCC Block Diagram

Figure 49.31 shows a block diagram of the sampling clock controller.

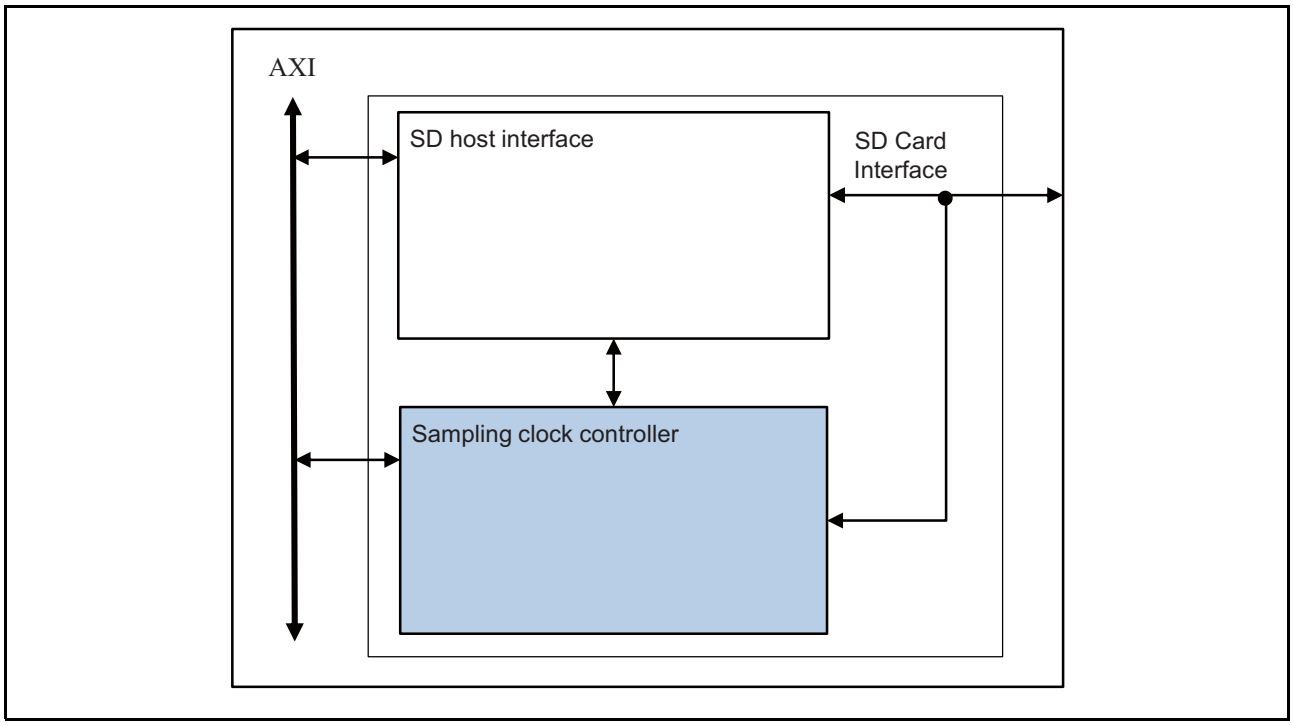

Figure 49.31 Block Diagram of the Sampling Clock Controller

49.6.3 SCC Register Configuration

Table 49.10 shows the SCC registers. The base addresses of each channel are as follows.

Channel 0: H'E8227000
Channel 1: H'E8229000

Table 49.10 Register Configuration

Name	Abbreviation	Address ([9:0])	Access Size
Initial setting register	SCC_DTCNTL	H'000	32
Sampling clock position setting register	SCC_TAPSET	H'008	32
Hardware adjustment register 1	SCC_DT2FF	H'010	32
Sampling clock selection register	SCC_CKSEL	H'018	32
Sampling clock position correction register	SCC_RVSCNTL	H'020	32
Sampling clock position correction request register	SCC_RVSREQ	H'028	32
Sampling data comparison register	SCC_SMPCMP	H'030	32

49.7 SCC Register Descriptions

49.7.1 Initial Setting Register (SCC_DTCNTL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	TAPNUM7 to TAPNUM0	H'08	R/W	When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H'FF (1: 1 mode), set these bits to H'08.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	TAPEN	0	R/W	SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled.

49.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	TAPSET7 to TAPSET0	H'00	R/W	SCC Sampling Clock Position ▪ Set the tuning result in the range from 0 to TAPNUM-1.

49.7.3 Sampling Clock Selection Register (SCC_CKSEL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DTSEL	0	R/W	Sampling Clock Selection 0: An SCC sampling clock is not used (for other than SDR104 and HS200). 1: An SCC sampling clock is used (for SDR104 or HS200). • For SDR104 or HS200, set DTSEL to 1. DIV[7:0] in the SD_CLK_CTRL register to H'FF (1:1 mode). • When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0).

49.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	TAPSEL7 to TAPSEL0	H'00	R	SCC Sampling Clock Position Display • Displays the SCC sampling clock position selected by hardware. • After RVSEN has been set to 1, the value may differ from that of TAPSET.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	RVSW	0	R/W	This bit is read as 0. The write value should be 1.
0	RVSEN	0	R/W	SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. • When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. • However, when RVSERR is 1, this module does not correct the SCC sampling clock position. • While tuning is being performed, set RVSEN to 0.

49.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RVSERR	0	R/W	SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. • If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. • Ignore this bit while tuning is being performed. • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
1	REQTAPUP	0	R/W	SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
0	REQTAPDWN	0	R/W	SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

49.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	DT2NESET7 to DT2NESET0	H'05	R/W	Hardware Adjustment 1 When the sampling clock controller is to be used, set these bits to H'03.
7 to 0	DT2NSSET7 to DT2NSSET0	H'02	R/W	Hardware Adjustment 2 When the sampling clock controller is to be used, set these bits to H'00.

49.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24 to 16	CMPNGU	All 0	R/W	Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8 to 0	CMPNGD	All 0	R/W	Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register

49.8 Usage Example of SCC

49.8.1 Tuning

SCC is tuned by using operation of single-block reading.
As shown in Figure 49.32, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.
Figure 49.33 and Table 49.11 show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).

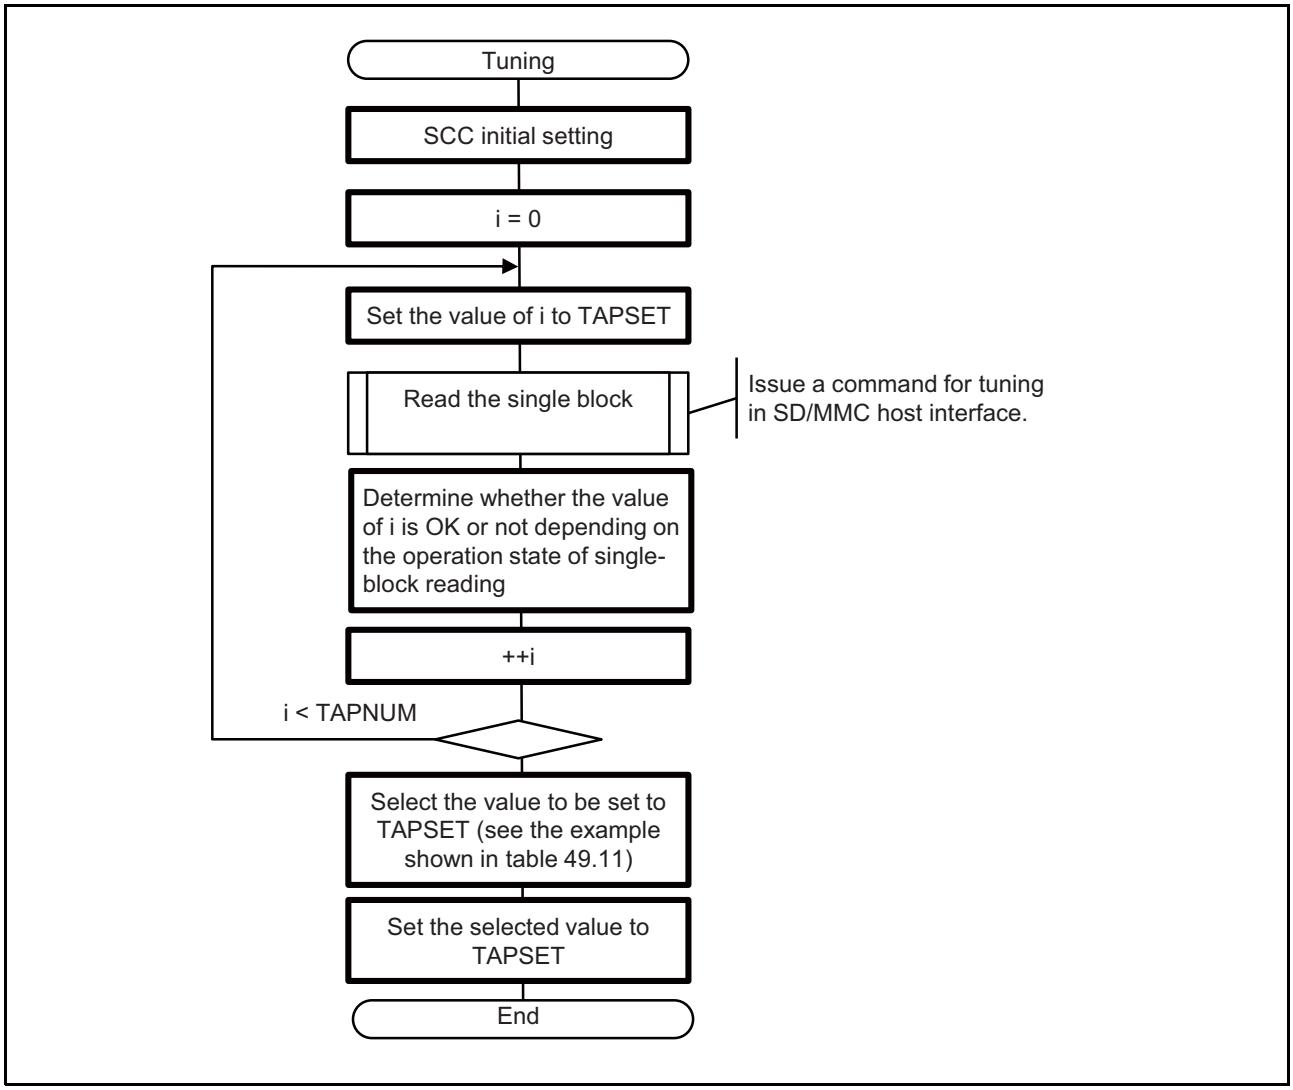

Figure 49.32 Example of Tuning Flow (Outline)

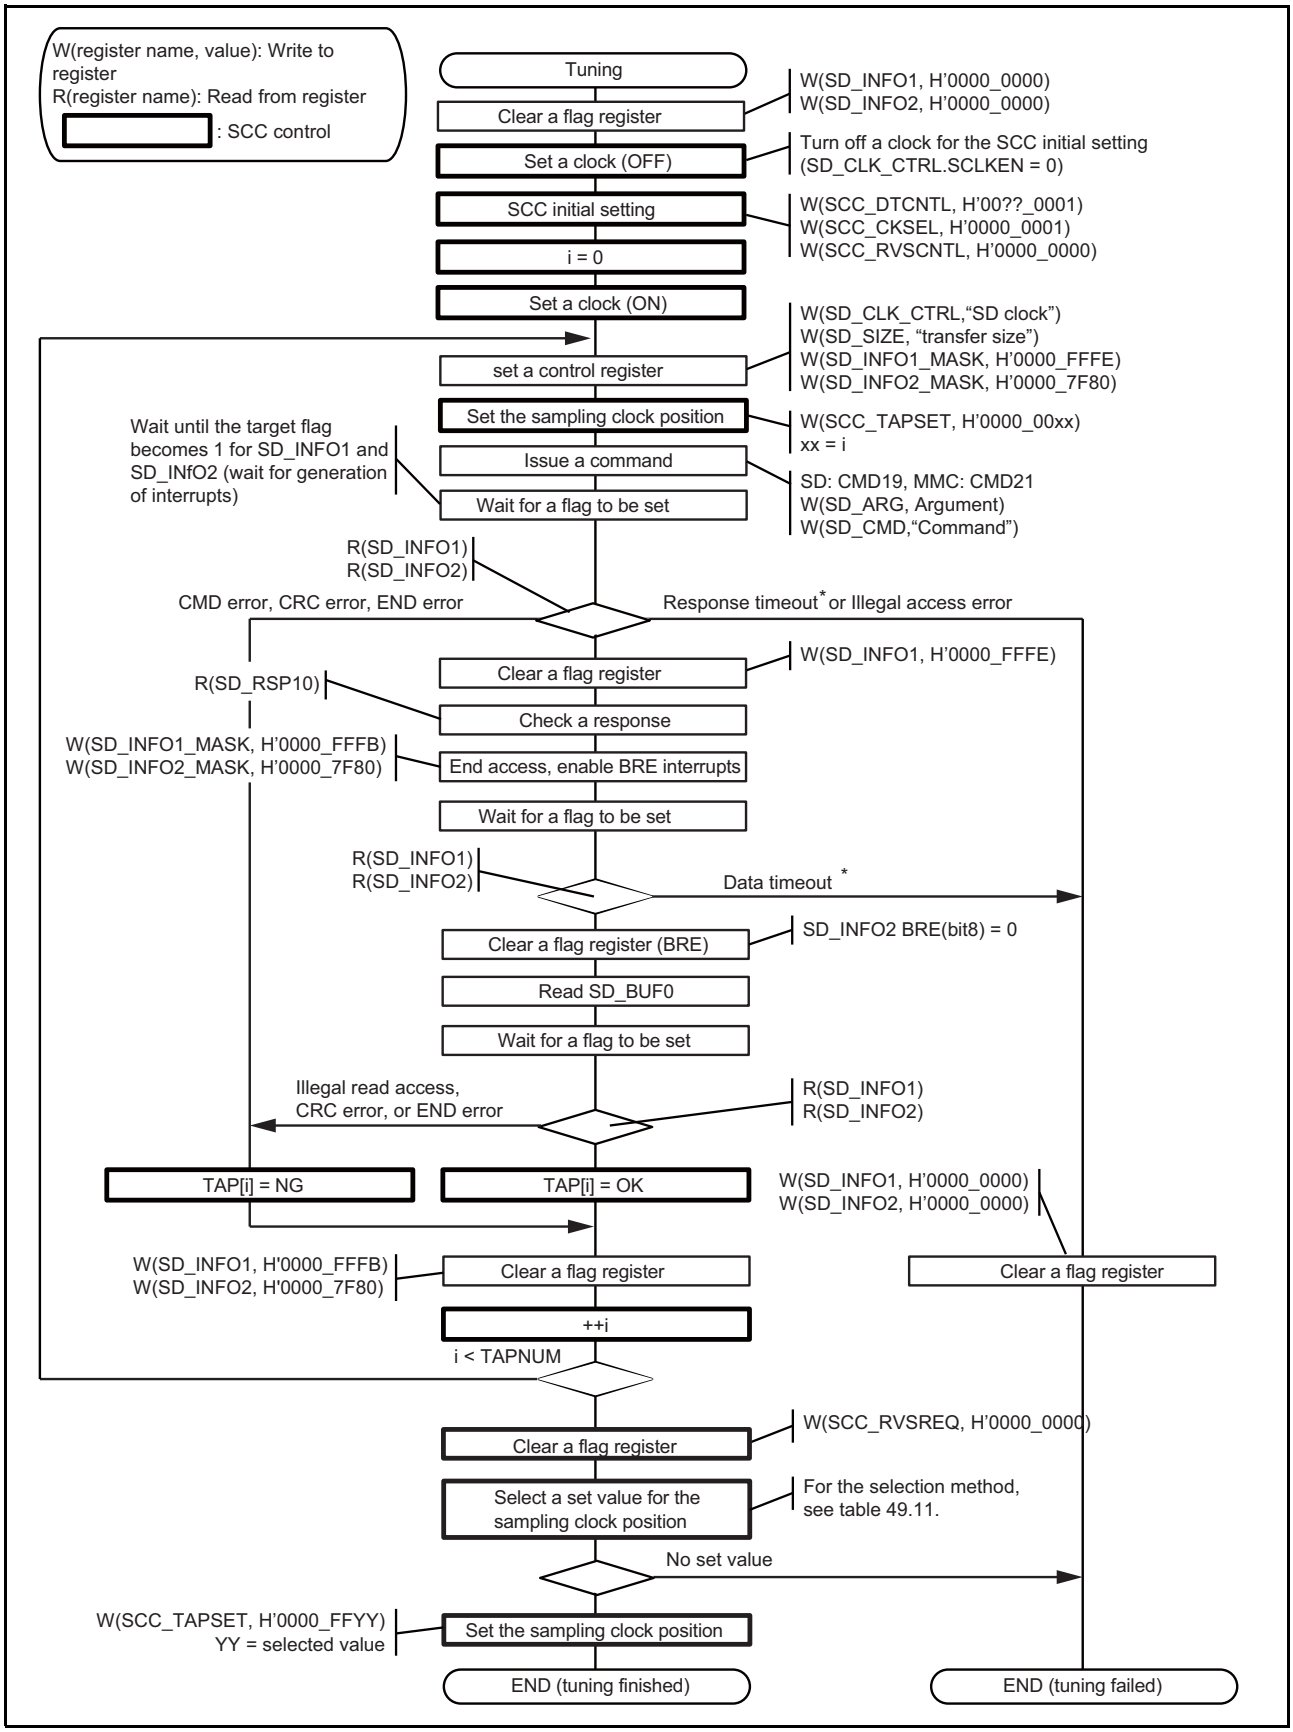

Figure 49.33 Example of Tuning Flow (Detailed)

*: If all of the TAP[i] has become "NG".

Table 49.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*1
TAP[i]	0	NG	OK	NG	OK	OK
	1	OK	OK	NG	NG	OK
	2	OK	NG	OK	NG	OK
	3	OK(←)	NG	OK	NG	OK
	4	OK	NG	NG	NG	OK
	5	OK	OK	NG	OK	OK
	6	NG	OK	NG	OK(←)	OK
Max. value→	7	NG	OK(←)	NG	OK	OK
	(0)	NG	OK	NG	OK	OK
	(1)	OK	OK	NG	NG	OK
	(2)	OK	NG	OK	NG	OK
	(3)	OK	NG	OK	NG	OK
	(4)	OK	NG	NG	NG	OK
	(5)	OK	OK	NG	OK	OK
	(6)	NG	OK	NG	OK	OK
	(7)	NG	OK	NG	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Symbols: (←): Example of selection, (x): repeated display of index x of TAP[x]

*1 If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data.

Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is section 49.8.3, Change point of the input data.

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

49.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.
There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 49.34 shows the flow of manual correction of the sampling clock position. Table 49.12 shows set values determined when correction is required (when TAPNUM = 8).

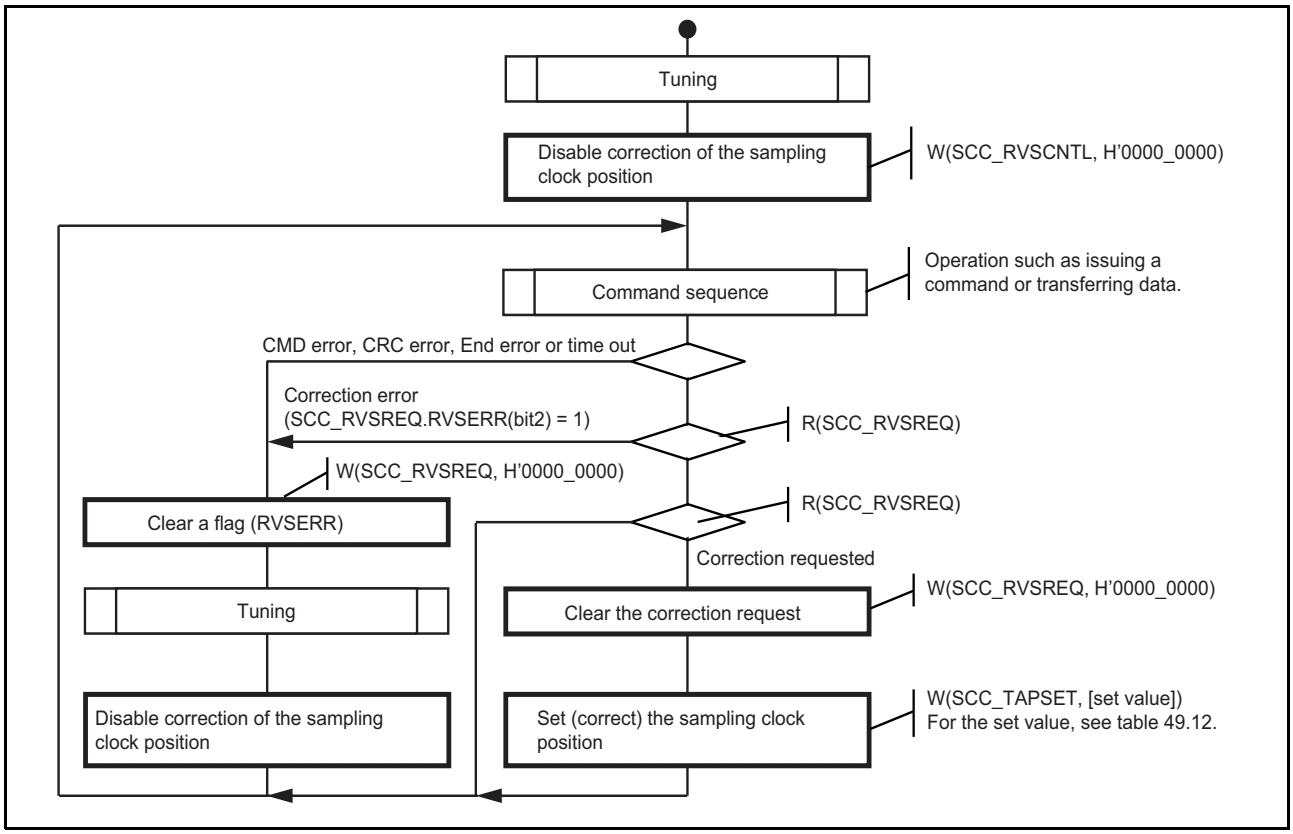

Figure 49.34 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 49.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 49.35 shows the flow of automatic correction of the sampling clock position.

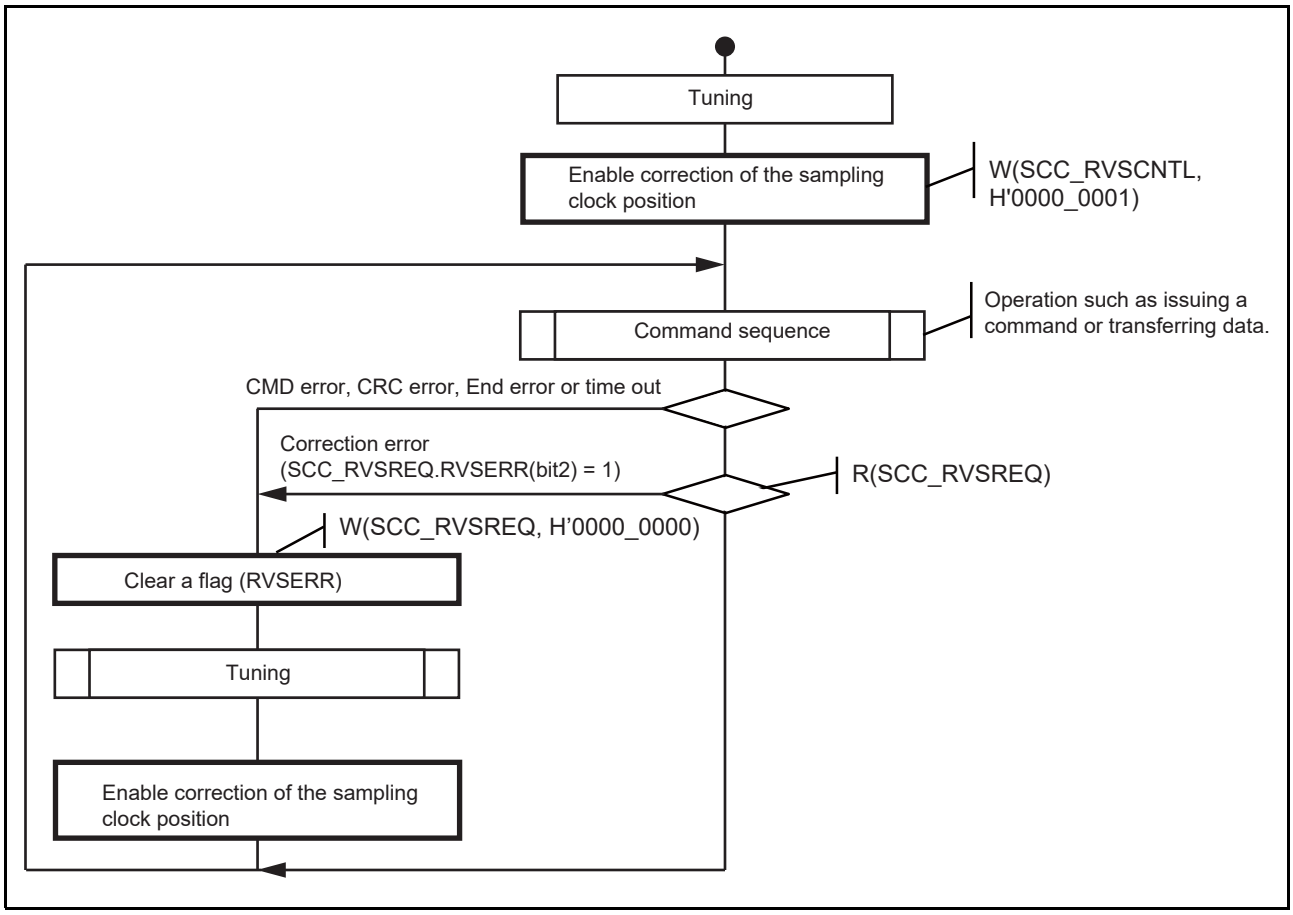

Figure 49.35 Flow of Automatic Correction of the Sampling Clock Position (Example)

49.8.3 Change point of the input data

Tuning is capture the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.

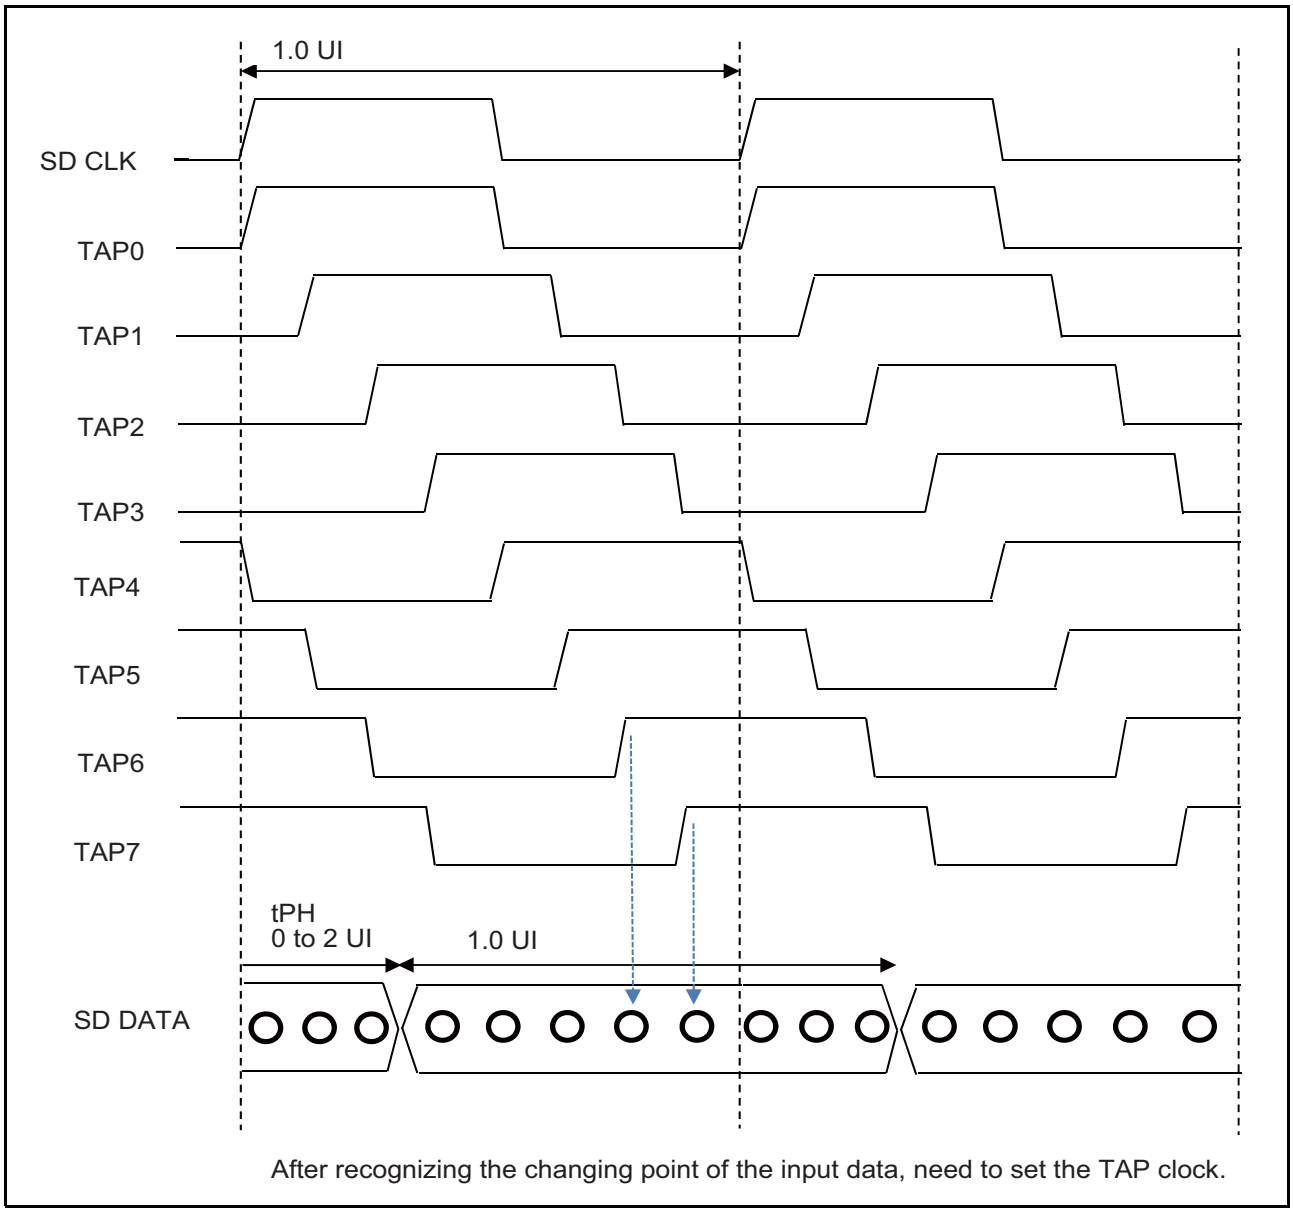

Figure 49.36 Example, All taps is OK.

Figure 49.36 is shown change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

50. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.
The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.
The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

50.1 Features

- Page
  - The on-chip large-capacity RAM consists of five pages.
  - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map
  The on-chip RAM is located in the address spaces shown in Table 50.1 and Table 50.2. Pages 0 and 1 of the large-capacity RAM each have a capacity of 512 Kbytes, and pages 2 to 4 of the large-capacity RAM has a capacity of 1 Mbyte.

Table 50.1 Address Spaces of On-Chip Large-Capacity RAM

Page	Address
Page 0 (512KB)	H'80000000 to H'8007FFFF
Page 1 (512KB)	H'80080000 to H'800FFFFF
Page 2 (1024KB)	H'80100000 to H'801FFFFF
Page 3 (1024KB)	H'80200000 to H'802FFFFF
Page 4 (1024KB)	H'80300000 to H'803FFFFF

Table 50.2 Address Spaces of On-Chip Data Retention RAM

Page	Address
Page 0 (16KB)	H'80000000 to H'80003FFF
Page 1 (16KB)	H'80004000 to H'80007FFF
Page 2 (32KB)	H'80008000 to H'8000FFFF
Page 3 (64KB)	H'80010000 to H'8001FFFF

- Ports
  Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.
- Method of arbitration
  When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.
- Number of access cycles
  The number of cycles for access to read or write is one cycle of Bφ.

50.2 Usage Notes

50.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

50.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit.
Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset.
Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

51. GPIO

51.1 Features

This LSI chip has 61 pins exclusively for use with single functions. It also has 22 ports: P0 to PL, and JP0.
The pins of the ports can be used as general-purpose input/output pins, each of which may also be assigned one of multiple other selectable functions.

Switching of the following pin functions by controlling the respective registers is possible for the specific function ports.

- Driving ability of the CKIO pin by controlling PCKIO
- Driving ability and operating voltage of the pins for the SPI multi I/O bus controller by controlling PSPIBSC and PPOC
- Selection of the HyperBus™*1 controller or Octa*2 memory controller pin by controlling PHMOM0
- Driving ability and operating voltage of the pins for the SD/MMC host interfaces by controlling PSDMMC0 to PSDMMC2 and PPOC

Note 1. HyperBus, HyperFlash, and HyperRAM are trademarks of Cypress Semiconductor Corporation.
Note 2. OctaFlash and OctaRAM are trademarks of Macronix International Co., Ltd.

The general-purpose input/output port pins are multiplexed with the peripheral on-chip module functions. The functions multiplexed on these pins can be selected as desired by setting of the registers.
Each port has the port direction register (PDR) that selects non-use, input, or output, the port output data register (PODR) that holds data for output, the port input register (PIDR) that indicates the pin states, and the port mode register (PMR) that specifies the pin function of each port.
Each port has the control register (PFS) that is used to select the input/output function and interrupt pin from the multiplexed port pins, and to assign the function to the selected pin.
The configuration of the I/O ports differs depending on the package. Table 51.1 shows the specifications of I/O ports, and Table 51.2 lists the port functions.

Note 1. The driving ability of some pins cannot be switched. For details, refer to section 51.3.5, GPIO Driving Ability Control Register (DSCR).
Note 2. The dedicated pins of MIPI, LVDS, and USB are excluded from the list. Refer to the related sections for each pin.

51.1.1 Port group index m n

Throughout this section, the individual port groups are identified by the index "m" (m = 0 to 9, A to H, J to M), and the port groups pins are identified by the index "n" (n = 0 to 7). For example PORTm.PMRn for the port mode control register and Pmn.PFS for the pin control register which are used for the Pmn pin.
The index “m = M” means the pin control register which is used for the JP0_0 and JP0_1 pins.

51.1.2 Base address

The addresses of the registers used to control the ports are given as addresses offset from the base address <PORTm_base>.

Table 51.3 Base Address

Name	Address
<PORTm_base>	H'FCFF E000

51.3.1 Port Direction Register (PDR)

The PDR register is used to select non-use, input, or output (input enable) for individual pins of the corresponding port when the pins are configured as the general I/O pins. When 00 (Hi-Z) is set to this register, this LSI can be protected from input Hi-z state.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDR7[1:0]		PDR6[1:0]		PDR5[1:0]		PDR4[1:0]		PDR3[1:0]		PDR2[1:0]		PDR1[1:0]		PDR0[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
15 to 14	PDR7[1:0]	00	R/W	Odd bit Even bit 0 0: Hi-Z 0 1: Setting prohibited 1 0: Input (functions as an input pin.) 1 1: Output (functions as an output pin (port read enable).)
13 to 12	PDR6[1:0]	00	R/W	
11 to 10	PDR5[1:0]	00	R/W	
9 to 8	PDR4[1:0]	00	R/W	
7 to 6	PDR3[1:0]	00	R/W	
5 to 4	PDR2[1:0]	00	R/W	
3 to 2	PDR1[1:0]	00	R/W	
1 to 0	PDR0[1:0]	00	R/W	

Note: Each bit of PORTm.PDR corresponds to each pin of port m; pin function can be specified in 2-bit units.
Write 00 (Hi-Z) or 10 (input) to the PORT5.PDRn (n = 0 to 7), PORTL.PDRn (n = 0 to 4), and PORTM.PDR0 bits because the P5_0 to P5_7, PL_0 to PL_4, and JP0_0 pins are only for input. Write 00 (non-use) or 11 (output) to the PORTM.PDR1 bit because the JP0_1 pin is only for input.
The bit corresponding to a pin that does not exist is also reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.2 Port Output Data Register (PODR)

The PODR register holds the data to be output from the pins used for general I/O.

	7	6	5	4	3	2	1	0
	PODR7	PODR6	PODR5	PODR4	PODR3	PODR2	PODR1	PODR0
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	PODR7	0	R/W	0: Low output 1: High output
6	PODR6	0	R/W	
5	PODR5	0	R/W	
4	PODR4	0	R/W	
3	PODR3	0	R/W	
2	PODR2	0	R/W	
1	PODR1	0	R/W	
0	PODR0	0	R/W	

Note: Write 0 to the PORT5.PODRn (n = 0 to 7), PORTL.PODRn (n = 0 to 4), and PDRTM.PODR0 bits because the P5_0 to P5_7, PL_0 to PL_4, and JP0_0 pins are only for input. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.3 Port Input Data Register (PIDR)

The PIDR register reflects the states of the individual input port pins.

	7	6	5	4	3	2	1	0
	PIDR7	PIDR6	PIDR5	PIDR4	PIDR3	PIDR2	PIDR1	PIDR0
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	PIDR7	0	R	0: Low input 1: High input
6	PIDR6	0	R	
5	PIDR5	0	R	
4	PIDR4	0	R	
3	PIDR3	0	R	
2	PIDR2	0	R	
1	PIDR1	0	R	
0	PIDR0	0	R	

Note: If PORTm.PDR is set to 10 or 11, the pin states of ports m can be read with PORTm.PIDR, regardless of the values of PORTm.PMR. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0.

51.3.4 Port Mode Register (PMR)

The PMR register specifies the function of the pins of the port.

	7	6	5	4	3	2	1	0
	PMR7	PMR6	PMR5	PMR4	PMR3	PMR2	PMR1	PMR0
Initial value:	0	0	0	0	0	0	0	0

Note 1. The initial value of the PMR register of PORTM is 2’b11.

Bit	Bit Name	Initial value	R/W	Description
7	PMR7	0	R/W	0: Uses the pin as a general I/O pin. 1: Uses the pin as an I/O port for peripheral functions.
6	PMR6	0	R/W	
5	PMR5	0	R/W	
4	PMR4	0	R/W	
3	PMR3	0	R/W	
2	PMR2	0	R/W	
1	PMR1	0	R/W	
0	PMR0	0	R/W	

Note: Each bit of PORTm.PMR corresponds to each pin of port m; pin function can be specified in 1-bit units. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.5 GPIO Driving Ability Control Register (DSCR)

The DSCR register controls driving ability of the ports. For pins PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, PJ_5, and PJ_6, setting of 01 (normal driving ability) or 11 (high driving ability) is only possible. For pins other than those above, setting of 01 (normal driving ability) is only possible.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSCR7[1:0]		DSCR6[1:0]		DSCR5[1:0]		DSCR4[1:0]		DSCR3[1:0]		DSCR2[1:0]		DSCR1[1:0]		DSCR0[1:0]	
Initial value:	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

Bit	Bit Name	Initial value	R/W	Description
15 to 14	DSCR7[1:0]	01 *2	R/W	Odd bit Even bit Driving ability 0 1: Normal driving ability (4 mA) 1 1: High driving ability (8 mA) *1 0 0: Setting prohibited.*3 1 0: Setting prohibited.
13 to 12	DSCR6[1:0]	01 *2	R/W	
11 to 10	DSCR5[1:0]	01 *2	R/W	
9 to 8	DSCR4[1:0]	01 *2	R/W	
7 to 6	DSCR3[1:0]	01 *2	R/W	
5 to 4	DSCR2[1:0]	01 *2	R/W	
3 to 2	DSCR1[1:0]	01 *2	R/W	
1 to 0	DSCR0[1:0]	01 *2	R/W	

m = 0 to *

Note 1. For pins other than PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, PJ_5, and PJ_6, setting of 01 (normal driving ability) is only possible and setting of 11 (high driving ability) is prohibited. The write value should always be 01.
Note 2. The initial value of pins PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, and PJ_5 is 11.
Note 3. The bit corresponding to a pin that is not present is reserved. A reserved bit is always read as 00. The write value should always be 00.

51.3.6 Write Protect Register (PWPR)

The PWPR register enables or disables write access to the PFS register and the PFSWE bit in this register.

	7	6	5	4	3	2	1	0
	B0WI	PFSWE	—	—	—	—	—	—
Initial value:	1	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	B0WI	1	R/W	0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled
6	PFSWE	0	R/W	0: Writing to the PFS register is disabled 1: Writing to the PFS register is enabled
5 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

PFSWE Bit (PFS Register Write Enable)

Writing to PmnPFS register (m = 0 to 9, A to H, J to M, n = 0 to 7) is enabled only when the PFSWE bit is set to 1. To set the PFSWE bit to 1, write 1 to the PFSWE bit after writing 0 to the B0WI bit.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

51.3.7 P0n Pin Function Control Register (P0nPFS) (n = 0 to 6)

The P0nPFS register selects the pin function.
The P0nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.5.

PSEL[2:0] bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P0n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.5 Register Settings for Input/Output Pin Function in 324-Pin Products

PSEL[2:0] Register Setting Value	Pin						
	P0_0	P0_1	P0_2	P0_3	P0_4	P0_5	P0_6
000b (Value after reset)	Hi-Z						
001b	D0	D1	D2	D3	D4	D5	D6
010b	DRP24 *1	DRP25 *1	DRP26 *1	DRP27 *1	DRP28 *1	DRP29 *1	DRP30 *1
011b	DV0_DATA17	DV0_DATA18	DV0_DATA19	DV0_DATA20	DV0_DATA21	DV0_DATA22	DV0_DATA23
100b	MTIOC6B	MTIOC6C	MTIOC6D	MTIOC7A	MTIOC7B	MTIOC7C	MTIOC7D
101b	GTIOC3B	GTIOC4A	GTIOC4B	GTIOC6A	GTIOC6B	GTIOC7A	GTIOC7B
110b	—	—	—	—	—	—	—

Note: —: Setting prohibited.
Note 1. Only in products with a DRP

51.3.8 P1n Pin Function Control Register (P1nPFS) (n = 0 to 4)

The P1nPFS register selects the pin function.
The P1nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.6.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P1n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.6 Register Settings for Input/Output Pin Function in 324-Pin Products

PSEL[2:0] Register Setting Value	Pin				
	P1_0	P1_1	P1_2	P1_3	P1_4
000b (Value after reset)	Hi-Z				
001b	D7	D8	D9	D10	D11
010b	DRP31 *1	MTIOC8A	MTIOC8B	MTIOC8C	MTIOC8D
011b	IRQ0	IRQ1	IRQ2	IRQ3	IRQ4
100b	CAN_CLK	CAN0RX	CAN0RX_DATARATE_EN	CAN0TX	CAN0TX_DATARATE_EN
101b	VBUSEN0	OVRCUR0	VBUSEN1	OTG_ID1	VBUSIN0
110b	—	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.
Note 1. Only in products with a DRP

51.3.9 P2n Pin Function Control Register (P2nPFS) (n = 0 to 3)

The P2nPFS register selects the pin function.
The P2nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.7.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P2n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.7 Register Settings for Input/Output Pin Function in 324-Pin Products

PSEL[2:0] Register Setting Value	Pin			
	P2_0	P2_1	P2_2	P2_3
000b (Value after reset)	Hi-Z			
001b	D12	D13	D14	D15
010b	GTIOC6A	GTIOC6B	GTIOC7A	GTIOC7B
011b	IRQ5	IRQ6	IRQ7	WDTOVF#/PERROUT#
100b	CAN1RX	CAN1RX_RATARATE_EN	CAN1TX	CAN1TX_RATARATE_EN
101b	OTG_EXICEN0	OTG_ID0	VBUSIN1	OTG_EXICEN1
110b	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.
Note: The P23PFS register cannot be initialized by an internal power-on reset through the watchdog timer.

51.3.10 P3n Pin Function Control Register (P3nPFS) (n = 0 to 5)

The P3nPFS register selects the pin function.
The P3nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.8, Table 51.9.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P3n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.8 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin					
	P3_0	P3_1	P3_2	P3_3	P3_4	P3_5
000b (Value after reset)	Hi-Z

110b	—	IRQ6	—	IRQ7	—	—
111b	—	RMII1_RXER	RMII1_CRS_DV	—	—	RMII1_RXD1

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

Table 51.9 Register Settings for Input/Output Pin Function in 176-Pin Products

PSEL[2:0] Register Setting Value	Pin				
	P3_1	P3_2	P3_3	P3_4	P3_5
000b (Value after reset)	Hi-Z				
001b	ET1_RXER	ET1_CRS	ET1_MDC	ET1_MDIO	ET1_RXD1
010b	NFALE	NFRE#	NFWE#	NFRB#	NFCLE
011b	VBUSEN0	CC1_Ra1	OTG_EXICEN0	CC2_Ra1	CC2_Ra0
100b	CAN1RX	CAN1RX_ DATARATE_EN	CAN1TX	CAN1TX_ DATARATE_EN	CAN0TX_ DATARATE_EN
101b	RSPCK2	MOSI2	MISO2	SSL20	SSL00
110b	IRQ6	—	IRQ7	—	—
111b	RMII1_RXER	RMII1_CRS_DV	—	—	RMII1_RXD1

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.11 P4n Pin Function Control Register (P4nPFS) (n = 0 to 7)

The P4nPFS register selects the pin function.
The P4nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.10.

PSEL[2:0] Bit (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P4n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.10 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin							
	P4_0	P4_1	P4_2	P4_3	P4_4	P4_5	P4_6	P4_7
000b (Value after reset)	Hi-Z							
001b	SCK0	RxD0	TxD0	RTS0#	CTS0#	ET0_LINKSTA	ET0_EXOUT/ ET0_SCLKIN	ET0_WOL
010b	TXOUT0P	TXOUT0M	TXOUT1P	TXOUT1M	TXOUT2P	TXOUT2M	TXCLKOUTP	TXDLKOUTM
011b	SCI_SCK1	SCI_RXD1	SCI_TXD1	SCI_CTS1# /RTS1#	SCI_CTS0# /RTS0#	SCI_RXD0	SCI_TXD0	SCI_SCK0
100b	SSIBCK1	SSIRxD1	SSITxD1	SSILRCK1	WDTOVF#/ PERROUT#	RxD4	TxD4	SCK4
101b	MTIOC8A	MTIOC8B	MTIOC8C	MTIOC8D	OTG_ EXICEN0	DREQ0	DACK0	TEND0
110b	IRQ0	IRQ1	IRQ2	IRQ3	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.
Note: The P44PFS register cannot be initialized by an internal power-on reset through the watchdog timer.

51.3.12 P5n Pin Function Control Register (P5nPFS) (n = 0 to 7)

The P5nPFS register selects the pin function.
The P5nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.11.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P5n pin as the pin interrupt function.
PSetting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.11 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin							
	P5_0	P5_1	P5_2	P5_3	P5_4	P5_5	P5_6	P5_7
000b (Value after reset)	Hi-Z							
001b	AN000	AN001	AN002	AN003	AN004	AN005	AN006	AN007
010b	IRQ4	IRQ5	IRQ6	IRQ7	IRQ0	IRQ1	IRQ2	IRQ3
011b	SD0_CD	SD0_WP	VBUSIN0	OTG_ID0	SD1_CD	SD1_WP	—	—
100b	SD1_CD	SD1_WP	—	—	—	—	—	—
101b	—	—	—	—	—	—	—	—
110b	—	—	—	—	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.13 P6n Pin Function Control Register (P6nPFS) (n = 0 to 7)

The P6nPFS register selects the pin function.
The P6nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.
The ISEL bit to which IRQn is not specified is reserved. Be sure to write a value after a reset.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.12, Table 51.13.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P6n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.12 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

Note: —: Setting prohibited.

51.3.16 P9n Pin Function Control Register (P9nPFS) (n = 0 to 7)

The P9nPFS register selects the pin function.
The P9nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.18.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P9n pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.18 Register Settings for Input/Output Pin Function in 324-Pin Products

PSEL[2:0] Register Setting Value	Pin							
	P9_0	P9_1	P9_2	P9_3	P9_4	P9_5	P9_6	P9_7
000b (Value after reset)	Hi-Z							
001b	A8	A9	A10	A11	A12	A13	A14	A15
010b	DRP16 *1	DRP15 *1	DRP14 *1	DRP13 *1	DRP12 *1	DRP11 *1	DRP10 *1	DRP09 *1
011b	DV0_ DATA9	DV0_ DATA8	DV0_ DATA7	DV0_ DATA6	DV0_ DATA5	DV0_ DATA4	DV0_ DATA3	DV0_ DATA2
100b	TxD4	RxD4	SCK4	—	—	—	—	—
101b	SSIDATA2	SSILRCK2	SSIBCK2	SSIRxD0	SSITxD0	SSILRCK0	SSIBCK0	SD1_WP
110b	—	—	—	—	—	—	—	—

Note: —: Setting prohibited.
Note 1. Only in products with a DRP

51.3.17 PAn Pin Function Control Register (PAnPFS) (n = 0 to 7)

The PAnPFS register selects the pin function.
The PAnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.19.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PAn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.19 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin							
	PA_0	PA_1	PA_2	PA_3	PA_4	PA_5	PA_6	PA_7
000b (Value after reset)	Hi-Z							
001b	A16	A17	A18	A19	A20	A21	A22	A23
010b	DV0_ DATA13	DV0_ DATA12	DV0_ DATA11	DV0_ DATA10	DV0_ DATA9	DV0_ DATA8	DV0_ DATA7	DV0_ DATA6
011b	LCD0_ DATA10	LCD0_ DATA11	LCD0_ DATA12	LCD0_ DATA13	LCD0_ DATA14	LCD0_ DATA15	LCD0_ DATA16	LCD0_ DATA17
100b	SCI_TXD1	SCI_RXD1	SCI_SCK1	SCI_CTS0#/ RTS0#	SCI_TXD0	SCI_RXD0	SCI_SCK0	SSIRxD1
101b	MTIOC8C	MTIOC8B	MTIOC8A	MTIOC0D	MTIOC0C	MTIOC0B	MTIOC0A	POE10
110b	—	IRQ6	—	—	—	IRQ5	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.18 PBn Pin Function Control Register (PBnPFS) (n = 0 to 5)

The PBnPFS register selects the pin function.
The PBnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.20.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PBn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.20 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin					
	PB_0	PB_1	PB_2	PB_3	PB_4	PB_5
000b (Value after reset)	Hi-Z					
001b	A24	A25	BS0#	CS0#	CS1#	WAIT#
010b	DV0_DATA5	DV0_DATA4	DV0_DATA3	DV0_DATA2	DV0_DATA1	DV0_DATA0
011b	LCD0_DATA18	LCD0_DATA19	LCD0_DATA20	LCD0_DATA21	LCD0_DATA22	LCD0_DATA23
100b	SSITxD1	SSILRCK1	SSIBCK1	SSIDATA2	SSILRCK2	SSIBCK2
101b	POE8	POE4	POE0	CTS0#	RTS0#	TxD0
110b	—	—	—	—	—	—

Note: —: Setting prohibited.

51.3.19 PCn Pin Function Control Register (PCnPFS) (n = 0 to 7)

The PCnPFS register selects the pin function.
The PCnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.21.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PCn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.21 Register Settings for Input/Output Pin Function 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin							
	PC_0	PC_1	PC_2	PC_3	PC_4	PC_5	PC_6	PC_7
000b (Value after reset)	Hi-Z							
001b	VBUSIN1	VBUSIN0	OTG_ EXICEN0	OTG_ID0	OTG_ID1	VBUSEN1	VBUSEN0	OVRCUR0
010b	NFDATA5	NFDATA6	NFDATA7	NFCLE	NFALE	NFRE#	NFWE#	NFRB#
011b	ET1_TXCLK	ET1_TXD2	ET1_TXD3	ET1_COL	ET1_TXER	ET1_RXDV	ET1_RXD2	ET1_RXD3
100b	RSPCK2	MOSI2	MISO2	SSL20	SPDIF_IN	SPDIF_OUT	SD1_CD	SD1_WP
101b	IRQ2	LCD0_ TCON6	LCD0_ TCON5	LCD0_ TCON4	LCD0_ TCON3	LCD0_ TCON2	LCD0_ TCON1	LCD0_ TCON0
110b	—	—	—	—	IRQ1	IRQ0	IRQ7	IRQ6

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.20 PDn Pin Function Control Register (PDnPFS) (n = 0 to 7)

The PDnPFS register selects the pin function.
The PDnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.22.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PDn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.22 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin							
	PD_0	PD_1	PD_2	PD_3	PD_4	PD_5	PD_6	PD_7
000b (Value after reset)	Hi-Z							
001b	RIIC0SCL	RIIC0SDA	RIIC1SCL	RIIC1SDA	RIIC2SCL	RIIC2SDA	RIIC3SCL	RIIC3SDA
010b	IRQ0	IRQ1	IRQ2	IRQ3	IRQ4	IRQ5	IRQ6	IRQ7
011b	MTCLKA	MTCLKB	MTCLKC	MTCLKD	—	—	—	—
100b	GTETRGA	GTETRGB	GTETRGC	GTETRGD	—	—	—	—
101b	—	—	—	—	—	—	—	—
110b	—	—	—	—	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.21 PEn Pin Function Control Register (PEnPFS) (n = 0 to 6)

The PEnPFS register selects the pin function.
The PEnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.23.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PEn pin as the pin interrupt function.
PSetting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.23 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin						
	PE_0	PE_1	PE_2	PE_3	PE_4	PE_5	PE_6
000b (Value after reset)	Hi-Z						
001b	ET0_RXCLK	ET0_RXD0	ET0_RXD1	ET0_RXER	ET0_CRS	ET0_MDC	ET0_MDIO
010b	VIO_FLD	VIO_D7	VIO_D6	VIO_D5	VIO_D4	VIO_D3	VIO_D2
011b	SCK2	RxD2	TxD2	SSIBCK0	SSILRCK0	SSITxD0	SSIRxD0
100b	POE4	POE8	POE10	MTIOC0A	MTIOC0B	MTIOC0C	MTIOC0D
101b	—	VBUSIN1	—	—	—	CC1_Rd1	CC2_Rd1
110b	—	IRQ1	—	—	—	—	—
111b	REF50CK0	RMII0_RXD0	RMII0_RXD1	RMII0_RXER	RMII0_CRS_DV	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.22 PFn Pin Function Control Register (PFnPFS) (n = 0 to 7)

The PFnPFS register selects the pin function.
The PFnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.24.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PFn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.24 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin							
	PF_0	PF_1	PF_2	PF_3	PF_4	PF_5	PF_6	PF_7
000b (Value after reset)	Hi-Z							
001b	SCK3	RxD3	TxD3	SCK2	RxD2	TxD2	RTS2#	GTETRGD
010b	DV0_DATA15	DV0_DATA16	DV0_DATA17	DV0_DATA18	DV0_DATA19	DV0_DATA20	DV0_DATA21	DV0_DATA23
011b	LCD0_DATA8	LCD0_DATA7	LCD0_DATA6	LCD0_DATA5	LCD0_DATA4	LCD0_DATA3	LCD0_DATA2	LCD0_DATA0
100b	MTIOC7A	MTIOC7B	MTIOC7C	MTIOC7D	MTIOC6A	MTIOC6B	MTIOC6C	MTCLKD
101b	RSPCK1	MOSI1	MISO1	SSL10	SSIBCK0	SSILRCK0	SSITxD0	IRQ1
110b	—	IRQ4	—	—	IRQ1	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.23 PGn Pin Function Control Register (PGnPFS) (n = 0 to 7)

The PGnPFS register selects the pin function.
The PGnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.25.

PSEL[2:0] bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PGn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.25 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin							
	PG_0	PG_1	PG_2	PG_3	PG_4	PG_5	PG_6	PG_7
000b (Value after reset)	Hi-Z							
001b	ET0_TXCLK	ET0_TXD2	ET0_TXD3	ET0_COL	ET0_TXER	ET0_RXDV	ET0_RXD2	ET0_RXD3
010b	VIO_D8	VIO_D9	VIO_D10	VIO_D11	VIO_D15	VIO_D14	VIO_D13	VIO_D12
011b	RSPCK0	MOSI0	MISO0	SSL00	RSPCK1	MOSI1	MISO1	SSL10
100b	MTIOC3A	MTIOC3C	MTIOC3B	MTIOC3D	MTIOC4A	MTIOC4B	MTIOC4C	MTIOC4D
101b	HM_RSTO#	HM_INT#/ OM_ECS#	GTIOC0A	GTIOC0B	GTIOC1A	GTIOC1B	GTIOC2A	GTIOC2B
110b	—	—	IRQ4	—	—	—	IRQ5	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.24 PHn Pin Function Control Register (PHnPFS) (n = 0 to 6)

The PHnPFS register selects the pin function.
The PHnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.26, Table 51.27.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PHn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.26 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin						
	PH_0	PH_1	PH_2	PH_3	PH_4	PH_5	PH_6
000b (Value after reset)	Hi-Z						
001b	AUDIO_CLK	AUDIO_XOUT	CTS2	HM_RSTO#	HM_INT#/ OM_ECS#	HM_RSTO#	HM_INT#/ OM_ECS#
010b	VIO_D1	VIO_D0	DV0_DATA22	RTS2#	CTS2#	NFDATA2	NFDATA3

100b	MTIOC1A	MTIOC1B	MTIOC6D	MTIOC2A	MTIOC2B	MTIC5U	MTIC5V
101b	CC1_Rd0	CC2_Rd0	SSIRxD0	SD0_CD	SD0_WP	IRQ5	IRQ4
110b	IRQ3	IRQ2	—	IRQ3	IRQ2	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

Table 51.27 Register Settings for Input/Output Pin Function in 176-Pin Products

PSEL[2:0] Register Setting Value	Pin			
	PH_0	PH_1	PH_3	PH_4
000b (Value after reset)	Hi-Z			
001b	AUDIO_CLK	AUDIO_XOUT	HM_RSTO#	HM_INT#/ OM_ECS#
010b	VIO_D1	VIO_D0	RTS2#	CTS2#
011b	GTIOC4A	GTIOC4B	GTIOC6A	GTIOC6B
100b	MTIOC1A	MTIOC1B	MTIOC2A	MTIOC2B
101b	CC1_Rd0	CC2_Rd0	SD0_CD	SD0_WP
110b	IRQ3	IRQ2	IRQ3	IRQ2

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.25 PJn Pin Function Control Register (PJnPFS) (n = 0 to 7)

The PJnPFS register selects the pin function.
The PJnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.28, Table 51.29.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PJn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.28 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin

101b	SSIRxD3	VBUSIN0	SSITxD3	SSILRCK3	SSIBCK3	SSILRCK2
110b	—	IRQ0	—	—	—	IRQ4

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.26 PKn Pin Function Control Register (PKnPFS) (n = 0 to 5)

The PKnPFS register selects the pin function.
The PKnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.30, Table 51.31.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PKn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.30 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

PSEL[2:0] Register Setting Value	Pin					
	PK_0	PK_1	PK_2	PK_3	PK_4	PK_5
000b (Value after reset)	Hi-Z					
001b	ET1_TXEN	ET1_TXD0	ET1_TXD1	ET1_RXCLK	ET1_RXD0	GTETRGA

111b	RMII1_TXD_EN	RMII1_TXD0	RMII1_TXD1	REF50CK1	RMII1_RXD0	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.
Note: The PK5PFS register cannot be initialized by an internal power-on reset through the watchdog timer.

Table 51.31 Register Settings for Input/Output Pin Function in 176-Pin Products

PSEL[2:0] Register Setting Value	Pin				
	PK_0	PK_1	PK_2	PK_3	PK_4
000b (Value after reset	Hi-Z				
001b	ET1_TXEN	ET1_TXD0	ET1_TXD1	ET1_RXCLK	ET1_RXD0
010b	NFDATA3	NFDATA4	NFDATA5	NFDATA6	NFDATA7

100b	MTIOC1B	CAN_CLK	CAN0RX	CAN0RX_ DATARATE_EN	CAN0TX
101b	SSIBCK2	SSIDATA2	RSPCK0	MOSI0	MISO0
110b	—	—	IRQ5	—	IRQ6
111b	RMII1_TXD_EN	RMII1_TXD0	RMII1_TXD1	REF50CK1	RMII1_RXD0

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.27 PLn Pin Function Control Register (PLnPFS) (n = 0 to 4)

The PLnPFS register selects the pin function.
The PLnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.32.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PLn pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.32 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin				
	PL_0	PL_1	PL_2	PL_3	PL_4
000b (Value after reset)	Hi-Z				
001b	—	—	—	—	—
010b	—	—	—	—	—
011b	—	—	—	—	—
100b	—	—	—	—	—
101b	IRQ4	IRQ5	IRQ6	IRQ7	IRQ0
110b	—	—	—	—	—

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.
Note: —: Setting prohibited.

51.3.28 PMn Pin Function Control Register (PMnPFS) (n = 0 to 1)

The PMnPFS register selects the pin function.
The PMnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

	7	6	5	4	3	2	1	0
	—	ISEL	—	—	—	PSEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
6	ISEL	0	R/W	0: Not used as an interrupt input pin. 1: Used as an interrupt input pin.
5 to 3	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PSEL[2:0]	000	R/W	These bits select the peripheral function. For individual pin functions, see Table 51.33.

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bits (pin interrupt input function selection bit)

Set this bit to 1 when using the JP0_0 pin as the pin interrupt function.
Setting 0 here leads to the interrupt controller stopping control over pin interrupts.
As the JP0_1 pin is exclusively used as an output pin, the setting of this bit has no effect.

Table 51.33 Register Settings for Input/Output Pin Function

PSEL[2:0] Register Setting Value	Pin	
	JP0_0	JP0_1
000b	Hi-Z	
001b (Value after reset)	TDI	TDO/SWO
010b	—	—
011b	—	—
100b	—	—
101b	—	—
110b	—	—

Note: —: Setting prohibited.

51.3.29 Ethernet Control Register (PFENET)

The Ethernet control register (PFENET) selects an Ethernet interface mode to be used.

PHYMODE0

This bit specifies the Ethernet interface mode of the ETHERC channel 0. Select the same mode as the one specified by the pin function select bits (PmnPFS.PSEL[2:0]). When the signals for the RMII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 0 (RMII mode), whereas when the signals for the MII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 1 (MII mode).

PHYMODE1

This bit specifies the Ethernet interface mode of the ETHERC channel 1. Select the same mode as the one specified by the pin function select bits (PmnPFS.PSEL[2:0]). When the signals for the RMII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 0 (RMII mode), whereas when the signals for the MII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 1 (MII mode).

	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PHY MODE1	PHY MODE0
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
7 to 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1	PHYMODE1	0	R/W	Sets the Ethernet interface mode of channel 1. 0: RMII mode (ETHERC channel 1) 1: MII mode (ETHERC channel 1)
0	PHYMODE0	0	R/W	Sets the Ethernet interface mode of channel 0 0: RMII mode (ETHERC channel 0) 1: MII mode (ETHERC channel 0)

51.3.30 Dedicated Pin POC Control Register (PPOC)

The PPOC register selects the operating voltage of the pins only used for the SPI multi I/O bus controller and SD/MMC host interfaces. This register should be set to match the voltage applied to the power supply for dedicated pins before the dedicated pins are used.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	POC SEL0	—	—	—	—	POC3	POC2	—	POC0
Initial value:	0	0	0	0	0	0	0	1*	0	0	0	0	1*	1*	X	1*

Note: * In boot mode 3 or 4, different values are set according to the boot program.
For details, see section 3.5.4, Boot Mode 3, and section 3.5.5, Boot Mode 4.

Bit	Bit Name	Initial value	R/W	Description
31 to 9	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
8	POCSEL0	1*	R/W	See the description of the POC0 bit.
7 to 4	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
3	POC3	1*	R/W	0: The dedicated pins of the SD/MMC host interface 1 operate from a 1.8-V power supply. 1: The dedicated pins of the SD/MMC host interface 1 operate from a 3.3-V power supply.
2	POC2	1*	R/W	0: The dedicated pins of the SD/MMC host interface 0 operate from a 1.8-V power supply. 1: The dedicated pins of the SD/MMC host interface 0 operate from a 3.3-V power supply.
1	—	X	R/W	Reserved When read, an undefined value is returned.
0	POC0	1*	R/W	[POCSEL0, POC0] 00, 01, or 10: The dedicated pins of the SPI multi I/O bus controller operate from a 1.8-V power supply. 11: The dedicated pins of the SPI multi I/O bus controller operate from a 3.3-V power supply.

51.3.31 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0)

The PSDMMC0 register specifies the driving ability of the pins of the SD/MMC host interface 0.
This register should be set in accord with the POC2 bit of the PPOC register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	1	0	0	1	0	0	1	0	0	1	0	0

51.3.32 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1)

The PSDMMC1 register specifies the driving ability of the pins of the SD/MMC host interface 0.
This register should be set in accord with the POC2 bit of the PPOC register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	1	0	0	1	0	0	1	0	0	1	0	0

3, 2	SD0_DAT5_DRV	10	R/W	SD0_DAT5 Port Driving Ability Control Register
1, 0	SD0_DAT4_DRV	10	R/W	SD0_DAT4 Port Driving Ability Control Register

When the SD/MMC host interface 0 operates from a 1.8-V power supply:

Odd bit	Even bit
1	1: 6 mA

Others: Setting prohibited

When the SD/MMC host interface 0 operates from a 3.3-V power supply:

Odd bit	Even bit
1	0: 6 mA

Others: Setting prohibited

51.3.33 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2)

The PSDMMC2 register specifies the driving ability of the pins of the SD/MMC host interface 1.
This register should be set in accord with the POC3 bit of the PPOC register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	1	0	0	1	0	0	1	0	0	1	0	0

51.3.34 SPI Multi I/O Bus Controller Dedicated Pin Driving Ability Control Register (PSPIBSC)

The PSPIBSC register specifies the driving ability of the pins of the SPI multi I/O bus controller.
This register should be set in accord with the POCSEL0 and POC0 bits of the PPOC register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	QSPI1_SSL_DRV		QSPI1_IO3_DRV		QSPI1_IO2_DRV		QSPI1_IO1_DRV		QSPI1_IO0_DRV		QSPI1_SPCLK_DRV	
Initial value:	0	0	0	0	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RPC_WPN_DRV		RPC_RESETN_DRV		QSPI0_SSL_DRV		QSPI0_IO3_DRV		QSPI0_IO2_DRV		QSPI0_IO1_DRV		QSPI0_IO0_DRV		QSPI0_SPCLK_DRV	
Initial value:	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*	1*

Note: * In boot mode 3, different values are set according to the boot program.
For details, see section 3.5.4, Boot Mode 3.

Bit	Bit Name	Initial value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
27, 26	QSPI1_SSL_DRV	11*	R/W	QSPI1_SSL Port Driving Ability Control Register
25, 24	QSPI1_IO3_DRV	11*	R/W	QSPI1_IO3 Port Driving Ability Control Register
23, 22	QSPI1_IO2_DRV	11*	R/W	QSPI1_IO2 Port Driving Ability Control Register
21, 20	QSPI1_IO1_DRV	11*	R/W	QSPI1_IO1 Port Driving Ability Control Register
19, 18	QSPI1_IO0_DRV	11*	R/W	QSPI1_IO0 Port Driving Ability Control Register
17, 16	QSPI1_SPCLK_DRV	11*	R/W	QSPI1_SPCLK Port Driving Ability Control Register
15, 14	RPC_WPN_DRV	11*	R/W	RPC_WP# Port Driving Ability Control Register

1, 0	QSPI0_SPCLK_DRV	11*	R/W	QSPI0_SPCLK Port Driving Ability Control Register

When the SPI multi I/O bus controller operates from a 1.8-V power supply:
Odd bit Even bit
1 1: 12 mA
Others: Setting prohibited

When the SPI multi I/O bus controller operates from a 3.3-V power supply:
Odd bit Even bit
0 1: 8 mA
Others: Setting prohibited

Note: The initial value of these bits (odd and even bits) is as follows:
Boot mode 3: 01
Others: 11

51.3.35 HyperBus Controller and Octa Memory Controller Dedicated Pin Control Register (PHMOM0)

PHMOM0 selects HyperBus Controller or Octa Memory Controller.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HOSEL
Initial value:	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

Bit	Bit Name	Initial value	R/W	Description
31 to 30	—	00	R/W	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	—	All 1	R/W	Reserved These bits are always read as 1. The write value should always be 1.
15	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
14 to 1	—	All 1	R/W	Reserved These bits are always read as 1. The write value should always be 1.
0	HOSEL	0	R/W	0: Select HyperBus controller 1: Select Octa memory controller

51.3.36 Peripheral Pin Function Control Register (PMODEPFS)

The PMODEPFS register switches the ETHER pin function between EXOUT (output) and SCLKIN (input), and selects the output function of the VBUSEN pin of the USB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VBUS1_SEL	VBUS0_SEL	ET1_EXOUT_SEL	ET0_EXOUT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial value	R/W	Description
31 to 4	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
3	VBUS1_SEL	0	R/W	Selects the output function of the VBUSEN1 pin of the channel 1 USB 2.0 host module. 1: The VBUSEN1 pin is controlled by the VBOUT bit of the VBCTRL register. 0: The VBUSEN1 pin is controlled by the PP bit of the PORTSC1 register.
2	VBUS0_SEL	0	R/W	Selects the output function of the VBUSEN0 pin of the channel 0 USB 2.0 host module. 1: The VBUSEN0 pin is controlled by the VBOUT bit of the VBCTRL register. 0: The VBUSEN0 pin is controlled by the PP bit of the PORTSC1 register.
1	ET1_EXOUT_SEL	0	R/W	Selects EXOUT or SCLKIN for ETHER1. 1: SCLKIN1 input 0: EX1 EXOUT output
0	ET0_EXOUT_SEL	0	R/W	Selects EXOUT or SCLKIN for ETHER0 1: SCLKIN0 input 0: EX0 EXOUT output

51.3.37 CKIO pin Driving Ability Control Register (PCKIO)

The PCKIO register controls driving ability of the CKIO pin.

	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CKIO_DRV	
Initial value:	0	0	0	0	0	0	0	1

Bit	Bit Name	Initial value	R/W	Description
7 to 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CKIO_DRV	01	R/W	These bits control the driving ability of the CKIO pin. 00: Setting prohibited. 01: 8 mA (recommended for 66-MHz operation) 10: 12 mA (recommended for 132-MHz operation) 11: Setting prohibited.

51.4 Usage Notes

51.4.1 Procedure for Specifying Input/Output Pin Function

Use the following procedure to specify the input/output pin functions.

1. Set the bits corresponding to the given pin in the port direction register (PDR) and the port mode register (PMR) to 00 and 0, respectively to set the pin function as the general-purpose I/O port pin.
2. Specify the assignments of input/output signals for peripheral modules to the desired pins.
3. Setting the PWPR.PFSWE bit to 1 after setting the PWPR.B0WI bit to 0 leads to the Pmn pin function control register (PmnPFS) (m = 0 to 9, A to H, J to M, n = 0 to 7) being writable.
4. Specify the input/output function for the pin through the PSEL[2:0] bit settings in the PmnPFS register.
5. Set the PFSWE bit in the PWPR register to 0 to disable writing to the PmnPFS register.
6. Set the PMR to 1 as necessary to switch to the selected input/output function for the pin.
7. The level of port pins can be read by setting the corresponding bits in the PDR register to 10 as required.

51.4.2 Notes on PFS Register Setting

1. Settings of the Pmn Pin Function Control Register (PmnPFS) (m = 0 to 9, A to H, J to M, n = 0 to 7) should be made only while the PMR register for the target pin is set to 0. If a PmnPFS register is set while the PMR register is 1, unexpected edges may be input through the input pin or unexpected pulses are output through the output pin.
2. When the PmnPFS.ISEL bit is set to 1 while pin interrupts are used, the pin state is input because input to the target pin is enabled regardless of the PDR register setting. Therefore, the following conditions must be satisfied.
   • Follow the procedure for setting up the interrupt controller. For details, see Figure 7.3, Flow of Switching Pin Functions.
   • Do not set the PmnPFS.ISEL bit to 1 for a pin for which the output function was selected.
   If PmnPFS.ISEL bit is set with a wrong procedure, a malfunction might occur by input of an unintended edge.
3. Only the allowed values (functions) should be specified in the Pmn pin function control registers. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
4. Do not assign a single function to multiple pins through the PFS register settings.
5. Points to note regarding the Port Mode Register (PMR), Port Direction Register (PDR), Pmn Pin Function Control Register (PmnPFS) settings for pins that have multiplexed pin functions are listed in Table 51.34.
   Reading the level of pins of port 5 is only available when the analog input alternative function is not selected.
   Modify the PSEL[2:0] bits when the bit corresponding to the given pin in the PMR register is set to 0.

Table 51.34 Register Settings

	PORTM.PMR		PmnPFS		
Item	PMRn	PDRn[1:0]	ISEL	PSEL[2:0]	Point to Note
After a reset	0 *1	00	0	000*1	These registers are not in use (Hi-Z input protection) after release from the reset state.
When these registers are not in use	0	00	0	X	
General input/ output ports	0	10/11 *2	0/1 *3	X	If these are multiplexed with pin interrupt inputs, set the PmnPFS.ISEL bit to 1 after setting PDRn[1:0] to 10 (input).
Peripheral functions	1	00/10 *4	0/1 *3	Peripheral function (see Table 51.5 to Table 51.33)	If these are multiplexed with pin interrupt inputs, set the PmnPFS.ISEL bit to 1 for pins for which the input function or input/output function was selected. The PmnPFS.ISEL bit must be set to 0 for pins for which the output function was selected because they cannot be multiplexed with pin interrupt inputs. When using this function with the port read function (reading the level of port pins from PIDRn bit), set PDRn[1:0] bits to 10.
Interrupt inputs	0	10	1	X	See section 51.4.4, Note on Pin Interrupts.
Analog inputs	1	00	X *5	001	To switch the output buffer and input buffer off, set the port pins for not in use.

x: Setting not required.

Note 1. The values after a reset in PORTM.PMR.PMR0, PORTM.PMR.PMR1, PM0PFS.PSEL[2:0], and PM1PFS.PSEL[2:0] are different with those specified as the initial values.
For details on the PSEL[2:0] bits, refer to “PMn Pin Function Control Register (PMnPFS) (n = 0 to 1)”.
For details on the PORTM.PMR register, refer to section 51.3.4, Port Mode Register (PMR).
Note 2. Setting the PDRn[1:0] bits to 10 sets the pin function for the general-purpose input port pin.
Setting the PDRn[1:0] bits to 11 sets the pin function for the general-purpose output port pin.
Note 3. Setting the PmnPFS.ISEL bit to 0 makes the pin incapable of functioning as an IRQ pin.
Setting the PmnPFS.ISEL bit to 1 makes the pin capable of functioning as an IRQ pin.
Note 4. When the PDRn[1:0] bits are set to 00, the port read function (reading the level of port pins from PIDRn bit) cannot be used.
When the PDRn[1:0] bits are set to 10, the port read function can be used.
Note 5. Even if the PmnPFS.ISEL bit is set to 1, the pin with this function cannot be used for pin interrupts.

51.4.3 Usage Note on Port Read Function

When a peripheral module for a pin which is bidirectional or an output is in use and the value of the PDR bits for the given pin is changed from 00 (initial value) to 10 (input enabled), the state of the pin can be read (port read function) from the PIDR register while the peripheral function is in use.
When a peripheral module for a pin which is an input or any of the input/output pin functions listed in Table 51.35 is in use, input is always enabled and the pin function can be used in parallel with port reading without changing the setting of the PDR register.
A shoot-through current flows when an external pin enters the Hi-Z state. An external pin must be pulled down or up when in the Hi-Z state.
When the pin functions in Table 51.36 are in use with an external bus controller, setting the PDR register to 10 (input enabled) is prohibited because the external bus controller controls enabling and disabling of input to the pins.

51.4.4 Note on Pin Interrupts

51.4.4.1 Control of Pin Interrupts

Signals input from the general-purpose I/O port pins can be used for pin interrupts. For details on pin functions, see section 7.4.4, Pin Interrupts. Interrupt IDs 480 to 511 are allocated to the pin interrupts. Therefore, the general-purpose I/O port pins are classified into 32 groups and an interrupt ID number from 480 to 511 is allocated to each group. Table 51.37 shows the general-purpose I/O port pins in each group and the correspondence between the groups and interrupt IDs.

If multiple port pins in the same group are to be used for pin interrupts, the following restriction on input applies; when a port pin for use as a pin interrupt is at the high level, input of an interrupt request from another pin is prohibited. Details on the conditions for input are given in Table 51.38.

For details on how to set priority levels for the interrupt IDs allocated to the individual groups and the interrupt configuration register (GICD_ICFGRn), see section 7, Interrupt Controller.

Table 51.37 Details of Pin Interrupt Groups

Interrupt ID	Group Name into which Port Pins are Classified		GPIO Port Pin						
480	Group 0	(TINT0)	PL_0	PL_1	PL_2	PL_3	PL_4	PM_0	—
481	Group 1	(TINT1)	PK_0	PK_1	PK_2	PK_3	PK_4	PK_5	—
482	Group 2	(TINT2)	PJ_4	PJ_5	PJ_6	PJ_7	—	—	—
483	Group 3	(TINT3)	PJ_0	PJ_1	PJ_2	PJ_3	—	—	—
484	Group 4	(TINT4)	PH_0	PH_1	PH_2	PH_3	PH_4	PH_5	PH_6
485	Group 5	(TINT5)	PG_4	PG_5	PG_6	PG_7	—	—	—

491	Group 11	(TINT11)	PD_0	PD_1	PD_2	PD_3	—	—	—
492	Group 12	(TINT12)	PC_4	PC_5	PC_6	PC_7	—	—	—
493	Group 13	(TINT13)	PC_0	PC_1	PC_2	PC_3	—	—	—
494	Group 14	(TINT14)	PB_0	PB_1	PB_2	PB_3	PB_4	PB_5	—
495	Group 15	(TINT15)	PA_4	PA_5	PA_6	PA_7	—	—	—
496	Group 16	(TINT16)	PA_0	PA_1	PA_2	PA_3	—	—	—
497	Group 17	(TINT17)	P9_4	P9_5	P9_6	P9_7	—	—	—
498	Group 18	(TINT18)	P9_0	P9_1	P9_2	P9_3	—	—	—
499	Group 19	(TINT19)	P8_4	P8_5	P8_6	P8_7	—	—	—
500	Group 20	(TINT20)	P8_0	P8_1	P8_2	P8_3	—	—	—
501	Group 21	(TINT21)	P7_4	P7_5	P7_6	P7_7	—	—	—
502	Group 22	(TINT22)	P7_0	P7_1	P7_2	P7_3	—	—	—
503	Group 23	(TINT23)	P6_4	P6_5	P6_6	P6_7	—	—	—
504	Group 24	(TINT24)	P6_0	P6_1	P6_2	P6_3	—	—	—
505	Group 25	(TINT25)	P5_4	P5_5	P5_6	P5_7	—	—	—
506	Group 26	(TINT26)	P5_0	P5_1	P5_2	P5_3	—	—	—
507	Group 27	(TINT27)	P4_1	P4_2	P4_3	P4_4	P4_5	P4_6	P4_7
508	Group 28	(TINT28)	P3_1	P3_2	P3_3	P3_4	P3_5	P4_0	—
509	Group 29	(TINT29)	P2_0	P2_1	P2_2	P2_3	P3_0	—	—
510	Group 30	(TINT30)	P1_0	P1_1	P1_2	P1_3	P1_4	—	—

Interrupt ID	Group Name into which Port Pins are Classified		GPIO Port Pin						
511	Group 31	(TINT31)	P0_0	P0_1	P0_2	P0_3	P0_4	P0_5	P0_6

Table 51.38 shows the behavior of two port pins, PL_0 and PL_1 in group 0. The other port pins in group 0 behave in the same way. In addition, this also applies to the behavior of multiple port pins in each of groups 1 to 31.

Table 51.38 Conditions for Input of Interrupt Requests between Port Pins in the Same Group

GICD_ICFGRn Setting	Conditions for Input of Pin Interrupts					Whether or Not to Meet the Condition for Input of Pin Interrupt Requests
	PL_0	PL_1	Target Interrupt	State of Interrupt ID Signal 480	State of Interrupt Request	
Rising Edge Detection		Low	PL_0	Rising Edge	Interrupt requests are issued from PL_0.	○
	Low		PL_1	Rising Edge	Interrupt requests are issued from PL_1.	○
			PL_0	Rising Edge	Interrupt requests are issued from PL_0.*1	○
			PL_1	Rising Edge	Interrupt requests are issued from PL_1.*1	○
		High	PL_0	High Level	Interrupt requests are not issued from PL_0.	×
	High		PL_1	High Level	Interrupt requests are not issued from PL_1.	×
			PL_0, PL_1	Rising Edge	Interrupt requests are issued from both PL_0 and PL_1.*2	×
High Level Detection	High Level	Low	PL_0	High Level	Interrupt requests are issued from PL_0.	○
	Low	High Level	PL_1	High Level	Interrupt requests are issued from PL_1.	○
	High Level		PL_0	High Level	Interrupt requests are issued from PL_0.*1	○
		High Level	PL_1	High Level	Interrupt requests are issued from PL_1.*1	○
	High Level	High Level	PL_0, PL_1	High Level	Interrupt requests are issued from both PL_0 and PL_1.*2	×
	High Level		PL_0	High Level	Interrupt requests are issued from both PL_0 and PL_1.*2	×
		High Level	PL_1	High Level	Interrupt requests are issued from both PL_0 and PL_1.*2	×

Note 1. The restriction on the input from pins in the same group is met. For details, refer to section 51.4.4.2, Restriction on the Input from Pins in the Same Group.

Note 2. Interrupt requests from multiple pins in the same group cannot be input at the same time. You cannot identify the port pin from which an interrupt request has been input.

51.4.4.2 Restriction on the Input from Pins in the Same Group

When setting pin interrupts with the use of pins in the same group, set a further interrupt so that it's issued the wait time limit (tTINTGW) after an interrupt has been issued. For details on tTINTGW, refer to "Wait time limit tTINTGW for TINT inputs from pins in the same group" in (2) Timing for Input of Interrupt Signals in the description of the timing pins for control signals in the electrical characteristics section.
Figure 51.16 shows an outline of the timing under the condition for the cases where pins in the same group are used for pin interrupts.

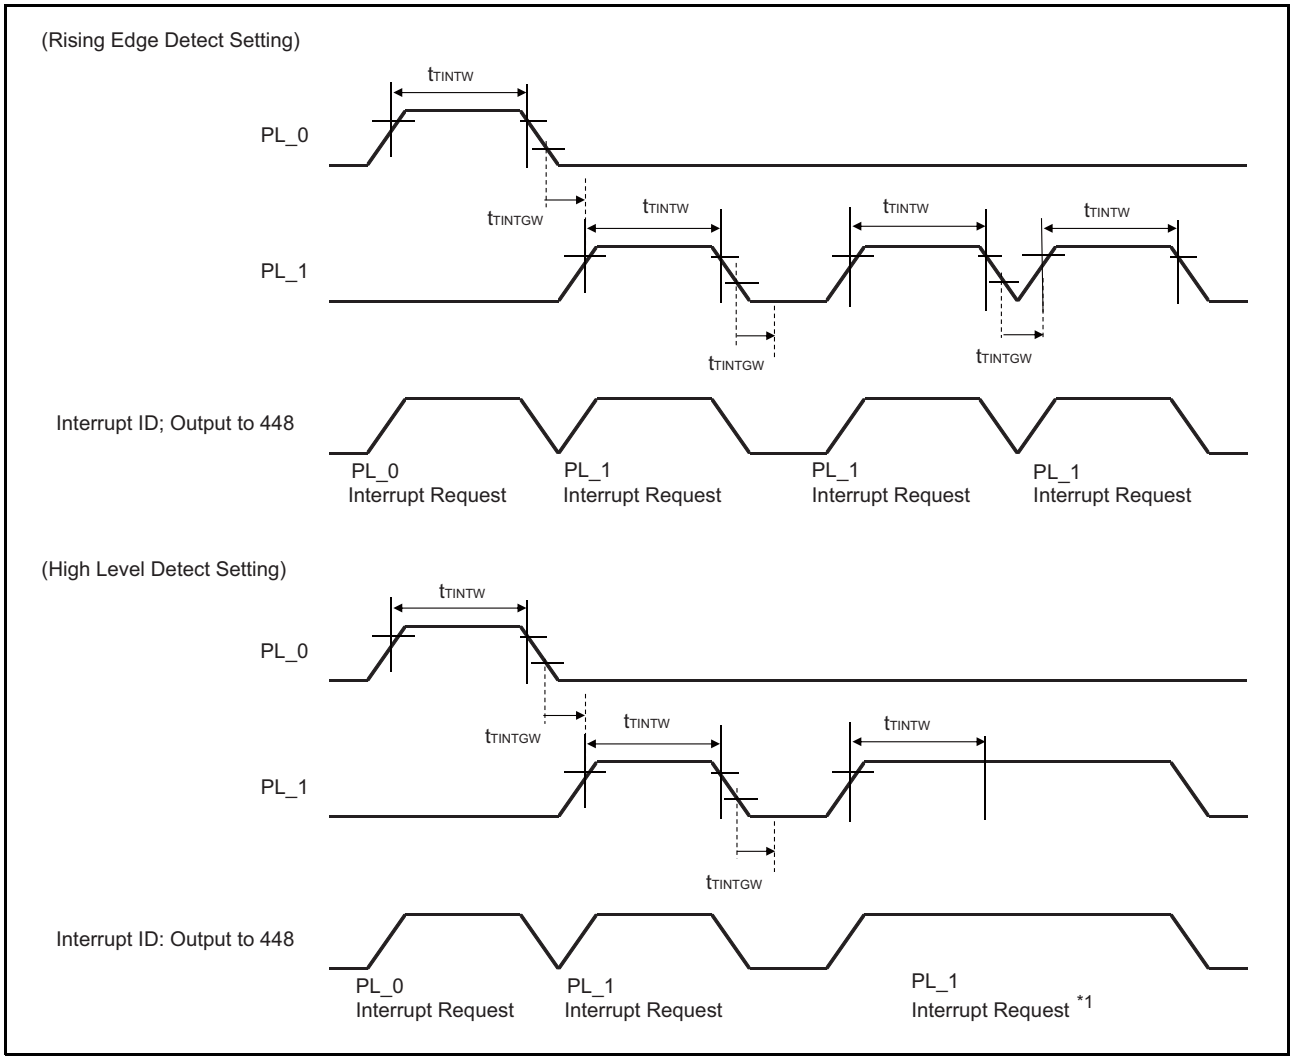

Figure 51.16 Restriction on the Timing of Input on Pins in the Same Group for Use as Pin Interrupts

tTINTGW represents the wait time after a pin interrupt signal falls.
The minimum interval in cases where pins in the same group are used for consecutive pin interrupts is "the time for the operating width of a port pin, TINTW" plus "the wait time for TINT inputs on pins in the same group, tTINTGW".

Note 1. The restriction of tTINTGW can only be ignored when high-level detection is selected for the interrupt controller and interrupts are set as to only issue from a single pin.

52. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

52.1 Features

52.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 52.1 shows transitions between these states.

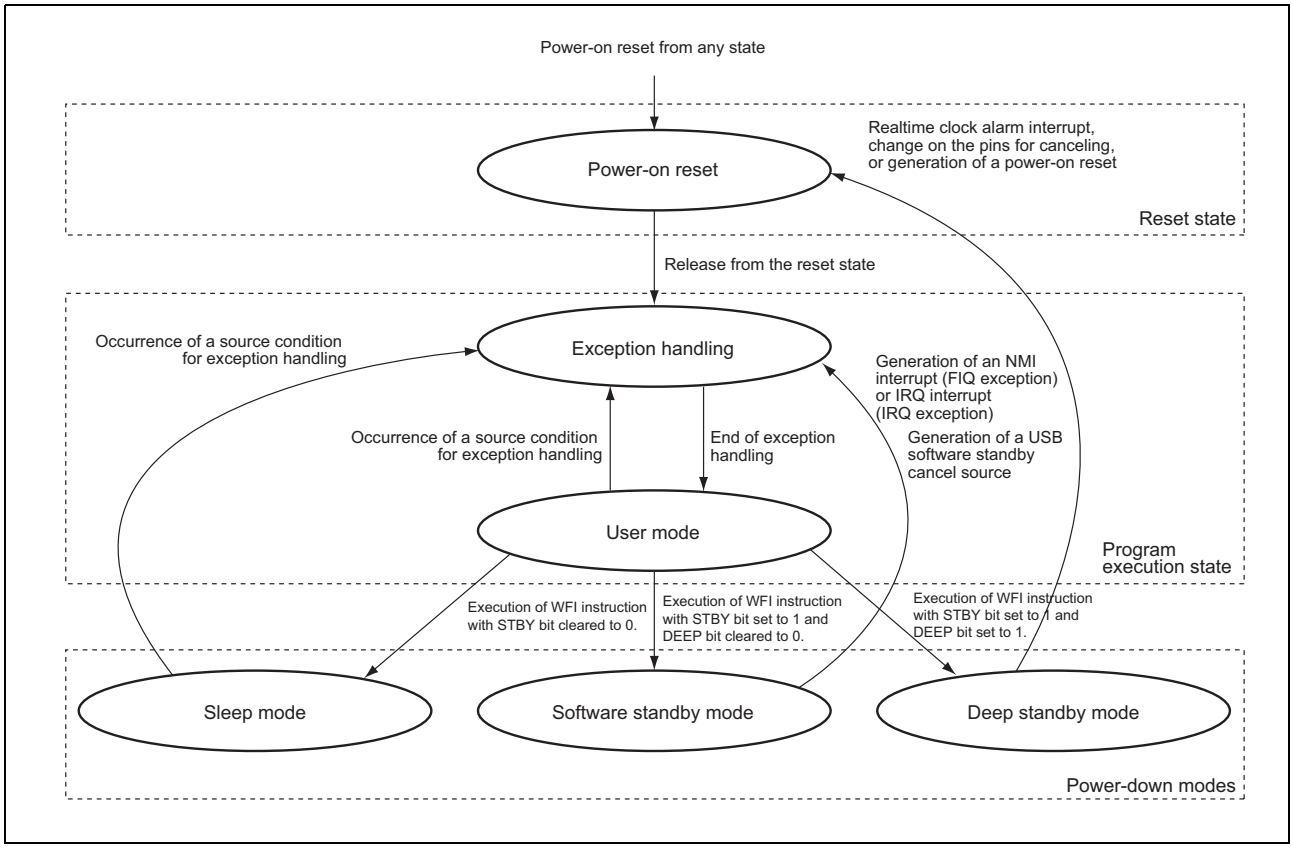

Figure 52.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 52.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 52.1 States of Power-Down Modes

		State							
Power Down Mode	Transition Conditions	CPU, CPU Register, Primary Cache, TLB	Secondary Cache	Large-Capacity On-Chip RAM (including on-chip data-retention RAM)	On-Chip Peripheral Modules	Realtime Clock	Internal Power Supply	External Memory	Canceling Procedure
Sleep mode	Execute WFI instruction with STBY bit in STBCR1 cleared to 0	Halted Contents are held.*4	Running	Running	Running	Running *1	Applied	Auto refresh	• Interrupt • Power-on reset
Software standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively	Halted Contents are held.*4	Halted Contents are held.*4	Halted Contents are held.*5	Halted	Running *1	Applied	Self refresh	• NMI or IRQ interrupt • Power-on reset • Change on the USB Software standby cancel source signal
Deep standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1	Halted Contents are not held.	Halted Contents are not held.	Halted Contents in on-chip data-retention RAM are held*2, and the other contents in large-capacity on-chip RAM are not held.	Halted	Running *1	Shut off*6	Self refresh	• Power-on reset*3 • Realtime clock alarm interrupts 0 and 1*3 • Change on the pins for canceling*3 • USB 2.0 host/ function module channel interrupts 0 and 1
Module standby mode	Set the MSTP bits in STBCR2 to STBCR10 to 1	Running	Running	Running	Specified module halted	Halted	Applied	Auto refresh	• Clear MSTP bit to 0

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 16, Realtime Clock (RTC). When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm 0 or 1 interrupt, a USB cancel source 0 or 1, or change on the pins for canceling (PK_4, PK_2, PJ_5, PJ_1, PH_0, PG_6, PG_2, PH_1, PE_1, P6_2, P3_3, P3_1, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1

register or VRAMWE bit in the SYSCR2 register to disable accesses, the contents can be retained when software standby mode is canceled by a power-on reset. Note that this area can not be retained because the area at addresses from H'8002_0000 to H'8002_3FFF is used as working memory for the boot program in boot modes 0 to 7. In boot modes 1 and 2, this area can not be retained because a program is transferred from the external flash memory to the area at addresses from H'8002_4000 to H'8002_4000 + the size of the program - 1. For details, see section 3, Boot Mode.

Note 6. In deep standby mode, the fake debug mode, in which shutting off the supply of power to all modules is disabled, is usable for debugging.
For details, see section 53.4.3, Clock Power Control Register (ICEREGCLKPWRCTRL).

52.2 Register Descriptions

Table 52.2 shows the register configuration.

Table 52.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR1	R/W	H'00	H'FCFE0020	8
Standby control register 2	STBCR2	R/W	H'6A	H'FCFE0024	8
Standby control register 3	STBCR3	R/W	H'FD	H'FCFE0420	8
Standby control register 4	STBCR4	R/W	H'FF	H'FCFE0424	8
Standby control register 5	STBCR5	R/W	H'F3	H'FCFE0428	8
Standby control register 6	STBCR6	R/W	H'FF	H'FCFE042C	8
Standby control register 7	STBCR7	R/W	H'FF	H'FCFE0430	8
Standby control register 8	STBCR8	R/W	H'F7	H'FCFE0434	8
Standby control register 9	STBCR9	R/W	H'FF	H'FCFE0438	8
Standby control register 10	STBCR10	R/W	H'9F	H'FCFE043C	8
Software reset control register 1	SWRSTCR1	R/W	H'00	H'FCFE0460	8
Software reset control register 2	SWRSTCR2	R/W	H'00	H'FCFE0464	8
System control register 1	SYSCR1	R/W	H'FF	H'FCFE0400	8
System control register 2	SYSCR2	R/W	H'FF	H'FCFE0404	8
System control register 3	SYSCR3	R/W	H'00	H'FCFE0408	8
CPU status register	CPUSTS	R	H'00	H'FCFE0018	8
Standby request register 1	STBREQ1	R/W	H'00	H'FCFE0030	8
Standby request register 2	STBREQ2	R/W	H'00	H'FCFE0034	8
Standby request register 3	STBREQ3	R/W	H'00	H'FCFE0038	8
Standby acknowledge register 1	STBACK1	R	H'00	H'FCFE0040	8
Standby acknowledge register 2	STBACK2	R	H'00	H'FCFE0044	8
Standby acknowledge register 3	STBACK3	R	H'00	H'FCFE0048	8
USB software standby cancel source control register 0	SSTBCCR0	R/W	H'0000	H’FCFEF810	16
USB software standby cancel source control register 1	SSTBCCR1	R/W	H'0000	H’FCFEF812	16
USB Software standby cancel source request register 0	SSTBCRR0	R/W	H'0000	H’FCFEF814	16
USB Software standby cancel source request register 1	SSTBCRR1	R/W	H'0000	H’FCFEF816	16
On-chip data-retention RAM area setting register	RRAMKP	R/W	H'00	H'FCFFC000	8
Deep standby control register	DSCTR	R/W	H'00	H'FCFFC002	8
Deep standby cancel source select register	DSSSR	R/W	H'0000	H'FCFFC004	16
USB Deep standby cancel source select register	USBDSSSR	R/W	H'00	H'FCFFC020	8
Deep standby cancel edge select register	DSESR	R/W	H'0000	H'FCFFC006	16
Deep standby cancel source flag register	DSFR	R/W	H'0000	H'FCFFC008	16
USB Deep standby cancel source flag register	USBDSFR	R/W	H'00	H'FCFFC024	8
Deep standby cancel Oscillation stability count register	DSCNT	R/W	H'0000	H'FCFFC00E	16
XTAL crystal oscillator gain control register	XTALCTR	R/W	H'00	H'FCFF1810	8
RTCXTAL select register	RTCXTALSEL	R/W	H'000x	H'FCFFC040	16

52.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode. 11: Executing WFI instruction puts chip into deep standby mode.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]

x: Don't care

52.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	—	—	—	—	—	—	MSTP 20
Initial value:	0	1	1	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 57.1, Pin States. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP20	0	R/W	Module Stop 20*1 When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	MSTP 36	MSTP 35	MSTP 34	MSTP 33	MSTP 32	—	MSTP 30
Initial value:	1	1	1	1	1	1	0	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
6	MSTP36	1	R/W	Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to the OS timer channel 0 is halted. 0: OS timer channel 0 runs. 1: Clock supply to OS timer channel 0 is halted.
5	MSTP35	1	R/W	Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the OS timer channel 1 is halted. 0: OS timer channel 1 runs. 1: Clock supply to OS timer channel 1 is halted.
4	MSTP34	1	R/W	Module Stop 34 When the MSTP34 bit is set to 1, the clock supply to the OS timer channel 2 is halted. 0: The OS timer channel 2 runs. 1: Clock supply to the OS timer channel 2 is halted.
3	MSTP33	1	R/W	Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 3 (MTU3a) is halted. 0: The multi-function timer pulse unit 3 runs. 1: Clock supply to the multi-function timer pulse unit 3 is halted.
2	MSTP32	1	R/W	Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CANFD interface is halted. 0: The CANFD interface runs. 1: Clock supply to the CANFD interface is halted.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	MSTP30	1	R/W	Module Stop 30 When the MSTP30 bit is set to 1, the clock supply to the General PWM Timer (GPT) is halted. 0: The General PWM Timer runs. 1: Clock supply to the General PWM Timer is halted.

52.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP47	MSTP46	MSTP45	MSTP44	MSTP43	MSTP42	MSTP41	MSTP40
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted.
6	MSTP46	1	R/W	Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted.
5	MSTP45	1	R/W	Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted.
4	MSTP44	1	R/W	Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted.
3	MSTP43	1	R/W	Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted.
2	MSTP42	1	R/W	Module Stop 42 When the MSTP42 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted.
1	MSTP41	1	R/W	Module Stop 41 When the MSTP41 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted.
0	MSTP40	1	R/W	Module Stop 40 When the MSTP40 bit is set to 1, the clock supply to the serial communication interface (IrDA) is halted. 0: The serial communication interface (IrDA) runs. 1: Clock supply to the serial communication interface (IrDA) is halted.

52.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP57	MSTP56	—	—	MSTP53	MSTP52	MSTP51	—
Initial value:	1	1	1	1	0	0	1	1
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to the A/D converter is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to the capture engine unit (CEU) is halted. 0: The capture engine unit (CEU) runs. 1: Clock supply to the capture engine unit (CEU) is halted.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP53	0	R/W	Module Stop 53 When the MSTP53 bit is set to 1, the clock supply to the realtime clock channel 0 is halted. 0: The realtime clock channel 0 runs. 1: Clock supply to the realtime clock channel 0 is halted. Note: When the realtime clock channel 0 is halted, set the bits in registers shown below. • Set the RCKSEL bit in the control register 4 (RCR4) of the realtime clock channel 0 to 0. • Set the RTCEN bit in the control register 3 (RCR3) of the realtime clock channel 0 to 0. After the settings above, set the MSTP53 bit to 1.
2	MSTP52	0	R/W	Module Stop 52 When the MSTP52 bit is set to 1, the clock supply to the realtime clock channel 1 is halted. 0: The realtime clock channel 1 runs. 1: Clock supply to the realtime clock channel 1 is halted. Note: When the realtime clock channel 1 is halted, set the bits in registers shown below. • Set the RCKSEL bit in the control register 4 (RCR4) of the realtime clock channel 1 to 0. • Set the RTCEN bit in the control register 3 (RCR3) of the realtime clock channel 1 to 0. After the settings above, set the MSTP52 bit to 1.
1	MSTP51	1	R/W	Module Stop 51* When the MSTP51 bit is set to 1, the clock supply to the JPEG codec unit is halted. 0: The JPEG codec unit runs. 1: Clock supply to the JPEG codec unit is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note: * The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	MSTP66	MSTP65	MSTP64	MSTP63	MSTP62	MSTP61	MSTP60
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
6	MSTP66	1	R/W	Module Stop 66* When the MSTP66 bit is set to 1, the clock supply to the video input module is halted. 0: The video input module runs. 1: Clock supply to the video input module is halted.
5	MSTP65	1	R/W	Module Stop 65* When the MSTP65 bit is set to 1, the clock supply to the channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller is halted. 0: The channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller run. 1: Clock supply to the channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller is halted.
4	MSTP64	1	R/W	Module Stop 64* When the MSTP64 bit is set to 1, the clock supply to the channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller is halted. 0: The channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller run. 1: Clock supply to the channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller is halted.
3	MSTP63	1	R/W	Module Stop 63* When the MSTP63 bit is set to 1, the clock supply to the PTP controller for the Ethernet controllers and DMA controller for the PTP controller is halted. 0: The PTP controller for the Ethernet controllers and DMA controller for the PTP controller run. 1: Clock supply to the PTP controller for the Ethernet controllers and DMA controller for the PTP controller is halted.
2	MSTP62	1	R/W	Module Stop 62* When the MSTP62 bit is set to 1, the clock supply to the circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers is halted. 0: The circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers run. 1: Clock supply to the circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers is halted.
1	MSTP61	1	R/W	Module Stop 61* When the MSTP61 bit is set to 1, the clock supply to the channel 0 USB 2.0 host/function module is halted. 0: The channel 0 USB 2.0 host/function module runs. 1: Clock supply to the channel 0 USB 2.0 host/function module is halted.
0	MSTP60	1	R/W	Module Stop 60* When the MSTP60 bit is set to 1, the clock supply to the channel 1 USB 2.0 host/function module is halted. 0: The channel 1 USB 2.0 host/function module runs. 1: Clock supply to the channel 1 USB 2.0 host/function module is halted.

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP77	MSTP76	MSTP75	—	MSTP73	MSTP72	MSTP71	MSTP70
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP77	1	R/W	Module Stop 77* When the MSTP77 bit is set to 1, the clock supply to the image renderer is halted. 0: The image renderer runs. 1: Clock supply to the image renderer is halted.
6	MSTP76	1	R/W	Module Stop 76* When the MSTP76 bit is set to 1, the clock supply to the 2D Drawing Engine is halted. 0: The 2D Drawing Engine runs. 1: Clock supply to the 2D Drawing Engine is halted.
5	MSTP75	1	R/W	Module Stop 75 When the MSTP75 bit is set to 1, the clock supply to the MIPI CSI-2 interface is halted. 0: The MIPI CSI-2 interface runs. 1: Clock supply to the MIPI CSI-2 interface is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP73	1	R/W	Module Stop 73 When the MSTP73 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted.
2	MSTP72	1	R	Module Stop 72 When the MSTP72 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted.
1	MSTP71	1	R/W	Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted.

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP87	MSTP86	MSTP85	MSTP84	MSTP83	—	MSTP81	—
Initial value:	1	1	1	1	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP87	1	R/W	Module Stop 87 When the MSTP87 bit is set to 1, the clock supply to channel 0 of the I2C bus interface (RIIC) is halted. 0: Channel 0 of the I2C bus interface runs. 1: Clock supply to channel 0 of the I2C bus interface is halted.
6	MSTP86	1	R/W	Module Stop 86 When the MSTP86 bit is set to 1, the clock supply to channel 1 of the I2C bus interface (RIIC) is halted. 0: Channel 1 of the I2C bus interface runs. 1: Clock supply to channel 1 of the I2C bus interface is halted.
5	MSTP85	1	R/W	Module Stop 85 When the MSTP85 bit is set to 1, the clock supply to channel 2 of the I2C bus interface (RIIC) is halted. 0: Channel 2 of the I2C bus interface runs. 1: Clock supply to channel 2 of the I2C bus interface is halted.
4	MSTP84	1	R/W	Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to channel 3 of the I2C bus interface (RIIC) is halted. 0: Channel 3 of the I2C bus interface runs. 1: Clock supply to channel 3 of the I2C bus interface is halted.
3	MSTP83	0	R/W	Module Stop 83 When the MSTP83 bit is set to 1, the clock supply to the SPI multi I/O bus controller is halted. 0: The SPI multi I/O bus controller runs. 1: Clock supply to the SPI multi I/O bus controller is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP81	1	R/W	Module Stop 81* When the MSTP81 bit is set to 1, the clock supply to the video display controller 6 is halted. 0: The video display controller 6 runs. 1: Clock supply to the video display controller 6 is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP97	MSTP96	MSTP95	—	MSTP93	MSTP92	MSTP91	MSTP90
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP97	1	R/W	Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.
6	MSTP96	1	R/W	Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.
5	MSTP95	1	R/W	Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP93	1	R/W	Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to the HyperBus controller is halted. 0: The HyperBus controller runs. 1: Clock supply to the HyperBus controller is halted.
2	MSTP92	1	R/W	Module Stop 92 When the MSTP92 bit is set to 1, the clock supply to the octa memory controller is halted. 0: The octa memory controller runs. 1: Clock supply to the octa memory controller is halted.
1	MSTP91	1	R/W	Module Stop 91* When the MSTP91 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface run. 1: Clock supply to the Renesas SPDIF interface is halted.
0	MSTP90	1	R/W	Module Stop 90* When the MSTP90 bit is set to 1, the clock supply to the dynamic reconfigurable processer (DRP) is halted. 0: The dynamic reconfigurable processer (DRP) runs. 1: Clock supply to the dynamic reconfigurable processer (DRP) is halted. If the product does not have a DRP, the value written to this bit should always be 1.

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP107	—	—	MSTP104	MSTP103	MSTP102	MSTP101	MSTP100
Initial value:	1	0	0	1	1	1	1	1
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP107	1	R/W	Module Stop 107*1 When the MSTP107 bit is set to 1, the clock supply to the Trusted Secure IP module is halted. 0: The Trusted Secure IP module runs. 1: Clock supply to the Trusted Secure IP module is halted. Note: If the product does not have a Trusted Secure IP module, the value written to this bit should always be 1.
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MSTP104	1	R/W	Module Stop 104*1 When the MSTP104 bit is set to 1, the clock supply to the NAND flash controller is halted. 0: The NAND flash controller runs. 1: Clock supply to the NAND flash controller is halted.
3	MSTP103	1	R/W	Module Stop 103 and 102*1 When the MSTP103 and MSTP102 bits are set to 11, the clock supply to the channel 0 SD/MMC host interface is halted. 00: The channel 0 SD/MMC host interface runs. 11: Clock supply to the channel 0 SD/MMC host interface is halted. Others: Setting prohibited
2	MSTP102	1	R/W	
1	MSTP101	1	R/W	Module Stop 101 and 100*1 When the MSTP101 and MSTP100 bits are set to 11, the clock supply to the channel 1 SD/MMC host interface is halted. 00: The channel 1 SD/MMC host interface runs. 11: Clock supply to the channel 1 SD/MMC host interface is halted. Others: Setting prohibited
0	MSTP100	1	R/W	

Note 1. The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.11 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls software resetting of individual modules and the operation of the crystal oscillator for audio.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXTALE	—	—	—	SRST13	SRST12	SRST11	SRST10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6 to 4	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SRST13	0	R/W	Video Display Controller 6 Software Reset Controls resetting of the video display controller 6 by software. 0: The video display controller 6 reset is canceled. 1: The video display controller 6 is reset.
2	SRST12	0	R/W	Trusted Secure IP Software Reset Controls resetting of the Trusted Secure IP module by software. 0: The Trusted Secure IP reset is canceled. 1: The Trusted Secure IP module is reset. Note: If the product does not have a Trusted Secure IP module, the value written to this bit should always be 0.
1	SRST11	0	R/W	JPEG Codec Unit Software Reset Controls resetting of the JPEG codec unit by software. 0: The JPEG codec unit reset is canceled. 1: The JPEG codec unit is reset.
0	SRST10	0	R/W	SPI Multi I/O Bus Controller Software Reset Controls resetting of the SPI multi I/O bus controller by software. 0: The SPI multi I/O bus controller reset is canceled. 1: The SPI multi I/O bus controller is reset.

52.2.12 Software Reset Control Register 2 (SWRSTCR2)

SWRSTCR2 is an 8-bit readable/writable register that controls a software reset for each module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	SRST 26	SRST 25	SRST 24	SRST 23	SRST 22	SRST 21	—
Initial value:	1	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
6	SRST26	0	R/W	NAND Flash Controller Software Reset Controls resetting of the NAND flash controller by software. 0: The NAND flash controller reset is canceled. 1: The NAND flash controller is reset.
5	SRST25	0	R/W	Video Input Module Software Reset Controls resetting of the video input module by software. 0: The video input module reset is canceled. 1: The video input module is reset.
4	SRST24	0	R/W	Image Renderer Software Reset Controls resetting of the image renderer by software. 0: The image renderer reset is canceled. 1: The image renderer is reset.
3	SRST23	0	R/W	MIPI CSI-2 Interface Software Reset Controls resetting of the MIPI CSI-2 interface by software. 0: The MIPI CSI-2 interface reset is canceled. 1: The MIPI CSI-2 interface is reset.
2	SRST22	0	R/W	2D Drawing Engine Software Reset Controls resetting of the 2D drawing engine by software. 0: The 2D drawing engine reset is canceled. 1: The 2D drawing engine is reset.
1	SRST21	0	R/W	Capture Engine Unit Software Reset Controls resetting of the capture engine unit by software. 0: The capture engine unit reset is canceled. 1: The capture engine unit is reset.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

52.2.13 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.
When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.
SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAME4	VRAME3	VRAME2	VRAME1	VRAME0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.14 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.
When a VRAMWEn (n = 0 to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.
SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAME4	VRAME3	VRAME2	VRAME1	VRAME0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.15 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn (n = 0 to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAMWE3	RRAMWE2	RRAMWE1	RRAMWE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3*2 in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2*2 in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1*2 in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0*2 in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 50, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

52.2.16 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	IS BUSY	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0.
4	ISBUSY	0	R	State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress
3 to 0	—	All 0	R	Reserved These bits are always read as 0.

52.2.17 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBRQ 15	—	STBRQ 13	STBRQ 12	STBRQ 11	STBRQ 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBRQ15	0	R/W	Standby Request to CoreSight 0: The standby request to the CoreSight is invalid. 1: The standby request to the CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	STBRQ13	0	R/W	Standby Request to JPEG Codec Unit 0: The standby request to the JPEG codec unit is invalid. 1: The standby request to the JPEG codec unit is valid.*1
2	STBRQ12	0	R/W	Standby Request to the Channel 0 SD/MMC Host Interface 0: The standby request to the channel 0 SD/MMC host interface is invalid. 1: The standby request to the channel 0 SD/MMC host interface is valid.*1
1	STBRQ11	0	R/W	Standby Request to the Channel 1 SD/MMC Host Interface 0: The standby request to the channel 1 SD/MMC host interface is invalid. 1: The standby request to the channel 1 SD/MMC host interface is valid.*1
0	STBRQ10	0	R/W	Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.18 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBRQ27	STBRQ26	STBRQ25	STBRQ24	STBRQ23	STBRQ22	STBRQ21	STBRQ20
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	STBRQ27	0	R/W	Standby Request to Video Input Module 0: The standby request to the video input module is invalid. 1: The standby request to the video input module is valid.*1
6	STBRQ26	0	R/W	Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1
5	STBRQ25	0	R/W	Standby Request to Channel 0 of Video Display Controller 6 0: The standby request to channel 0 of the video display controller 6 is invalid. 1: The standby request to channel 0 of the video display controller 6 is valid.*1
4	STBRQ24	0	R/W	Standby Request to Dynamic Reconfigurable Processor (DRP) 0: The standby request to the dynamic reconfigurable processor (DRP) is invalid. 1: The standby request to the dynamic reconfigurable processor (DRP) is valid.*1 If the product does not have a DRP, the value written to this bit should always be 0.
3	STBRQ23	0	R/W	Standby Request to Image Renderer 0: The standby request to the image renderer is invalid. 1: The standby request to the image renderer is valid.*1
2	STBRQ22	0	R/W	Standby Request to NAND Flash Controller 0: The standby request to the NAND flash controller is invalid. 1: The standby request to the NAND flash controller is valid.*1
1	STBRQ21	0	R/W	Standby Request to 2D Drawing Engine (Texture) 0: The standby request to the 2D drawing engine (texture) is invalid. 1: The standby request to the 2D drawing engine (texture) is valid.*1
0	STBRQ20	0	R/W	Standby Request to 2D Drawing Engine (Data) 0: The standby request to the 2D drawing engine (data) is invalid. 1: The standby request to the 2D drawing engine (data) is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.19 Standby Request Register 3 (STBREQ3)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	STBRQ33	STBRQ32	STBRQ31	STBRQ30
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	STBRQ33	0	R/W	Standby Request to the Channel 1 USB 2.0 Function Module 0: The standby request to the channel 1 USB 2.0 function module is invalid. 1: The standby request to the channel 1 USB 2.0 function module is valid.*1
2	STBRQ32	0	R/W	Standby Request to the Channel 1 USB 2.0 Host Module 0: The standby request to the channel 1 USB 2.0 host module is invalid. 1: The standby request to the channel 1 USB 2.0 host module is valid.*1
1	STBRQ31	0	R/W	Standby Request to the Channel 0 USB 2.0 Function Module 0: The standby request to the channel 0 USB 2.0 function module is invalid. 1: The standby request to the channel 0 USB 2.0 function module is valid.*1
0	STBRQ30	0	R/W	Standby Request to the Channel 0 USB 2.0 Host Module 0: The standby request to the channel 0 USB 2.0 host module is invalid. 1: The standby request to the channel 0 USB 2.0 host module is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.20 Standby Acknowledge Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBAK15	—	STBAK13	STBAK12	STBAK11	STBAK10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5	STBAK15	0	R	Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0.
3	STBAK13	0	R	Standby Acknowledgement from JPEG Codec Unit 0: The standby acknowledgement from the JPEG codec unit is invalid. 1: The standby acknowledgement from the JPEG codec unit is valid.*1
2	STBAK12	0	R	Standby Acknowledgement from the Channel 0 SD/MMC Host Interface 0: The standby acknowledgement from the channel 0 SD/MMC host interface is invalid. 1: The standby acknowledgement from the channel 0 SD/MMC host interface is valid.*1
1	STBAK11	0	R	Standby Acknowledgement from the Channel 1 SD/MMC Host Interface 0: The standby acknowledgement from the channel 1 SD/MMC host interface is invalid. 1: The standby acknowledgement from the channel 1 SD/MMC host interface is valid.*1
0	STBAK10	0	R	Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.21 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	STBAK 27	STBAK 26	STBAK 25	STBAK 24	STBAK 23	STBAK 22	STBAK 21	STBAK 20
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBAK27	0	R	Standby Acknowledgement from Video Input Module 0: The standby acknowledgement from the video input module is invalid. 1: The standby acknowledgement from the video input module is valid.*1
6	STBAK26	0	R	Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1
5	STBAK25	0	R	Standby Acknowledgement from Video Display Controller 6 0: The standby acknowledgement from the video display controller 6 is invalid. 1: The standby acknowledgement from the video display controller 6 is valid.*1
4	STBAK24	0	R	Standby Acknowledgement from Dynamic Reconfigurable Processor (DRP) 0: The standby acknowledgement from the dynamic reconfigurable processor (DRP) is invalid. 1: The standby acknowledgement from the dynamic reconfigurable processor (DRP) is valid.*1 If the product does not have a DRP, the value written to this bit should always be 0.
3	STBAK23	0	R	Standby Acknowledgement from Image Renderer 0: The standby acknowledgement from the image renderer is invalid. 1: The standby acknowledgement from the image renderer is valid.*1
2	STBAK22	0	R	Standby Acknowledgement from NAND Flash Controller 0: The standby acknowledgement from the NAND flash controller is invalid. 1: The standby acknowledgement from the NAND flash controller is valid.*1
1	STBAK21	0	R	Standby Acknowledgement from 2D Drawing Engine (Texture) 0: The standby acknowledgement from the 2D drawing engine (texture) is invalid. 1: The standby acknowledgement from the 2D drawing engine (texture) is valid.*1
0	STBAK20	0	R	Standby Acknowledgement from 2D Drawing Engine (Data) 0: The standby acknowledgement from the 2D drawing engine (data) is invalid. 1: The standby acknowledgement from the 2D drawing engine (data) is valid.*1

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.22 Standby Acknowledge Register 3 (STBACK3)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	STBAK 33	STBAK 32	STBAK 31	STBAK 30
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0.
3	STBAK33	0	R	Standby Acknowledgement from the Channel 1 USB 2.0 Function Module 0: The standby acknowledgement from the channel 1 USB 2.0 function module is invalid. 1: The standby acknowledgement from the channel 1 USB 2.0 function module is valid.*1
2	STBAK32	0	R	Standby Acknowledgement from the Channel 1 USB 2.0 Host Module 0: The standby acknowledgement from the channel 1 USB 2.0 host module is invalid. 1: The standby acknowledgement from the channel 1 USB 2.0 host module is valid.*1
1	STBAK31	0	R	Standby Acknowledgement from the Channel 0 USB 2.0 Function Module 0: The standby acknowledgement from the channel 0 USB 2.0 function module is invalid. 1: The standby acknowledgement from the channel 0 USB 2.0 function module is valid.*1
0	STBAK30	0	R	Standby Acknowledgement from the Channel 0 USB 2.0 Host Module 0: The standby acknowledgement from the channel 0 USB 2.0 host module is invalid. 1: The standby acknowledgement from the channel 0 USB 2.0 host module is valid.*1

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.23 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.
When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAMKP3	RRAMKP2	RRAMKP1	RRAMKP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
1	RRAMKP1	0	R/W	On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
0	RRAMKP0	0	R/W	On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.24 USB Software Standby Cancel Source Control Register 0 (SSTBCCR0)

SSTBCCR0 is a 16-bit readable/writable*1 register that corresponds to the USB channel 0. This register selects whether to mask the corresponding cancellation source in software standby mode. When bits 11 to 8, bit 1, and bit 0 of SSTBCCR0 are set to 0, corresponding cancellation sources are masked. When these bits are set to 1, the corresponding cancellation sources are not masked.
The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN0, OVRCLR0, CC1_Rd0, and CC2_Rd0 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CC2_RD	CC1_RD	OVRCLR	VBUSIN	—	—	—	—	—	—	DM	DP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	CC2_RD	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
10	CC1_RD	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
9	OVRCLR	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
8	VBUSIN	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
0	DP	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.

52.2.25 USB Software Standby Cancel Source Control Register 1 (SSTBCCR1)

SSTBCCR1 is a 16-bit readable/writable*1 register that corresponds to the USB channel 1. This register selects whether to mask the corresponding cancellation source in software standby mode. When bits 11 to 8, bit 1, and bit 0 of SSTBCCR1 are set to 0, corresponding cancellation sources are masked. When these bits are set to 1, the corresponding cancellation sources are not masked.
The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN1, OVRCLR1, CC1_Rd1, and CC2_Rd1 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CC2_RD	CC1_RD	OVRCLR	VBUSIN	—	—	—	—	—	—	DM	DP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	CC2_RD	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
10	CC1_RD	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
9	OVRCLR	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
8	VBUSIN	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.
0	DP	0	R/W	Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source.

52.2.26 USB Software Standby Cancel Source Request Register 0 (SSTBCRR0)

SSTBCRR0 is a 16-bit readable/writable*1 register that corresponds to the USB channel 0. This register sets a flag to indicate which cancellation source canceled the software standby mode, and reads and clears the flag after cancellation of the software standby mode.
The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN0, OVRCLR0, CC1_Rd0, and CC2_Rd0 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CC2_RD	CC1_RD	OVRCLR	VBUSIN	—	—	—	—	—	—	DM	DP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R	R	R	R	R/(W)*	R/(W)*

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	CC2_RD	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
10	CC1_RD	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
9	OVRCLR	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
8	VBUSIN	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	DM	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
0	DP	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode

Note: * Writing is permitted only in the case where [Clearing condition] is met.

52.2.27 USB Software Standby Cancel Source Request Register 1 (SSTBCRR1)

SSTBCRR1 is a 16-bit readable/writable*1 register that corresponds to the USB channel 1. This register sets a flag to indicate which cancellation source canceled the software standby mode, and reads and clears the flag after cancellation of the software standby mode.
The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN1, OVRCLR1, CC1_Rd1, and CC2_Rd1 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R	R	R	R	R/(W)*	R/(W)*

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	CC2_RD	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
10	CC1_RD	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
9	OVRCLR	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
8	VBUSIN	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	DM	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode
0	DP	0	R/(W)*	Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode

* Writing is permitted only in the case where [Clearing condition] is met.

52.2.28 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUS KEEPE	RAM BOOT	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'8000_0000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

52.2.29 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (PK_4, PK_2, PJ_5, PJ_1, PH_0, PG_6, PG_2, PH_1, PE_1, P6_2, P3_3, P3_1, and NMI) can be selected as a cancel source. The USB return factor can be selected with the USB Deep standby cancel source select register (USBDSSSR). The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PK_4	PK_2	PJ_5	PJ_1	PH_0	PG_6	NMI	RTCAR1	RTCAR0	PG_2	PH_1	PE_1	P6_2	P3_3	P3_1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	PK_4	0	R/W	Cancel by Change on PK_4 0: Deep standby mode is not canceled by change on the PK_4 pin. 1: Deep standby mode is canceled by change on the PK_4 pin.
13	PK_2	0	R/W	Cancel by Change on PK_2 0: Deep standby mode is not canceled by change on the PK_2 pin. 1: Deep standby mode is canceled by change on the PK_2 pin.
12	PJ_5	0	R/W	Cancel by Change on PJ_5 0: Deep standby mode is not canceled by change on the PJ_5 pin. 1: Deep standby mode is canceled by change on the PJ_5 pin.
11	PJ_1	0	R/W	Cancel by Change on PJ_1 0: Deep standby mode is not canceled by change on the PJ_1 pin. 1: Deep standby mode is canceled by change on the PJ_1 pin.
10	PH_0	0	R/W	Cancel by Change on PH_0 0: Deep standby mode is not canceled by change on the PH_0 pin. 1: Deep standby mode is canceled by change on the PH_0 pin.
9	PG_6	0	R/W	Cancel by Change on PG_6 0: Deep standby mode is not canceled by change on the PG_6 pin. 1: Deep standby mode is canceled by change on the PG_6 pin.
8	NMI	0	R/W	Cancel by Change on NMI 0: Deep standby mode is not canceled by change on the NMI pin. 1: Deep standby mode is canceled by change on the NMI pin.
7	RTCAR1	0	R/W	Cancel by Realtime Clock Alarm 1 Interrupt 0: Deep standby mode is not canceled by a realtime clock alarm 1 interrupt. 1: Deep standby mode is canceled by a realtime clock alarm 1 interrupt.
6	RTCAR0	0	R/W	Cancel by Realtime Clock Alarm 0 Interrupt 0: Deep standby mode is not canceled by a realtime clock alarm 0 interrupt. 1: Deep standby mode is canceled by a realtime clock alarm 0 interrupt.
5	PG_2	0	R/W	Cancel by Change on PG_2 0: Deep standby mode is not canceled by change on the PG_2 pin. 1: Deep standby mode is canceled by change on the PG_2 pin.
4	PH_1	0	R/W	Cancel by Change on PH_1 0: Deep standby mode is not canceled by change on the PH_1 pin. 1: Deep standby mode is canceled by change on the PH_1 pin.
3	PE_1	0	R/W	Cancel by Change on PE_1 0: Deep standby mode is not canceled by change on the PE_1 pin. 1: Deep standby mode is canceled by change on the PE_1 pin.

Bit	Bit Name	Initial Value	R/W	Description
2	P6_2	0	R/W	Cancel by Change on P6_2 0: Deep standby mode is not canceled by change on the P6_2 pin. 1: Deep standby mode is canceled by change on the P6_2 pin.
1	P3_3	0	R/W	Cancel by Change on P6_2 0: Deep standby mode is not canceled by change on the P3_3 pin. 1: Deep standby mode is canceled by change on the P3_3 pin.
0	P3_1	0	R/W	Cancel by Change on P6_2 0: Deep standby mode is not canceled by change on the P3_1 pin. 1: Deep standby mode is canceled by change on the P3_1 pin.

52.2.30 USB Deep Standby Cancel Source Select Register (USBDSSSR)

USBDSSSR is an 8-bit readable/writable register that selects whether or not to cancel the deep standby mode by the return factor of the channel 0 or 1 USB 2.0 host/function module.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	USBDSCE3	USBDSCE2	USBDSCE1	USBDSCE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	USBDSCE3	0	R/W	Cancel by the Return Factor (CLRVM) of the Channel 1 USB 2.0 Host/Function Module 0: Deep standby mode is not canceled by the return factor of the channel 1 USB 2.0 host/function module. 1: Deep standby mode is canceled by the return factor of the channel 1 USB 2.0 host/function module.
2	USBDSCE2	0	R/W	Cancel by the Return Factor (CLRVP) of the Channel 1 USB 2.0 Host/Function Module 0: Deep standby mode is not canceled by the return factor of the channel 1 USB 2.0 host/function module. 1: Deep standby mode is canceled by the return factor of the channel 1 USB 2.0 host/function module.
1	USBDSCE1	0	R/W	Cancel by the Return Factor (CLRVM) of the Channel 0 USB 2.0 Host/Function Module 0: Deep standby mode is not canceled by the return factor of the channel 0 USB 2.0 host/function module. 1: Deep standby mode is canceled by the return factor of the channel 0 USB 2.0 host/function module.
0	USBDSCE0	0	R/W	Cancel by the Return Factor (CLRVP) of the Channel 0 USB 2.0 Host/Function Module 0: Deep standby mode is not canceled by the return factor of the channel 0 USB 2.0 host/function module. 1: Deep standby mode is canceled by the return factor of the channel 0 USB 2.0 host/function module.

52.2.31 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

10	PH_0E	0	R/W	PH_0 Edge Detection 0: Falling edge of PH_0 is detected. 1: Rising edge of PH_0 is detected.
9	PG_6E	0	R/W	PG_6 Edge Detection 0: Falling edge of PG_6 is detected. 1: Rising edge of PG_6 is detected.
8	NMIE	0	R/W	NMI Edge Detection 0: Falling edge of NMI is detected. 1: Rising edge of NMI is detected.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	PG_2E	0	R/W	PG_2 Edge Detection 0: Falling edge of PG_2 is detected. 1: Rising edge of PG_2 is detected.
4	PH_1E	0	R/W	PH_1 Edge Detection 0: Falling edge of PH_1 is detected. 1: Rising edge of PH_1 is detected.
3	PE_1E	0	R/W	PE_1 Edge Detection 0: Falling edge of PE_1 is detected. 1: Rising edge of PE_1 is detected.
2	P6_2E	0	R/W	P6_2 Edge Detection 0: Falling edge of P6_2 is detected. 1: Rising edge of P6_2 is detected.
1	P3_3E	0	R/W	P3_3 Edge Detection 0: Falling edge of P3_3 is detected. 1: Rising edge of P3_3 is detected.
0	P3_1E	0	R/W	P3_1 Edge Detection 0: Falling edge of P3_1 is detected. 1: Rising edge of P3_1 is detected.

52.2.32 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI or realtime clock alarm interrupt) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.
All flags must be cleared immediately before transition to deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO KEEP	PK_4F	PK_2F	PJ_5F	PJ_1F	PH_0F	PG_6F	NMIF	RTC ARF1	RTC ARF0	PG_2F	PH_1F	PE_1F	P6_2F	P3_3F	P3_1F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Bit	Bit Name	Initial Value	R/W	Description
15	IOKEEP	0	R/(W)*1	Release of Pin State Retention Releases the retention of the pin state after canceling deep standby mode 0: Pin state not retained [Clearing condition] • Writing 0 after reading 1 1: Pin state retained [Setting condition] • When deep standby mode is entered

Note 1. Only 0 can be written after reading 1 to clear the flag.

52.2.33 USB Deep standby cancel source flag register (USBDSFR)

USBDSFR is an 8-bit readable/writable register that serves as a flag to check whether deep standby mode has been canceled by the channel 0 or 1 USB 2.0 host/function module.
When deep standby mode is canceled on the channel 0 or 1 USB 2.0 host/function module, power-on reset exception handling is executed, but this register holds the previous value.
When deep standby mode is canceled by a power-on reset, this register is initialized to H'00.
All flags of this register must be cleared immediately before the LSI chip enters deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	USBDSF3	USBDSF2	USBDSF1	USBDSF0
Initial value:	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	USBDSF3	0	R/(W)*	Channel 1 USB 2.0 Host/Function Module Flag (CLRVM) 0: The return source that cancels the deep standby mode is not in the channel 1 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 1 USB 2.0 host/function module.
2	USBDSF2	0	R/(W)*	Channel 1 USB 2.0 Host/Function Module Flag (CLRVP) 0: The return source that cancels the deep standby mode is not in the channel 1 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 1 USB 2.0 host/function module.
1	USBDSF1	0	R/(W)*	Channel 0 USB 2.0 Host/Function Module Flag (CLRVM) 0: The return source that cancels the deep standby mode is not in the channel 0 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 0 USB 2.0 host/function module.
0	USBDSF0	0	R/(W)*	Channel 0 USB 2.0 Host/Function Module Flag (CLRVP) 0: The return source that cancels the deep standby mode is not in the channel 0 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 0 USB 2.0 host/function module.

Note: Only 0 can be written to clear the flag after reading 1.

52.2.34 Deep standby cancel Oscillation stability count register (DSCNT)

DSCNT is a 16-bit readable/writable register. When deep standby mode is canceled by other than a power-on reset, this register serves as the oscillation stabilization counter for recovery.
This register is initialized to H'0000 at power on reset or after canceling deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CNTD[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	CNTD[7:0]	H'00	R/(W)*	Initial value of oscillation stability count for deep standby canceling Set the start value of counting except reset. When the count value overflows, deep standby mode is canceled and power-on reset exception handling is executed. Table 52.3 shows the setting contents of CNTD[7:0] bits.

Table 52.3 Oscillation Settling Time for deep standby canceling (other than power on reset)

	Oscillation Settling Time	
CNTD[7:0] Setting Value	P0φ = 33 MHz	P0φ = 27.5 MHz
H'00 (Initial Value)	15.8 ms	19.0 ms
H'A0	5.9 ms	7.1 ms
H'B0	4.9 ms	5.9 ms
H'C0	3.9 ms	4.7 ms
H'D0	2.9 ms	3.5 ms
H'E0	1.9 ms	2.3 ms

Note: Oscillation Settling Time(s) = (H'FF – CNTD[7:0] Setting Value)/(P0φ/2048)
Setting for 1ms or less is prohibited.

When the setting of the RTC1XT and RTC0XT bits in the RTCXTALSEL register is 0, the EXTAL clock stops oscillating when the chip is placed on deep standby. Set the CNTD[7:0] bits to obtain an interval that is no less than the sum of the on-chip oscillation circuit oscillation settling time (t_{ROSC}) of the EXTAL and the internal PLL circuit oscillation settling time (t_{POSC}).
When the setting of one or both of the RTC1XT or RTC0XT bits is 1, the EXTAL clock continues oscillating even on deep standby. In this case, set the CNTD[7:0] bits to obtain an interval that is no less than the internal PLL circuit oscillation settling time (t_{POSC}).

52.2.35 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL and the realtime clock.

If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.

This bit is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GAIN0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAIN0	0	R/W	XTAL Crystal Oscillator (EXTAL or XTAL Pin) Gain Select 0: Large gain 1: Small gain

52.2.36 RTCXTAL select register (RTCXTALSEL)

RTCXTALSEL is a 16-bit readable/writable register that controls EXTAL oscillation in deep standby mode.

When RTC1XT and RTC0XT bits are both 0, EXTAL stops oscillation simultaneously with deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTC1XT	RTC0XT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RTC1XT	x	R/W	RTC1 EXTAL used bit 0: E XTAL unused 1: EXTAL used
0	RTC0XT	x	R/W	RTC0 EXTAL used bit 0: EXTAL unused 1: EXTAL used

52.3 Operation

52.3.1 Sleep Mode

(1) Transition to Sleep Mode

When the WFI instruction is executed while the STBY bit of STBCR1 is 0, the program execution state is shifted to the sleep mode. Although the CPU halts after executing the WFI instruction, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run. The clock output from the CKIO pin is continued.
Note: When writing to STBCR1 register, see section 52.4, Usage Notes.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
  When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. An interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
  Sleep mode is canceled by a power-on reset.

52.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

Executing the WFI instruction with the STBY bit and DEEP bit in STBCR1 set to 1 and 0, respectively, leads to the LSI chip entering software standby mode from the program execution state. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules other than the USB module are halted. To halt the USB module as well, set the USBCTR.DIRPD bit to 1 before executing the procedure for transition to standby mode. For details, see section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used.
Only make this setting when the USB module is not to be used. Output of the clock signal from the CKIO pin also stops. The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. For the states of on-chip peripheral module registers in software standby mode, see section 55, Register States.

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to software standby proceeds.
Since the transition to software standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.
To suppress an unintended request from a bus master, use the software to stop bus masters before transition to the software standby mode.

The procedure for switching to software standby mode is as follows:

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the CKS[3:0] bits in WTCSR and the watchdog timer counter (WTCNT) so that the watchdog timer overflow period is no less than the oscillation settling time after release from the standby state.
4. When an IRQ interrupt signal is used as a software standby cancellation source, change the input/output port to a desired IRQ[*1] and clear all interrupt request flags for the IRQ7 to IRQ0 pins. Then, set the IRQMSK bit to 1 in the IRQ interrupt request register (IRQRR) of the interrupt controller to cancel the cancellation source signal mask of IRQ.
   For details of the interrupt request register, see section 7.3.3, IRQ Interrupt Request Register (IRQRR).
5. When using the USB software standby cancellation source signal, change the input/output port to a desired USB signal[*2] and set the corresponding cancellation source mask bit to 1 in the USB Software standby cancel source control register (SSTBCCR0/1) to cancel the mask. At this time, clear the cancellation source bit of the USB used as a cancellation source by the USB Software Standby Cancel Source Request Register (SSTBCRR0/1).
   For details about the USB Software standby cancel source control registers, see section 52.2.24, USB Software Standby Cancel Source Control Register 0 (SSTBCCR0) and section 52.2.25, USB Software Standby Cancel Source Control Register 1 (SSTBCCR1). For details about the USB Software standby cancel source request registers, see section 52.2.26, USB Software Standby Cancel Source Request Register 0 (SSTBCRR0) and section 52.2.27, USB Software Standby Cancel Source Request Register 1 (SSTBCRR1).
6. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR1. Then, execute a WFI instruction.

Note 1. If the desired IRQ has already been used, input/output port switching is not required.
Note 2. If the desired USB signal has already been used, input/output port switching is not required.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ), USB software standby cancel source, or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt or USB software standby cancel source
  When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) or the falling edge or rising edge of the USB software standby cancel source (DP, DM, VBUSIN, OVRCLR, CC1_RD, or CC2_RD) is detected, clock oscillation is started.
  This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.
  When the time specified by the clock select bits (CKS[3:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer has elapsed before the transition to software standby mode, the watchdog timer overflow occurs.
  Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire LSI. Software standby mode is thus cleared and NMI interrupts exception handling (IRQ interrupt exception handling in case of IRQ, and USB interrupt exception handling in case of USB) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel the software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register. When canceling software standby mode by the NMI interrupt, IRQ interrupts, or USB software standby cancellation source, set the CKS[3:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time. The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.
- Canceling by a reset
  When the RES# pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the RES# pin is driven high, the power-on reset exception handling is started.
  Keep the RES# pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.
When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

52.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 52.2.
When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

Note: When writing to STBCR1 register, see section 52.4, Usage Notes.

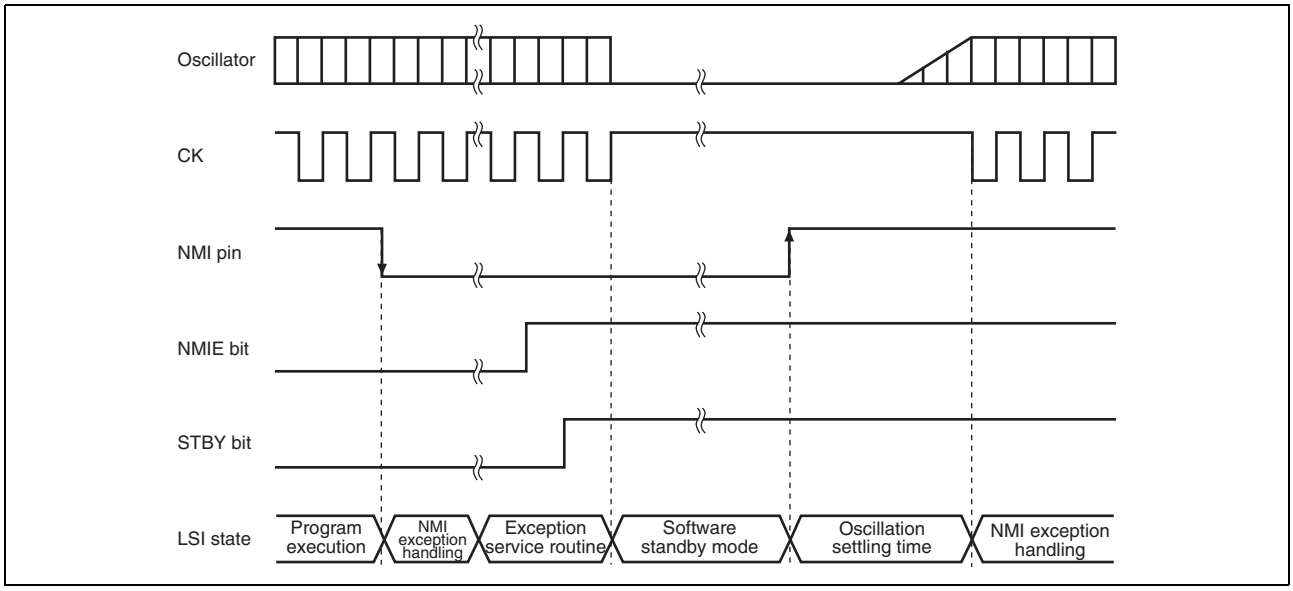

Figure 52.2 NMI Timing in Software Standby Mode (Application Example)

52.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.
The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to deep standby proceeds.
Since the transition to deep standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.
In addition, to suppress unintended requests from bus masters, the software should stop the bus masters before executing the procedure for the transition to deep standby mode. When not using the return factor of the USB 2.0 host/function module, execute the procedure in section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used before executing the procedure for the transition to deep standby mode.

The procedure for switching to deep standby mode is as follows. Figure 52.3 also shows its flowchart.

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby, set the corresponding bit in DSSSR or USBDSSSR, to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in DSESR. Also, set the oscillation stabilization time setting with the corresponding bit in the Deep standby cancel Oscillation stability count register (DSCNT).
5. Read any address on each page of the on-chip data-retention RAM area that must be retained. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.
6. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.
7. Clear the flag in the DSFR, USBDSFR register.
8. Set the CPU interface control register (GICC_CTLR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the GICC_CTLR register.
9. Execute the WFI instruction.
10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

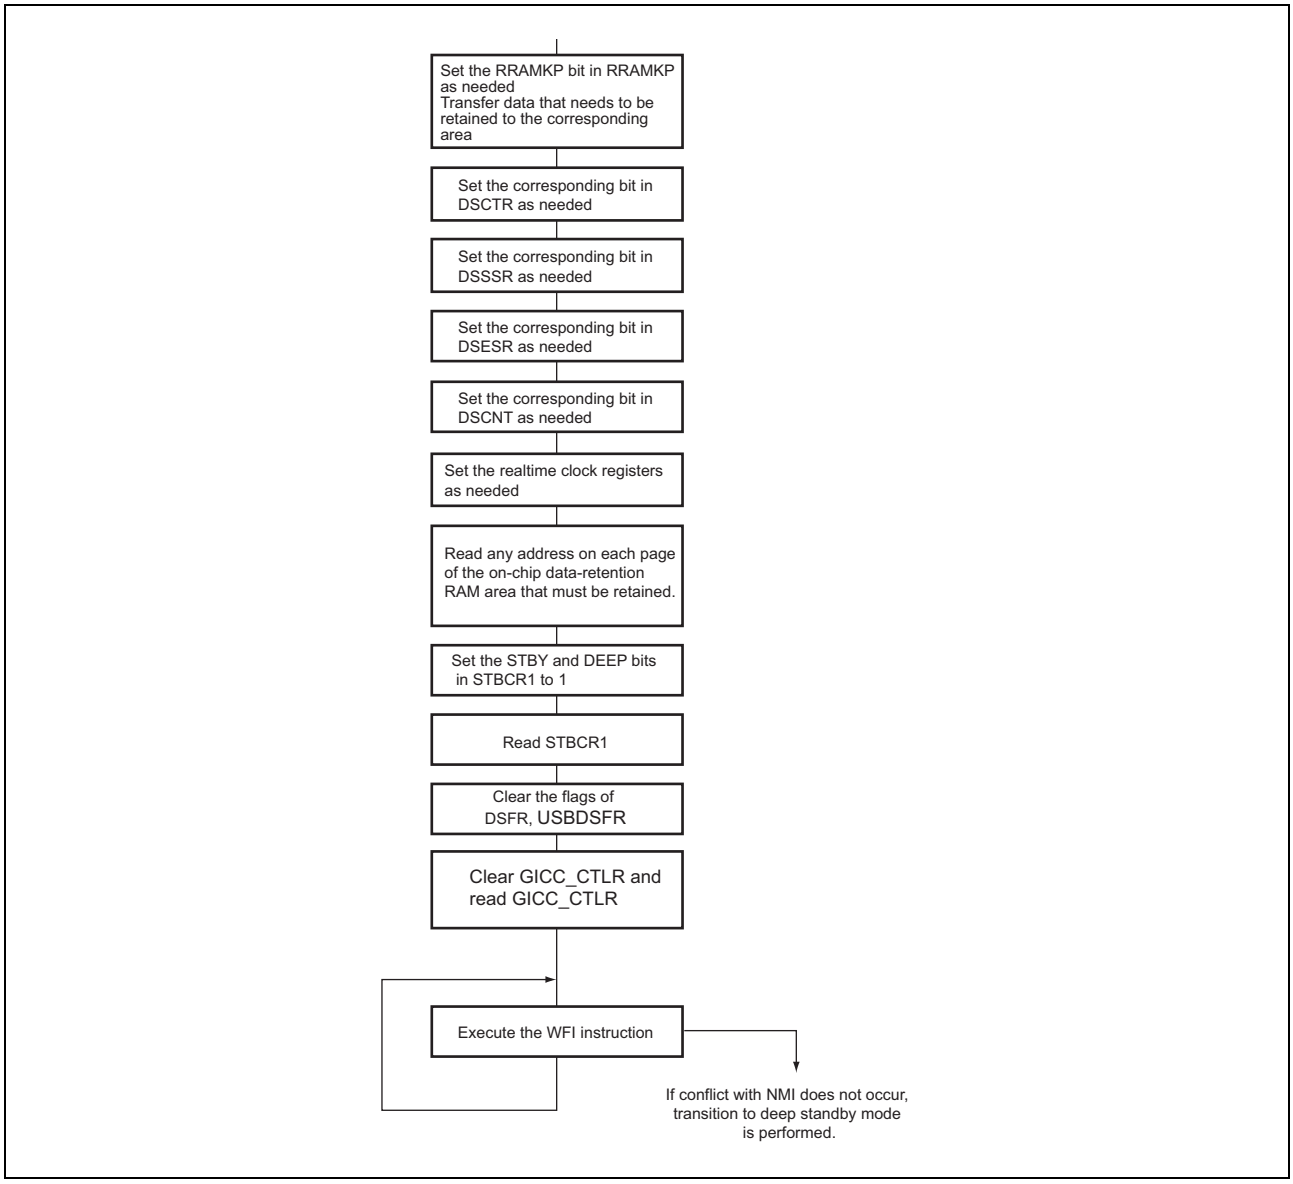

Figure 52.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or alarm interrupt of realtime clocks 0 and 1 or cancel source of the channels 0 and 1 USB 2.0 host/function modules), change on the pins for canceling, or a reset (power-on reset). The interrupt from the channels 0 and 1 USB 2.0 host/function modules can always cancel deep standby mode regardless of the setting value of the execution priority register of the interrupt controller. The realtime clock 0 or 1 alarm interrupt can always cancel deep standby mode regardless of the setting of the execution priority register for the interrupt controller and of the alarm interrupt enable flag (RCR1.AIE). This interrupt can also always cancel this mode regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.

Figure 52.4 shows the flowchart of canceling deep standby mode.

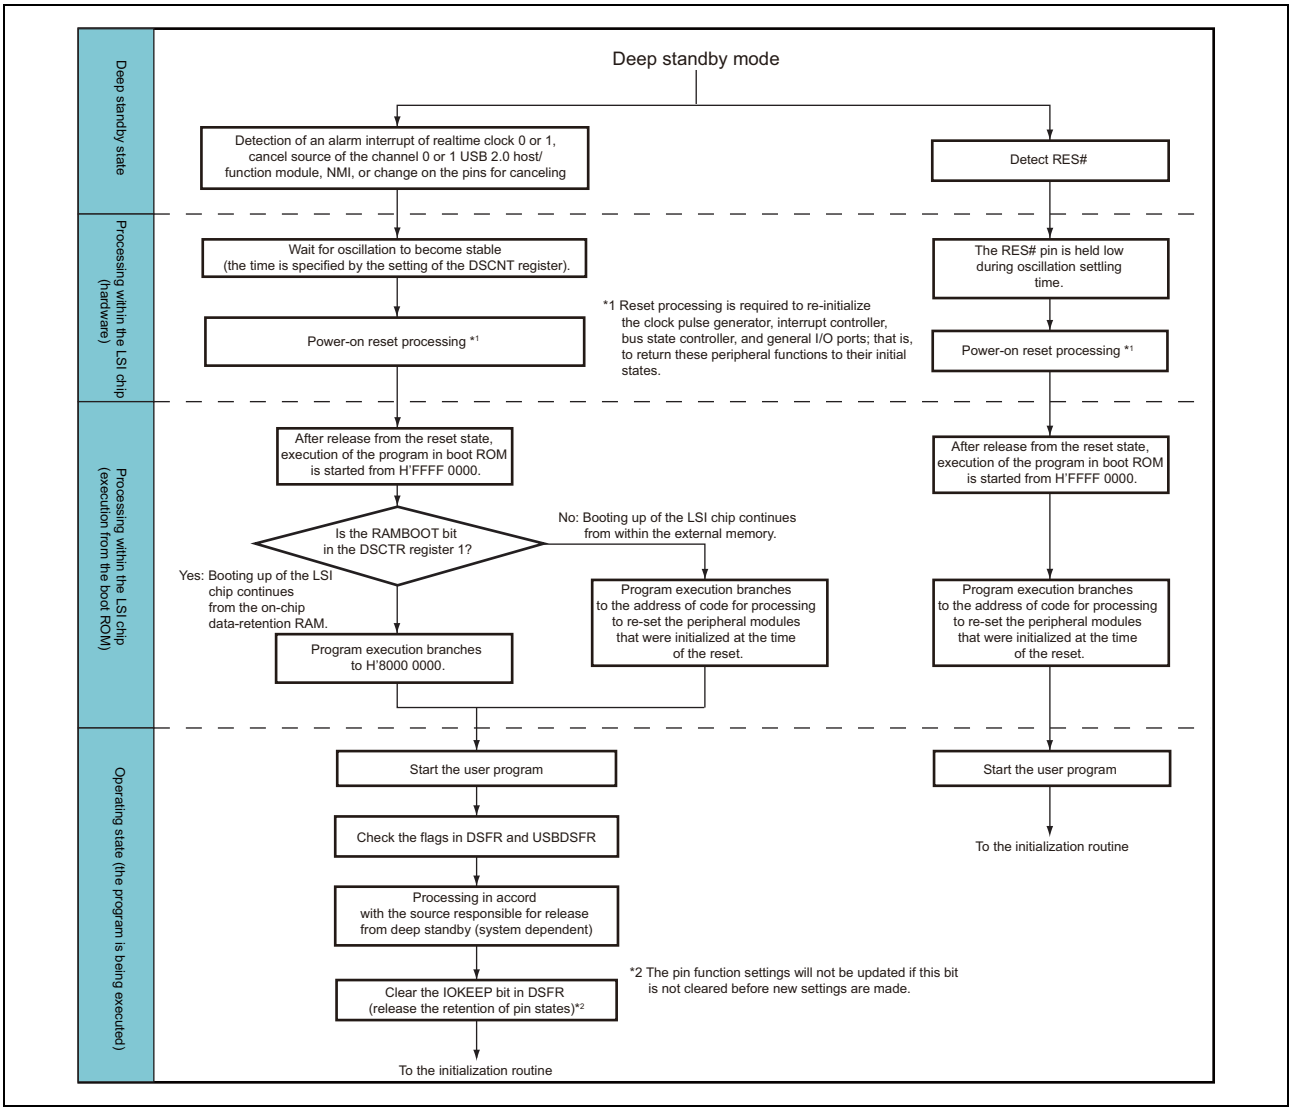

Figure 52.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset
  When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or a realtime clock 0 or 1 alarm interrupt (see section 16.3.6, Alarm Function) or channel 0 or 1 USB 2.0 host/function module interrupt is generated, clock oscillation is started after the wait time for the power supply stabilization settling time. After the oscillation settling time has elapsed (setting the corresponding bits in DSCNT), deep standby mode is cancelled and the power-on reset exception handling is executed.
  The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.
  The detecting of the NMI pin, the pins for canceling, and the realtime clock 0 or 1 alarm interrupt becomes enabled when the corresponding bits in DSSSR are set. Likewise, the detecting of the interrupt from the channels 0 and 1 USB 2.0 host/function modules becomes enabled when the corresponding bits in USBDSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR and USBDSFR after canceling the deep standby mode.
  When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.
- Canceling with a reset
  Driving the RES# pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the RES# pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the RES# pin low.
  Keep the RES# pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 52.4 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 52.4 lists the external memory control pins.

Table 52.4 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 52.5 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area: Bus Width: 16 Bits)	Boot Mode 1 (eSD Boot)	Boot Mode 2 (eMMC Boot)	Boot Mode 3 (Serial Flash Boot 3.3 V)	Boot Mode 4 (Octal-SPI Flash Boot)	Boot Mode 5 (SPIBSC: HyperFlash Boot 1)	Boot Mode 6 (OctaFlash Boot)	Boot Mode 7 (HyperFlash Boot 2)
A[20:1]	SD0_CLK			QSPI0_SPCLK		OM_SCLK	HM_CK

	SD0_DAT6			QSPI1_IO1		OM_SIO3	HM_DQ3
	SD0_DAT7			QSPI1_IO2		OM_SIO4	HM_DQ4
	SD0_RST#			QSPI1_IO3		OM_SIO5	HM_DQ5
				QSPI1_SSL		OM_SIO6	HM_DQ6
				RPC_RESET#		OM_SIO7	HM_DQ7
				RPC_WP#		OM_RESET#	HM_RESET#
				RPC_INT#			

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm 0 or 1) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode. In case of a USB interrupt, it can be confirmed by the USB Deep standby cancel source flag register (USBDSFR). Pins retain the state immediately before the transition to deep standby mode.

However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM (EBUSKEEPE bit = 1 and RAMBOOT bit = 1 setting), after cancellation of deep standby mode, both the external memory control pins and other pins continues to

retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

52.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting an MSTP bit in a standby control register to 1 halts supply of the clock signal to the corresponding on-chip peripheral module. This function can be used to reduce power consumption both while a program is running and in sleep mode. Disable a module before placing it in the module standby state. If interrupt requests are enabled, set the respective register in the target module or in the interrupt controller to disable interrupt requests. If DMA transfer requests are enabled, set the respective register in the target module to disable DMA transfer requests from the module and then set the respective register in the direct memory access controller to stop DMA transfers. In addition, do not attempt to access a module's registers while it is in the module standby state. The procedure for transitions to the module standby state depends on whether the STBREQ register has a bit for the corresponding module.

(a) Procedure for transition to module standby of modules for which the STBREQ register does not have a corresponding bit

1. Set the MSTP bit of the corresponding module to 1.

(b) Procedure for transition to module standby of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the module is ready to be stopped by the corresponding bit in the STBACK register being set to 1.
3. Set the MSTP bit of the corresponding module to 1.

For states of registers in the module standby function, see section 55, Register States.

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again. If you use the latter approach, the procedure for release from module standby depends on whether the STBREQ register has a bit for the corresponding module.

- Release from the module standby state after the activation of the module by a power-on reset while the MSTP bit is set to 1

1. Clear the MSTP bit to 0.
2. After that, dummy-read the same register.

- Release from the module standby state after a transition to standby following activation of the module

(a) Procedure for release from module standby of modules for which the STBREQ register does not have a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.

(b) Procedure for release from module standby of modules for which the STBREQ register has a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

52.3.6 Software Reset

Initialization equivalent to a power-on reset is only applied to the selected modules. The procedure for transitions to the software reset state varies according to whether the STBREQ register has a bit for the corresponding module. Follow the procedures below according to whether this is or is not the case. If DMA transfer requests are enabled, make the settings to stop the DMA transaction for the corresponding channel before transitions to the software reset state. For stopping the DMA transaction, see section 9.7.11, Transfer Status.

(1) Transition to Software Reset State

(a) Procedure for transition to the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(b) Procedure for transition to the software reset state of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the corresponding bit in the STBACK register has been set to 1.
3. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(2) Canceling Software Reset

(a) Procedure for release from the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.

(b) Procedure for release from the software reset state of modules for which the STBREQ register has a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0.

52.3.7 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator for XTAL and the realtime clock can be adjusted using the GAIN0 bit in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

After a change to the value of the GAIN0 bit, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the change to the gain for the crystal oscillator in use with XTAL proceeds.

Since the change to the gain for the crystal oscillator in use with XTAL cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.

To suppress an unintended request from a bus master, use the software to stop bus masters before changing the gain of the crystal oscillator for XTAL.

1. The large gain is selected in the initial state.
2. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer.
   Specifically, the following settings are necessary:
   TME in WTCSR = 0: Stop the watchdog timer.
   CKS[3:0] in WTCSR: Division ratio for watchdog timer count clock
   WTCNT: Initial counter value
   (The watchdog timer starts counting on the set clock.)
4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 55, Register States.
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

52.4 Usage Notes

52.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.
When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.
Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

52.4.2 Usage Notes when the Realtime Clocks are Not to be Used

When the realtime clocks are not to be used, make the required settings for the clocks that are not to be used by following the procedure listed below.

1. Set 0 in the RCKSEL bits in RTC control register 4 (RCR4) for RTC0 and RTC1, as described in section 16.2.21.
2. Set 0 in the RTCEN bits in RTC control register 3 (RCR3) for RTC0 and RTC1, as described in section 16.2.20. Check that the bits have actually been updated before proceeding with the next step.
3. Set 0 in the RTC1XT and RTC0XT bits in the RTCXTAL selection register (RTCXTALSEL), as described in section 52.2.36.
4. Set 1 in the MSTP53 and MSTP52 bits in the standby control register 5 (STBCR5), as described in section 52.2.5.

52.4.3 Usage Notes when USB 2.0 Host/Function Modules are Not to be Used

When the USB 2.0 host/function modules are not to be used, release the modules that are not to be used from the power-on reset state or deep standby state and then set up the registers by following the procedure shown below.
Note that, if the device in use is one in the 176-pin BGA package, be sure to perform the following processing for the channel 1 USB 2.0 host/function module.

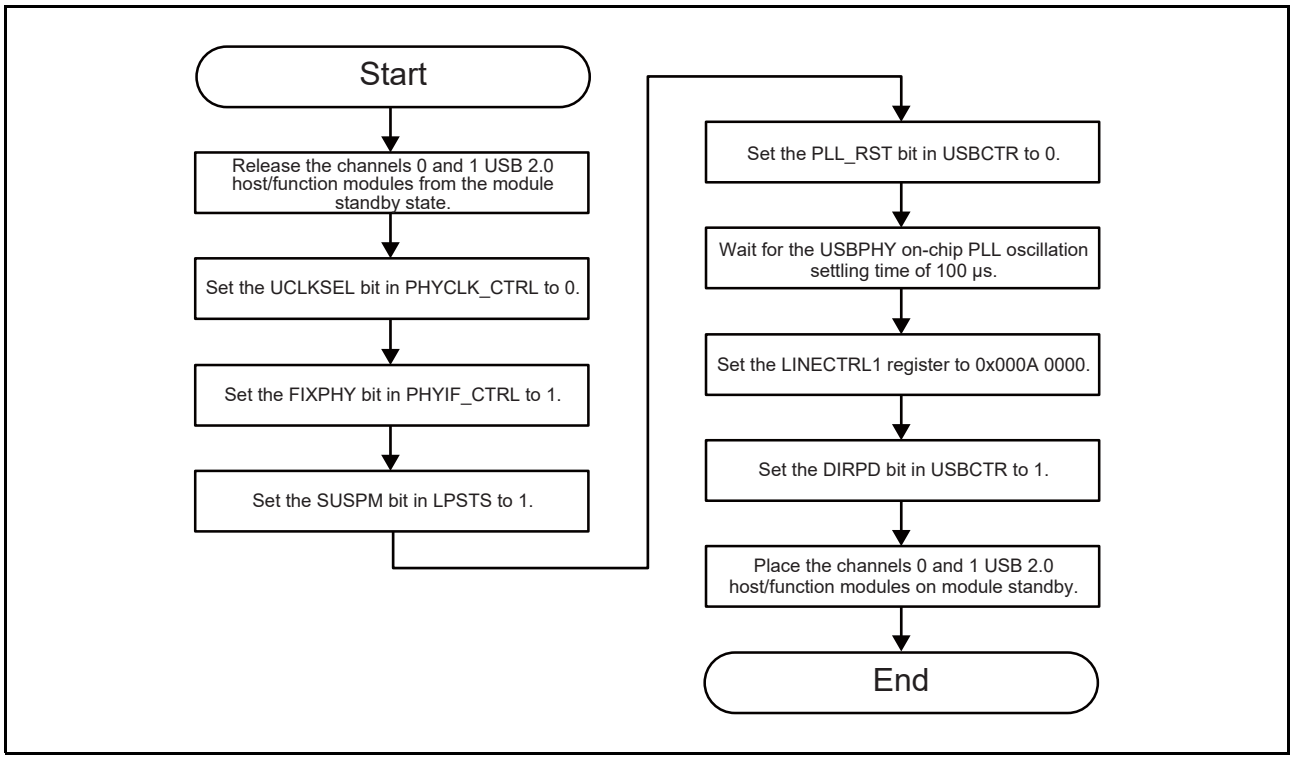

Figure 52.5 Flow of Settings when USB 2.0 Host/Function Modules are Not to be Used

For details on the registers, see section 32.2, Register Descriptions and section 33.2, Registers.

53. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

53.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 53.1 is a block diagram of this module and Table 53.1 shows the JTAG pin mode.

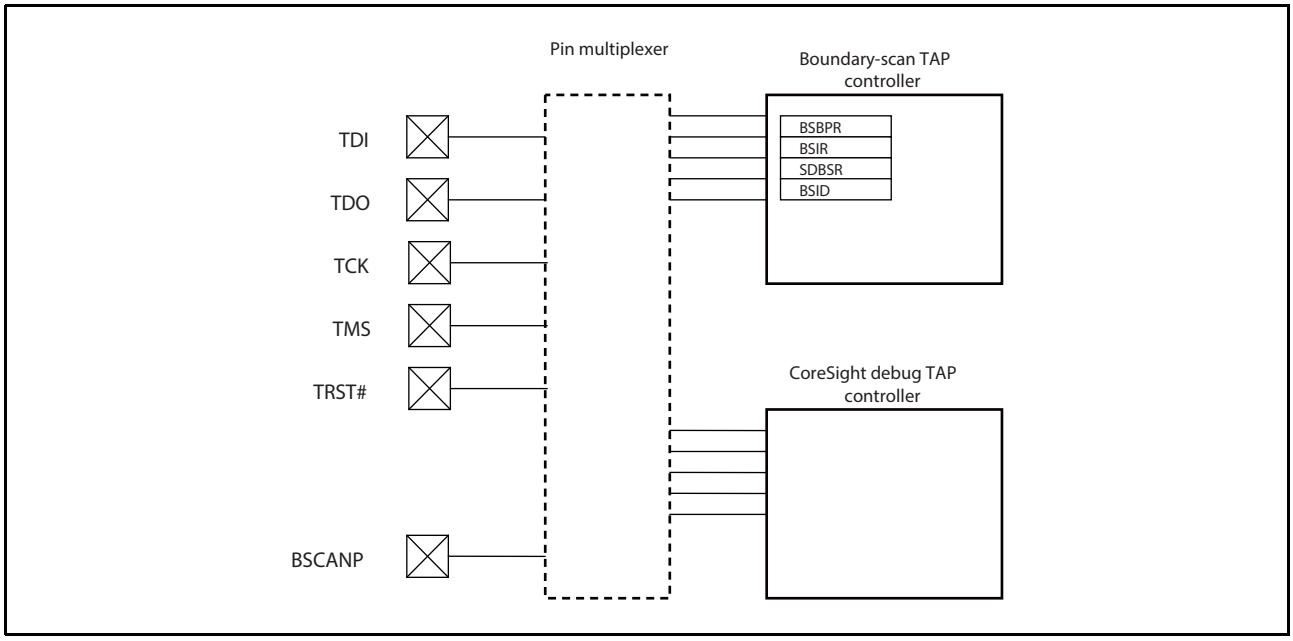

Figure 53.1 Block Diagram

Table 53.1 JTAG Pin Mode

BSCANP	JTAG Pin Mode
0	Normal operation (CoreSight debug mode)
1	Boundary-scan mode

The following lists the features of CoreSight.

- JTAG interface
  Supports JTAG and serial wire debug mode (SWD)
- Trace interface
  Outputs 4-bit × 264-Mbps (132 MHz DDR) trace data
  4-Kbyte Embedded Trace FIFO (ETF)
- SWV interface
  SW Trace output at 66 MHz (P1φ)
- Controls by ICE registers (Do not use these control other than for debugging purpose.)
- Control of resetting
  Disabling power shut-off in deep-standby mode during debugging (fake debug mode)

Figure 53.2 is a block diagram of CoreSight, Table 53.2 to Table 53.10 show the input/output pins of the cross-trigger interface (CTI), and Table 53.11 shows the address map for CoreSight. For details of CoreSight other than ICE registers, see the technical reference manual issued by Arm Ltd.

53.2 Input/Output Pins

Table 53.10 shows the pin configuration of the debugger interface.

Table 53.10 Pin Configuration

Name	Pin Name	Input/ Output	Function
Test clock	TCK/SWDCLK	Input	Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode.
Test mode select	TMS/SWDIO	Input, Input/ Output	Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode.
Test reset	TRST#*1	Input	This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 53.5.2, Reset Signal Setting.
Test data input	TDI	Input	Data is sent to this module by changing this signal in synchronization with the TCK signal.
Test data output	TDO/SWO	Output	Data is read from this module by reading this signal in synchronization with the TCK signal. This pin also functions as an output pin in the serial wire debug (SWD) mode.
Boundary scan setting	BSCANP	Input	Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use.
Clock output	TRACECLK	Output	Trace clock output pin
Enable output	TRACECTL	Output	Trace enable output pin
Data output	TRACEDATA3 to TRACEDATA0	Output	Trace data output pins

Note 1. When designing a board that can use an emulator, the RES# and TRST# pin circuits should be designed so that they can be set low and the TRST# pin can be controlled independently at power-on. When the TRST# pin is not in use, it should be either fixed to low level or connected to the RES# pin (or another pin which operates in the same manner as the RES# pin).

53.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 53.11 List of Registers of Boundary-Scan TAP Controller

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	BSBPR	—	—	—	—
Instruction register	BSIR	—	H'55	—	—
Boundary scan register	SDBSR	—	—	—	—
ID register	BSID	—	H'083B6447	—	—

53.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When BSIR is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

53.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by TRST# assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TI[7:0]	01010101	—	Test Instruction The instruction of this module is transferred to BSIR through a serial input from the TDI pin. For commands, see Table 53.12.

Table 53.12 Commands Supported for Boundary Scan TAP Controller

Bits 7 to 0								
TI7	TI6	TI5	TI4	TI3	TI2	TI1	TI0	Description
0	0	0	0	0	0	0	0	EXTEST
0	1	0	0	0	0	0	0	SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	IDCODE (initial value)
1	1	0	1	0	0	0	0	CLAMP
1	0	0	0	0	0	0	0	HIGHZ
1	1	1	1	1	1	1	1	BYPASS
Other than above								Reserved

53.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. SDBSR cannot be accessed by the CPU. The initial value is undefined. Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 53.13 shows the correspondence between the pins of this LSI and bits of the boundary scan register.

Table 53.13 Correspondence between Pins of this LSI and Bits of Boundary Scan Registers

324-Pin Bit Number	272-/256-Pin Bit Number	176-Pin Bit Number	Pin Name*1	Type	324-Pin Bit Number	272-/256-Pin Bit Number	176-Pin Bit Number	Pin Name*1	Type

20	20	-	PB_5	OUTPUT	2	2	-	PB_1	OUTPUT
19	19	-	PB_5	CONTROL	1	1	-	PB_1	CONTROL
18	18	-	PB_5	INPUT	0	0	-	PB_1	INPUT
17	-	-	P9_3	OUTPUT					

Note 1. The pin names are as listed in the “Port function/dedicated function” column of Table 1.4 in section 1.6, List of Pins.
Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.
Note 3. Bits of type “control” are active low. When the control bit is at the low level, the corresponding pin becomes an output.
Note 4. This pin is a TTL level input in the case of a boundary scan.

53.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can only be read from the pins when the IDCODE command is set. The device ID can be read from the CPU by access to the BSID register as described in section 5.11.1, BSID Register (BSID).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DID[31:16]															
Initial value:	0	0	0	0	1	0	0	0	0	0	1	1	1	0	1	1
R/W:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DID[15:0]															
Initial value:	0	1	1	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DID[31:0]	H'083B6447	—	Device ID This is the ID register stipulated by JTAG. Note that the higher-order four bits may be changed depending on the version of the chip.

53.4 ICE Registers

The debugger interface has the following ICE registers.
ICE registers are exclusively for use in debugging. Do not use these registers other than for debugging.

Table 53.14 Configuration of ICE Registers

Register Name	Abbreviation	R/W	Initial Value	Address		Access Size
				Viewed from CPU	Viewed from Debugger	
Mode reset control register	ICEREGMDRSTCTL*1	R/W	H'0000111E	H'FC00F000	H'8000F000	32
JTAG trace select register	ICEREGJTTRCSEL*1	R/W	H'00000000	H'FC00F004	H'8000F004	32
Clock power control register	ICEREGCLKPWRCTRL*1	R/W	H'00000000	H'FC00F014	H'8000F014	32
Lock access register	ICEREGLOCKACCES	W	—	H'FC00FFB0	H'8000FFB0	32

Note 1. When the CPU is to write a value to these registers, set the ICEREGLOCKACCESS register to "H'C5ACCE55" beforehand.

53.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved The read value is always 0.
12	RSTRB_CPU0_DERSTZ	1	R/W	NEON Reset (low-active) Resets the NEON unit in the CPU.
11 to 9	—	All 0	R	Reserved The read value is always 0.
8	RSTRB_CPU0_CPURSTZ	1	R/W	CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources.
7 to 5	—	All 0	R	Reserved The read value is always 0.
4	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
3	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
2	RSTRB_CPU_PRSTDBGZ	1	R/W	CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem.
1	RSTRB_CPU_SYSRSTZ	1	R/W	CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging.
0	—	0	R	Reserved The read value is always 0.

53.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCK_DIV_SEL[1:0]		—	—	—	—	TRCMUX_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved The read value is always 0.
26, 25	TRCCK_DIV_SEL [1:0]	0	R/W	Sets the divider ratio of the trace clock output. 00: Trace clock /4 (33-MHz DDR) 01: Trace clock /2 (66-MHz DDR) 10: Trace clock (132-MHz DDR) 11: Setting prohibited.
24 to 21	—	All 0	R	Reserved The read value is always 0.
20	TRCMUX_ SEL	0	R/W	Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting.
19 to 0	—	All 0	R	Reserved The read value is always 0.

53.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FAKEDBG CTRL	—	—	—	—	—	—	FAKE DBG
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The read value is always 0.
7	FAKEDBGCTRL	0	R/W	Enables or disables the fake debug mode*1. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register.
6 to 1	—	All 0	R	Reserved The read value is always 0.
0	FAKEDBG	0	R/W	Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode.

Note 1. In fake debug mode, stopping the power supply to any module, including the debugger interface, is disabled; the supply of power to the modules is continued. Using fake debug mode can be helpful in the debugging of software for a system which is released from the deep standby mode after a transition to deep standby mode. Do not use fake debug mode for purposes other than debugging. To use fake debug mode, set the FAKEDBGCTRL and FAKEDBG bits to 1.

53.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ICEREGLOCK ACCESS	—	W	To enable access to ICE registers by the CPU, first write H'C5ACCE55 to this register.

53.5 Operation

53.5.1 TAP Controller

Figure 53.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

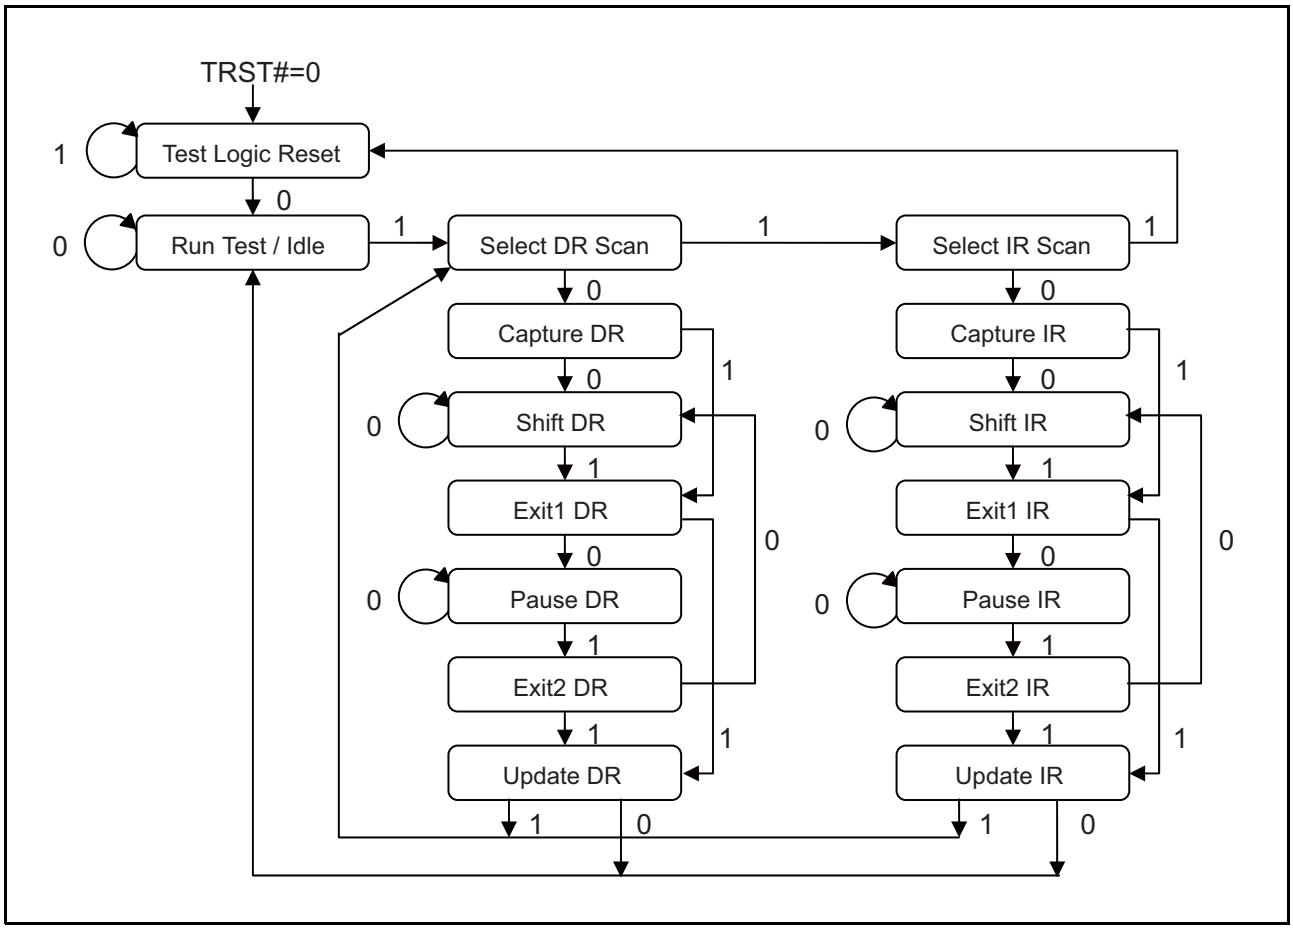

Figure 53.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing TRST# to 0 is performed asynchronously with the TCK signal.

53.5.2 Reset Signal Setting

Table 53.15 Reset Signal Setting

RES#	TRST#	Chip State
L	L	The chip is power-on reset and this module is reset.*1
	H	The chip is power-on reset.*1
H	L	This module is only reset.
	H	Normal operation

Note 1. By asserting the RES# and TRST# signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the RES# signal after negating the TRST# signal.

53.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

53.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI’s internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed, an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module’s pins in the IDCODE mode stipulated by JTAG. When this module is initialized (TRST# is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module’s pins in the CLAMP or HIGHZ mode stipulated by JTAG.

53.6.2 Points for Attention

Boundary scan mode does not cover the following signals.

Category / Module	Clock	Reset, Interrupt	Debugger interface	USB 2.0 Host function module
Pin Name	AUDIO_X1	RES#	TRST#	DP0
	AUDIO_X2		JP0_1	DM0
	USB_X1		JP0_0	RREF0
	USB_X2		TMS	DP1
	XTAL		TCK	DM1
	EXTAL		BSCANP	RREF1
	CKIO			
	RTC_X1			
	RTC_X2			

Category / Module	HyperBus controller Octa Memory controller	SPI Multi I/O bus controller	SD/MMC Host interface	MIPI CSI-2 Interface
Pin Name	HM_CK#	QSPI0_IO0	SD0_CLK	CSI_CLKP
	HM_CK / OM_SCLK	QSPI0_IO1	SD0_CMD	CSI_CLKN
	HM_CS0# / OM_CS0#	QSPI0_IO2	SD0_DAT0	CSI_DATA0P
	HM_CS1# / OM_CS1#	QSPI0_IO3	SD0_DAT1	CSI_DATA0N
	HM_DQ0 / OM_SIO0	QSPI0_SPCLK	SD0_DAT2	CSI_DATA1P
	HM_DQ1 / OM_SIO1	QSPI0_SSL	SD0_DAT3	CSI_DATA1N
	HM_DQ2 / OM_SIO2	QSPI1_IO0	SD0_DAT4	
	HM_DQ3 / OM_SIO3	QSPI1_IO1	SD0_DAT5	
	HM_DQ4 / OM_SIO4	QSPI1_IO2	SD0_DAT6	
	HM_DQ5 / OM_SIO5	QSPI1_IO3	SD0_DAT7	
	HM_DQ6 / OM_SIO6	QSPI1_SPCLK	SD0_RST#	
	HM_DQ7 / OM_SIO7	QSPI1_SSL	SD1_CLK	
	HM_RESET# / OM_RESET#	RPC_INT#	SD1_CMD	
	HM_RWDS / OM_DQS	RPC_RESET#	SD1_DAT0	
		RPC_WP#	SD1_DAT1	
			SD1_DAT2	
			SD1_DAT3	

53.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the TRST# signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the RES# signal.
3. Be sure to wait for at least 200 ns after negating the TRST# signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the TRST# signal.

54. Trusted Secure IP

This LSI incorporates a Trusted Secure IP module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator. In combination with the Trusted Secure IP driver, the Trusted Secure IP can prevent eavesdropping (confidentiality), falsification of information (integrity), and impersonation (authenticity).
Key information to be used in encrypting and decrypting data is only stored within the Trusted Secure IP, and any external access can be shut out to obtain a system with strong security.

54.1 Overview

Table 54.1 summarizes the specifications of the Trusted Secure IP. Figure 54.1 shows a block diagram of the Trusted Secure IP.

Table 54.1 Specifications of Trusted Secure IP (1/2)

Item	Description
Access control	Access management circuit • In case of irregular access to the Trusted Secure IP due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the Trusted Secure IP.
Encryption engine	AES: Compliant with NIST FIPS PUB 197 algorithm • Key sizes: 128, 192, or 256 bits • Block sizes: 128 bits • Block cipher mode of operation ECB, CBC, CTR: Compliant with NIST SP 800-38A CMAC: Compliant with NIST SP 800-38B CCM: Compliant with NIST SP 800-38C GCM: Compliant with NIST SP 800-38D XTS: Compliant with NIST SP 800-38E GCTR • Number of cycles for execution*1 ECB, CBC, CTR, CMAC, GCTR, XTS: 11 cycles of Bφ for 128-bit keys, 13 cycles of Bφ for 192-bit keys, 15 cycles of Bφ for 256-bit keys CCM: 22 cycles of Bφ for 128-bit keys, 26 cycles of Bφ for 192-bit keys, 30 cycles of Bφ for 256-bit keys AES-GCM • AES-GCM is realized by combining AES-GCTR and GHASH. RSA • Key sizes: Up to 2048 bits • Block sizes: Up to 2048 bits • Number of cycles for execution: Approximately 1,300,000 cycles of Bφ when the CRT is used*1 TDES • Key sizes: 56 bits, 2 × 56 bits, or 3 × 56 bits • Block sizes: 64 bits • Block cipher mode of operation: ECB, CBC • Number of cycles for execution*1 16 cycles of Bφ for 56-bit keys, 32 cycles of Bφ for 2 × 56-bit keys, 48 cycles of Bφ for 3 × 56-bit keys ARC4 • Key sizes: 2048 bits • Block sizes: 64 bits • Number of cycles for execution: 16 cycles of Bφ*1 HASH Support for SHA1, SHA224/SHA256/MD5, GHASH • Block sizes: 512bits • Number of cycles for execution*1 SHA1: 80 cycles of Bφ SHA224/SHA256/MD5: 64 cycles of Bφ GHASH: 9 cycles of Bφ

Table 54.1 Specifications of Trusted Secure IP (2/2)

Item	Description
Encryption engine	Key management • Keys are only valid within the Trusted Secure IP. • Only key generation information is output from the Trusted Secure IP. • Keys can be regenerated by the input of key generation information to the Trusted Secure IP. Endian • Big or little
Generation of random numbers	32-bit true random number generator • The Trusted Secure IP driver can assemble 32-bit true random numbers to generate 128- or 256-bit true random numbers. • The generated 128-bit and 256-bit true random numbers are used as keys in encrypting and decrypting data.
Unique ID	• An ID unique to the LSI (unique ID) is accessible from the access management circuit through the dedicated bus. • Combining the unique ID with the key generation information prevents the illicit copying of data to another LSI.
Interrupt sources	10
Low power consumption	Setting of the module stop state is possible.

Note 1. This does not include the overhead for calling functions of the Trusted Secure IP driver.

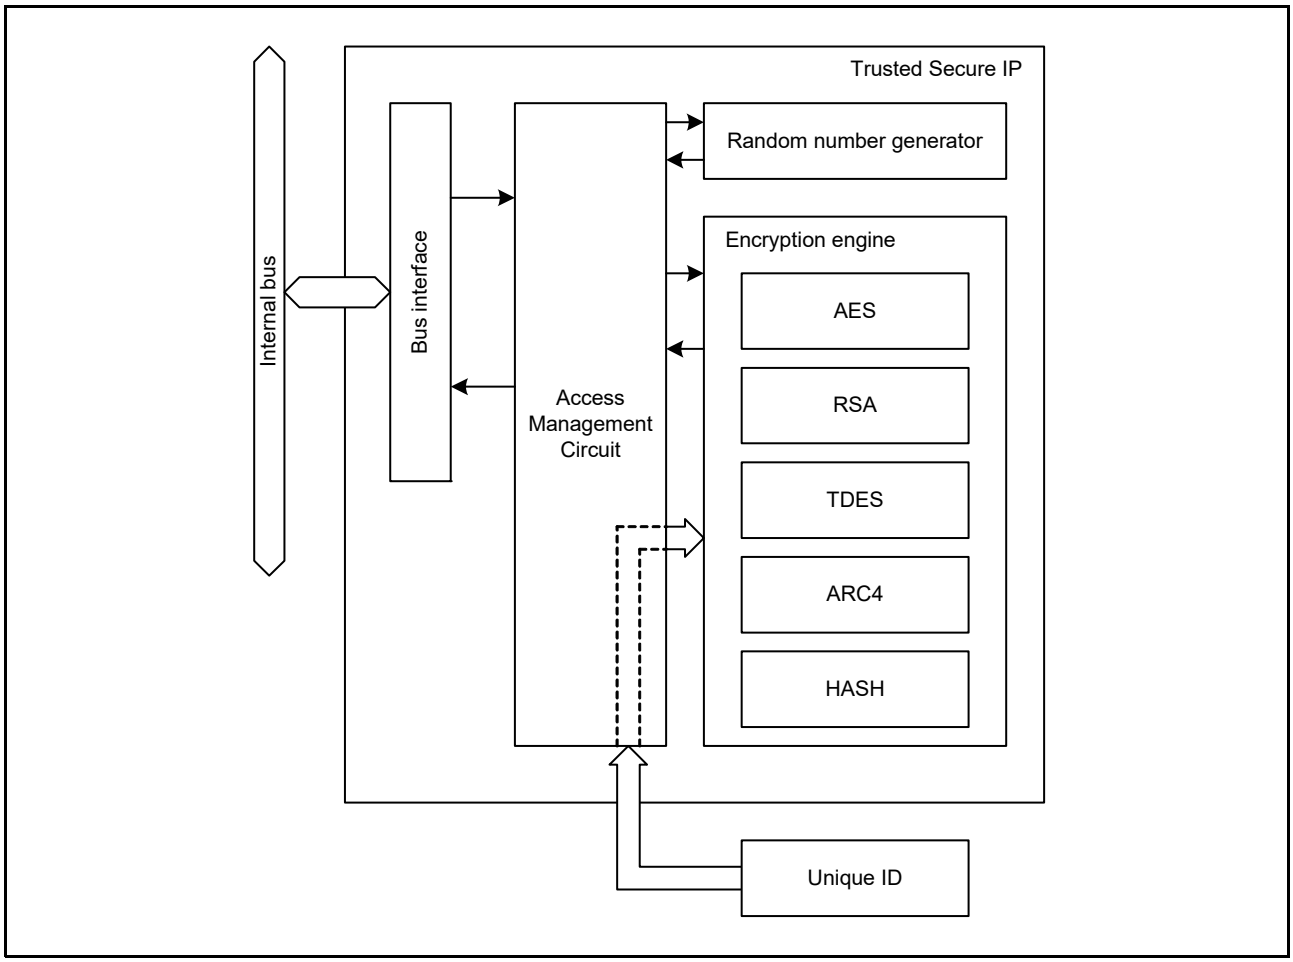

Figure 54.1 Trusted Secure IP Block Diagram

54.2 Operation

54.2.1 Operating Modes and State Transitions

Figure 54.2 shows the state transitions of the Trusted Secure IP.
Use of the Trusted Secure IP security functions is only possible through use of the Trusted Secure IP driver provided by Renesas Electronics, in accordance with the state transitions as shown in the figure below.
When irregular access to the Trusted Secure IP (access that violates the defined procedure) due to a falsified program or a program entering runaway execution, etc. is attempted, the access management circuit does not accept any subsequent access and stops the output of any data from the Trusted Secure IP.

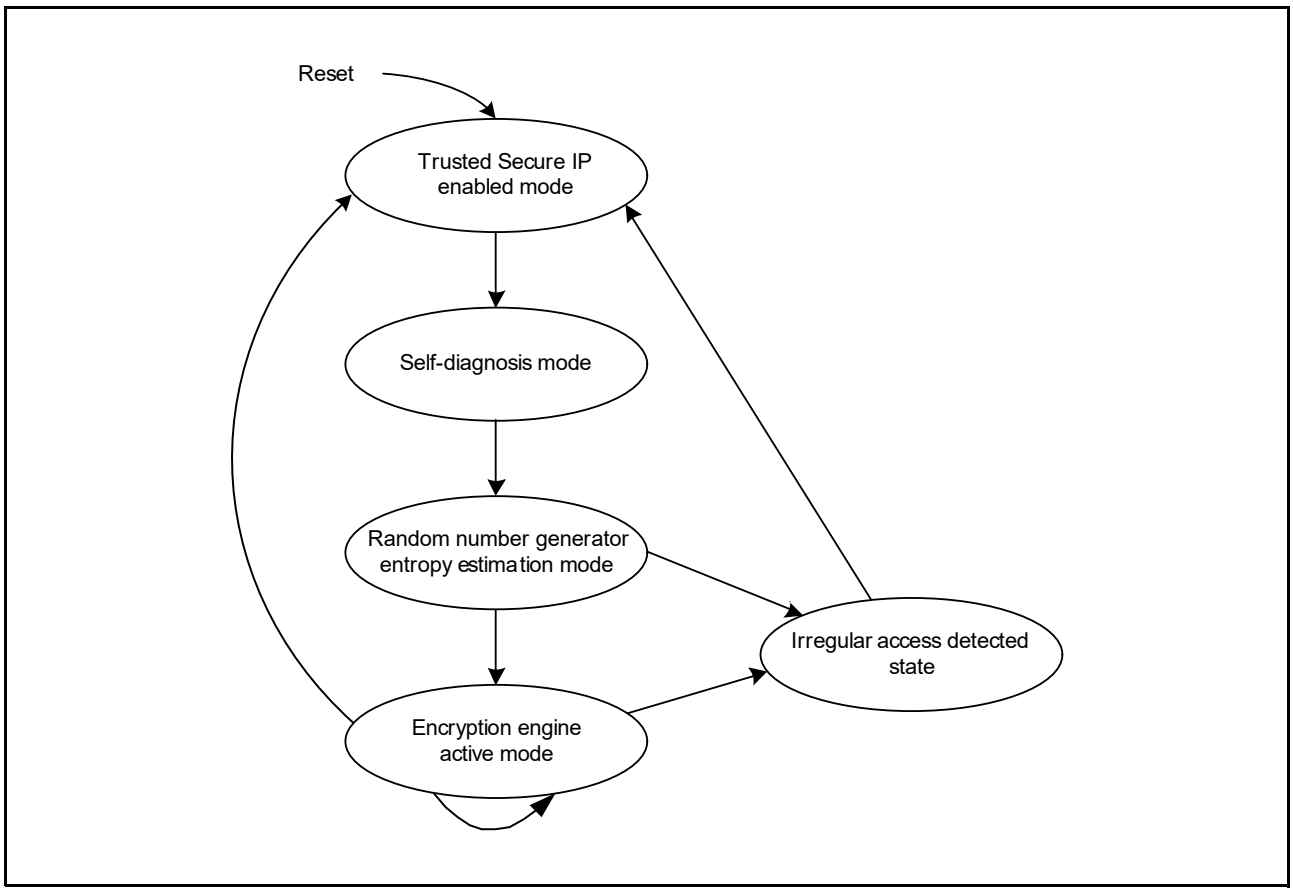

Figure 54.2 Trusted Secure IP Operating Modes and State Transitions

Many of the security functions that the Trusted Secure IP offers are applicable only in the encryption engine active mode. The operations that can be performed in this mode are given below.

(1) Key Installation
(2) Encryption and decryption
(3) Key generation
(4) Random number generation

54.2.2 Encryption Engine

Figure 54.3 shows processes of the encryption engine integrated in the Trusted Secure IP.
The encryption engine, using the key generation information, performs plaintext to ciphertext encryption and ciphertext to plaintext decryption by hardware.
In no part of the encryption or decryption process, is key data or intermediate data ever exposed outside of the Trusted Secure IP.

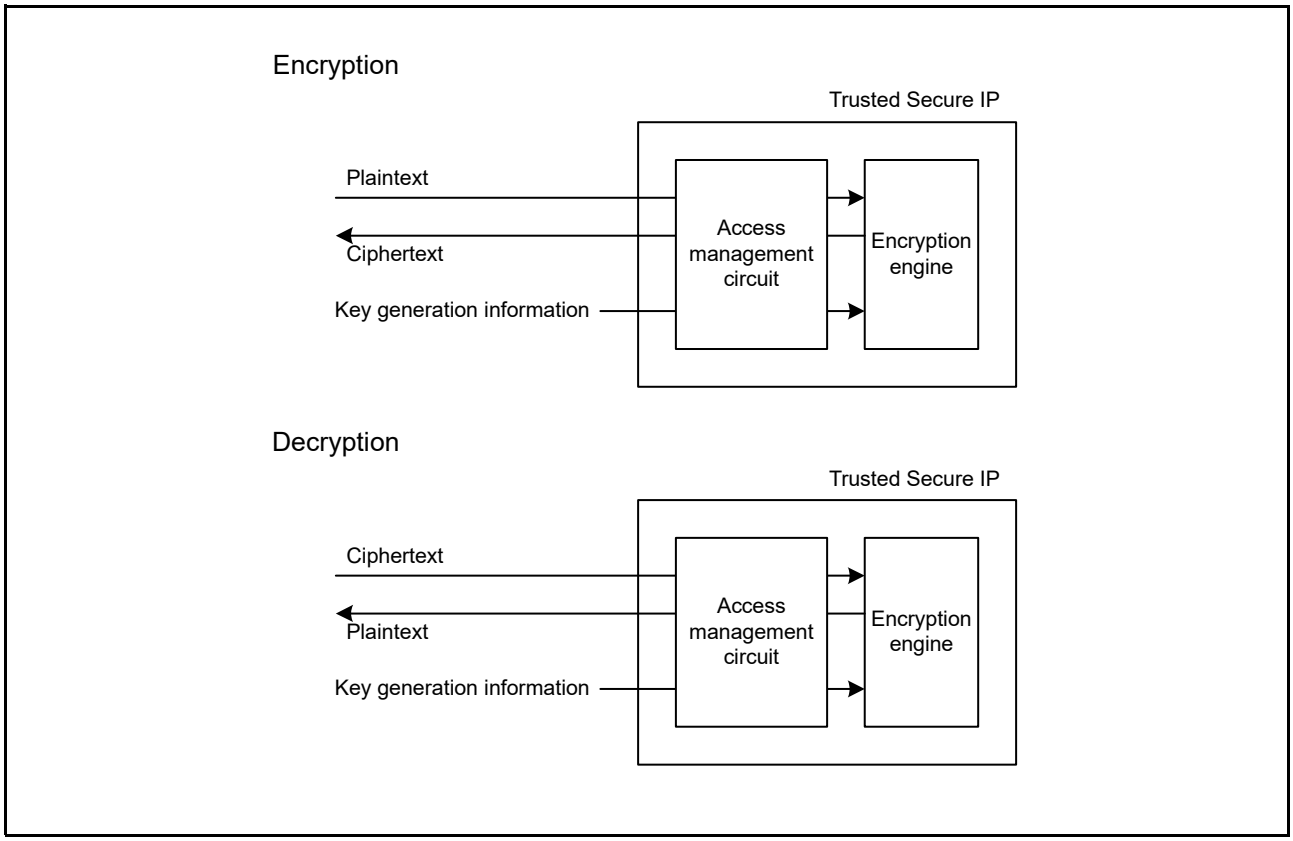

Figure 54.3 Encryption and Decryption processes by Encryption Engine

54.2.3 Key Installation

The key installation is the operation that safely converts the user key to the key generation information and stores it in flash memory. The procedure for installing the key data are given below.

(1) The user uses the key (Key-2) used for encrypting the user key to encrypt the user key (Key-1) producing eKey-1.
(2) The user sends the encrypted user key (eKey-1) to the Trusted Secure IP over the serial interface.
(3) The key generation information of the Key-2 (Index-2) contained in the Trusted Secure IP driver is used to recover the Key-2, which is then used to decrypt the user key.
(4) The user key is converted to user key generation information (Index-1) using the unique ID and a random number, and stored in flash memory.

The installation process and flow chart are given in Figure 54.4 and Figure 54.5, respectively.
Once the key data is installed, the user key generation information (Index-1) can then be used to perform encryption or decryption.

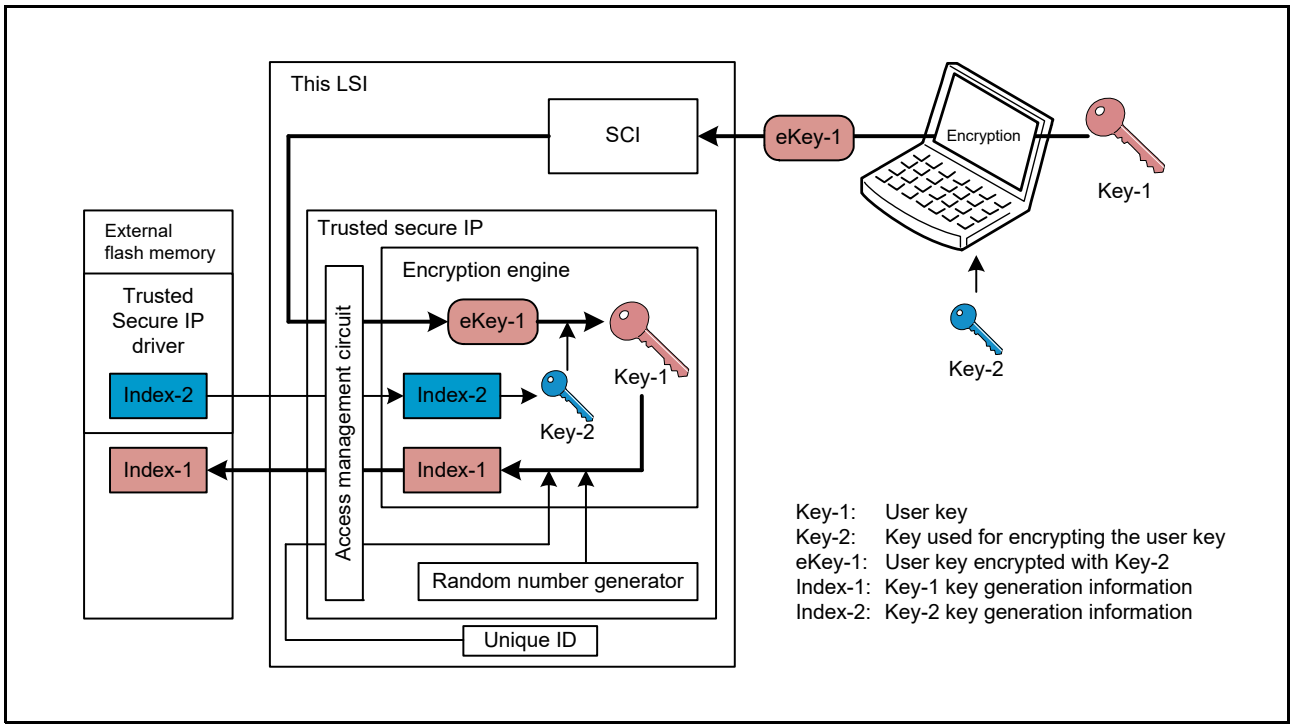

Figure 54.4 Key Installation Process

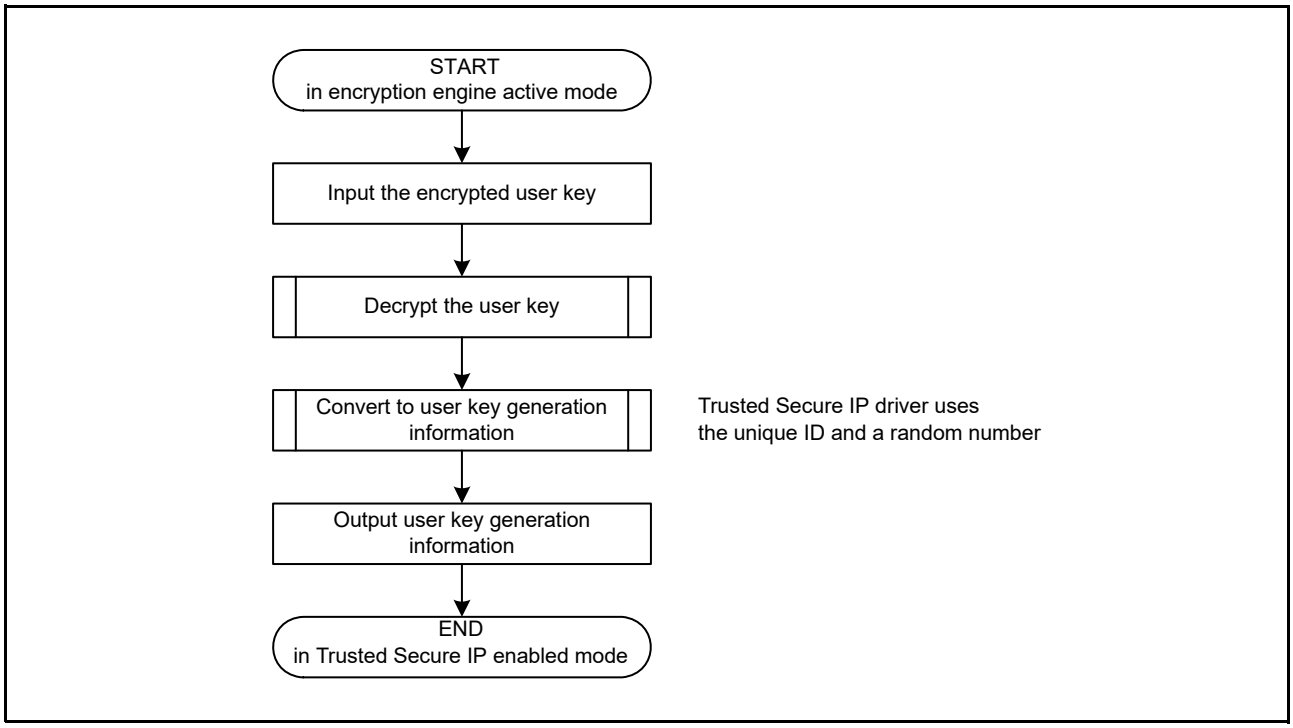

Figure 54.5 Key Installation Flow Chart

54.2.4 Encryption and Decryption

The procedures for encrypting and decrypting data are given below.

(1) Input the key generation information into the Trusted Secure IP, and recover the key data.
(2) Input the data to encrypt or decrypt into the Trusted Secure IP. This converts plaintext into ciphertext, and ciphertext into plaintext.
(3) Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output.
Figure 54.6, Figure 54.7, and Figure 54.8 show the timing diagram, encryption flow, and decryption flow, respectively.

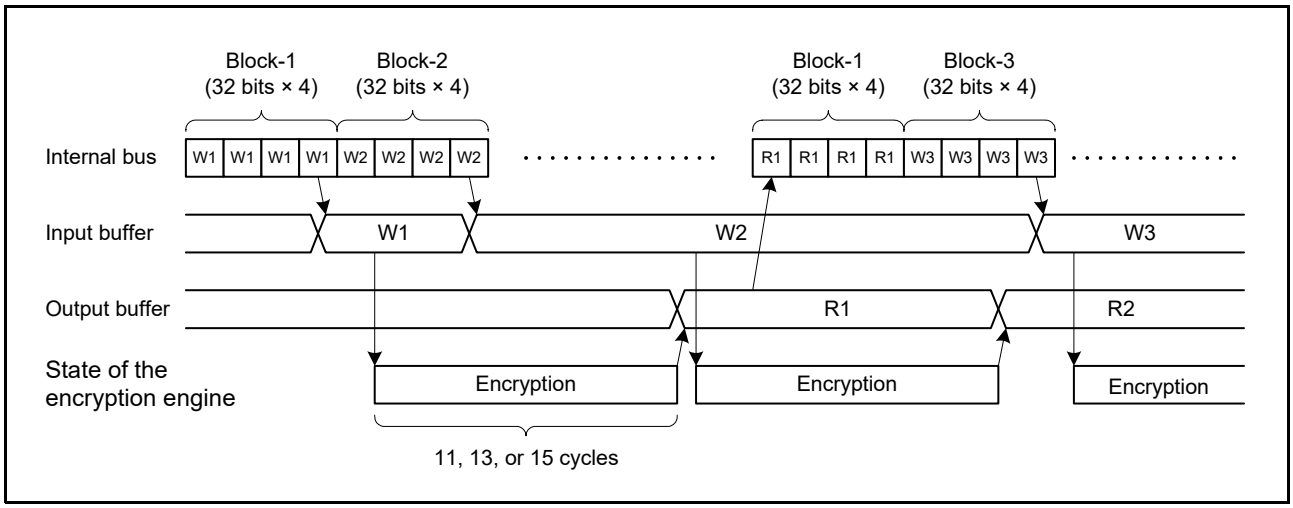

Figure 54.6 Encryption and Decryption Timing Diagram

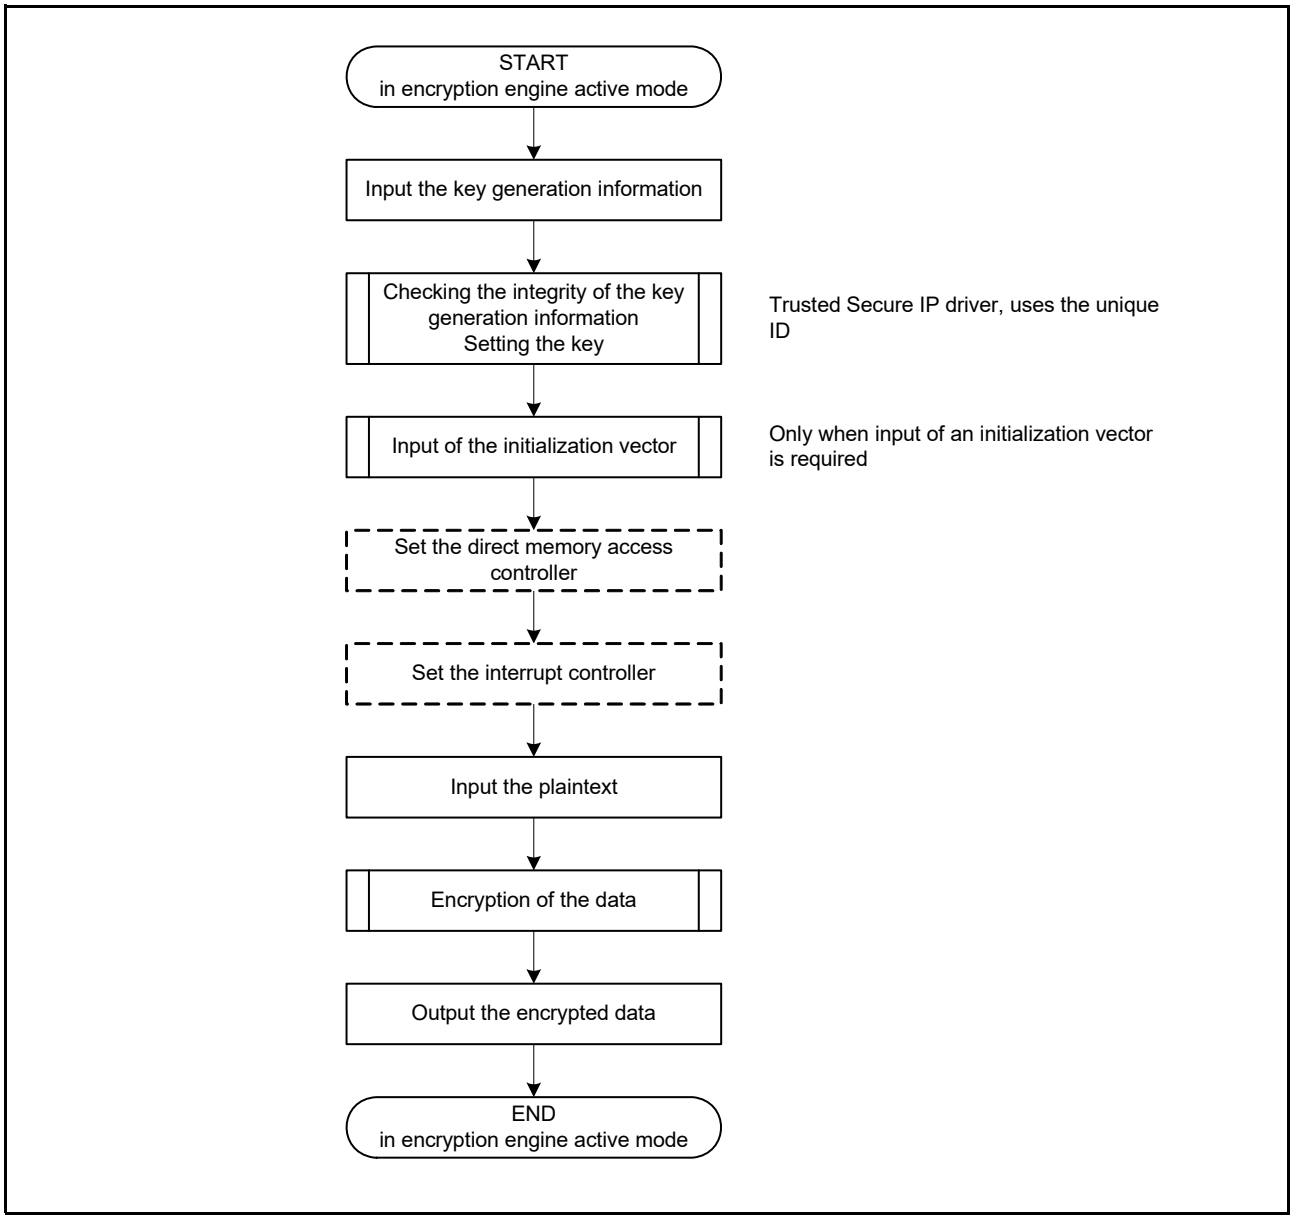

Figure 54.7 Encryption Flow Chart

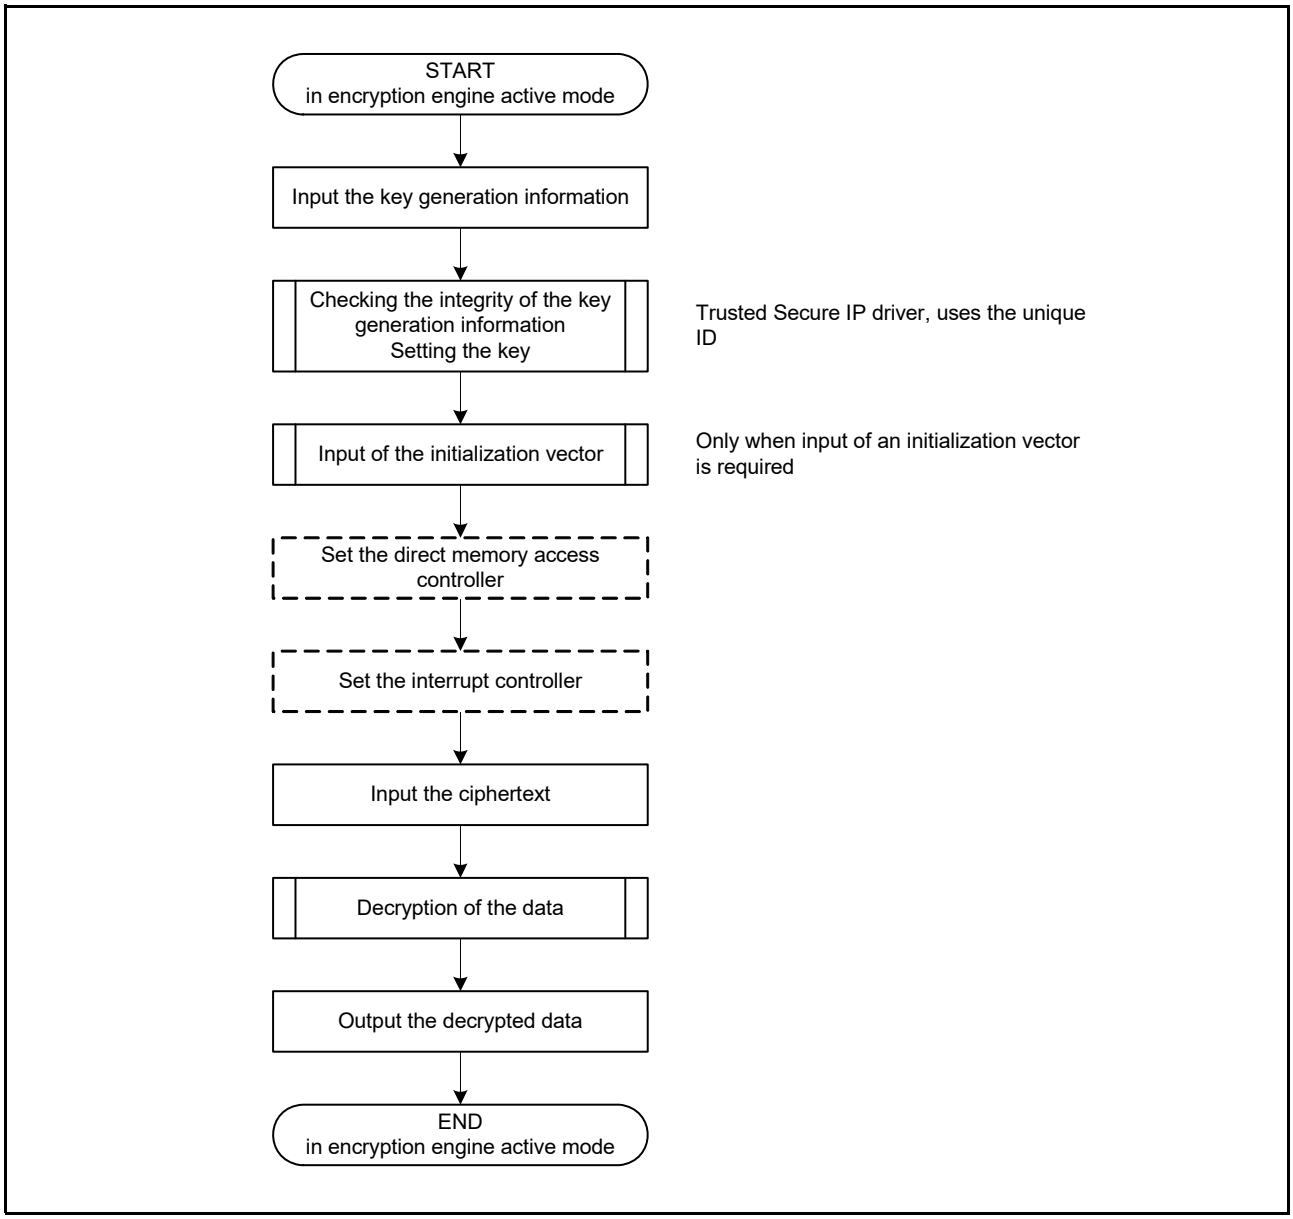

Figure 54.8 Decryption Flow Chart

54.2.5 Generating Key Generation Information (by Using Random Numbers)

Figure 54.9 shows the generating flow for the key generation information by using random numbers.

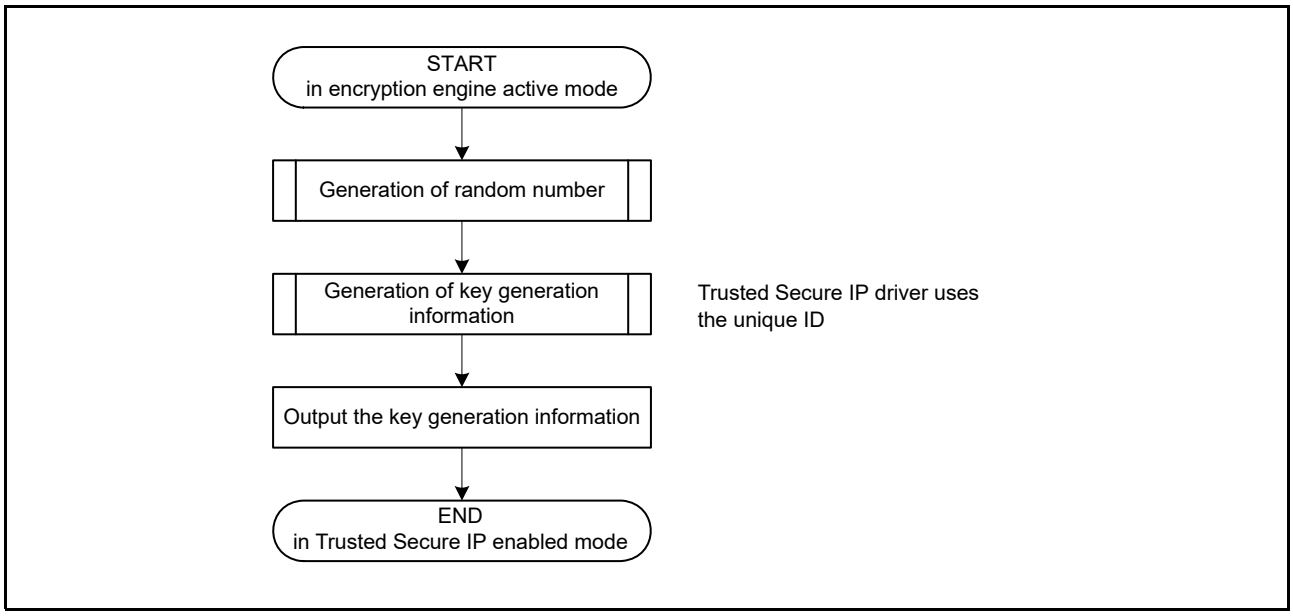

Figure 54.9 Key Generation Information Generating Flow Chart (Using Random Numbers)

54.2.6 Random Number Generation

Figure 54.10 shows the random number generation flow.

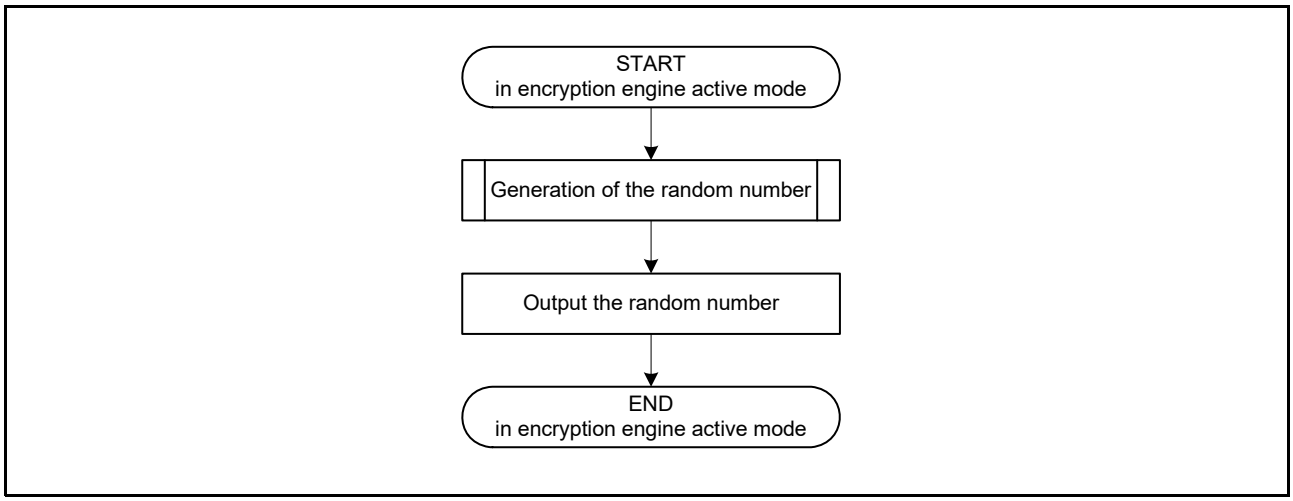

Figure 54.10 Random Number Generation Flow Chart

54.3 Interrupt

Table 54.2 lists the interrupt sources.
Trusted Secure IP driver uses interrupts caused by these interrupt sources. Do not change the setting of the interrupt controller corresponding to these interrupt sources.

Table 54.2 Trusted Secure IP Interrupt Sources

Name	Interrupt Source
PROC_BUSY	Procedure completion interrupt
ROMOK	Falsification detection interrupt
LONG_PLG	Calculation completion interrupt
WRRDY0	Write ready 0
WRRDY1	Write ready 1
WRRDY4	Write ready 4
RDRDY0	Read ready 0
RDRDY1	Read ready 1
IWRRDY	Integration write ready
IRDRDY	Integration read ready

54.4 Usage Notes

54.4.1 Setting the Module Stop Function

Operation of the Trusted Secure IP module is enabled or disabled by the MSTP107 bit of standby control register 10 (STBCR10), as stated in section 52.2.10, Standby Control Register 10 (STBCR10). After a reset, the Trusted Secure IP is stopped. After exiting the module stop state, the Trusted Secure IP can be accessed. Refer to section 52, Power-Down Modes for details.

54.4.2 Trusted Secure IP Driver

Use of the Trusted Secure IP requires the Trusted Secure IP driver provided by Renesas Electronics. Please contact our sales office for information regarding the Trusted Secure IP driver.

55. Register States

Note 5. Transfer can proceed.
Note 6. The CIE bit is initialized.
Note 7. The RESET and ADJ30 bits are initialized.
Note 8. Initialized when the realtime clock is not using the EXTAL pin.
Note 9. Access to these registers from the I/O area (SLV7) is not possible while TRST# is asserted.
Note 10. Initialized on assertion of TRST#.
Note 11. Retained in FAKE debug mode.
Note 12. The initial values of some registers for the OTP memory depend on values written to the memory.

56. Electrical Characteristics

56.1 Absolute Maximum Ratings

Table 56.1 Absolute Maximum Ratings

Item		Symbol	Value	Unit
Power supply voltage (I/O)		PVcc	–0.3 to 4.2	V
Power supply voltage (1.8-/3.3-V switchable I/O)		PVcc_SPI PVcc_SD0 PVcc_SD1	–0.3 to 4.2	V
Power supply voltage (1.8-V I/O)		PVcc_HO	–0.3 to 4.2	V
Power supply voltage (Internal)		Vcc	–0.3 to 1.6	V
PLL power supply voltage		PLLVcc	–0.3 to 1.6	V
Analog power supply voltage		AVcc	–0.3 to 4.2	V
USB transceiver analog power supply voltage (I/O)		USBAPVcc1 USBAPVcc0	–0.3 to 4.2	V
USB transceiver digital power supply voltage (I/O)		USBDPVcc1 USBDPVcc0	–0.3 to 4.2	V
LVDS analog power supply voltage		LVDSAPVcc	–0.3 to 4.2	V
LVDS PLL power supply voltage		LVDSPLLVcc	–0.3 to 1.6	V
MIPI analog power supply voltage		MIPIAVcc18	–0.3 to 2.6	V
Input voltage	1.8-V I/O input pins	V_{in}	–0.3 to 1.8-V power supply (PVcc_HO, MIPIAVcc18) + 0.3	V
	1.8-/3.3-V switchable I/O input pins	V_{in}	–0.3 to 1.8-/3.3-V power supply (PVcc_SPI, PVcc_SD0, PVcc_SD1) + 0.3	V
	Other input pins	V_{in}	–0.3 to 3.3-V power supply (PVcc, AVcc, USBAPVcc1, USBAPVcc0, USBDPVcc1, USBDPVcc0, LVDSAPVcc) + 0.3	V
Operating temperature	Ambient temperature	Ta	–40 to +85	°C
	Junction temperature	Tj	–40 to +125	
Storage temperature		T_{stg}	–55 to +125	°C

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded

56.2 Power-On/Power-Off Sequence

The 1.2-V power supply (Vcc, PLLVcc, and LVDSPLLVcc), 1.8-V power supply (PVcc_HO and MIPIAVcc18), 1.8-/3.3-V switchable power supply (PVcc_SPI, PVcc_SD0, PVcc_SD1), and 3.3-V power supply (PVcc, AVcc, USBAPVcc1, USBAPVcc0, USBDPVcc1, USBDPVcc0, and LVDSAPVcc) can be turned on and off in any order.
When turning on the power, be sure to drive both the TRST# and RES# pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.
When turning off the power, drive the TRST# and RES# pins low if the undefined output may cause a problem.

56.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 56.2 other than current consumption
  Vcc = 1.14 to 1.26 V, PVcc = USBDPVcc0 = USBDPVcc1 = AVcc = 3.0 to 3.6 V,
  PVcc_SPI = 3.0 to 3.6 V/1.7 to 1.9 V, PVcc_SD0 = 3.0 to 3.6 V/1.7 to 1.9 V,
  PVcc_SD1 = 3.0 to 3.6 V/1.7 to 1.9 V, PLLVcc = 1.14 to 1.26 V,
  USBAPVcc0 = USBAPVcc1 = 3.0 to 3.6 V, LVDSAPVcc = 3.0 to 3.6 V,
  LVDSPLLVcc = 1.14 to 1.26 V, PVcc_HO = MIPIAVcc18 = 1.7 to 1.9 V,
  Vss = AVss = USBVss = 0 V
  Ta = –40 to +85°C, Tj = –40 to +125°C

- Conditions used to obtain DC characteristics (2) in Table 56.2 for current consumption
  Vcc = 1.20 V, PVcc = USBDPVcc0 = USBDPVcc1 = AVcc = 3.3 V,
  PVcc_SPI = 3.3 V/1.8 V, PVcc_SD0 = 3.3 V/1.8 V, PVcc_SD1 = 3.3 V/1.8 V,
  PLLVcc = 1.20 V, USBAPVcc0 = USBAPVcc1 = 3.3 V, LVDSAPVcc = 3.3 V,
  LVDSPLLVcc = 1.20 V, PVcc_HO = MIPIAVcc18 = 1.8 V,
  Vss = AVss = USBVss = 0 V
  Ta = –40 to +85°C, Tj = –40 to +125°C
  Iφ = 528.0 MHz, Gφ = 264.00 MHz, Bφ = 132.00 MHz, P1φ = 66.00 MHz, P0φ = 33.00 MHz

Table 56.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PVcc	3.0	3.3	3.6	V	
		PVcc_SPI PVcc_SD0 PVcc_SD1	1.7	1.8	1.9	V	1.8-V power supply selection
			3.0	3.3	3.6	V	3.3-V power supply selection
		PVcc_HO	1.7	1.8	1.9	V	
		Vcc	1.14	1.20	1.26	V	
PLL power supply voltage		PLLVcc	1.14	1.20	1.26	V	
Analog power supply voltage		AVcc	3.0	3.3	3.6	V	
USB power supply voltage		USBAPVcc1 USBAPVcc0 USBDPVcc1 USBDPVcc0	3.0	3.3	3.6	V	
LVDS analog power supply voltage		LVDSAPVcc	3.0	3.3	3.6	V	
LVDS PLL power supply voltage		LVDSPLLVcc	1.14	1.20	1.26	V	
MIPI analog power supply voltage		MIPIAVcc18	1.7	1.8	1.9	V	
Input leakage current	All input pins (except MIPI CSI-2 interface Related Pins*1)	$\lvert I_{in} \rvert$	—	—	1.0	μA	V_{in} = 0.5 to PVcc – 0.5 V
	MIPI CSI-2 interface Related Pins*1				10	μA	V_{in} = 0.5 to MIPIAVcc18 – 0.5 V
Three-state leakage current	All input/output pins, all output pins (except PD_0 to PD_7) (off state)	$\lvert I_{STI} \rvert$	—	—	1.0	μA	V_{in} = 0.5 to PVcc – 0.5 V
	PD_0 to PD_7		—	—	10	μA	
Input capacitance	USB 2.0 Host/Function Module-Related Pins*2	C_{in}	—	—	20	pF	
	All input/output pins and all input pins other than above		—	—	10	pF	

Note 1. CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N, CSI_CLKP, CSI_CLKN pins
Note 2. DP1, DP0, DM1, DM0 pins

Table 56.2 DC Characteristics (2) [Current Consumption]

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in normal operation	Vcc	Icc	—	994	mA	When the DRP is not in use.
			—	400	mA	When the DRP is in use, these values are added to that of the above columns, respectively.
	PLLVcc	PLLIcc	—	21.8	mA	
	LVDSPLLVcc	LVDSPLLIcc	—	2.1	mA	
	MIPIAVcc18	MIPIAIcc18	—	10	mA	During MIPI transfer
	PVcc_HO	PIcc_HO	15*1	—	mA	PVcc_HO = 1.8 V HM_CK, HM_CK# / OM_SCLK = 132 MHz
	PVcc_SPI	PIcc_SPI	15*1	—	mA	PVcc_SPI = 3.3 V QSPI0_SPCLK, QSPI1_SPCLK = 66 MHz
			15*1	—	mA	PVcc_SPI = 1.8 V QSPI0_SPCLK, QSPI1_SPCLK = 132 MHz
	PVcc_SD0	PIcc_SD0	15*1	—	mA	PVcc_SD0 = 3.3 V SD0_CLK = 33 MHz
			11*1	—	mA	PVcc_SD0 = 1.8 V SD0_CLK = 132 MHz
	PVcc_SD1	PIcc_SD1	15*1	—	mA	PVcc_SD1 = 3.3 V SD1_CLK = 33 MHz
			11*1	—	mA	PVcc_SD1 = 1.8 V SD1_CLK = 132 MHz
	PVcc	PIcc	100*1	—	mA	
	USBDPVcc0 + USBDPVcc1	UDPIcc	52*1	—	mA	In USB high-speed operation (1ch)
			93*1	—	mA	In USB high-speed operation (2ch)
			19*1	—	mA	In USB full-speed operation (1ch)
			29*1	—	mA	In USB full-speed operation (2ch)
	USBAPVcc0 + USBAPVcc1	UAPIcc	—	11	mA	When 1-ch is in use
			—	18	mA	When 2-ch is in use
	LVDSAPVcc	LVDSAPIcc	—	30	mA	During LVDS transfer
	AVcc	AIcc	—	1	mA	During A/D conversion
Current consumption in sleep mode	Vcc	I_{sleep}	—	850	mA	
	For the other power supply, the current consumption is the same as in normal operation.					
Current consumption in software standby mode	Vcc + PLLVcc + LVDSPLLVcc	I_{sstby}	30	500	mA	
	MIPIAVcc18 + PVcc_SPI + PVcc_HO + PVcc_SD0 + PVcc_SD1	$PI_{sstby18\_33}$	0.4	3.4	µA	
	PVcc + AVcc + USBAPVcc1 + USBAPVcc0 + USBDPVcc1 + USBDPVcc0 + LVDSAPVcc	PI_{sstby}	3	20	µA	When the USB host/function is not in use
			4.5	5	mA	When the USB host/function is in use

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in deep standby mode	Vcc + PLLVcc + LVDSPLLVcc	I_{dstby}	16	155	µA	RAM 0 Kbytes retained
			22	170	µA	RAM 16 Kbytes retained
			28	185	µA	RAM 32 Kbytes retained
			40	215	µA	RAM 64 Kbytes retained
			64	275	µA	RAM 128 Kbytes retained
	MIPIAVcc18 + PVcc_SPI + PVcc_HO + PVcc_SD0 + PVcc_SD1	$PI_{dstby18\_33}$	0.4	2.1	µA	
	PVcc + AVcc + USBAPVcc1 + USBAPVcc0 + USBDPVcc1 + USBDPVcc0 + LVDSAPVcc	PI_{dstby}	2.4	7	µA	RTC is not operating
			7.7	12.5	µA	RTC_X1 selected
			1.3	—	mA	EXTAL 12 MHz selected, small gain
			1.5	—	mA	EXTAL 24 MHz selected, small gain

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.

Table 56.2 DC Characteristics (3) [Except 1.8-/3.3-V Switchable I/O Interface, I²C Bus Interface, and USB 2.0 Host/ Function Module-Related Pins]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage*1		V_{IH}	2.2	—	PVcc + 0.3	V	
Input low voltage*1		V_{IL}	–0.3	—	0.8	V	
Schmitt trigger input characteristics		VT^+	PVcc × 0.665	—	PVcc + 0.3	V	
		VT^-	–0.3	—	0.8	V	
		$VT^+ – VT^-$	0.2	—	—	V	
Output high voltage		V_{OH}	PVcc – 0.5	—	—	V	I_{OH} = –8.0 mA*2, –2.0 mA*3
Output low voltage		V_{OL}	—	—	0.4	V	I_{OL} = 8.0 mA*2, 2.0 mA*3
RAM standby voltage	Software standby mode (large-capacity on-chip RAM)	V_{RAMS}	0.85	—	—	V	Measured with Vcc as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V_{RAMD}	1.14	—	—	V	

Note 1. Except for Schmitt trigger function
Note 2. This is the value when high driving ability is set with a pin for which high driving ability is selectable.
Note 3. This is the value when normal driving ability is set with a pin for which high driving ability is selectable or the value of the pin to which normal driving ability is fixed.

Table 56.2 DC Characteristics (4) [1.8-/3.3-V Switchable I/O Interface*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	1.27	—	PVcc_* + 0.3	V	PVcc_SPI with 1.8-V power supply selection
				2		PVcc_SD0 and PVcc_SD1 with 1.8-V power supply selection
		PVcc_* × 0.625	—	PVcc_* + 0.3	V	3.3-V power supply selection
Input low voltage	V_{IL}	–0.3	—	0.58	V	1.8-V power supply selection
		–0.3	—	PVcc_* × 0.25	V	3.3-V power supply selection
Output high voltage	V_{OH}	1.4	—	—	V	1.8-V power supply selection, I_{OH} = –2.0 mA
		PVcc_* × 0.75	—	—	V	3.3-V power supply selection, I_{OH} = –2.0 mA
Output low voltage	V_{OL}	—	—	0.45	V	1.8-V power supply selection, I_{OL} = 2.0 mA
		—	—	PVcc_* × 0.125	V	3.3-V power supply selection, I_{OL} = 2.0 mA

Note: PVcc_SPI, PVcc_SD0, PVcc_SD1

Table 56.2 DC Characteristics (5) [1.8-V I/O Interface*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	1.27	—	PVcc_* + 0.3	V	
Input low voltage	V_{IL}	–0.3	—	0.58	V	
Output high voltage	V_{OH}	1.4	—	—	V	I_{OH} = –2.0 mA
Output low voltage	V_{OL}	—	—	0.45	V	I_{OL} = 2.0 mA

Note: PVcc_HO

Table 56.2 DC Characteristics (6) [I^2C Bus Interface-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	PVcc × 0.7	—	PVcc + 0.3	V	
Input low voltage	V_{IL}	–0.3	—	PVcc × 0.3	V	
Schmitt trigger input characteristics	$V_{IH} – V_{IL}$	PVcc × 0.05	—	—	V	
Output low voltage	V_{OL}	—	—	0.4	V	I_{OL} = 3.0 mA (RIICnFER.FMPE = 0)
		—	—	0.4	V	I_{OL} = 20.0 mA (RIICnFER.FMPE = 1)

Note: The PD_0 to PD_7 pins are open-drain pins.

Table 56.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R_{REF}	2.2 kΩ ± 1%				

Note: RREF0, RREF1 pins.

Table 56.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R_{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/receive mode
DP and DM pull-down resistance (when host is selected)	R_{pd}	14.25	—	24.80	kΩ	

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (9) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	2.0	—	—	V	
Input low voltage	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	| (DP) – (DM) |
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Output high voltage	V_{OH}	2.8	—	3.6	V	I_{OH} = –200 µA
Output low voltage	V_{OL}	0.0	—	0.3	V	I_{OL} = 2 mA
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	C_L = 50 pF (full-speed) C_L = 200 to 600 pF (low-speed)

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (10) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V_{HSSQ}	100	—	150	mV	
Common mode voltage range	V_{HSCM}	–50	—	500	mV	
Idle state	V_{HSOI}	–10.0	—	10.0	mV	
Output high voltage	V_{HSOH}	360	—	440	mV	
Output low voltage	V_{HSOL}	–10.0	—	10.0	mV	
Chirp J output voltage (difference)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V_{CHIRPK}	–900	—	–500	mV	

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (11) [LVDS-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Differential Output Voltage	VOD	250	350	450	mV	R_L = 100Ω
Difference VOD between 'H' and 'L'	ΔVOD	—	—	50	mV	R_L = 100Ω
Offset (Common Mode) Voltage	VOS	1.125	1.25	1.375	V	R_L = 100Ω
Difference VOS between 'H' and 'L'	ΔVOS	—	—	50	mV	R_L = 100Ω

Note: TXCLKOUTP, TXCLKOUTM, TXOUT2P to TXOUT0P, and TXOUT2M to TXOUT0M pins

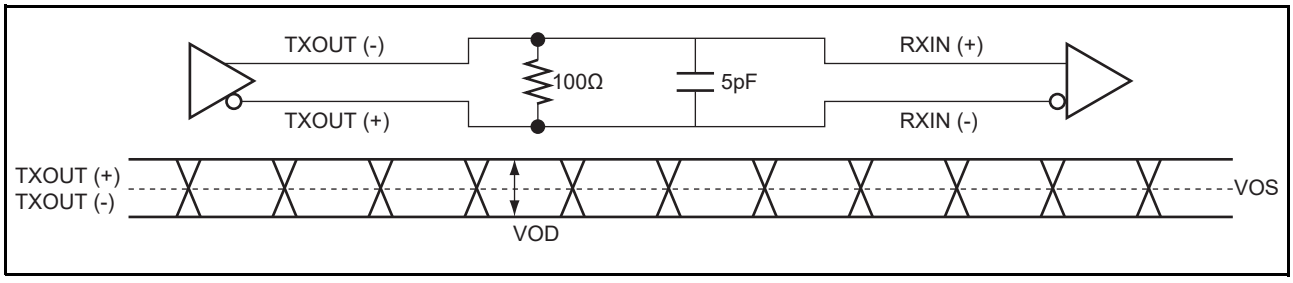

Figure 56.1 LVDS output waveform

Table 56.2 DC Characteristics (12) [MIPI CSI-2 interface-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input signal voltage range	V_{PIN}	–50	—	1350	mV	
Ground shift	V_{GNDSH}	–50	—	50	mV	
transient pin voltage level	$V_{PIN(absmax)}$	–0.15	—	1.45	V	
Differential input high threshold	V_{IDTH}	—	—	70	mV	HS Receiver
Differential input low threshold	V_{IDTL}	–70	—	—	mV	HS Receiver
Single-ended input high voltage	V_{IHHS}	—	—	460	mV	HS Receiver
Single-ended input low voltage	V_{ILHS}	–40	—	—	mV	HS Receiver
Input common mode voltage	$V_{CMRX(DC)}$	70	—	330	mV	HS Receiver
Differential input impedance	Z_{ID}	80	—	125	Ω	HS Receiver
Input high voltage	V_{IH}	880	—	—	mV	LP Receiver
Input low voltage	V_{IL}	—	—	550	mV	LP Receiver
Input hysteresis	V_{HYST}	—	50	—	mV	LP Receiver, Reference value

Note: CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N, CSI_CLKP, CSI_CLKN pins

Table 56.3 Permissible Output Currents

Item			Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	PD_0 to PD_7	High-speed mode	IOL	—	—	20	mA
		Normal mode				6	mA
	The CKIO, SD0_CLK, and SD1_CLK output pins, and output pins driven by the PVcc_SPI, or PVcc_HO power supply pin	High drive				12	mA
		Normal drive				8	mA
	SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0					6	mA
	Output pins other than above	High drive*1				8	mA
		Normal drive*2				2	mA
Permissible output high current (per pin)	The CKIO, SD0_CLK, and SD1_CLK output pins, and output pins driven by the PVcc_SPI, or PVcc_HO power supply pin	High drive	– IOH	—	—	12	mA
		Normal drive				8	mA
	SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0					6	mA
	Output pins other than above	High drive*1				8	mA
		Normal drive*2				2	mA
Permissible output current (total)			Σ IO	—	—	150	mA

Caution: To protect the LSI's reliability, the output current values should not exceed the values in Table 56.3.

Note 1. This is the value when high driving ability is set with a pin for which high driving ability is selectable.
Note 2. This is the value when normal driving ability is set with a pin for which high driving ability is selectable or the value of the pin to which normal driving ability is fixed.

56.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: Vcc = 1.14 to 1.26 V, PVcc = USBDPVcc0 = USBDPVcc1 = AVcc = 3.0 to 3.6 V, PVcc_SPI = 3.0 to 3.6 V/1.7 to 1.9 V, PVcc_SD0 = 3.0 to 3.6 V/1.7 to 1.9 V, PVcc_SD1 = 3.0 to 3.6 V/1.7 to 1.9 V, PLLVcc = 1.14 to 1.26 V, USBAPVcc0 = USBAPVcc1 = 3.0 to 3.6 V, LVDSAPVcc = 3.0 to 3.6 V, LVDSPLLVcc = 1.14 to 1.26 V, PVcc_HO = MIPIAVcc18 = 1.7 to 1.9 V,
Vss = AVss = USBVss = 0 V,
Ta = –40 to +85°C, Tj = –40 to +125°C

Table 56.4 Operating Frequency

Item		Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock (Iφ)	f	55	528	MHz	
	Image processing clock (Gφ)		55	264	MHz	
	Internal bus clock (Bφ)		27.5	132	MHz	
	Peripheral clock 1 (P1φ)		27.5	66	MHz	
	Peripheral clock 0 (P0φ)		27.5	33	MHz	

56.4.1 Clock Timing

Table 56.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module)	f_{EX}	12MHz ± 100ppm 24MHz ± 100ppm			Figure 56.2
EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module)		10 20	12 24	MHz	
EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module)	t_{EXcyc}	83.34 41.67	100 50	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f_{EX}	10.00	50.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t_{EXcyc}	20.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f_{EX}	1.00	50.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t_{EXcyc}	20.00	1000.00	ns	
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module)	f_{EX}	48MHz ± 100ppm			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input rise time	t_{EXr}	—	4	ns	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input fall time	t_{EXf}	—	4	ns	
CKIO clock output frequency	f_{OP}	27.5*1	132*1	MHz	
CKIO clock output cycle time	t_{cyc}	7.58*1	36.36*1	ns	Figure 56.3 (1), Figure 56.3 (2)
CKIO clock output low pulse width 1	t_{CKOL1}	t_{cyc} / 2 – t_{CKOr1}	—	ns	Figure 56.3 (1)
CKIO clock output high pulse width 1	t_{CKOH1}	t_{cyc} / 2 – t_{CKOf1}	—	ns	
CKIO clock output rise time 1	t_{CKOr1}	—	3	ns	
CKIO clock output fall time 1	t_{CKOf1}	—	3	ns	
CKIO clock output low pulse width 2	t_{CKOL2}	t_{cyc} / 2 – t_{CKOr2}	—	ns	Figure 56.3 (2)
CKIO clock output high pulse width 2	t_{CKOH2}	t_{cyc} / 2 – t_{CKOf2}	—	ns	
CKIO clock output rise time 2	t_{CKOr2}	—	2	ns	
CKIO clock output fall time 2	t_{CKOf2}	—	2	ns

CKIO clock output high pulse width 3	t_{CKOH3}	t_{cyc} / 2 – t_{CKOf3}	—	ns	
CKIO clock output rise time 3	t_{CKOr3}	—	1*2	ns	
CKIO clock output fall time 3	t_{CKOf3}	—	1*2	ns	
On-chip PLL circuit oscillation settling time	t_{POSC}	1	—	ms	Figure 56.4, Figure 56.5
On-chip oscillation circuit oscillation settling time (RTC_X1)	t_{ROSC}	—	3*3	s	Figure 56.7
On-chip oscillation circuit oscillation settling time (other than above)		—	4*3	ms	Figure 56.4, Figure 56.5 , Figure 56.7
Mode hold time	t_{MDH}	200	—	ns	Figure 56.4, Figure 56.5

Note 1. The range of CKIO clock output frequency and cycle time is determined by register settings. See, Table 6.4 and Table 6.5.
Note 2. Output load: 15 pF

Note 3. Settings for values smaller than the above specifications may be possible, as long as the values are confirmed through evaluation by the manufacturer of the oscillator.

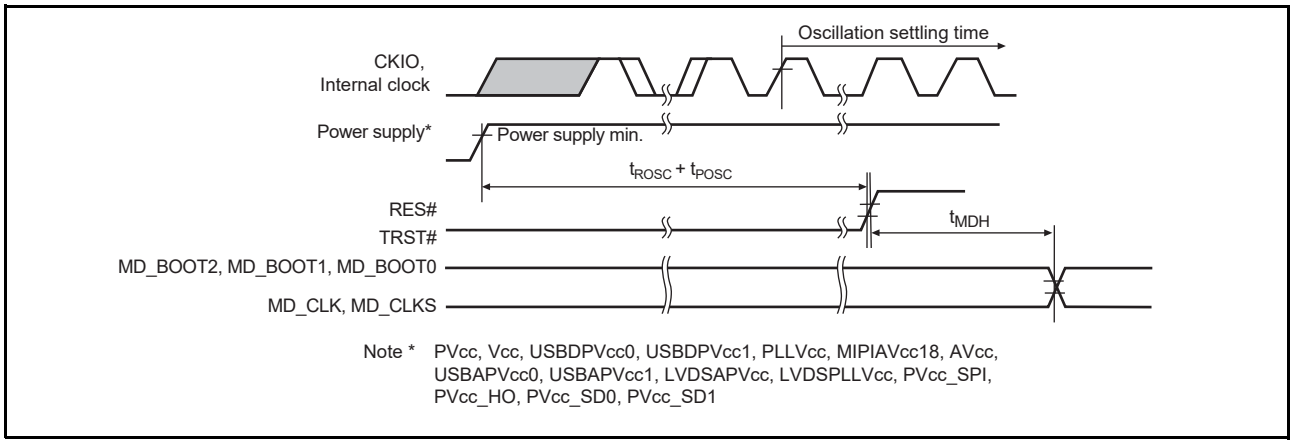

Figure 56.4 Power-On Oscillation Settling Time

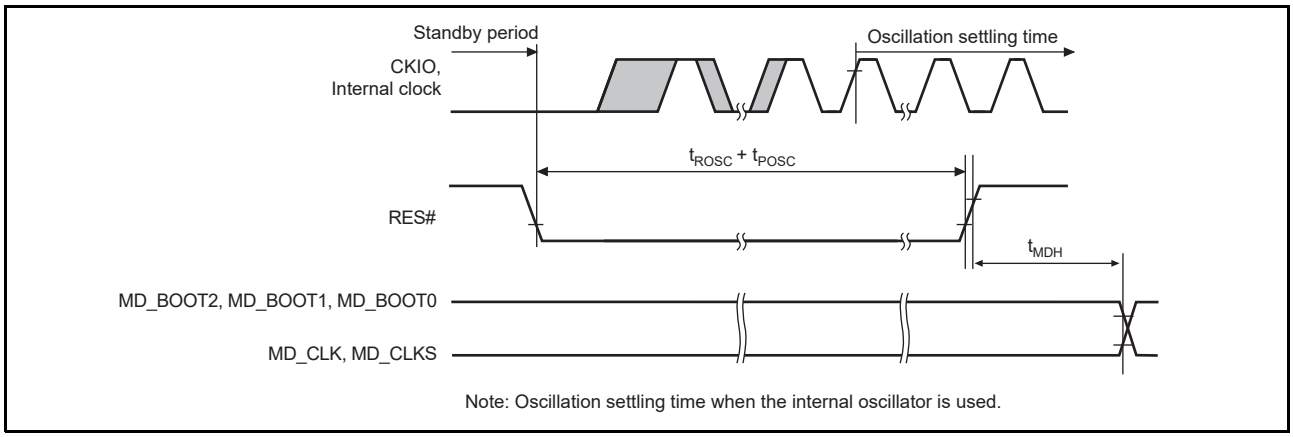

Figure 56.5 Oscillation Settling Time on Return from Standby (Return by Reset)

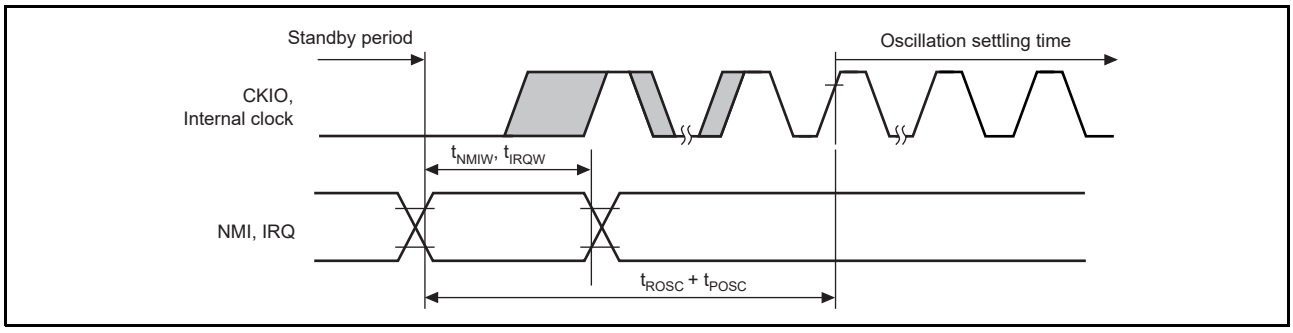

Figure 56.6 Oscillation Settling Time on Return from Standby (Return by NMI or IRQ)

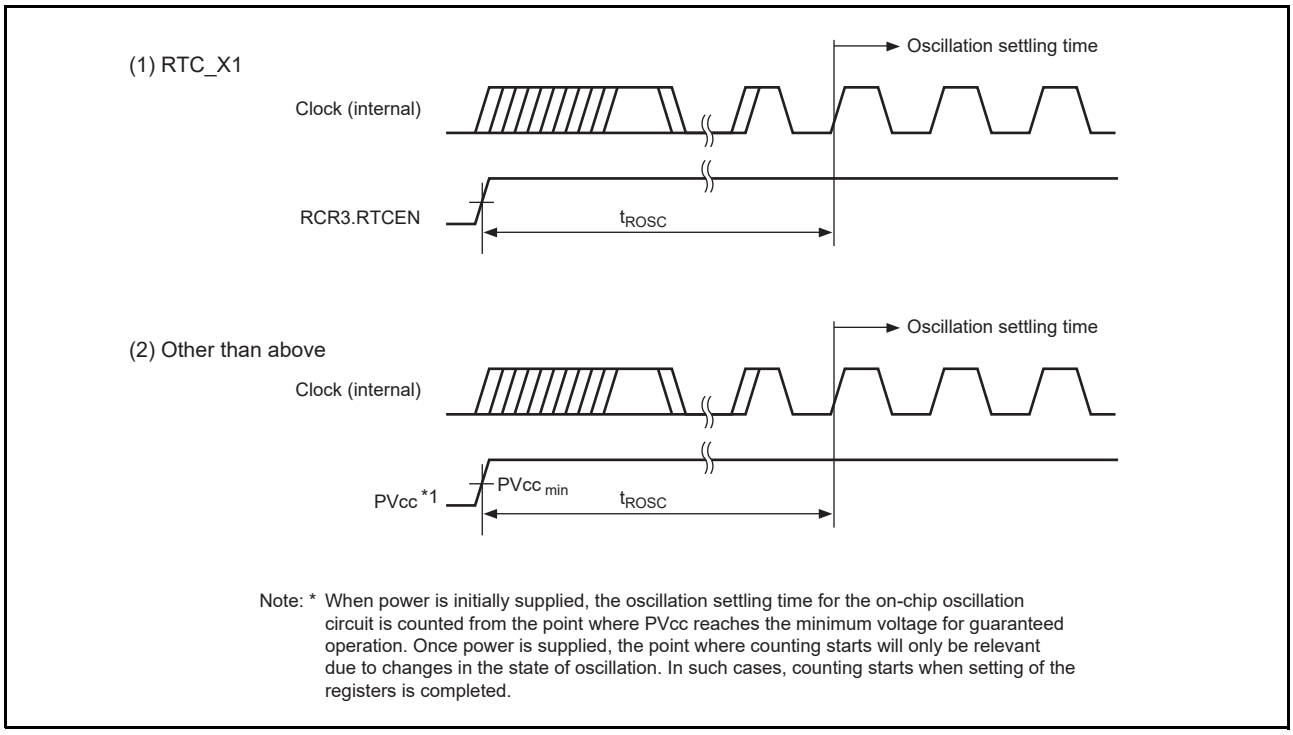

Note: * When power is initially supplied, the oscillation settling time for the on-chip oscillation circuit is counted from the point where PVcc reaches the minimum voltage for guaranteed operation. Once power is supplied, the point where counting starts will only be relevant due to changes in the state of oscillation. In such cases, counting starts when setting of the registers is completed.

Figure 56.7 On-chip Oscillation Circuit Oscillation Settling Time

56.4.2 Control Signal Timing

Table 56.6 Control Signal Timing

Item		Symbol	Min.	Max.	Unit	Figure
RES# pulse width	Exit from standby mode	t_{RESW}	10	—	ms	Figure 56.8 (1)
	Other than above		20	—	tcyc*2	
TRST# pulse width		t_{TRSW}	20	—	tcyc*2	
NMI pulse width		t_{NMIW}	20	—	tcyc*2	Figure 56.3 (2) , Figure 56.6
IRQ pulse width		t_{IRQW}	20	—	tcyc*2	
TINT pulse width		t_{TINTW}	20	—	tcyc*2	
TINT input wait timing in the same group*1		t_{TINTGW}	20	—	tcyc*2	Figure 56.8 (2)
RES# input rise time		t_{RSr}	—	500	µs	Figure 56.8 (3)

Note 1. This restriction applies only to the same group of pin interrupts. For details, see section 51.4.4.2, Restriction on the Input from Pins in the Same Group.
Note 2. tcyc indicates the cycle when the setting of the CKIOSEL bits in the CKIO select register is 2'b01 (initial value).

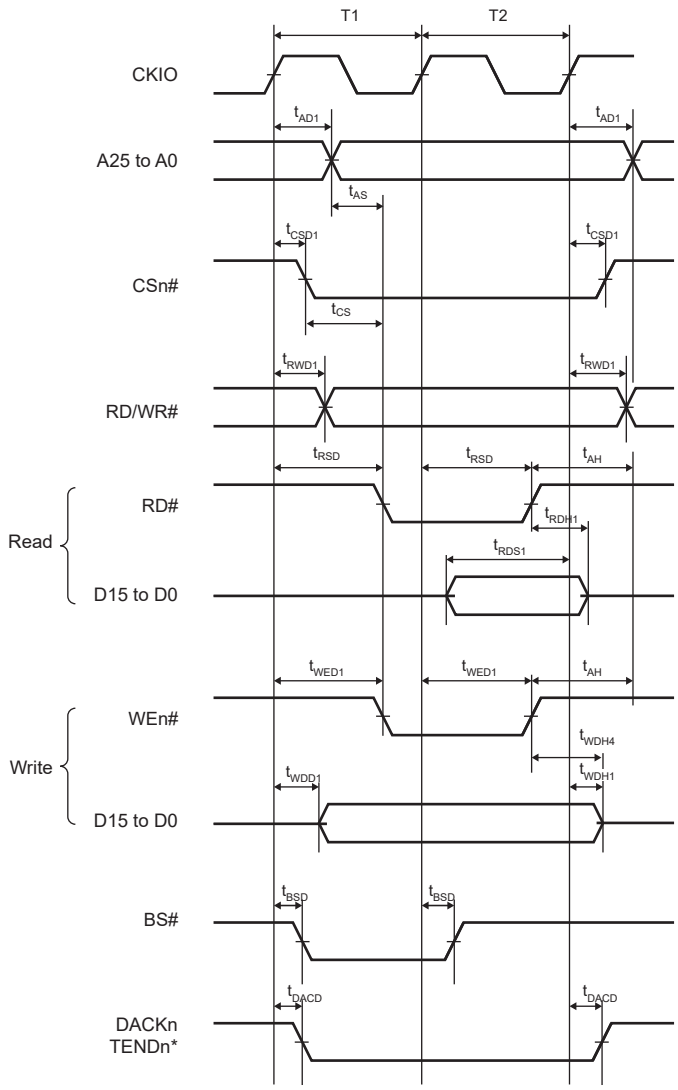
Multiplexed address hold time	t_{MAH}	1.0*3	—	ns	Figure 56.17
Address setup time for AH	t_{AVVH}	1 / 2 t_{cyc} – 2	—	ns	Figure 56.17
DACK, TEND delay time	t_{DACD}	Refer to the direct memory access controller timing		ns	Figure 56.13 to Figure 56.34

Note 1. The maximum value (f_{max}) of CKIO (external bus clock) depends on the number of wait cycles and the system configuration of your board.

Note 2. 1/2 t_{cyc} indicated in minimum and maximum values for the item of delay, setup, and hold times represents a half cycle from the rising edge with a clock. That is, 1/2 tcyc describes a reference of the falling edge with a clock.

Note 3. These values specified are for 66 MHz max operation. For CKIO = 110 to 132 MHz operation, some wait cycle insertion and input timing design are required depending on the system configuration.



Note: * The waveform for DACKn and TENDn is when active low is specified.

56.4.17 I²C Bus Interface Timing

Table 56.21 I²C Bus Interface Timing

Item	Symbol	I/O	**Standard mode** (Sm)		**Fast mode** (Fm)		Fast mode plus (Fm+)		Unit
			Min.	Max.	Min.	Max.	Min.	Max.	
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	0	1000	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	—	1.3	—	0.5	—	µs
Hold time*1	$t_{HD:STA}$	I/O	4.0	—	0.6	—	0.26	—	µs
Low period of SCL clock	t_{LOW}	I/O	4.7	—	1.3	—	0.5	—	µs
High period of SCL clock	t_{HIGH}	I/O	4.0	—	0.6	—	0.26	—	µs
Setup time for start/restart condition	$t_{SU:STA}$	I/O	4.7	—	0.6	—	0.26	—	µs
Data hold time (I²C bus device)	$t_{HD:DAT}$	I/O	0*2	—	0*2	—	0	—	µs
Data setup time	$t_{SU:DAT}$	I/O	250	—	100*3	—	50	—	ns
SDA and SCL signal rise time	t_R	Input	—	1000	20	300	—	120	ns
SDA and SCL signal fall time*3	t_F	Input	—	300	20 × (PVcc / 5.5 V)	300	20 × (PVcc / 5.5 V)	120	ns
		Output	—	250	20 × (PVcc / 5.5 V)	250	20 × (PVcc / 5.5 V)	120	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	—	0.6	—	0.26	—	µs
Capacitive load for each bus line	C_b	—	—	400*4	—	400*4	—	550*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	—	—	0	50*5	0	50*5	ns

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU: DAT (min.)}$ 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released ($t_{R (max.)}$ + $t_{SU: DAT (min.)}$ = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 23, I²C Bus Interface.

56.4.31 AC Characteristics Measurement Conditions

- I/O signal reference level: PVcc/2, PVcc_SPI/2, PVcc_HO/2, PVcc_SD0/2, PVcc_SD1/2, the minimum values of V_{IH}, V_{T+}, and V_{OH}, and the maximum values of V_{IL}, V_{T-}, and V_{OL} (refer to the individual timing chart)
- Input pulse level: PVcc, PVcc_SPI, PVcc_HO, PVcc_SD0, and PVcc_SD1
- Input rise and fall times: 1 ns

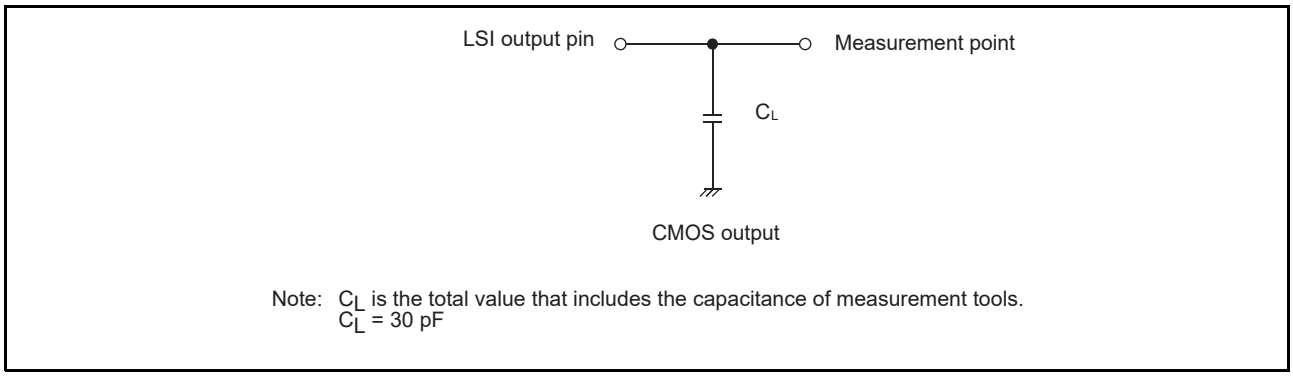

Figure 56.111 Output Load Circuit

56.5 A/D Converter Characteristics

Conditions: Vcc = 1.14 to 1.26 V, PVcc = USBDPVcc0 = USBDPVcc1 = AVcc = 3.0 to 3.6 V,
PVcc_SPI = 3.0 to 3.6 V/1.7 to 1.9 V, PVcc_SD0 = 3.0 to 3.6 V/1.7 to 1.9 V, PVcc_SD1 = 3.0 to 3.6V/1.7 to 1.9V, PLLVcc = 1.14 to 1.26 V, USBAPVcc0 = USBAPVcc1 = 3.0 to 3.6 V, LVDSAPVcc = 3.0 to 3.6 V,
LVDSPLLVcc = 1.14 to 1.26 V, PVcc_HO = MIPIAVcc18 = 1.7 to 1.9 V,
Vss = AVss = USBVss = 0 V
Ta = –40 to +85°C, Tj = –40 to +125°C

Table 56.40 A/D Converter Characteristics

Item	Min.	Typ.	Max.	Unit	Test Conditions
Resolution	8	—	12	bits	
Analog input capacitance	—	—	30	pF	
Conversion time*1 (P1φ = 66 MHz, P0φ = 33 MHz)	1	—	—	us	Sampling in 20 states
Permissible signal-source impedance	—	—	1	kΩ	
DNL	—	—	± 3	LSB	
INL	—	—	± 4	LSB	
Offset error	—	—	± 5.5	LSB	
Full-scale error	—	—	± 5.5	LSB	
Absolute accuracy	—	—	± 7	LSB	

Note: The above specification values apply when there is no access to the external bus during A/D conversion. If access proceeds during A/D conversion, values may not fall within the above ranges.

Note 1. The conversion time includes the sampling time and the comparison time (t_{SPL} + t_{SAM}).

57. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

57.1 Pin States

Table 57.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 57.1 Pin States

Pin Function			Pin State						
					Pin State Retained*2			Power-Down State	
					EBUSKEEPE*3 (Other than States at Right)				
Type	Pin Name		Normal State (Other than States at Right)	Power-On Reset*1	0	1	Power-On Reset*4	Deep Standby Mode	Software Standby Mode
Clock	EXTAL*6		I	I	I			I/Z*5	I/Z*5
	XTAL*6		O	O	O			O/Z*5	O/Z*5
	CKIO	Boot mode 0	O/Z*7	O	O	O/Z*7		O/Z*7	O/Z*7
		Other than Boot mode 0	O/Z*7	O	O/Z*7			O/Z*7	O/Z*7
	AUDIO_CLK (P6_4)		I	—	—			Z	Z
	AUDIO_CLK (PH_0)		I	—	—			I/Z*12	I
	AUDIO_X1*6		I	I	I			Z	Z
	AUDIO_X2*6		O	O	O			L	L
	AUDIO_XOUT		O	—	O/Z*9*15			O/Z*9*15	L/Z*9
System control	RES#		I	I	I			I	I

[Legend]
I: Input
O: Output
H: High-level output
L: Low-level output
Z: High-impedance
-: Condition under which the pin function is not selectable

Note 1. Indicates the power-on reset by low-level input to the RES# pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 51, GPIO).
Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI or by the realtime clock alarm interrupt, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 52, Power-Down Modes).
Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 52, Power-Down Modes).
Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 52, Power-Down Modes).
Note 5. Depends on the setting of the RTC1XT and RTC0XT bits in the RTCXTAL select register (RTCXTALSEL) (see section 52, Power-Down Modes).
Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, USB_X2) must be open.
Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
Note 8. Depends on the setting in the port direction register (PDR) of the general I/O ports.
Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 52, Power-Down Modes).
Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) (see section 52, Power-Down Modes).
Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 3 (RCR3) (see section 16, Realtime Clock (RTC)).
Note 14. O in serial wire debug (SWD) mode. In modes other than serial wire debug (SWD), Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.
Note 16. Depends on the setting of the SHUTDOWNZ bit in the PHY Operation Control Register (PHYCNT) (see section 47, MIPI CSI2 Interface).
Note 17. Only in products with a DRP

57.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 57.2 Handling of Unused Pins (Except for Debugger Interface Pins)

Pin Name	Handling
NMI	Fix this pin at a high level (pull up or connect to a power supply).
DP1, DP0, DM1, DM0	Connect these pins, via a 10 kΩ resistor, to GND.
RREF0, RREF1	Open-circuit
Dedicated to the USB (USBAPVcc0, USBAPVcc1, USBDPVcc0, USBDPVcc1)	Supply power at 3.3 V.
Dedicated USB ground (USBVss)	Connect to ground.
Dedicated A/D power (AVcc)	Supply power at 3.3 V.
Dedicated A/D ground (AVss)	Connect to ground.
LVDS analog power supply (LVDSAPVcc)	Supply power at 3.3 V.
LVDS PLL power supply (LVDSPLLVcc)	Supply power at 1.2 V.
MIPIAVcc18	Supply power at 1.8 V.
CSI_CLKP, CSI_CLKN, CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N	Connect to ground.
PVcc_SD0, PVcc_SD1	Supply power at 3.3 V.
Input/output pins driven by the PVcc_SD0 or PVcc_SD1 power supply (SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0)	Fix the levels on the pins (pull them up or down)*1
PVcc_SPI	Supply power at 3.3 V.
Input/output pins driven by the PVcc_SPI power supply (QSPI0_IO3 to QSPI0_IO0, QSPI1_IO3 to QSPI1_IO0, QSPI1_SSL)	Open-circuit
PVcc_HO	Supply power at 1.8 V.
Input/output pins driven by the PVcc_HO power supply (HM_RWDS/OM_DQS, HM_DQ7/OM_SIO7 to HM_DQ0/ OM_SIO0)	Fix the levels on the pins (pull them up or down)*1 *3
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)*1.
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down)*2; alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note 1. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.
Note 2. By setting the ports in accord with section 51, GPIO, setting of a fixed level can be made unnecessary for some pins. For details, see section 51.3.1, Port Direction Register (PDR).
Note 3. In the case of a pull-up resistor, connection is to the 1.8-V power supply.

Table 57.3 Handling of Debugger Interface Pins (when Emulator is not Used)

Pin	Handling
BSCANP	Fix this pin at a low level (pull down or connect to the ground level).
TRST#	Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the RES# pin
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
TDO	Open-circuit

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.
Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

57.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.
For the states of pins in deep standby mode, refer to the corresponding items under section 57.1, Pin States. Handling of unused pins as described under section 57.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 57.4 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (VCC, PLLVcc, LVDSPLL VCC)	Supply power at 1.2 V.
1.8-V power (MIPIAVcc18)	Supply power at 1.8 V.
1.8-V/3.3-V switchable power supply (PVCC_SPI, PVCC_HO, PVCC_SD0, PVCC_SD1)	Supply power at 1.8 V / 3.3 V.
3.3V power (PVCC, AVCC, USBAPVCC1, USBAPVCC0, USBDPVCC1, USBDPVCC0, LVDSAPVCC)	Supply power at 3.3 V.
Ground (Vss, AVss, USBVss)	Connect to ground.
RREF0, RREF1	Connect this pin to USBVss via 2.2 kΩ ± 1% resistor.
DP1, DP0, DM1, DM0	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
EXTAL, RTC_X1, AUDIO_X1, USB_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level)
XTAL, RTC_X2, AUDIO_X2, USB_X2	Connect the pins to the crystal oscillator or open circuit.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

B. Thermal Characteristics

The junction temperature (Tj) of an average sample (typ. value) can be calculated from either of the following expressions.

Calculation by using θja

$Tj = Ta + (P_D \times \theta ja)$, where

- Tj: junction temperature;
- Ta: ambient temperature;
- P_D: power consumption of the entire LSI; and
- θja: thermal resistance between Tj and Ta.

Calculation by using Ψjt

$Tj = Tt + (P_D \times \Psi jt)$, where

- Tt: temperature at the center of the top of the package; and
- Ψjt: thermal characteristics parameter representing the difference between Tj and Tt.

Since the value of θja varies greatly with the usage environment (e.g. the board and casing), the junction temperature (Tj) calculated by using θja is less accurate. Accordingly, when calculating Tj by using θja, allow a sufficient margin in designing the system. The value of Ψjt varies little with differences in the usage environment, but pay particular attention to measuring the temperature at the center of the top of the package (Tt) if you use this approach. For the values of θja and Ψjt, contact your local sales representative.

		20-65	Figure 20.28 (3) Example of Timing Adjustment (Serial Flash (DDR mode)): Newly added
		20-66	Figure 20.29 Data Alignment in External Address Space Read Mode: "When a HyperFlash memory device is connected (PHYCNT.OCTA[1:0] = 00) or an Octal-SPI flash memory device is connected (PHYCNT.OCTA[1:0] = 01 and PHYCNT.ALT_ALIGN = 1)" Title corrected
		20-67	Figure 20.30 Data Alignment in Manual Mode: "When an Octal-SPI flash memory device is connected (PHYCNT.OCTA[1:0] = 01, PHYCNT.ALT_ALIGN = 0, and PHYCNT.PHYMEM[1:0] = 00)" Title corrected “When an Octal-SPI flash memory device is connected (PHYCNT.OCTA[1:0] = 01, PHYCNT.ALT_ALIGN = 1, and PHYCNT.PHYMEM[1:0] = 01)” Title corrected
		20-69	20.6.6 Write Data when the Octal-SPI Flash Memory is Connected: Title corrected, Body corrected
		21. HyperBus™ Controller	
		21-10	21.5.6 CS0 Memory Timing Register (MTR0): Description of bits 15 to 12 (RCSH[3:0]) and bits 11 to 8 (WCSH[3:0]) corrected
		21-11	21.5.7 CS1 Memory Timing Register (MTR1): Description of bits 15 to 12 (RCSH[3:0]) and bits 11 to 8 (WCSH[3:0]) corrected
		22. Octa Memory Controller	
		22-4	Table 22.3 Octa memory controller register configuration: Initial Value of Device size register 0 (DSR0), Device size register 1 (DSR1), and Memory delay trim register (MDTR) corrected
		22-7	22.4.3 Device Command Setting Register (DCSR): Description of bit 27 (DOPI) corrected
		22-8	22.4.4 Device Size Register 0 (DSR0): Initial Value of bits 29 to 0 (DV0SZ[29:0]) corrected
			22.4.5 Device Size Register 1 (DSR1): Initial Value of bits 31, 30 (DV1TYP[1:0]) and bits 29 to 0 (DV1SZ[29:0]) corrected
		22-9	22.4.6 Memory Delay Trim Register (MDTR): Initial Value of bits 27 to 24 (DQSEDOPI[3:0]), bits 15 to 12 (DQSESOPI[3:0]), and bits 11 to 8 (DQSERAM[3:0]) corrected
		22-14, 22-15	22.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR): Description of bit 7 (CTR0) and bits 23 to 16 (Reserved) corrected
		23. I^2C Bus Interface	
		23-25, 23-26	23.3.7 RIICnSER — I^2C Bus Status Enable Register: Bit Name of SARy Bit (Slave Address Register y Enable) (y = 0 to 2) corrected
			Table 23.12 RIICnSER register contents: Bit Name of Bit Position 2, 1, and 0 (SAR2, SAR1, and SAR0) corrected
		23-30	23.3.9 RIICnSR1 — I^2C Bus Status Register 1 AASy Flag (Slave Address y Detection) (y = 0 to 2): Bit Name of RIICnSER.SARy (y = 0 to 2) corrected
		23-37	23.3.11 RIICnSARy — I^2C Slave Address Register y (y = 0 to 2) SVA0 Bit (10-Bit Address LSB): Bit Name of RIICnSER.SARy (y = 0 to 2) corrected
			23.3.11 RIICnSARy — I^2C Slave Address Register y (y = 0 to 2) SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits): Bit Name of RIICnSER.SARy (y = 0 to 2) corrected
			23.3.11 RIICnSARy — I^2C Slave Address Register y (y = 0 to 2) FSy Bit (7-Bit/10-Bit Address Format Selection): Bit Name of RIICnSER.SARy (y = 0 to 2) corrected
		23-67	23.9.1 Slave-Address Match Detection: Bit Name of RIICnSER.SARy bit (y = 0 to 2) corrected
		30. 12-Bit A/D Converter	
		30-15	30.2.4 A/D Channel Select Register A0 (ADANSA0): Bits b15 to b8 (Reserved) added
			30.2.5 A/D Channel Select Register B0 (ADANSB0): Bits b15 to b8 (Reserved) added
		30-16	30.2.6 A/D Channel Select Register C0 (ADANSC0): Bits b15 to b8 (Reserved) added

Rev.	Date	Description	
		Page	Summary
2.00	Dec 28, 2018	30-17	A/D-Converted Value Addition/Average Mode Select Register 0 (ADADS0): Bits b15 to b8 (Reserved) added
		32. USB 2.0 Host Module	
		32-53	Table 32.43 SPD_CTRL Register: Description of bit 31 (SUSPENDM_ENABLE), bit 30 (SLEEPM_ENABLE), and bit 23 (WKCNNT_ENABLE) corrected
		33. USB 2.0 Function Module	
		33-3	33.1.2.7 Other functions: Body corrected
		33-7	Table 33.3 List of Registers: D0FIFOSEL (D0FIFO Port Select Register), D0FIFOCTR (D0FIFO Port Control Register), D1FIFOSEL (D1FIFO Port Select Register), and D1FIFOCTR (D1FIFO Port Control Register) Newly added
		33-20	33.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: 020H>: Function of bit 14 (REW) corrected
		33-22, 33-23	33.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address: 028H> D1FIFO Port Select Register [D1FIFOSEL] <Address: 02CH>: Newly added
		33-24	33.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: 022H> D0FIFO Port Control Register [D0FIFOCTR] <Address: 02AH> D1FIFO Port Control Register [D1FIFOCTR] <Address: 02EH>: Title corrected
		33-55	33.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: 06CH> (1) Maximum packet size (MXPS) bits: Body corrected
		—	Device Address Configuration Registers: deleted
		33-90, 33-91	33.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: 42CH> Channel Configuration Register ch1 [CHCFG_1] <Address: 46CH>: Function of bit 0 (SEL) added
		33-91	Table 33.21 Range of Sizes That Can Be Specified in SDS and DDS Bits, corrected
		33-115	33.9.4.1 FIFO buffer allocation: Body corrected
			Figure 33.9 Example of FIFO Buffer Memory Mapping, corrected
		33-116	Table 33.25 List of FIFO Buffer Clearing Modes, corrected
		33-117	33.9.5 FIFO Port Functions: Body corrected
			Table 33.26 FIFO Port Function Settings, corrected
		33-118	33.9.5.1 FIFO port selection: Body corrected
			Table 33.27 FIFO Port Access for Each Pipe, corrected
		33-119	33.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction): Newly added
			Table 33.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software: Newly added
			33.9.5.3 BRDY interrupt timing selection function: Body corrected
		33-135	33.9.12.1 Register mode/link mode (1) Register mode (a) Operation flow of register mode Description of the register mode operation flow 1. Channel setting: Body corrected
		33-143	33.9.12.1 Register mode/link mode (2) Link mode (c) Descriptor setting: Body corrected
		33-168	Figure 33.35 Flowchart of Resume from Deep Standby in Response to a Bus Reset, corrected
		33-169	Figure 33.36 Flowchart of Resumption from Deep Standby in Response to Reception of the Resume Signal, corrected
		43. 2D Drawing Engine (DRW)	
		43-63	43.6.5.1 Color Channel Blending: Blending formula corrected
		43-65	43.6.5.2 Alpha Channel Blending: Blending formula corrected
		47. MIPI CSI2 Interface	
		47-39	47.2.37 SOT Error Count Register (SERRCNT): Bit Name of bits 7 to 0 (ERRSOTHS_CNT) corrected

Rev.	Date	Description	
		Page	Summary
2.00	Dec 28, 2018	47-40	47.2.39 ECC_CRCT Count Register (ECCCM): Bit Name of bits 3 to 0 (ECC_CRCT_CNT) corrected
		47-41	47.2.40 ECC_ERR Count Register (ECECM): Bit Name of bits 7 to 0 (ECC_ERR_CNT) corrected
			47.2.41 CRC_ERR Count Register (CRCECM): Bit Name of bits 7 to 0 (CRC_ERR_CNT) corrected
		47-48	47.2.53 PHY Timing Register 2 (PHYTIM2): Bit 5 (Reserved) corrected
		48. Video Input Module	
		48-14	48.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC): Description of bits 10 to 0 (SPPrC[10:0]) corrected
		48-15	48.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC): Description of bits 10 to 0 (EPPrC[10:0]) corrected
		49. SD/MMC Host Interface	
		49-22	49.2.15 SD Buffer Read/Write Register (SD_BUF0): Bit Name of bits 63 to 0 (BUF63 to BUF0) corrected
		49-30	49.2.27 DMAC Reset Register (DM_CM_RST): Note added
		49-61	Figure 49.24 SD_BUF DMA Read Flowchart Example: Flowchart corrected
		49-62	Figure 49.25 SD_BUF DMA Write Flowchart Example: Flowchart corrected
		51. GPIO	
		51-26	Table 51.10 Register Settings for Input/Output Pin Function: Pin name (SSILRCK1) corrected
		51-32	Table 51.16 Register Settings for Input/Output Pin Function in 324-Pin Products: Pin name (SSILRCK3) corrected
		51-34	Table 51.18 Register Settings for Input/Output Pin Function in 324-Pin Products: Pin name (SSILRCK2 and SSILRCK0) corrected
		51-36	Table 51.20 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products: Pin name (SSILRCK1 and SSILRCK2) corrected
		51-39	Table 51.23 Register Settings for Input/Output Pin Function: Pin name (SSILRCK0) corrected
		51-40	Table 51.24 Register Settings for Input/Output Pin Function: Pin name (SSILRCK0) corrected
		51-44	Table 51.28 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products: Pin name (SSILRCK3 and SSILRCK2) corrected
		51-45	Table 51.29 Register Settings for Input/Output Pin Function in 176-Pin Products: Pin name (SSILRCK3 and SSILRCK2) corrected
		51-62	Table 51.34 Register Settings: "Point to Note" corrected
		51-67	Table 51.38 Conditions for Input of Interrupt Requests between Port Pins in the Same Group: Note 2 corrected
		52. Power-Down Modes	
		52-40	52.2.33 USB Deep standby cancel source flag register (USBDSFR): Bit Name (USBDSF3, USBDSF2, USBDSF1, and USBDSF0) corrected
		52-51	Table 52.5 External Memory Control Pins in Different Modes: Boot Mode 4 (Octal-SPI Flash Boot) corrected
		56. Electrical Characteristics	
		56-4	Table 56.2 DC Characteristics (3) [Except 1.8-/3.3-V Switchable I/O Interface, I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]: Schmitt trigger input characteristics, corrected
		56-53, 56-54	Table 56.18 SPI Multi I/O Bus Controller Timing*1, corrected
		56-54	Figure 56.56 SDR Transfer Format Transmission and Reception Timing, corrected
			Figure 56.57 DDR Transfer Format Transmission and Reception Timing, corrected
		56-55	Figure 56.60 Transmit/Receive Timing with Octal-SPI flash memory or HyperFlash™ Connected: Title corrected
		56-56	Table 56.19 HyperBus™ Controller Timing*1*2, corrected
		56-58	Table 56.20 Octa Memory Controller Timing*1*2, corrected
			Figure 56.66 Clock Timing: Title corrected, Signal name (OM_SCLK) corrected

Rev.	Date	Description	
		Page	Summary
2.00	Dec 28, 2018	56-59	Figure 56.67 SPI Transfer Format Transmission and Reception Timing, corrected
			Figure 56.68 SOPI Transfer Format Transmission and Reception Timing, corrected
		56-60	Figure 56.70 DOPI Transfer Format Transmission Timing: Newly added
		56-83	Table 56.36 SD/MMC Host Interface Timing (MMC HS-DDR mode 3.3-/1.8-V power supply selection), corrected
		56-84	Table 56.37 SD/MMC Host Interface Timing (MMC HS200 mode 1.8-V power supply selection, Output load: 15pF), corrected
3.00	Dec 06, 2019	All	12-Bit A/D Converter corrected to A/D Converter
		1. Overview	
		1-4	Table 1.1 Features of RZ/A2M: Specification of Octa memory controller corrected
		1-5	Table 1.1 Features of RZ/A2M: Item and specification of CANFD interface corrected
		1-5	Table 1.1 Features of RZ/A2M: Specification of USB 2.0 host/function module corrected
		1-10	Table 1.2 Product Lineup: Note corrected
		1-18	Table 1.3 Pin Function: Classification of CANFD interface corrected
		1-20	Table 1.3 Pin Function: Function of the RREF1 and RREF0 pins of the USB 2.0 host/function module corrected
		3. Boot Mode	
		3-2	Table 3.1 External Pin (MD_BOOT2 to MD_BOOT0) Settings and Corresponding Boot Modes: Boot mode name of Boot Mode 6 corrected
		3-3	Table 3.2 Hardware Used in Each Boot Mode: QSPI0_SCLK and QSPI1_SCLK respectively corrected to QSPI0_SPCLK and QSPI1_SPCLK, Boot mode name of Boot Mode 6 corrected
		3-4	Table 3.3 Exception Vector Address in Each Boot Mode: Boot mode name of Boot Mode 6 corrected
		3-13	Figure 3.8 Example of connection with eMMC device, corrected
		3-14	Figure 3.9 Control signals output to the serial flash memory through SPI communication conversion, corrected
		3-15	Figure 3.10 Connection example when using boot mode 3, corrected
		3-16	Figure 3.11 Connection example when using boot mode 4, corrected
		3-17	Figure 3.12 Control signal output to HyperFlash by HyperBus protocol conversion, corrected
		3-18	Figure 3.13 Connection example when using boot mode 5, corrected
		3-19	Figure 3.14 Control signals output to the OctaFlash, corrected
		3-19	Table 3.10 Register setting value of each peripheral module in boot mode 6: Initial values after reset of the DSR0 register corrected
		3-20	Figure 3.15 Connection example when using boot mode 6, corrected
		3-21	3.5.8 Boot Mode 7: Body corrected
		3-21	Figure 3.16 Control signal output to HyperFlash by HyperBus protocol conversion, corrected
		3-22	Figure 3.17 Connection example when using boot mode 7, corrected
		3-24	3.7.3 Notes on Serial Flash Booting (Boot Mode 3, 4, 6) after This LSI is Reset: Body corrected
		5. LSI Internal Bus	
		5-3	Table 5.2 List of Peripheral Buses: Description of Connected peripheral modules corrected
		5-13	5.8.5 Slave Area (3) Protection unit information (ARPROT[2:0], AWPROT[2:0]): Note corrected
		5-49	5.11.25 Slave Access Control Register 0 (SLVACCCTL0): Description of bit 14 (POEGNS) corrected
		5-51	5.11.26 Slave Access Control Register 1 (SLVACCCTL1): Description of bit 16 (RCANNS) corrected
		6. Clock Pulse Generator	
		6-2	Figure 6.1 Block Diagram: Peripheral clock 0C deleted
		6-18	Figure 6.8 Clock Signals for Other Modules 1: Description of frequency deleted
		6-20	Figure 6.10 Distribution of Internal Clock Signals: DRP module added
		6-21	Figure 6.11 Distribution of Internal Clock Signals (2): DRP module deleted

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	7. Interrupt Controller	
		7-17	7.4.4 Pin Interrupts: Body corrected
		7-26	Table 7.3 List of Interrupt IDs: Request Source Name(ALM, ALM_S) of Realtime Clock Module corrected
		8. Bus State Controller	
		8-8, 8-9	8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5): Name of bits 24 to 22, 21 to 19, and 18 to 16 (IWRRD[2:0], IWRRS[2:0], IWRWS[2:0]) corrected, Description of bits 24 to 22 (IWRRD[2:0]), bits 21 to 19 (IWRRS[2:0]), bits 18 to 16 (IWRWS[2:0]), and bit 14 to 12 (TYPE[2:0]) corrected
		8-76	8.5.11 Others (4) Usage Note on Changing CKIO Clock Selections: Register name (CKIO Select Register) corrected
		9. Direct Memory Access Controller	
		9-53 to 9-56, 9-58	Table 9.4 On-Chip Module Requests: General PWM timer channel 0 to 7, CANFD interface, corrected
		10. Multi-Function Timer Pulse Unit 3 (MTU3a)	
		10-1	Table 10.1 MTU Specifications: Description of Count clock, Available operations, and Low power consumption function corrected
		10-2, 10-3	Table 10.2 MTU Functions: External clocks in phase-counting mode added, MTU Function of DMAC activation, Interrupt sources and Module stop function corrected, Item (Interrupt skipping 1) corrected, Note 3 added, and note number after Note 3 renumbered.
		10-4	Figure 10.1 Block Diagram of MTU (MTU0 to MTU4, MTU8), corrected
		10-5	Figure 10.2 Block Diagram of MTU (MTU5 to MTU7), corrected
		10-6	Table 10.3 Pin Configuration of the MTU: Function of MTCLKA, and MTCLKB corrected
		10-12	10.2.1 Timer Control Register (TCR): Register symbols (MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, and MTU8.TCR) corrected, Description of TPSC[2:0]bit, and CKEG[1:0] bit corrected
		10-13	Table 10.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8): Location moved
		10-13	Table 10.6 CCLR[2:0] (MTU1 and MTU2): Location moved
		10-13	10.2.1 Timer Control Register (TCR): Register symbol (MTU5.TCRU, MTU5.TCRV, and MTU5.TCRW) corrected, Description of TPSC[1:0] bit corrected
		10-14	10.2.2 Timer Control Register 2 (TCR2): Register symbol (MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, and MTU8.TCR2) corrected
		10-14	10.2.2 Timer Control Register 2 (TCR2): Register symbol (MTU1.TCR2, and MTU2.TCR2) corrected, Body corrected, Description of TPSC2[2:0] bit corrected
		10-15	10.2.2 Timer Control Register 2 (TCR2): Register symbols (MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W) corrected, Description of Bit table (x: Don't care) added, Description of TPSC2[2:0] bit, and CKEG[1:0] bit, corrected
		10-17	Table 10.10 TPSC[2:0], TPSC2[2:0] (MTU3, MTU4, MTU6, MTU7, and MTU8): Note 1 deleted
		10-17	Table 10.11 TPSC[1:0], TPSC2[2:0] (MTU5): Note deleted
		10-20	10.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B): Body corrected
		10-21	10.2.5 Timer Mode Register 3 (TMDR3): Description of LWA Bit corrected
		10-23	10.2.6 Timer I/O Control Register (TIOR), MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: Body corrected
		10-24	Table 10.14 TIORH (MTU0): Description of IOB[3:0]=11xx corrected, Note 1 added.
		10-25	Table 10.15 TIORL (MTU0): Description of IOD[3:0]=11xx corrected. Note 2 added.
		10-26	Table 10.16 TIOR (MTU1): Table heading, corrected (MTU1.TGRB/TGRBLW Function)

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-29	Table 10.23 TIORL (MTU6): Note 1, corrected
		10-30	Table 10.25 TIORL (MTU7): Note 1, corrected
		10-31	Table 10.26 TIORH (MTU8): Value of Bit 6 (IOB2) corrected. Note 1 added.
		10-31	Table 10.27 TIORL (MTU8): Note 1, corrected
		10-32	Table 10.28 TIORH (MTU0): Description of IOA[3:0] = 1100 corrected. Note 1 added.
		10-32	Table 10.29 TIORL (MTU0): Description of IOC[3:0] = 11xx corrected. Note 2 added.
		10-33	Table 10.30 TIOR (MTU1): Table heading, corrected (MTU1.TGRA/TGRALW Function)
		10-35	Table 10.35 TIORL (MTU4): Note 1, corrected
		10-36	Table 10.37 TIORL (MTU6): Note 1, corrected
		10-37	Table 10.39 TIORL (MTU7): Note 1, corrected
		10-39	Table 10.42 TIORU, TIORV, and TIORW (MTU5): Note 1 added
		10-41	10.2.8 Timer Interrupt Enable Register (TIER): Register symbols (MTU1.TIER, MTU2.TIER, MTU0.TIER, MTU3.TIER, MTU6.TIER, MTU4.TIER, MTU7.TIER, and MTU8.TIER) corrected
		10-43	10.2.8 Timer Interrupt Enable Register (TIER): Register symbols (MTU0.TIER2) corrected, Description of TTGE2 Bit corrected, Register symbol (MTU5.TIER) corrected
		10-44	10.2.9 Timer Status Register (TSR): Register symbols (MTU1.TSR, MTU2.TSR, MTU3.TSR, MTU4.TSR, MTU6.TSR, and MTU7.TSR) corrected
		10-48	10.2.13 Timer Counter (TCNT), MTU8.TCNT: Note of Bit table added, Body corrected
		10-49	10.2.14 Timer Longword Counter (TCNTLW): Note of Bit table added
		10-50	10.2.15 Timer General Register (TGR): Register symbols (MTU0.TGR to MTU7.TGR) added.
		10-50	10.2.15 Timer General Register (TGR), MTU8.TGR: Note of Bit table added
		10-51	10.2.16 Timer Longword General Registers (TGRALW and TGRBLW): Title corrected, Note of Bit table added, Body corrected
		10-52	10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Title corrected, MTU.TSTRA: Register symbol (MTU.TSTRA) corrected, Body corrected, Description of CSTn Bits corrected
		10-53	10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Register symbol (MTU.TSTRB) corrected, Description of CSTn Bits corrected
		10-53	10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Register symbol (MTU5.TSTR) corrected
		10-54	10.2.18 Timer Synchronous Registers (TSYRA and TSYRB): Title corrected, Register symbols (MTU.TSYRA (MTU0, MTU1, MTU2, MTU3, MTU4)) corrected
		10-55	10.2.18 Timer Synchronous Registers (TSYRA and TSYRB): Register symbol (MTU.TSYRB) corrected
		10-56, 10-57	10.2.19 Timer Counter Synchronous Start Register (TCSYSTR): Note 1. of Bit table corrected, Descriptions of SCH7 Bit, SCH6 Bit, SCH4 Bit, SCH3 Bit, SCH2 Bit, SCH1 Bit, and SCH0 Bit corrected
		10-58	10.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB): Description of the RWE bit corrected
		10-59	10.2.21 Timer Output Master Enable Registers (TOERA and TOERB): Title corrected, Register symbol (MTU.TOERA) corrected, Body corrected
		10-60	10.2.21 Timer Output Master Enable Registers (TOERA and TOERB): Register symbol (MTU.TOERB) corrected, Body corrected
		10-61	10.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B): Note 4 of bit map deleted, Note 4 of bit 3 (TOCL) added, Description of OLSP Bit and OLSN Bit corrected
		10-62	Figure 10.3 Example of Output in Complementary PWM Mode, corrected
		10-63	10.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B): Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-67	10.2.25 Timer Gate Control Register A (TGCRA): Description of bit 6 (BDC) corrected, Description of FB Bit and P Bit corrected
		10-71	Table 10.53 Setting of BTE[1:0] Bits in TBTERA and TBTERB: Title corrected
		10-72	10.2.32 Timer Waveform Control Registers (TWCRA and TWCRB): Description of SCC Bit corrected
		10-74	10.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C): Register symbols (MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, and MTU8.NFCR8) corrected, Body corrected
		10-75	10.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C): Register symbols (MTU0.NFCRC) corrected, Bit Symbol (NFCS[1:0]) corrected, Body corrected
		10-76	10.2.34 Noise Filter Control Register 5 (NFCR5): Pin names (MTIC5U, MTIC5V, and MTIC5W) corrected
		10-77	10.2.35 Timer A/D Converter Start Request Control Register (TADCR): Register symbol (MTU4.TADCR) corrected, Note 4 of the bit map deleted, Notes 1 to 3 of the bit table corrected, Description of bit 3 (ITA3AE), bit 2 (ITA4VE), bit 1 (ITB3AE), and bit 0 (ITB4VE) corrected, Name of bits 15 and 14 (BF[1:0]) corrected, Note numbers corrected, Note numbers corrected, Note, Note 1, and Note 3 corrected
		10-78	Table 10.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4), corrected
		10-79	10.2.35 Timer A/D Converter Start Request Control Register (TADCR): Register symbol (MTU7.TADCR) corrected, Note 4 of tje bit map deleted, Note 1 to 3 of the bit table corrected, Description of bit 3 (ITA6AE), bit 2 (ITA7VE), bit 1 (ITB6AE), and bit 0 (ITB7VE) corrected, Name of bits 15 and 14 (BF[1:0]) corrected, Note numbers corrected, Note, Note 1, and Note 3 corrected
		10-80	Table 10.55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7), corrected
		10-81	10.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB): Note2 corrected
		10-82	10.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB): Description of bit 0 (TITM) corrected, Note 1, and Note2 added
		—	Table 10.56 Interrupt Skipping Function Selected through TITM Bit: deleted
		10-83, 10-84	10.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B): Register symbol (MTU.TITCR1A, and MTU.TITCR1B) corrected, the location of the description moved and corrected.
		10-85	10.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B): Register symbol (MTU.TITCNT1A) corrected, Description of bits 7 and 3 corrected
		10-86	10.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B): Register symbol (MTU.TITCNT1B) corrected, Description of bits 7 and 3 corrected.
		10-87	10.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B): Register symbol (MTU.TITCR2A) corrected
		10-88	10.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B): Register symbol (MTU.TITCR2B) corrected
		10-89	10.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B): Register symbol (MTU.TITCNT2A) corrected, Description of bits 7 to 3 corrected
		10-90	10.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B): Register symbol (MTU.TITCNT2B) corrected, Description of bits 7 to 3 corrected
		10-91	10.3.1 Basic Functions: Body corrected
		10-91	10.3.1 Basic Functions (1) Counter Operation: Body corrected
		10-91	Figure 10.5 Example of Count Operation Setting Procedure: Title corrected, Descrptions of [1] and [5], corrected
		10-92	10.3.1 Basic Functions (b) Free-Running Count Operation and Periodic Count Operation: Body corrected
		10-92	Figure 10.6 Free-Running Counter Operation, corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-92	Figure 10.7 Periodic Counter Operation, corrected
		10-93	10.3.1 Basic Functions (2) Waveform Output by Compare Match: Body corrected
		10-93	Figure 10.8 Example of Procedure for Setting Waveform Output by Compare Match: Description of [4], corrected
		10-95	10.3.1 Basic Functions (3) Input Capture Function: Body corrected, Note corrected
		10-95	Figure 10.11 Example of Input Capture Operation Setting Procedure: Description of [2], corrected
		10-96	Figure 10.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8), corrected
		10-97	10.3.2 Synchronous Operation: Body corrected
		10-97	Figure 10.13 Example of Synchronous Operation Setting Procedure: Descriptions of [1] and [5], corrected
		10-100	Figure 10.17 Example of Buffer Operation Setting Procedure: Description of [3], corrected
		10-102	10.3.3 Buffer Operation (3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation: Body corrected
		10-103	10.3.4 Cascaded Operation: Body corrected
		10-104	Figure 10.21 Cascaded Operation Setting Procedure: Descriptions of [1] and [2], corrected
		10-104	Figure 10.22 Cascaded Operation Example (a), corrected
		10-108	10.3.5 PWM Modes: Body corrected
		10-109	10.3.5 PWM Modes (b) PWM Mode 2: Body corrected
		10-110	Figure 10.26 Example of PWM Mode Setting Procedure: Descriptions of [2] to [4] and [7] corrected
		10-112	10.3.5 PWM Modes (2) Examples of PWM Mode Operation: Body corrected
		10-112	Figure 10.29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, 7), corrected
		10-114	10.3.6.1 16-Bit Phase Counting Mode: Body corrected
		10-114	Figure 10.30 Example of 16-Bit Phase Counting Mode Setting Procedure: Processing No. corrected ([2] → [3]), Description of [3] corrected
		10-116	Figure 10.32 Example of Operation in Phase Counting Mode 2 (When MTUn.TCR2.PCB[1:0] is 00b (n = 1, 2)): Title corrected
		10-116	Figure 10.33 Example of Operation in Phase Counting Mode 2 (When MTUn.TCR2.PCB[1:0] is 01b (n = 1, 2)): Title corrected

		10-180	Figure 10.101 Example of Procedure for Specifying Synchronous Counter Clearing in MTU6 and MTU7: Title corrected, Descriptions of start and end processing corrected
		10-180	10.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7 (b) Examples of Synchronous Counter Clearing in MTU6 and MTU7: Title corrected, Body corrected
		10-180	Figure 10.102 Example of Synchronous Counter Clearing in MTU6 and MTU7 (1): Title corrected
		10-181	Figure 10.103 Example of Synchronous Counter Clearing in MTU6 and MTU7 (2): Title corrected
		10-182	Figure 10.105 Example of External Pulse Width Measurement (Measuring High Pulse Width), corrected
		10-183	10.3.12 Dead Time Compensation: Body corrected
		10-183	Figure 10.107 Delay in Dead Time in Complementary PWM Operation: Location moved
		10-184	Figure 10.108 Example of Dead Time Compensation Setting Procedure: Processing corrected
		10-185	10.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode: Title corrected, Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-185	Figure 10.109 TCNTU Capture at Crest and Trough in Complementary PWM Operation: Title corrected, Fiugre corrected
		10-188	Table 10.78 MTU Interrupt Sources: Note 1 corrected
		10-188	10.4.1 Interrupt Sources and Priorities (1) Input Capture/Compare Match Interrupt: Body corrected
		10-188	10.4.1 Interrupt Sources and Priorities (2) Overflow Interrupt: Body corrected
		10-188	10.4.2 DMAC Activation (1) DMAC Activation: Body corrected
		10-189	10.4.3 A/D Converter Activation (1) A/D Converter Activation by TGRA Input Capture/Compare Match or at MTU4.TCNT (MTU7.TCNT) Trough in Complementary PWM Mode: Description of suffix in body corrected
		10-189	10.4.3 A/D Converter Activation (2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE: Body corrected
		10-190	Table 10.79 Interrupt Sources and A/D Converter Start Request Signals: Note 1 corrected
		10-191	Figure 10.111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8), corrected
		10-191	Figure 10.112 Count Timing in Internal Clock Operation (MTU5), corrected
		10-191	Figure 10.113 Count Timing in External Clock Operation (MTU0 to MTU4, MTU6 to MTU8): Title corrected, Figure corrected
		10-191	Figure 10.114 Count Timing in External Clock Operation (Phase Counting Mode), corrected
		10-192	10.5.1 Input/Output Timing (2) Output Compare Output Timing: Body corrected
		10-192	Figure 10.115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D), corrected
		10-192	Figure 10.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D), corrected
		10-196	Figure 10.124 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Stopped), corrected
		10-196	Figure 10.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating), corrected
		10-197	Figure 10.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8), corrected
		10-197	Figure 10.128 TGI Interrupt Timing (Compare Match) (MTU5), corrected
		10-199	Figure 10.131 TCIV Interrupt Timing, corrected
		10-199	Figure 10.132 TCIU Interrupt Timing, corrected
		10-200	10.6.2 Count Clock Restrictions: Title corrected, Body corrected
		10-200	Figure 10.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode, corrected
		10-200	10.6.3 Note on Cycle Setting: Formula for frequency (f) in the case of MTU0 to MTU4 and MTU6 to MTU8 corrected
		10-201	Figure 10.135 Contention between TCNT Write and Increment Operations, corrected
		10-203	10.6.8 Contention between Buffer Register Write and TCNT Clear Operations: Body corrected
		10-205	10.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation: Body corrected
		10-205	Figure 10.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation, corrected
		10-207	10.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode: Body corrected
		10-207	Figure 10.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode, corrected
		10-208	10.6.16 Overflow in Reset-Synchronized PWM Mode: Body corrected
		10-209	10.6.17 Contention between Overflow/Underflow and Counter Clearing: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-209	Figure 10.147 Contention between Overflow and Counter Clearing, corrected
		10-210	10.6.18 Contention between TCNT Write Operation and Overflow/Underflow: Body corrected
		10-210	Figure 10.148 Contention between TCNT Write Operation and Overflow, corrected
		10-210	10.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode: Body corrected
		10-212	10.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR): Body corrected
		10-213	10.6.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode: Body corrected
		10-215	Figure 10.151 Continuous Output of Interrupt Signal in Response to a Compare Match, corrected
		10-216	10.6.27 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode, added
		10-216	Figure 10.152 A/D Converter Start Request when TADCOBRA is Set to 0 in MTU4, added
		10-217	Figure 10.153 A/D Converter Start Request when TADCOBRA is Set to the Same Value as TCDR in MTU4, added
		10-219	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation: Body corrected
		10-220	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode: Descriptions of operations (3), (6), (10), and (14) corrected
		10-221	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1: Description of operation (14) corrected
		10-221	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2: Description of operation (12) corrected
		10-223	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode: Descriptions of operations (13), (14), (16), and (18) corrected
		10-224	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode: Destinations for reference of operations (1) to (13) corrected, Descriptions of operations (14), (16), and (18) corrected
		10-225	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode: Descriptions of operations (3), (6), (10), and (14) corrected
		10-226	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1: Description of operation (14) corrected
		10-226	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2: Description of operation (12) corrected
		10-228	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode: Descriptions of operations (14), (15), (17), and (19) corrected
		10-229	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode: Descriptions of operations (15), (17), and (19) corrected
		10-230	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode: Description of operation (3) corrected
		10-232	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2: Description of operation (11) corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	10-234	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2: Description of operation (11) corrected
		10-236	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode: Descriptions of operations (2), (4), (6), (10), and (14) corrected
		10-237	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1: Description of operation (14) corrected
		10-238	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode: Description of operation (12) corrected
		10-239	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings: Descriptions of operations (12), (13), (15), and (17) corrected
		10-240	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode: Descriptions of operations (12), (13), (15), and (17) corrected
		10-241	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode: Descriptions of operations (2), (4), (6), (10), and (14) corrected
		10-242	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1: Description of operation (14) corrected
		10-243	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode: Descriptions of operations (11), (12), (14), and (16) corrected
		10-244	10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode: Description of operation (12) corrected
		11. Port Output Enable 3 (POE3)	
		11-16	11.2.11 Port Output Enable Control Register 5 (POECR5): Symbol of bit 4 (IC4ADDMT0ZE), bit 2 (IC2ADDMT0ZE), and bit1 (IC1ADDMT0ZE) corrected
		12. General PWM Timer (GPT)	
		All	Suffix corrected as follows: GTADTRm → GTADTRn, GTADTBRm → GTADTBRn, GTADTDBRm → GTADTDBRn, GTADTBRm → GTADTBRn, GTDVm → GTDVn, GTDBm → GTDBn
		12-3	Figure 12.1 GPT block diagram, corrected
		12-7	12.2.1 General PWM Timer Write-Protection Register (GTWP): Register name corrected (GTIBCSR → GTICBSR)
		12-8	12.2.2 General PWM Timer Software Start Register (GTSTR): Body corrected
		12-9	12.2.3 General PWM Timer Software Stop Register (GTSTP): Body corrected
		12-9	12.2.4 General PWM Timer Software Clear Register (GTCLR): Body corrected
		12-23	12.2.8 General PWM Timer Up Count Source Select Register (GTUPSR): Body corrected
		12-26	12.2.9 General PWM Timer Down Count Source Select Register (GTDNSR): Body corrected
		12-34	12.2.12 General PWM Timer Control Register (GTCR): Description of b18 to b16 (MD[2:0]) in Bit table corrected
		12-36, 12-37	12.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC): b17 and b16 of Bit table corrected, Description of the OmDTYR bit corrected
		12-39, 12-40	12.2.14 General PWM Timer I/O Control Register (GTIOR): Description of the OADF[1:0] and OBDF[1:0] bits corrected
		12-44	12.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD): Description of the GRP[1:0] bit corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	12-45 to 12-47	12.2.16 General PWM Timer Status Register (GTST): Bit names of bit 5 (TCFF), bit 4 (TCFE), bit 3 (TCFD), and bit 2 (TCFC) corrected
		12-51, 12-52	12.2.17 General PWM Timer Buffer Enable Register (GTBER): Descriptions of bits 25 and 24 (ADTTA[1:0]) and bits 29 and 28 (ADTTB[1:0]) in Bit table corrected, Description of the PR[1:0] bits corrected
		12-54	12.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC): Body corrected
		12-58	12.2.24 A/D Converter Start Request Timing Register n (GTADTRn) (n = A, B): Suffix corrected
		12-58	12.2.25 A/D Converter Start Request Timing Buffer Register n (GTADTBRn): Suffix corrected, Register address of GPT32Em.GTADTBRB added
		12-58	12.2.26 A/D Converter Start Request Timing Double-Buffer Register n (GTADTDBRn) (n = A, B): Suffix corrected
		12-59	12.2.27 General PWM Timer Dead Time Control Register (GTDTCR): Description of the TDE bit corrected
		12-60	12.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D): Suffix corrected, Body corrected
		12-60	12.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D): Suffix corrected
		12-62	12.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR): Description of b31 to b1 in Bit table corrected
		12-67	12.3.1.1 Counter Operation (4) Event count operation in up-counting using hardware sources: Body corrected
		12-68	12.3.1.1 Counter Operation (5) Event count operation in down-counting using hardware sources: Body corrected
		12-68	Figure 12.9 Example setting for an event count operation in down-counting using hardware sources: Description of setting count source corrected
		12-69	12.3.1.1 Counter Operation (6) Counter clear operation: Body corrected
		12-76	12.3.2 Buffer Operation: Body corrected
		12-76	12.3.2.1 GTPR Register Buffer Operation: Body corrected
		12-79	12.3.2.2 Buffer Operation for GTCCRA and GTCCRB (1) When GTCCRA or GTCCRB functions as an output compare register: Body corrected
		12-83	Figure 12.27 Example setting for GTCCRA and GTCCRB buffer operation with input capture: Description of setting operating mode corrected
		12-86	Figure 12.31 Example setting for GTADTRA and GTADTRB buffer operation: Description of setting buffer operation corrected
		12-89	12.3.3.2 Saw-Wave One-Shot Pulse Mode: Body corrected
		12-99	12.3.4 Automatic Dead Time Setting Function: Body corrected
		12-106	Figure 12.49 Example of output duty 0% and 100% functions: Setting examples corrected
		12-109	Figure 12.55 Example setting for count start/stop operation by hardware source: Descriptions of setting hardware count start and setting hardware count stop corrected
		12-111	Figure 12.58 Example setting for count clearing operation by hardware source: Description of setting hardware source operation corrected
		12-112	12.3.7.3 Hardware Clear Operation: Body corrected
		12-115	12.3.8.2 Synchronized Operation by Hardware: Body corrected
		12-115	Figure 12.62 Example of a simultaneous start, stop, and clear by the hardware sources, with the same count cycle (GTPR register value): Title corrected
		12-132	Table 12.18 Conditions of up-counting and down-counting in phase counting mode 5 (B): Register setting corrected
		12-136	12.4.1 Interrupt Sources and Priorities (3) CCMPAn interrupt (n = 0 to 7): Body corrected
		12-136	12.4.1 Interrupt Sources and Priorities (4) CCMPBn interrupt (n = 0 to 7): Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	12-143	Figure 12.87 Example setting for A/D converter start request timing operation: Descriptions of setting operating mode and starting count operation corrected
		12-147	12.7 Noise Filter Function: Body corrected
		12-148	12.8.1 Write-Protection for Registers: Register name corrected (GTIBCSR → GTICBSR)
		12-158	Figure 12.100 Example of temporary cancellation of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low, corrected
		12-160	12.10.1 Settings for the Module-Stop Function: Body corrected
		12-161	12.10.4 Starting and Stopping the GTCNT Counter: Body corrected
		12-161	12.10.5 Priority On Conflicts (3) GTCCRn registers (n = A to F): Suffix corrected
		12-162	12.10.5 Priority On Conflicts (5) GTADTRn registers (n = A, B): Suffix corrected
		12-162	12.10.5 Priority On Conflicts (6) GTDVn registers (n = U, D): Suffix corrected
		13. Port Output Enable for GPT (POEG)	
		13-2	Figure 13.1 POEG block diagram, corrected
		13-5	13.3 Output-Disable Control Operation: Body corrected
		13-8	13.5 External Trigger Output to the GPT: Bit name corrected (POEGG.INV → POEGGn.INV)
		13-9	13.6.2 Specifying Pins Associated with the GPT: Body corrected
		16. Realtime Clock (RTC)	
		16-2	Table 16.2 RTC specifications: Description of Interrupts corrected
		16-3	Figure 16.1 RTC block diagram, corrected
		16-5	Table 16.4 Register Configuration: Note corrected to Note 1, Note 2 added
		16-6	16.2.1 64-Hz Counter (R64CNT): Counter notation corrected (R64CNT counter → R64CNT)
		16-7	16.2.2 Second Counter (RSECCNT) / Binary Counter 0 (BCNT0) (1) In calendar count mode: Counter notation corrected (RSECCNT counter → RSECCNT)
		16-8	16.2.3 Minute Counter (RMINCNT) / Binary Counter 1 (BCNT1) (1) In calendar count mode: Counter notation corrected (RMINCNT counter → RMINCNT)
		16-8	16.2.3 Minute Counter (RMINCNT) / Binary Counter 1 (BCNT1) (2) In binary count mode: Counter notation corrected (BCNT1 counter → BCNT1)
		16-9	16.2.4 Hour Counter (RHRCNT) / Binary Counter 2 (BCNT2) (1) In calendar count mode: Counter notation corrected (RHRCNT counter → RHRCNT)
		16-9	16.2.4 Hour Counter (RHRCNT) / Binary Counter 2 (BCNT2) (2) In binary count mode: Counter notation corrected (BCNT2 counter → BCNT2)
		16-10	16.2.5 Day-of-Week Counter (RWKCNT) / Binary Counter 3 (BCNT3) (1) In calendar count mode: Counter notation corrected (RWKCNT counter → RWKCNT)
		16-11	16.2.6 Day Counter (RDAYCNT): Counter notation corrected (RDAYCNT counter → RDAYCNT), Body corrected
		16-11	16.2.7 Month Counter (RMONCNT): Counter notation corrected (RMONCNT counter → RMONCNT)
		16-12	16.2.8 Year Counter (RYRCNT): Description of bits 7 to 4 (YR10[3:0]) Function of b7 to b4 (YR10[3:0]) in Bit table corrected, Counter notation corrected (RYRCNT counter → RYRCNT)
		16-13	16.2.9 Second Alarm Register (RSECAR) / Binary Counter 0 Alarm Register (BCNT0AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RSECCNT counter → RSECCNT)
		16-14	16.2.10 Minute Alarm Register (RMINAR) / Binary Counter 1 Alarm Register (BCNT1AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RMINCNT counter → RMINCNT)

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	16-15	16.2.11 Hour Alarm Register (RHRAR) / Binary Counter 2 Alarm Register (BCNT2AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RHRCNT counter → RHRCNT)
		16-16	16.2.12 Day-of-Week Alarm Register (RWKAR) / Binary Counter 3 Alarm Register (BCNT3AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RWKCNT counter → RWKCNT)
		16-17	16.2.13 Day Alarm Register (RDAYAR) / Binary Counter 0 Alarm Enable Register (BCNT0AER) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RDAYCNT counter → RDAYCNT)
		16-18	16.2.14 Month Alarm Register (RMONAR) / Binary Counter 1 Alarm Enable Register (BCNT1AER) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RMONCNT counter → RMONCNT)
		16-20	16.2.16 Year Alarm Enable Register (RYRAREN) / Binary Counter 3 Alarm Enable Register (BCNT3AER) (1) In calendar count mode: Register and counter notation corrected (RYRCNT counter → RYRCNT)
		16-23	16.2.18 RTC Control Register 1 (RCR1): Register notation corrected (RCR1 register → RCR1), Description of the PIE bit corrected
		16-24	16.2.19 RTC Control Register 2 (RCR2) (1) In calendar count mode: Body corrected
		16-28	16.2.20 RTC Control Register 3 (RCR3): Register notation corrected (RCR3 register → RCR3)
		16-28	16.2.21 RTC Control Register 4 (RCR4): Register notation corrected (RCR4 register → RCR4)
		16-29	16.2.22 Frequency Register H/L (RFRH/L): Undefined value x and its description added to Bit map of the RFRH register
		16-32	Figure 16.2 Outline of initial settings after a power on: Processing of "Set the time capture control register" deleted
		16-39	16.3.8.1 Automatic Adjustment: Register notation corrected (RADJ register → RADJ)
		16-41	16.3.8.2 Adjustment by Software: Register notation corrected (RADJ register → RADJ)
		16-44	16.5.1 Register Writing during Counting: RCR1.RTCOS and RCR2.RTCOE registers deleted
		16-45	16.5.4 Notes When Writing to and Reading from Registers: Body corrected
		18. Serial Communications Interface (SCIg)	
		18-1	18. Serial Communications Interface (SCIg): Body corrected
		18-23	18.2. 11 Bit Rate Register (BRR): Body corrected
		18-23	Table 18.6 Relationship between N Setting in BRR and Bit Rate B: "Clock synchronous" row corrected
		18-29	Table 18.14 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372): "Error" column corrected
		18-31	Table 18.17 Relationship between MDDR Setting (M) and Bit Rate (B) When Bit Rate Modulation Function is Used: "Clock synchronous*1" and "Smart card interface" under the "Mode" column corrected, Note 1 corrected
		18-79	18.9.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode): Title corrected
		20. SPI Multi I/O Bus Controller	
		All	Mode names corrected as follows: Manual operating mode → Manual mode and External Address Space Read Operation → External Address Space Read Mode
		20-2	20.1.5 Manual Mode: Body corrected
		20-6	20.4.1 Common Control Register (CMNCR): Body corrected, R/W of bit 24 corrected, Description of bit 31 (MD) corrected
		20-15	20.4.7 Data Read Enable Setting Register (DRENR): Description of bits 11 to 8 (ADE[3:0]) corrected
		20-20	20.4.12 Manual Mode Enable Setting Register (SMENR): Description of bits 11 to 8 (ADE[3:0]) corrected
		20-24	20.4.16 Manual Mode Write Data Register 1 (SMWDR1): Body corrected
		20-26	20.4.18 Data Read Dummy Cycle Setting Register (DRDMCR): Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	20-28	20.4.20 Manual Mode Dummy Cycle Setting Register (SMDMCR): Body corrected
		20-36	20.4.27 PHY Adjustment Register 2 (PHYADJ2): Description of bits 31 to 0 (ADJ2[31:0]) corrected
		20-37	20.5.1 System Configuration: Body corrected
		20-39	Figure 20.4 System Configuration Example with HyperFlash Connected, corrected
		20-40	Figure 20.5 System Configuration Example with OctaFlash Connected, corrected
		20-41	20.5.2 Address Map: Body corrected
		20-52	Table 20.4 Data Registers: "Dummy cycle" row corrected
		20-52	Table 20.5 Data Registers (HyperFlash): "Dummy cycle" row corrected
		20-53	20.5.8 Command Sequence (2) Data Enable: Body corrected
		20-53	Figure 20.18 Data and Enable (Serial Flash), corrected
		20-55	20.5.8 Command Sequence (3) Bit Size: Body corrected
		20-55	Figure 20.19 Transfer Format Example with 1-Bit Data Size and One Serial Flash Memory Connected, corrected
		20-55	Figure 20.20 Transfer Format Example with 1-Bit Data Size and Two Serial Flash Memories Connected, corrected
		20-56	Figure 20.21 Transfer Format Example with 4-Bit Data Size and One Serial Flash Memory Connected, corrected
		20-57	Figure 20.23 Transfer Format Example in the HyperFlash Command and Address Phase, corrected
		20-64	20.5.17 Timing Adjustment: Body corrected
		20-64	Figure 20.28 (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected
		20-65	Figure 20.28 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected
		20-66	Figure 20.28 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected
		20-67	20.5.18 Data Alignment: Body corrected
		21. HyperBus™ Controller	
		21-2	Figure 21.2 Example of Connections between this LSI and Hyper and HyperRAM Devices, corrected
		21-3	Table 21.1 List of Input/Output Pins: Note added
		21-15	21.6.2.3 One-Byte Write Access: Title corrected, Body corrected
		21-15	Figure 21.6 Waveforms of One-Byte Writing: Title and figure corrected
		21-16	Table 21.3 Command/Address Bit Assignments: Description of bit 45 (Burst type) corrected
		21-17	21.6.3.1 Write Operation Flow: Body corrected
		21-19	21.6.3.3 Flow of Write and Read Operations for the Configuration Register: Body corrected
		21-20	Figure 21.11 Timing Chart of Read and Write Operations, corrected
		22. Octa Memory Controller	
		All	Notation of hexadecimal numbers corrected
		22-3	Table 22.1 Configuration of Hyper Memory Controller Pins: Note added
		22-3	22.3.1 Device Interface: Body corrected
		22-4	22.4 Register Descriptions: Body corrected
		22-7	22.4.3 Device Command Setting Register (DCSR): Description of bits 15 to 8 (DMLEN[7:0]) corrected
		22-8	22.4.4 Device Size Register 0 (DSR0): Description of bits 29 to 0 (DV0SZ[29:0]) corrected
		22-8	22.4.5 Device Size Register 1 (DSR1): Description of bits 29 to 0 (DV1SZ[29:0]) corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	22-9	22.4.6 Memory Delay Trim Register (MDTR): Description of bits 27 to 24 (DQSEDOPI[3:0]), bits 23 to 16 (DV1DEL[7:0]), bits 15 to 12 (DQSESOPI[3:0]), bits 11 to 8 (DQSERAM[3:0]), and bit 7 to 0 (DV0DEL[7:0]) corrected
		22-10	Table 22.4 Examples of Setting the OM_DQS Enable Counter for OctaRAM: Title and heading corrected
		22-10	Table 22.5 Examples of Setting the OM_DQS Enable Counter for OctaFlash Memory: Title and header corrected
		22-11	22.4.7 Auto-Calibration Timer Register (ACTR): Body corrected
		22-11	22.4.8 Auto-Calibration Address Register 0 (ACAR0): Body corrected, Description of bits 31 to 0 (CAD0[31:0]) corrected
		22-12	22.4.9 Auto-Calibration Address Register 1 (ACAR1): Body corrected, Description of bits 31 to 0 (CAD1[31:0]) corrected
		22-13, 22-14	22.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR): Description of bits 29 to 27 (DVRDHI1[2:0]) and bits 13 to 11 (DVRDHI0[2:0]) corrected
		22-18	22.4.12 Device Chip Select Timing Setting Register (DCSTR): Body corrected, Description of bits 13 to 11 (DVSELHI[2:0]) corrected
		22-20, 22-21	22.4.13 Controller and Device Setting Register (CDSR): Body corrected, Note of Bit table corrected
		22-22	22.4.14 Memory Map Dummy Length Register (MDLR): Body corrected, Description of bits 31 to 24 (DV1WDL[7:0]), bits 23 to 16 (DV1RDL[7:0]), bits 15 to 8 (DV0WDL[7:0]), and bits 7 to 0 (DV0RDL[7:0]) corrected, Note of Bit table corrected
		22-26	22.4.19 Configure Write without Data Register (CWNDR): Body corrected
		22-27	22.4.20 Configure Write Data Register (CWDR): Body corrected
		22-27	22.4.21 Configure Read Register (CRR): Body corrected
		22-29	Figure 22.2 Example of Connections between this LSI and OctaFlash and OctaRAM Devices, corrected
		22-32	Figure 22.6 Waveform of Write Operation in OctaRAM Interface, corrected
		22-33	Figure 22.8 Waveform of Read Operation in OctaFlash Interface (SOPI Mode), corrected
		22-33	Figure 22.9 Waveform of Read Operation in OctaFlash Interface (DOPI Mode with Pre-cycle Enabled), corrected
		22-34	Figure 22.10 Waveform of Read Operation in OctaRAM Interface (with Pre-cycle Enabled), corrected
		22-37	22.5.5 One-Byte Write Access to an Octa Memory Device in the DOPI Mode: Title corrected, Body corrected
		22-37	Figure 22.13 Waveforms in One-Byte Write Access in the DOPI Mode: Title and figure corrected
		22-38	Table 22.6 Example of Initial Settings of the Octa Memory Controller: Data of steps 4 and 6 corrected, Description of step 8 corrected
		22-42	22.6 Delaying OM_DQS and Auto-Calibration: Title corrected
		22-42	22.6.1 Delaying OM_DQS: Title corrected, Body corrected
		22-42	Figure 22.14 Example of Securing the Latching of Data by Delaying OM_DQS: Title and figure corrected
		22-42	22.6.2 OM_DQS Auto-Calibration: Body corrected
		—	22.6.2.1 Automatic Calibration Setting Flow: Title deleted
		22-43	Figure 22.15 Flow of Settings for the Auto-Calibration Mode: Title and figure corrected
		22-44	Figure 22.16 Example of the Initial Setting of the DV0DEL or DV1DEL Bits in MDTR, added
		22-45	22.7 OM_DQS Enable Counter: Body corrected, Note 1, Note 2, and Note 3 corrected
		22-46	Figure 22.17 Timing of the OM_DQS Enable Counter in DOPI Mode for the Flash Memory with 4 as the Number of Dummy Cycles (Latency), and OM_DQS Pre-Cycle Off: Title and figure corrected
		23. I^2C Bus Interface	
		23-3	23.2.1 Functional Overview: Description of SCL clock corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	23-24	23.3.6 RIICnFER — I²C Bus Function Enable Register: Description of NACKE bit corrected
		23-66	Figure 23.23 Block Diagram of Digital Noise Filter Circuit, corrected
		23-85	23.13.2 Extra SCL Clock Cycle Output Function: Body corrected
		23-85	Figure 23.40 Extra SCL Clock Cycle Output Function (CLO Bit), corrected
		24. Serial Sound Interface (SSIF-2)	
		All	I2S→I²S, corrected
		24-9	24.4.1.1 Control Register (SSICR) Descriptions of bits 21 to 19 (DWL[2:0]) and bits 18 to 16 (SWL[2:0]) in Bit table corrected
		25. CANFD Interface (RS-CANFD)	
		All	CAN FD→CANFD, corrected
		25-2	Table 25.3 Index: Descriptions of indexes d and b corrected
		25-4	Table 25.7 Interrupt Requests: RSCFD0 deleted
		25-4	Table 25.8 External Input/Output Signals: RSCFD0 deleted, CAN_CLK unit signal added
		25-5	Table 25.9 RS-CANFD Module Specifications: Specifications of Buffer and Reception filter function corrected
		25-12	25.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register: Description of RCMC bit corrected
		25-32	25.3.4.4 RSCANnGERFL — Global Error Flag Register: R/W of bits 17 and 16 in Bit map corrected
		25-38	Table 25.27 RSCANnGAFLECTR Register Contents: Function of bits 4 to 0 (AFLPN[4:0]) corrected
		25-38	25.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register: Description of AFLPN[4:0] bits corrected
		25-111	Table 25.82 RSCANnGTSTCFG Register Contents: Function of bits 22 to 16 (RTMPS[6:0]) corrected
		25-111	25.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register: Description of RTMPS[6:0] bits corrected
		25-119	25.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register: Description of RCMC bit corrected
		25-135	25.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1): Description of DBRP[7:0] bits corrected
		25-137, 25-138	25.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1): Description of GWEN bit corrected
		25-141	25.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1): Title corrected
		25-144, 25-145	Table 25.103 RSCFDnCFDGCFG Register Contents: Function of bit 12 (TSSS) and bit 4 (DCS) corrected
		25-151	25.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register: R/W of bits 17 and 16 in Bit map corrected
		25-156	25.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register: Bit notation corrected (TSCCFG Bit → TSCCFG[1:0] Bits)
		25-157	25.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register: Initial values after reset of bits 3, 2, and 0 in Bit map corrected, Description of AFLPN[4:0] bits corrected
		25-157	Table 25.110 RSCFDnCFDGAFLECTR Register Contents: Function of bits 4 to 0 (AFLPN[4:0]) corrected
		25-166	25.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0): Title corrected
		25-184	25.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5): Description of CFITSS bit corrected
		25-205	25.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register: Function of bits 13 to 10 corrected (CFDMAE[5:2] → Reserved)
		25-207	25.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register: Function of bits 13 to 10 corrected (CFDMASTS[5:2] → Reserved)

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	25-241	Table 25.167 RSCFDnCFDGTSTCFG Register Contents: Function of bits 22 to 16 (RTMPS[6:0]) corrected
		25-241	25.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register: Description of RTMPS[6:0] bits corrected
		25-251	Table 25.173 Global Mode Transition Time: *1 added to "Two CAN bit times" and "Two CAN frames" under "Maximum Transition Time"
		25-255	Table 25.175 Operation in Transitions to Channel Reset Mode/Channel Halt Mode: Title corrected
		25-257	Table 25.176 Registers Initialized in Global Reset Mode or Channel Reset Mode: Note corrected
		25-258	Table 25.177 Registers Initialized Only in Global Reset Mode: Note corrected
		25-259	Figure 25.6 Entry of Receive Rules (for Setting Channels 0 and 1): Title corrected
		25-267	Figure 25.10 Interval Timer Block Diagram, corrected
		25-267	25.8.3.1 Interval Transmission Function: Description of (4) corrected
		25-269	25.8.6 Transmit History Function: Body corrected
		25-270	25.9.1 CAN-CANFD Gateway (Only in CANFD Mode): Body corrected
		25-273	25.10.5 RAM Test: Body corrected
		25-275	25.11.1 Initial Settings: Body corrected
		25-275	Figure 25.16 CAN Setting Procedure after the MCU is Reset, corrected
		25-276	Figure 25.17 Bit Timing Chart, corrected
		25-277	Figure 25.18 CAN Clock Control Block Diagram, corrected
		25-280	25.11.1.5 Buffer Setting: Body corrected
		25-280	Figure 25.20 Buffer Configuration, corrected
		25-281	Figure 25.21 Buffer Setting Procedure: Description of "Enable interrupts of buffers to be used" processing corrected
		25-283	Figure 25.23 Receive Buffer Reading Procedure: Note corrected
		25-285	Figure 25.25 Transmit/Receive FIFO Buffer Reading Procedure, corrected
		25-303	Figure 25.37 RAM Test Setting Procedure: *1 added
		27. Ethernet Controller (ETHERC)	
		27-36	27.5.3 Handling when Control Information Included a Mismatch: Body corrected
		27-36	27.5.4 Points to Note when the EPTPC Is not in Use, added
		27-36	27.5.5 Procedure of Resetting the Ethernet Controller, added
		28. PTP Module for the Ethernet Controller (EPTPCa)	
		28-12 to 28-54	28.2.1 MINT Interrupt Source Status Register (MIESR) to 28.2.35 Cut-Through Transfer Start Threshold Register (TRNCTTDR): Address notation corrected
		28-100	28.2.82 Response Message Reception Timeout Register (RSTOUTR): Register symbol added to Address
		28-101	28.2.83 PTP Reset Register (PTRSTR): Address notation corrected
		28-102	28.2.84 STCA Clock Select Register (STCSELR): Address notation corrected
		28-139	Table 28.27 Limits on the Values that can be Specified for a Pulse Output Timer: "Resolution of the cycle" and "Resolution of the pulse width" rows corrected
		28-146	28.5.1 Setting of the Module-Stop Function, added
		28.146	Table 28.29, added
		28.147	28.5.1.1 Release from the Module-Stop State, added
		28.147	28.5.1.2 Transition to the Module-Stop State, added
		28-147	28.5.2 Notes on Placing the CPU on Software Standby, added
		28-149	28.5.5 Transfer by PTPEDMAC when the Transparent Clock (TC) is in Use, added
		30. A/D Converter	
		30-1	30.1 Overview: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	30-4	Table 30.2 Functions of A/D Converter: Names of triggers from GPT corrected
		30-17	30.2.7 A/D-Converted Value Addition/Average Mode Select Register 0 (ADADS0): Function of bits 7 to 0 in Bit table corrected
		30-23	Table 30.7 Selection of A/D Activation Sources by the TRSB[5:0] Bits (for Group B only): Names of triggers from GPT corrected
		30-24	Table 30.8 Selection of A/D Activation Sources by the TRSA[5:0] Bits: Names of triggers from GPT corrected
		30-27	Table 30.9 Selection of A/D Activation Sources by the TRSC[5:0] Bits (for Group C only): Names of triggers from GPT corrected
		30-40	30.2.21 A/D Compare Function Window-B Status Register (ADCMPBSR): Bits 15 to 8 in Bit map deleted, Bit numbers in Bit table corrected (b15 to b1 → b7 to b1)
		30-45	30.3.1 Scanning Operation: Names of triggers from GPT corrected
		30-49	30.3.2.4 Extended Operations When Double Trigger Mode is Selected: Names of triggers from GPT corrected
		30-54	30.3.4.2 A/D Conversion in Double Trigger Mode: Names of triggers from GPT corrected
		30-90	30.5.9 Range of Voltage on the Analog Input Pins, added
		30-90	30.5.10 Notes on Board Design, added
		30-90	30.5.11 Notes on Noise Prevention, added
		30-90	Figure 30.31 Example of a Protection Circuit for the Analog Inputs, added
		31. NAND Flash Controller	
		All	Sequence name corrected as follows: Universal command sequence, Generic Command Sequence → Generic Sequence
		31-1	31.1.1 Features: Description of DMA controller corrected
		31-2	Figure 31.1 Block Diagram: INTNFMA interrupt signal added
		31-2	31.1.2 Block Diagram: Body corrected
		31-5, 31-6	31.2.2 Main configurations register (CONTROL): Descriptions of bits 20 to 18 and bits 2 and 1 (ECC_BLOCK_SIZE[1:0]) in Bit table corrected
		31-7, 31-8	31.2.3 GENERIC_SEQ register (GEN_SEQ_CTRL): Descriptions of bits 11 and 10 (ROW_A1[1:0]), 9 and 8 (ROW_A0[1:0]), 7 and 6 (COL_A1[1:0]), and 5 and 4 (COL_A0[1:0]) corrected
		31-9	31.2.4 Controller status register (STATUS): Body corrected, Description of bit 9 (DATASIZE_ERROR_ST) in Bit table corrected
		31-10	31.2.5 LUN status register (LUN_STATUS_0): Body corrected
		31-14	31.2.8 ECC module control register (ECC_CTRL): Description of bits 2 to 0 (ECC_CAP[2:0]) in Bit table corrected
		31-41	31.2.34 MLUN register (MLUN): Description of bits 2 to 0 (MLUN_IDX[2:0]) in Bit table corrected
		31-43	Table 31.5 Instruction Encoding: Description of INPUT_SEL field corrected
		31-45	31.3.1 Command Generation (c) SEQ_2 Sequence: Body corrected
		31-46	31.3.1 Command Generation (d) SEQ_3 Sequence: Body corrected
		31-47	31.3.1 Command Generation (h) SEQ_7 Sequence: Body corrected
		31-48	31.3.1 Command Generation (j) SEQ_9 Sequence: Body corrected
		31-48	31.3.1 Command Generation (k) SEQ_10 Sequence: Body corrected
		31-48	31.3.1 Command Generation (l) SEQ_11 Sequence: Body corrected
		31-49	31.3.1 Command Generation (o) SEQ_14 Sequence: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	31-50	31.3.1 Command Generation (p) SEQ_15 sequence: Body corrected
		31-51	31.3.1 Command Generation (v) SEQ_22 sequence: Body corrected
		31-63	31.3.3 Instructions (11) SELECT LUN WITH STATUS Command (a) Command Description: Body corrected
		31-66	31.3.3 Instructions (17) READ PAGE Command (a) Command Description: Body corrected
		31-83	Figure 31.32 Configuration: Processing 5 corrected
		31-84	31.3.7 Setup and Configuration (1) Send Data to NAND Flash via Slave Interface: Description numbered 2, and body corrected
		31-85	31.3.7 Setup and Configuration (2) Read Data from NAND Flash via Slave Interface: Descriptions numbered 2 and 4, and body corrected
		31-86	31.3.7 Setup and Configuration (3) Send Data to NAND Flash via Master Interface (using DMA): Descriptions numbered 2 and 4, and body corrected
		31-88	31.3.7 Setup and Configuration (4) Fast Writing and Reading of Several Pages from the Memory using DMA: Description numbered 2 corrected
		31-89	Figure 31.36 Fast Writing and Reading of Several Pages from the Memory Using DMA, corrected
		31-90	31.3.7 Setup and Configuration (5) Writing to Partial Pages: Description numbered 2 corrected
		31-90	Figure 31.37 Writing to Partial Pages: Description of processing 3 corrected
		31-91	31.3.7 Setup and Configuration (6) Reading Partial Pages: Descriptions numbered 2 and 4 corrected
		31-92	Figure 31.39 Block Diagram, corrected
		31-92	31.4.1 Block Diagram: Body corrected
		31-93	31.4.2 DMA (2) DMA Description: Body corrected
		31-94, 31-96	31.4.2 DMA (b) Scatter-Gather Mode: Body corrected
		—	Figure 31.40 Descriptor Fields for Scatter-Gather DMA (64 bits), deleted
		—	Table 31.47 Descriptor Fields for Scatter-Gather DMA (64 bits), deleted
		31-94	Figure 31.40 Descriptor Fields for Scatter-Gather DMA: Title corrected
		31-95	Table 31.47 Descriptor Fields for Scatter-Gather DMA: Title corrected
		31-96	Figure 31.41 Example of Scatter-Gather DMA Data Transfer, corrected
		31-98	31.4.4 BCH Algorithm Implementation: Body corrected
		32. USB 2.0 Host Module	
		32-1	32.1 Overview: Body corrected
		32-1	32.1.2 Features: Table corrected, Note 2 added to the table
		32-7	32.2 Register Descriptions: Title corrected
		32-12	Table 32.5 HcCommandStatus Register: Descriptions of bit 2 (BLF) and bit 1 (CLF) corrected
		32-25	Table 32.21 HcRhDescriptorA Register: Description of bit 12 (NOCP) corrected
		32-66	Table 32.54 BCCTRL1 Register: Descriptions of bit 5 (DCPMODE), bit 4 (VDMSRCE), bit 3 (IDPSINKE), bit 2 (VDPSRCE), bit 1 (IDMSINKE) and bit 0 (IDPSRCE) corrected
		32-67	32.2.4.5 UCOM Register (7) CC STATUS Register (offset: 840h): Initial values after reset of bits 28 to 25 in Bit map corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	32-67	Table 32.55 CC_STATUS Register: Description of bit 31 (CC_INT_SEL) and bit 5 (CC_PERI_STA) corrected
		32-68	Table 32.56 Conditions for Detecting the Connection of a Peripheral Device: Title corrected
		32-70	32.3 Clock Signals: Title corrected
		32-72	32.4 Interrupt Sources: Title corrected
		32-80	32.5 Power-Saving Function: Title corrected
		32-81	32.6 Battery Charging: Title corrected
		32-82	32.7 Bus Master: Title corrected
		32-82	32.7.1 Functional specifications of the bus master: Title corrected
		32-82	32.7.1.2 Issuing requests for different types of bus transfer: Title corrected
		32-85	32.8 Overcurrent Control and VBUS Control: Title corrected
		32-85	32.8.2 Overcurrent detection timer setting: Body corrected
		32-88	32.9 Procedure for Setting this Module: Title corrected
		32-88	Figure 32.1 Sequence Common to Both Host and Peripheral Modes: Title added, Processing corrected
		32-89	Figure 32.2 Initialization Sequence: Title added
		33. USB 2.0 Function Module	
		33-1	33.1.1 Overview: Body corrected
		33-5	33.1.4.2 Notes (2) Setting for battery charging when the peripheral controller is selected, added
		33-30	33.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: 040H>: Name of bit 15 (VBINT) corrected
		33-48	33.2.15.2 Pipe Configuration Register [PIPECFG] <Address: 068H>: Title corrected
		33-71	33.2.19.1 Low Power Status Register [LPSTS] <Address: 102H>: Bit number of SUSPM bit in Bit table corrected (9 → 14)
		33-74	33.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: 144H>: Bit name of bits 7 to 4 in Bit map corrected
		33-100	33.8.2.1 Descriptor Interval Register [DSCITVL] <Address: 704H>: Name of bit 15 to 8 (DITVL) corrected
		33-147	33.9.12.1 Register mode/link mode • Notes on descriptors: Body corrected
		33-166	Table 33.58 List of Registers to be Saved: System configuration control register 1 (SYSCFG1) deleted
		41. LVDS Output Interface	
		41-6	41.4.4 LVDS PLL Setting Register (LPLLSETR): Description of bits 22 to 16 (LVDSPLL_FD[6:0]) corrected
		43. 2D Drawing Engine (DRW)	
		43-10	43.2.2 Surface Control Register (CONTROL2): Bit numbers in Bit table corrected (b31, 30 → b31, b30)
		45. JPEG Codec Unit	
		45-5	45.2.1 JPEG Code Mode Register (JCMOD): Description of bit 3 (DSP) corrected
		45-30	Figure 45.2 Compression Initial Setting Flow: Description of software reset corrected
		45-37	Figure 45.5 Decompression Initial Setting Flow: Description of software reset corrected
		46. Capture Engine Unit	
		46-20	46.4.6 Capture Interface Width Register (CAPWR): Bit number in Bit table corrected (12 to 10 → 12 to 0)
		46-65	46.5.3 Display in the Video Display Controller 6: Title corrected, Body corrected
		47. MIPI CSI2 Interface	
		47-2	Figure 47.1 CSI2 Block Diagram, corrected

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	47-9	47.2.5 Channel Data Type Select Register (VCDT): R/W of bits 20 to 16, descriptions of bits 9 and 8 (SEL_VC) and bit 6 (SEL_DT_ON), and initial values of bits 5 to 0 (SEL_DT) in Bit table corrected
		47-12	47.2.8 Automatic Standby Control Register (ASTBY): Initial value of bit 5 (VD_MSK_EN) in Bit table corrected
		47-40	47.2.39 ECC_CRCT Count Register (ECCCM): Bit numbers in Bit table corrected (31 to 4 → 31 to 8 and 3 to 0 → 7 to 0)
		47-53	47.3.5 Single-Channel Output: Destination for reference (Figure 47.8) added to body
		47-58 to 47-60	47.3.8 PHY Timing Setting, added
		47-59	Figure 47.11 Timing of TCLK_PREPARE and TCLK_SETTLE, added
		47-60	Figure 47.12 Timing of THS_PREPARE and THS_SETTLE, added
		47-60	Table 47.8 Setting Examples of PHY Timing Registers (when Bφ = 132 MHz, 1 UIINST = 1 ns), added
		47-61	Figure 47.13 Example 1 of Initial Setting Procedure for the Video Modules, corrected
		47-61	Figure 47.14 Example 2 of Initial Setting Procedure for the Video Modules, corrected
		47-65	Figure 47.17 Procedure for Starting PHY Block 1: Title corrected
		47-65	Figure 47.18 Procedure for Starting PHY Block 2: Title corrected
		—	Table 47.9 Example of PHY Timing Register Settings Based on Internal Bus Clock (Bφ) Frequency and Data Transfer Rate, deleted
		48. Video Input Module	
		48-1	Table 48.1 Input Interface for VIN: *2 added to "8-bit user defined data (RAW8)" under "Data Type", Note 2 corrected
		48-28	48.2.20 YC-RGB Conversion Coefficient Registers: Formula for YC → RGB color space conversion corrected
		49. SD/MMC Host Interface	
		49-13	49.2.7 SD Card Interrupt Flag Register (SD_INFO2): Description of bit 13 (SCLKDIVEN) corrected
		51. GPIO	
		51-4, 51-5	Table 51.2 Port Functions: *1 added to PG_0 to PG_7 and PJ_0 to PJ_7 under "Switching of Driving Ability", Note 1 added, Note corrected to Note 2
		51-19	51.3.5 GPIO Driving Ability Control Register (DSCR): Body corrected, Function in Bit table corrected, Note 1 corrected, Note 3 added, Note deleted
		51-28	Table 51.12 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products: Function of P6_1 pin when the register setting is 111b corrected
		51-29	Table 51.13 Register Settings for Input/Output Pin Function in 176-Pin Products: Function of P6_1 pin when the register setting is 111b corrected
		52. Power-Down Modes	
		52-7	52.2.3 Standby Control Register 3 (STBCR3): Bit 1 in Bit map: Function corrected (MSTP31 → reserved), R/W corrected Bit 2 (MSTP32) in Bit table: Description corrected (CAN-FD → CANFD); Bit 1 in Bit table: Function corrected (MSTP31 → reserved), R/W and description corrected
		52-44	52.3.2 Software Standby Mode (1) Transition to Software Standby Mode Step 4 in the description titled "The procedure for switching to software standby mode is as follows:" corrected
		52-47	52.3.4 Deep Standby Mode (1) Transition to Deep Standby Mode: Step 5 in the procedure for the transition to deep standby mode corrected
		52-48	Figure 52.3 Flowchart of Transition to Deep Standby Mode, corrected
		52-49	Figure 52.4 Flowchart of Canceling Deep Standby Mode, corrected
		52-51	Table 52.5 External Memory Control Pins in Different Modes: Heading corrected to "Boot Mode 6 (OctaFlash Boot)"

Rev.	Date	Description	
		Page	Summary
3.00	Dec 06, 2019	54. Trusted Secure IP	
		54-5	Figure 54.4 Key Installation Process, corrected
		55. Register States	
		55-3	Table 55.1 Register States: Note numbers of the "Power-On Reset" and "Deep Standby" columns of DSFR, USBBSFR, XTALCTR, RTCXTALSEL registers in "Power-down modes" row corrected
		56. Electrical Characteristics	
		56-2	56.3 DC Characteristics: Condition corrected
		56-3	Table 56.2 DC Characteristics (2) [Current Consumption]: Typical values of Icc, PLLIcc, LVDSPLLIcc, MIPIAIcc18, UAPIcc, LVDSAPIcc, AIcc in the "Current consumption in normal operation" row and I_{sleep} in the "Current consumption in sleep mode" row corrected
		56-7	Table 56.3 Permissible Output Currents, corrected
		56-8	56.4 AC Characteristics: Conditions corrected
		56-13	Table 56.6 Control Signal Timing: Note corrected to Note 1, Note 2 added
		56-16	Table 56.8 Bus Timing: Address delay time 2 (t_{AD2}) corrected
		56-48	Table 56.15 SCIFA Timing: t_{SEcyc} corrected to t_{p1cyc}
		56-50	Table 56.17 Renesas Serial Peripheral Interface Timing: t_{cyc} corrected to t_{p1cyc}, Note added
		56-53	Table 56.18 SPI Multi I/O Bus Controller Timing: Clock cycle (t_{SPBcyc}) corrected, Data output buffer off time during SDR transfer (t_{BOFF}) corrected
		56-55	Table 56.20 Octa Memory Controller Timing: Minimum value of OM_CS hold time in DOPI writing corrected
		56-65	56.4.19 CANFD Interface Timing: Title corrected
		56-65	Table 56.23 CANFD Interface Timing: Title and heading corrected
		56-65	Figure 56.77 CANFD Interface Condition: Title and figure corrected
		56-74	Table 56.30 Video Display Controller 6 Timing: DV0_CLK input clock cycle (t_{Dcyc}), LCD0_EXTCLK input clock cycle (t_{Ecyc}), LCD0_CLK output clock cycle (t_{Lcyc}) corrected
		56-77	Table 56.32 Capture Engine Unit Signal Timing: Camera clock cycle (t_{VCYC})corrected
		56-89	56.5 A/D Converter Characteristics: Condition corrected
		56-89	Table 56.40 A/D Converter Characteristics: Title corrected
		57. States and Handling of Pins	
		57-5, 57-8	Table 57.1 Pin States: Interface names corrected (CAN interface → CANFD interface, MIPI → MIPI CSI2 interface)
		57-10	Table 57.2 Handling of Unused Pins (Except for Debugger Interface Pins): Pins added, Note 3 added
		57-12	Table 57.4 Handling of Pins in Deep Standby Mode: Handling of RREF0, RREF1 corrected
		Appendix	
		Appendix -3	Figure A.3 Dimensions of 272-Pin BGA Package, corrected
4.00	Nov 27, 2020	1. Overview	
		1-9	Table 1.1 Features of RZ/A2M: In specification of package, RENESAS Code of 256-pin BGA package corrected
		1-10	Table 1.2 Product Lineup: DRP Function and Trusted Secure IP of R7S921040VCBG to R7S921043VCBG, Trusted Secure IP of R7S921051VCBG to R7S921053VCBG, and RENESAS Code of 256-pin BGA package corrected
		3. Boot Mode	
		3-1	Body corrected and Note 4 added
		5. LSI Internal Bus	
		5-60	Table 5.7 Interrupt Signals for the Write Buffers: X2HPERI12_ERRINT added, and Write Buffer Connection Source/Destination of X2HPERI34_ERRINT, X2HPERI5_ERRINT, X2HPERI67_ERRINT, and X2HDBGR_ERRINT corrected

Rev.	Date	Description	
		Page	Summary
4.00	Nov 27, 2020	6. Clock Pulse Generator	
		6-16	Figure 6.5 Clock Signals for the System and Realtime Clock: Description of peripheral clock 1C added
		7. Interrupt Controller	
		7-28	Table 7.3 List of Interrupt IDs: Internal bus added
		8. Bus State Controller	
		8-8, 8-9	8.4.2 CSn Space Bus Control Register (CSnBCR): Bit name and descriptions of bits 24 to 22, 21 to 19, and 18 to 16 corrected
		9. Direct Memory Access Controller	
		9-56, 9-57	Table 9.4 On-Chip Module Requests: DMA transfer request signals of A/D converter and I^2C channels 0 to 3 corrected
		9-58	Table 9.4 On-Chip Module Requests: Setting of the CHCFG_n/nS.LVL bit for serial communication interface channels 0 and 1 and Ethernet MAC controller corrected
		9-59	Table 9.4 On-Chip Module Requests: DMA transfer request signals of DRP corrected
		16. Realtime Clock (RTC)	
		16-33	Figure 16.3 Clock and count mode setting procedure: Notes 1 and 2 added, and Notes 1 and 2 corrected to Notes 3 and 4
		18. Serial Communications Interface (SCIg)	
		18-2	Figure 18.1 Block Diagram of SCIg (SCI0 and SCI1): Input and output of RXDn and TXDn corrected
		20. SPI Multi I/O Bus Controller	
		20-4 to 20-71	All (Description of operation in Octal-SPI flash memory protocol mode): Octal-SPI flash memory corrected to Octal-SPI flash memory protocol mode
		20-1	20.1.2 OctaFlash™, Xccela™ Flash Memory Interface: Note added
		20-7	20.4.1 Common Control Register (CMNCR): Note added in description of bits 9 and 8 (IO0FV[1:0])
		20-12	20.4.5 Data Read Extended Address Setting Register (DREAR): Body corrected
		20-12	20.4.5 Data Read Extended Address Setting Register (DREAR): Descriptions of bits 23 to 16 (EAV[7:0]) and bits 2 to 0 (EAC[2:0]) corrected
		20-17	20.4.10 Manual Mode Address Setting Register (SMADR): Description of bits 31 to 24 (ADR[31:24]) corrected
		20-20	20.4.12 Manual Mode Enable Setting Register (SMENR): Description of bits 11 to 8 (ADE[3:0]) corrected
		20-27	20.4.19 Data Read DDR Enable Register (DRDRENR): Description of bits 14 to 12 (HYPE) corrected
		20-29	20.4.21 Manual Mode DDR Enable Register (SMDRENR): Description of bits 14 to 12 (HYPE[2:0]) corrected
		20-31	20.4.22 PHY Control Register (PHYCNT): Note 3 added in description of bit 18 (HS)
		20-32	20.4.23 PHY Offset Register 1 (PHYOFFSET1): Body corrected
		20-32	20.4.23 PHY Offset Register 1 (PHYOFFSET1): Description of bits 29 and 28 (DDRTMG) corrected
		20-36	20.4.26 PHY Adjustment Register 1 (PHYADJ1): Description of bits 31 to 0 (ADJ1[31:0]) corrected
		20-36	20.4.27 PHY Adjustment Register 2 (PHYADJ2): Description of bits 31 to 0 (ADJ2[31:0]) corrected
		20-41	20.5.2 Address Map: Body corrected
		20-41	Table 20.3 Address Map: Max. Access Area corrected
		20-42	20.5.3 32-bit Serial Flash Addresses: Description in the last paragraph corrected
		20-50	Figure 20.15 Data Transfer Timing using the SSLKP Bit: QSPIn_SSL corrected
		20-54	Figure 20.19 Data and Enable (Octal-SPI Flash Memory Protocol Mode), added
		20-64	Table 20.14 Supported Protocol for Serial Flash Memory: Bit Width 1-1-0 added
		20-64	Table 20.15 Supported Protocol for Octal-SPI Flash Memory: Bit Width 1-1-0 and 8-8-0 added
		20-65	20.5.17 Timing Adjustment: Body corrected

Rev.	Date	Description	
		Page	Summary
4.00	Nov 27, 2020	20-65	Figure 20.29 (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode Except in the Case of Octal-SPI Flash Memory): Title corrected
		20-66	Figure 20.29 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): Title corrected
		20-67	Figure 20.29 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): Title corrected
		20-71	20.6.2 Transfer to read data while the signal on the QSPIn_SSL pin is asserted, deleted
		22. Octa Memory Controller	
		22-11	22.4.7 Auto-Calibration Timer Register (ACTR): In description of bits 31 to 0 (CTP[31:0]), automatic calibration cycle time corrected
		22-26	22.4.19 Configure Write without Data Register (CWNDR): Body corrected
		22-27	22.4.20 Configure Write Data Register (CWDR): Body corrected
		25. CANFD Interface (RS-CANFD)	
		25-3	Table 25.6 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI: Transfer Rate, clk_xincan, and clkc of CANFD corrected
		25-5	Table 25.9 RS-CANFD Module Specifications: In specification of communication speed, data bit rate in CANFD mode corrected
		25-305	25.12 Notes on the RS-CANFD Module: In the first bullet, "When changing interface mode without resetting the RS-CANFD" corrected to "When changing the interface mode without applying a power-on reset"
		32. USB 2.0 Host Module	
		32-4	32.1.2.6 Usage Notes, added
		32-6	32.1.4 Input/Output Pins: Pin name of OTG Power IC ID of channel 1 corrected
		32-27	Table 32.23 HcRhStatus Register: Description of bit 15 (DRWE) corrected (HcRhPortStatus register → HcRhPortStatus1 register)
		32-53	Table 32.43 SPD_CTRL Register: Description of bit 31 (SUSPENDM_ENABLE) corrected (HcRhPortStatus register → HcRhPortStatus1 register)
		32-62	Table 32.50 OBINTSTA Register: Descriptions of bit 6 (CHGDETCHG1_STA) and bit 4 (PDDETCHG1_STA) corrected
		32-65	Table 32.53 LINECTRL1 Register: Description of bits 21 and 20 (DSDP[1:0]) corrected
		32-66	Table 32.54 BCCTRL1 Register, corrected
		32-81	Table 32.59 Function of Charging Port: Title added
		32-81	32.6.1 Support of charging port: Description added
		32-82	32.6.1.1 When the host controller is to be used in the CDP mode, added
		32-83	32.6.1.2 When the host controller is to be used in the DCP mode, added
		32-83	32.6.2 Support of portable device: Description added
		32-84	Figure 32.2 Example of the Control Flow for Portable Devices, added
		32-95	32.11 Points for Caution, added
		32-95 to 32-104	32.11.1 Actions after Device Disconnection, added
		47. MIPI CSI2 Interface	
		47-18	47.2.12 Interrupt Source Mask Register (INTCLOSE): Note added
		47-62	47.3.9.1 Terminology, added
		48. Video Input Module	
		48-77	Table 48.14 Specifications: Description of UDS scaler setup sequence corrected
		51. GPIO	
		51-9	Figure 51.7 (7) TTL AND Input Buffer: JP0_3 corrected to TCK/SWDCLK
		51-10	Figure 51.9 (9) Bidirectional Buffer with TTL AND Input and Latch: JP0_2 corrected to TMS/SWDIO

Rev.	Date	Description	
		Page	Summary
4.00	Nov 27, 2020	51-10	Figure 51.10 (10) Schmitt AND Input Buffer: JP0_4 corrected to TRST#
		52. Power-Down Modes	
		52-57	52.4.3 Usage Notes when USB 2.0 Host/Function Modules are Not to be Used: Body corrected
		52-57	Figure 52.5 Flow of Settings when USB 2.0 Host/Function Modules are Not to be Used: Title added
		56. Electrical Characteristics	
		56-65	Table 56.23 CANFD Interface Timing: Maximum transfer rate of CANFD corrected
		Appendix	
		Appendix -2	Figure A.2 Dimensions of 256-Pin BGA Package, corrected
